Summary of enhancements in FastIron release 07.4.00a	lii
Summary of enhancements in FastIron release 07.4.00	liii
Unsupported features	lv
Document conventions	lvi
Text formatting	lvi
Command syntax conventions	lvii
Notes, cautions, and danger notices	lvii
Related publications	lvii
Getting technical help	lviii

Chapter 1

Management Applications

Management port overview	1
How the management port works.	2
CLI Commands for use with the management port.	2
Logging on through the CLI.	4
Online help	4
Command completion	4
Scroll control.	5
Line editing commands.	5
Using stack-unit, slot number, and port number with CLI commands.	6
CLI nomenclature on Chassis-based models.	6
CLI nomenclature on FESX Compact devices	6
CLI nomenclature on Stackable devices	7
Searching and filtering output from CLI commands	7
Using special characters in regular expressions	9
Creating an alias for a CLI command	11
Logging on through the Web Management Interface	12
Navigating the Web Management Interface	13

Chapter 2

Basic Software Features

Basic system parameter configuration	18
Entering system administration information	19
SNMP parameter configuration	19
Displaying virtual routing interface statistics	22
Disabling Syslog messages and traps for CLI access	23
Cancelling an outbound Telnet session	24
Specifying an SNTP server	24
Configuring the device as an SNTP server	28
Displaying SNTP server information	29
Enabling broadcast mode for an SNTP client	30
Setting the system clock	30
Limiting broadcast, multicast, and unknown unicast traffic	32
CLI banner configuration	37
Local MAC address for Layer 2 management traffic	40
Basic port parameter configuration	40
Assigning a port name	40
Port speed and duplex mode modification	41
Enabling auto-negotiation maximum port speed advertisement and down-shift	42
Modifying port duplex mode	45
MDI and MDIX configuration	45
Disabling or re-enabling a port	46
Flow control configuration	47
Symmetric flow control on FCX devices	49
PHY FIFO Rx and Tx depth configuration	53
Interpacket Gap (IPG) on a FastIron X Series switch	53
IPG on FastIron Stackable devices	55
Enabling and disabling support for 100BaseTX	57
Enabling and disabling support for 100BaseFX	57
Changing the Gbps fiber negotiation mode	59
Port priority (QoS) modification	60
Dynamic configuration of Voice over IP (VoIP) phones	60
Port flap dampening configuration	61
Port loop detection	65

Chapter 3

Operations, Administration, and Maintenance

OAM Overview	71
Software versions installed and running on a device	72
Determining the flash image version running on the device ..	72
Displaying the boot image version running on the device	74
Displaying the image versions installed in flash memory	74
Flash image verification	75
Image file types	76
Software upgrades	77
Boot code synchronization feature	77
Viewing the contents of flash files	77

Using SNMP to upgrade software	80
Software reboot.....	81
Software boot configuration notes.....	81
Displaying the boot preference	81
Loading and saving configuration files	82
Replacing the startup configuration with the running configuration	83
Replacing the running configuration with the startup configuration.....	83
Logging changes to the startup-config file.....	83
Copying a configuration file to or from a TFTP server	83
Dynamic configuration loading	84
Maximum file sizes for startup-config file and running-config	86
Loading and saving configuration files with IPv6	87
Using the IPv6 copy command	87
Copying a file from an IPv6 TFTP server.....	88
IPv6 ncopy command	89
IPv6 TFTP server file upload	90
Using SNMP to save and load configuration information	91
Erasing image and configuration files	92
System reload scheduling	92
Reloading at a specific time	92
Reloading after a specific amount of time.....	93
Displaying the amount of time remaining before a scheduled reload	93
Canceling a scheduled reload.....	93
Diagnostic error codes and remedies for TFTP transfers.....	93
Network connectivity testing	95
Pinging an IPv4 address	95
Tracing an IPv4 route.....	96
Hitless management on the FSX 800 and FSX 1600.....	97
Benefits of hitless management.....	98
Supported protocols and services for hitless management events	98
Hitless management configuration notes and feature limitations	100
Hitless reload or switchover requirements and limitations ..	100
What happens during a Hitless switchover or failover	101
Enabling hitless failover on the FSX 800 and FSX 1600	103
Executing a hitless switchover on the FSX 800 and FSX 1600	104
Hitless OS upgrade on the FSX 800 and FSX 1600	104
Syslog message for Hitless management events	107
Displaying diagnostic information.....	108

Chapter 4

Security Access

Securing access methods	110
-------------------------------	-----

Remote access to management function restrictions	112
ACL usage to restrict remote access	112
Defining the console idle time	115
Remote access restrictions.....	115
Restricting access to the device based on IP or MAC address	117
Defining the Telnet idle time	118
Changing the login timeout period for Telnet sessions.....	118
Specifying the maximum number of login attempts for Telnet access	118
Changing the login timeout period for Telnet sessions.....	118
Restricting remote access to the device to specific VLAN IDs	119
Designated VLAN for Telnet management sessions to a Layer 2 Switch.....	120
Device management security	121
Disabling specific access methods.....	122
Passwords used to secure access	124
Setting a Telnet password	124
Setting passwords for management privilege levels	125
Recovering from a lost password	127
Displaying the SNMP community string	128
Specifying a minimum password length.....	128
Local user accounts	129
Enhancements to username and password	129
Local user account configuration	133
Creating a password option.....	135
Changing a local user password.....	136
SSL security for the Web Management Interface	136
Enabling the SSL server on the Brocade device	137
Changing the SSL server certificate key size.....	137
Support for SSL digital certificates larger than 2048 bits ...	138
Importing digital certificates and RSA private key files.....	138
Generating an SSL certificate.....	138

TACACS and TACACS+ security	139
How TACACS+ differs from TACACS.	139
TACACS/TACACS+ authentication, authorization, and accounting	139
TACACS authentication	142
TACACS/TACACS+ configuration considerations	145
Enabling TACACS	146
Identifying the TACACS/TACACS+ servers.	146
Specifying different servers for individual AAA functions ...	147
Setting optional TACACS and TACACS+ parameters	147
Configuring authentication-method lists for TACACS and TACACS+	149
Configuring TACACS+ authorization	151
TACACS+ accounting configuration.	154
Configuring an interface as the source for all TACACS and TACACS+ packets	155
Displaying TACACS/TACACS+ statistics and configuration information	156
RADIUS security.	157
RADIUS authentication, authorization, and accounting	157
RADIUS configuration considerations.	160
Configuring RADIUS.	161
Brocade-specific attributes on the RADIUS server	161
Enabling SNMP to configure RADIUS	163
Identifying the RADIUS server to the Brocade device	163
Specifying different servers for individual AAA functions ...	163
RADIUS server per port	164
RADIUS server to individual ports mapping.	165
RADIUS parameters.	166
Setting authentication-method lists for RADIUS	167
RADIUS authorization	169
RADIUS accounting	171
Configuring an interface as the source for all RADIUS packets	172
Displaying RADIUS configuration information	172
Authentication-method lists	174
Configuration considerations for authentication- method lists	175
Examples of authentication-method lists.	175
TCP Flags - edge port security	177
Using TCP Flags in combination with other ACL features	178

Chapter 5

SSH2 and SCP

SSH version 2 overview	179
Tested SSH2 clients.	180
SSH2 supported features	180
SSH2 unsupported features	180

SSH2 authentication types	181
Enabling and disabling SSH by generating and deleting host keys	181
Configuring DSA or RSA challenge-response authentication	183
Optional SSH parameters	185
Setting the number of SSH authentication retries	186
Deactivating user authentication	186
Enabling empty password logins	186
Setting the SSH port number	187
Setting the SSH login timeout value	187
Designating an interface as the source for all SSH packets	187
Configuring the maximum idle time for SSH sessions	187
Filtering SSH access using ACLs	188
Terminating an active SSH connection	188
Displaying SSH information	188
Displaying SSH connection information	188
Displaying SSH configuration information	189
Displaying additional SSH connection information	190
Secure copy with SSH2	191
Enabling and disabling SCP	191
Secure copy configuration notes	191
Example file transfers using SCP	191
SSH2 client	195
Enabling SSH2 client	195
Configuring SSH2 client public key authentication	195
Using SSH2 client	196
Displaying SSH2 client information	197

Chapter 6

Software-based Licensing

Software license terminology	199
Software-based licensing overview	200
How software-based licensing works	200
Seamless transition for legacy devices	201
License types	201
Non-licensed features	202
Licensed features and part numbers	202
Licensing rules	206
General notes about licensing	206
Licensing rules for FCX and ICX 6610 devices	207
Licensing rules for FESX6, FSX 800, and FSX 1600 devices	208
Licensing for Ports on Demand	208
Configuring PoD on an interface	208
Configuring the upper PoD ports in a stack for ICX 6610 devices only	209
Displaying license configuration for PoD ports after a license upgrade	210

Upgrading or downgrading configuration considerations for PoD .	212
Configuration considerations for stacking or trunking PoD ports .	213
Configuration considerations when configuring PoD on an interface .	213
Configuration considerations when configuring PoD for ICX 6450 devices only .	214
Software licensing configuration tasks .	216
Obtaining a license .	216
Installing a license file .	221
Using TFTP to copy a license file on FESX, SX 800 and SX 1600, and FWS devices .	221
Using TFTP to copy a license file on FCX and ICX devices .	221
Using Secure Copy to install a license .	221
Verifying the license file installation .	222
Deleting a license file .	222
Deleting a license on FESX, SX 800 and SX 1600, and FWS devices .	222
Deleting a license on FCX and ICX devices .	223
Using a trial license .	223
What happens when a trial license expires .	223
Console, syslog, and trap messages for trial license expiration .	224
Renewing or extending a trial license .	224
Viewing software license information from the Brocade software portal .	224
Transferring a license .	226
Special replacement instructions for legacy devices .	226
Syslog messages and trap information .	227
Viewing information about software licenses .	227
Viewing the License ID .	227
Viewing the license database .	229
Viewing software packages installed in the device .	232

Chapter 7

Brocade Stackable Devices

Brocade IronStack overview .	236
Brocade IronStack features .	236
Brocade stackable models .	236
Brocade IronStack terminology .	237
Supported IronStack topologies .	239
Brocade IronStack topologies .	239

Connecting ICX 6450 and ICX 6430 devices in a stack	244
Connecting ICX 6450 devices in a stack.	245
Connecting ICX 6430 devices in a stack	245
Trunking configuration considerations for ICX 6430 and ICX 6450 devices.	245
Software requirements	248
IronStack construction methods.	249
Scenario 1 - Three-member IronStack in a ring topology using secure-setup.	250
Scenario 2 - Three-member IronStack in a ring topology using the automatic setup process.	254
Scenario 3 - Three member IronStack in a ring topology using the manual configuration process	257
FCX IronStack configuration.	258
Configuring FCX stacking ports.	259
Configuring a default stacking port to function as a data port	264
Configuring an ICX 6610 IronStack	265
ICX 6610 trunked stacking ports configuration.	265
Configuration notes for ICX stack topologies	265
Periodic background stack diagnosis for ICX 6610 devices	266
Configuring an ICX 6430 and ICX 6450 IronStack	266
Configuring ICX 6430 or ICX 6450 trunked stacking ports	267
Configuring ICX 6430 or ICX 6450 multi-trunked stacking ports.	267
Periodic background stack diagnosis for ICX 6430 and ICX 6450 devices	268
Error messages encountered during the configuration of an ICX 6430 or ICX 6450 IronStack	269
Verifying an IronStack configuration	270
Brocade IronStack management	273
Logging in through the CLI.	273
Logging in through the console port.	273
IronStack management MAC address	275
Removing MAC address entries	277
CLI command syntax for stack units.	279
IronStack CLI commands	279
Important notes about stacking images	281
Copying the flash image to a stack unit from the Active Controller.	283
Reloading a stack unit.	283
Controlling stack topology	283
Managing IronStack partitioning.	284
MIB support for the IronStack.	285
Persistent MAC address for the IronStack	286
Unconfiguring an IronStack.	287
Displaying IronStack information	289
Adding, removing, or replacing units in an IronStack	311
Renumbering stack units	313
Syslog, SNMP, and traps for stack units.	314

IronStack troubleshooting	315
Troubleshooting an unsuccessful stack build	315
Troubleshooting a stacking upgrade	317
Troubleshooting image copy issues	318
Stack mismatches	318
Image mismatches	319
Advanced feature privileges (FCX devices only)	319
Configuration mismatch for stack units	320
Auto Image Copy for stack units	321
Memory allocation failure	322
Recovering from a stack unit mismatch	323
Troubleshooting secure-setup	324
Troubleshooting unit replacement issues	324
More about IronStack technology	325
Configuration, startup configuration files, and stacking flash	325
IronStack topologies	326
Port down and aging	326
Brocade IronStack device roles and elections	326
Hitless stacking	329
Supported hitless stacking events	329
Non-supported hitless stacking events	330
Supported hitless stacking protocols and services	330
Hitless stacking configuration notes and feature limitations	333
What happens during a hitless stacking switchover or failover	333
Standby Controller role in hitless stacking	335
Support during stack formation, stack merge, and stack split	337
Hitless stacking default behavior	340
Hitless stacking failover	342
Hitless stacking switchover	343
Displaying information about hitless stacking	350
Displaying information about stack failover	350
Displaying information about link synchronization status	350
Syslog messages for hitless stacking failover and switchover	351

Chapter 8

IPv6 Configuration on FastIron X Series, FCX, and ICX Series Switches

Full Layer 3 IPv6 feature support	355
IPv6 addressing overview	355
IPv6 address types	356
IPv6 stateless auto-configuration	358
IPv6 CLI command support	358

IPv6 host address on a Layer 2 switch	360
Configuring a global or site-local IPv6 address with a manually configured interface ID	361
Configuring a link-local IPv6 address as a system-wide address for a switch.	361
Configuring the management port for an IPv6 automatic address configuration.	362
Configuring basic IPv6 connectivity on a Layer 3 switch.	362
Enabling IPv6 routing.	362
IPv6 configuration on each router interface	362
Configuring IPv4 and IPv6 protocol stacks.	365
IPv6 management (IPv6 host support)	366
Configuring IPv6 management ACLs	366
Restricting SNMP access to an IPv6 node.	366
Specifying an IPv6 SNMP trap receiver	367
Configuring SNMP V3 over IPv6	367
Configuring SNMP over IPv6.	367
Secure Shell, SCP, and IPv6	367
IPv6 Telnet	367
IPv6 traceroute.	368
IPv6 Web management using HTTP and HTTPS	369
Restricting Web management access	369
Configuring name-to-IPv6 address resolution using IPv6 DNS resolver	370
Defining an IPv6 DNS entry.	370
Pinging an IPv6 address	370
Configuring an IPv6 Syslog server	372
Viewing IPv6 SNMP server addresses	372
Disabling router advertisement and solicitation messages ..	373
Disabling IPv6 on a Layer 2 switch.	373
Static IPv6 route configuration.	373
IPv6 over IPv4 tunnels	376
IPv6 over IPv4 tunnel configuration notes	376
Configuring a manual IPv6 tunnel	377
Clearing IPv6 tunnel statistics	378
Displaying IPv6 tunnel information.	378
ECMP load sharing for IPv6	381
Disabling or re-enabling ECMP load sharing for IPv6	382
Changing the maximum load sharing paths for IPv6	382
Enabling support for network-based ECMP load sharing for IPv6	382
Displaying ECMP load-sharing information for IPv6	382
IPv6 ICMP feature configuration	383
Configuring ICMP rate limiting	383
Enabling IPv6 ICMP redirect messages	384

IPv6 neighbor discovery configuration	384
IPv6 neighbor discovery configuration notes	385
Neighbor solicitation and advertisement messages	385
Router advertisement and solicitation messages	386
Neighbor redirect messages	386
Setting neighbor solicitation parameters for duplicate address detection	387
Setting IPv6 router advertisement parameters	387
Prefixes advertised in IPv6 router advertisement messages	389
Setting flags in IPv6 router advertisement messages	390
Enabling and disabling IPv6 router advertisements	390
Configuring reachable time for remote IPv6 nodes	391
IPv6 MTU	391
Configuration notes and feature limitations for IPv6 MTU	391
Changing the IPv6 MTU	392
Static neighbor entries configuration	392
Limiting the number of hops an IPv6 packet can traverse	393
IPv6 source routing security enhancements	393
TCAM space on FCX device configuration	394
Allocating TCAM space for IPv4 routing information	394
Allocating TCAM space for GRE tunnel information	394
Clearing global IPv6 information	395
Clearing the IPv6 cache	395
Clearing IPv6 neighbor information	395
Clearing IPv6 routes from the IPv6 route table	396
Clearing IPv6 traffic statistics	396
Displaying global IPv6 information	396
Displaying IPv6 cache information	397
Displaying IPv6 interface information	398
Displaying IPv6 neighbor information	400
Displaying the IPv6 route table	401
Displaying local IPv6 routers	402
Displaying IPv6 TCP information	403
Displaying IPv6 traffic statistics	407
.....	410

Chapter 9

FWS Series Switch IPv6 management

IPv6 management overview	412
IPv6 addressing	412
Enabling and disabling IPv6	413

IPv6 management features	413
IPv6 management ACLs	413
IPv6 Web management using HTTP and HTTPS	413
IPv6 logging	414
Name-to-IPv6 address resolution using IPv6 DNS server. . .	415
Defining an IPv6 DNS entry.	415
Pinging IPv6	415
SNTP over IPv6.	417
SNMP3 over IPv6.	417
Specifying an IPv6 SNMP trap receiver	417
Secure Shell, SCP, and IPv6	417
IPv6 Telnet	417
IPv6 traceroute.	419
IPv6 management commands.....	419

Chapter 10

SNMP Access

SNMP overview	421
SNMP community strings	422
Encryption of SNMP community strings.....	422
Adding an SNMP community string	422
Displaying the SNMP community strings	424
User-based security model	425
Configuring your NMS	426
Configuring SNMP version 3 on Brocade devices	426
Defining the engine id	426
Defining an SNMP group.....	427
Defining an SNMP user account.....	428
Defining SNMP views	429
SNMP version 3 traps.....	430
Defining an SNMP group and specifying which view is notified of traps	430
Defining the UDP port for SNMP v3 traps	431
Trap MIB changes	432
Specifying an IPv6 host as an SNMP trap receiver	432
SNMP v3 over IPv6	433
Specifying an IPv6 host as an SNMP trap receiver	433
Viewing IPv6 SNMP server addresses	433
Displaying SNMP Information.....	434
Displaying the Engine ID	434
Displaying SNMP groups	435
Displaying user information.....	435
Interpreting varbinds in report packets	435
SNMP v3 configuration examples	436
Simple SNMP v3 configuration.....	436
More detailed SNMP v3 configuration	436

Chapter 11	Foundry Discovery Protocol (FDP) and Cisco Discovery Protocol (CDP) Packets
	FDP Overview.....437
	FDP configuration438
	Displaying FDP information.....439
	Clearing FDP and CDP information.....442
	CDP packets443
	Enabling interception of CDP packets globally443
	Enabling interception of CDP packets on an interface443
	Displaying CDP information.....443
	Clearing CDP information445
Chapter 12	LLDP and LLDP-MED
	LLDP terms used in this chapter448
	LLDP overview449
	Benefits of LLDP450
	LLDP-MED overview450
	Benefits of LLDP-MED451
	LLDP-MED class.....452
	General LLDP operating principles452
	LLDP operating modes452
	LLDP packets453
	TLV support.....454
	MIB support.....457
	Syslog messages.....457
	LLDP configuration458
	LLDP configuration notes and considerations.....458
	Enabling and disabling LLDP.....459
	Enabling support for tagged LLDP packets459
	Changing a port LLDP operating mode459
	Maximum number of LLDP neighbors462
	Enabling LLDP SNMP notifications and Syslog messages ..462
	Changing the minimum time between LLDP transmissions .463
	Changing the interval between regular LLDP transmissions .464
	Changing the holdtime multiplier for transmit TTL464
	Changing the minimum time between port reinitializations .465
	LLDP TLVs advertised by the Brocade device465
	LLDP-MED configuration.....474
	Enabling LLDP-MED.....475
	Enabling SNMP notifications and Syslog messages for LLDP-MED topology changes.....475
	Changing the fast start repeat count476
	Defining a location id.....476
	Defining an LLDP-MED network policy483

LLDP-MED attributes advertised by the Brocade device	485
Extended power-via-MDI information	486
Displaying LLDP statistics and configuration settings.	488
LLDP configuration summary	488
Displaying LLDP statistics	489
Displaying LLDP neighbors	491
Displaying LLDP neighbors detail	492
Displaying LLDP configuration details	493
Resetting LLDP statistics	495
Clearing cached LLDP neighbor information.	495

Chapter 13

Hardware Component Monitoring

Virtual cable testing	497
Virtual cable testing configuration notes	497
Virtual cable testing command syntax	498
Viewing the results of the cable analysis	498
Digital optical monitoring	500
Digital optical monitoring configuration limitations.	500
Enabling digital optical monitoring	500
Setting the alarm interval	500
Displaying information about installed media	501
Viewing optical monitoring information	502
Syslog messages for optical transceivers	505

Chapter 14

Syslog

About Syslog messages	508
Displaying Syslog messages.	508
Enabling real-time display of Syslog messages	509
Enabling real-time display for a Telnet or SSH session	509
Displaying real-time Syslog messages	510
Syslog service configuration.	510
Displaying the Syslog configuration	510
Disabling or re-enabling Syslog.	514
Specifying a Syslog server	514
Specifying an additional Syslog server	514
Disabling logging of a message level	515
Changing the number of entries the local buffer can hold	515
Changing the log facility	516
Displaying interface names in Syslog messages.	517
Displaying TCP or UDP port numbers in Syslog messages	517
Retaining Syslog messages after a soft reboot	518
Clearing the Syslog messages from the local buffer	518
Syslog messages for hardware errors	518

Chapter 15

Network Monitoring

Basic system management	521
Viewing system information	521
Viewing configuration information	522
Viewing port statistics	523
Viewing STP statistics	525
Clearing statistics	526
Traffic counters for outbound traffic	526
Viewing egress queue counters on FCX devices	530
RMON support	531
Maximum number of entries allowed in the RMON control table	531
Statistics (RMON group 1)	532
History (RMON group 2)	534
Alarm (RMON group 3)	534
Event (RMON group 9)	535
sFlow	535
sFlow version 5	536
sFlow support for IPv6 packets	536
sFlow configuration considerations	537
Configuring and enabling sFlow	539
Enabling sFlow forwarding	545
sFlow version 5 feature configuration	546
Displaying sFlow information	549
Utilization list for an uplink port	552
Utilization list for an uplink port command syntax	553
Displaying utilization percentages for an uplink	553

Chapter 16

Basic Layer 2 Features

About port regions	556
FastIron X Series device port regions	556
FCX and FWS device port regions	557
ICX 6610 device port regions	557
ICX 6430 device port regions	557
ICX 6450 device port regions	558
Enabling or disabling the Spanning Tree Protocol (STP)	558
Modifying STP bridge and port parameters	558
Management MAC address for stackable devices	559
MAC learning rate control	559
Changing the MAC age time and disabling MAC address learning	560
Disabling the automatic learning of MAC addresses	560
Displaying the MAC address table	561
Static MAC entry configuration	561
Multi-port static MAC address	561
VLAN-based static MAC entries configuration	563

Clearing MAC address entries	563
Flow-based MAC address learning	564
Flow-based learning overview	564
Flow-based learning configuration considerations	565
Configuring flow-based MAC address learning	566
Displaying information about flow-based MACs	567
Clearing flow-based MAC address entries	567
Enabling port-based VLANs	567
Assigning IEEE 802.1Q tagging to a port	568
Defining MAC address filters	569
MAC address filters configuration notes and limitations	569
MAC address filters command syntax	570
Enabling logging of management traffic permitted by MAC address filters	571
MAC address filter override for 802.1X-enabled ports	572
Locking a port to restrict addresses	574
Lock address configuration notes	574
Lock address command syntax	574
Monitoring MAC address movement	574
Configuring the MAC address movement threshold rate	575
Viewing the MAC address movement threshold rate configuration	576
Configuring an interval for collecting MAC address move notifications	577
Viewing MAC address movement statistics for the interval history	577
Displaying and modifying system parameter default settings	578
System default settings configuration considerations	578
Displaying system parameter default values	578
Modifying system parameter default values	584
Dynamic buffer allocation for QoS priorities for FastIron X Series devices	584
Default queue depth limits for FastIron X Series devices	585
Configuring the total transmit queue depth limit for FastIron X Series devices	585
Configuring the transmit queue depth limit for a given traffic class on FastIron X Series devices	586
Removing buffer allocation limits on FastIron X Series devices	587
Buffer profile configuration	587
Default queue depth limits for FastIron X Series devices	589
Dynamic buffer allocation for FCX, FWS, and ICX devices	589
Configuring buffer profiles	590
Configuring buffer sharing on FCX and ICX devices	599
Removing buffer allocation limits on FCX, FWS, and ICX	602
Buffer profiles for VoIP on FastIron stackable devices	603
Remote Fault Notification on 1Gbps fiber connections	603
Enabling and disabling remote fault notification	604

Link Fault Signaling for 10Gbps Ethernet devices	604
Jumbo frame support	606

Chapter 17

Metro Features

Topology groups	607
Master VLAN and member VLANs	608
Control ports and free ports	608
Topology group configuration considerations	608
Configuring a topology group	609
Displaying topology group information	610
Metro Ring Protocol	611
Metro Ring Protocol configuration notes	613
MRP rings without shared interfaces (MRP Phase 1)	613
MRP rings with shared interfaces (MRP Phase 2)	614
Ring initialization	616
How ring breaks are detected and healed	621
Master VLANs and customer VLANs	623
Metro Ring Protocol configuration	625
Metro Ring Protocol diagnostics	628
Displaying MRP information	629
MRP CLI example	631
VSRP	633
VSRP configuration notes and feature limitations	634
Layer 2 and Layer 3 redundancy	635
Master election and failover	635
VSRP-aware security features	639
VSRP parameters	640
Configuring basic VSRP parameters	642
Configuring optional VSRP parameters	643
Displaying VSRP information	651
VSRP fast start	654
VSRP and MRP signaling	656

Chapter 18

Power over Ethernet

Power over Ethernet overview	659
Power over Ethernet terms used in this chapter	660
Methods for delivering Power over Ethernet	660
PoE autodiscovery	662
Power class	662
Power specifications	663
Dynamic upgrade of PoE power supplies	663
Power over Ethernet cabling requirements	665
Supported powered devices	665
Installing PoE firmware	666
PoE and CPU utilization	668
Enabling and disabling Power over Ethernet	669
Disabling support for PoE legacy power-consuming devices	669

Enabling the detection of PoE power requirements advertised through CDP	670
Command syntax for PoE power requirements	670
Setting the maximum power level for a PoE power-consuming device	670
Setting power levels configuration note	671
Configuring power levels command syntax	671
Setting the power class for a PoE power-consuming device	672
Setting the power class configuration notes	672
Setting the power class command syntax	672
Setting the power budget for a PoE interface module	673
Setting the inline power priority for a PoE port	673
Command syntax for setting the inline power priority for a PoE port	674
Resetting PoE parameters	675
Displaying Power over Ethernet information	675
Displaying PoE operational status	675
Displaying detailed information about PoE power supplies ..	678

Chapter 19

UDLD and Protected Link Groups

UDLD overview	685
UDLD for tagged ports	686
Configuration notes and feature limitations for UDLD	686
Enabling UDLD	686
Enabling UDLD for tagged ports	687
Changing the Keepalive interval	688
Changing the Keepalive retries	688
Displaying UDLD information	688
Clearing UDLD statistics	690
Protected link groups	691
About active ports	691
Using UDLD with protected link groups	691
UDLD with protected link groups configuration notes	691
Creating a protected link group and assigning an active port	692

Chapter 20

Trunk Groups and Dynamic Link Aggregation

Trunk group overview	697
Trunk group connectivity to a server	698
Trunk group rules	699
Trunk group configuration examples	702
Support for flexible trunk group membership	704
Trunk group load sharing	705

Configuring a trunk group	707
CLI syntax for configuring consecutive ports in a trunk group	707
CLI syntax for configuring non-consecutive ports in a trunk group	708
Example 1: Configuring the trunk groups.	709
Example 2: Configuring a trunk group that spans two Ethernet modules in a chassis device.	709
Example 3: Configuring a multi-slot trunk group with one port per module	710
Example 4: Configuring a trunk group of 10 Gbps Ethernet ports	710
Additional trunking options	711
Displaying trunk group configuration information	716
Viewing the first and last ports in a trunk group	717
Dynamic link aggregation	718
IronStack LACP trunk group configuration example	719
Examples of valid LACP trunk groups	719
Configuration notes and limitations for configuring IronStack LACP trunk groups.	721
Adaptation to trunk disappearance	722
Flexible trunk eligibility	723
Enabling dynamic link aggregation.	724
How changing the VLAN membership of a port affects trunk groups and dynamic keys	725
Additional trunking options for LACP trunk ports.	725
Link aggregation parameters	725
Displaying and determining the status of aggregate links.	731
Events that affect the status of ports in an aggregate link.	731
Displaying link aggregation and port status information	731
Displaying LACP status information	734
Clearing the negotiated aggregate links table	734
Single instance LACP configuration	734
Configuration notes for single link LACP	735
CLI syntax for single link LACP	735

Chapter 21

VLANs

VLAN overview	738
Types of VLANs.	738
Modifying a port-based VLAN	744
Default VLAN	754
802.1Q tagging	755
Spanning Tree Protocol (STP)	758
Virtual routing interfaces.	759
VLAN and virtual routing interface groups.	760
Dynamic, static, and excluded port membership	761
Super aggregated VLANs.	763
Trunk group ports and VLAN membership.	763
Summary of VLAN configuration rules	764

Routing between VLANs	765
Virtual routing interfaces (Layer 2 switches only)	765
Routing between VLANs using virtual routing interfaces (Layer 3 switches only)	765
Dynamic port assignment (Layer 2 switches and Layer 3 switches)	766
Assigning a different VLAN ID to the default VLAN	766
Assigning different VLAN IDs to reserved VLANs 4091 and 4092	767
Assigning trunk group ports	768
Enable spanning tree on a VLAN	768
Configuring IP subnet, IPX network and protocol-based VLANs	770
IP subnet, IPX network, and protocol-based VLAN configuration example	770
IP subnet, IPX network, and protocol-based VLANs within port-based VLANs	772
IPv6 protocol VLAN configuration	776
Routing between VLANs using virtual routing interfaces (Layer 3 switches only)	776
Configuring protocol VLANs with dynamic ports	782
Aging of dynamic ports	783
Configuration guidelines for membership aging of dynamic VLAN ports	784
Configuring an IP, IPX, or AppleTalk Protocol VLAN with Dynamic Ports	784
Configuring an IP subnet VLAN with dynamic ports	785
Configuring an IPX network VLAN with dynamic ports	785
Configuring uplink ports within a port-based VLAN	787
Configuration considerations for uplink ports within a port-based VLAN	787
Configuration syntax for uplink ports within a port-based VLAN	787
IP subnet address on multiple port-based VLAN configuration	788
VLAN groups and virtual routing interface group	791
Configuring a VLAN group	791
Configuring a virtual routing interface group	793
Displaying the VLAN group and virtual routing interface group information	794
Allocating memory for more VLANs or virtual routing interfaces	795
Super-aggregated VLAN configuration	796
Configuration notes for aggregated VLANs	799
Configuring aggregated VLANs	799
Verifying the aggregated VLAN configuration	801
Complete CLI examples for aggregated VLANs	801

802.1ad tagging configuration	804
Configuration rules for 802.1ad tagging	805
Enabling 802.1ad tagging	805
Example 802.1ad configuration	806
Configuring 802.1ad tag profiles	808
Private VLAN configuration	809
Configuration notes for PVLANS and standard VLANs	813
Enabling broadcast or unknown unicast traffic to the PVLAN	816
CLI example for a general PVLAN network	816
CLI example for a PVLAN network with switch-switch link ports	817
Dual-mode VLAN ports	818
Displaying VLAN information	821
Displaying VLANs in alphanumeric order	821
Displaying system-wide VLAN information	822
Displaying global VLAN information	823
Displaying VLAN information for specific ports	823
Displaying a port VLAN membership	824
Displaying a port dual-mode VLAN membership	824
Displaying port default VLAN IDs (PVIDs)	825
Displaying PVLAN information	825

Chapter 22

Multi-Chassis Trunking

Multi-Chassis Trunking Overview	827
How MCT works	828
MCT terminology	829
MCT data flow	830
MCT and VLANs	834
Cluster client automatic configuration	835
MCT feature interaction	835
Basic MCT configuration	837
MCT configuration considerations	837
Differences in configuring MCT for the switch and router image	838
Configuring MCT	838
Setting up cluster client automatic configuration	841
MCT failover scenarios	843
Layer 2 behavior with MCT	846
MAC operations	846
Port loop detection	849
MCT Layer 2 protocols	850
Protocol-based VLANs	850
Uplink switch	851
Layer 2 multicast snooping over MCT	851
Layer 3 behavior with MCT	854
Layer 3 unicast over MCT	855
MCT for VRRP or VRRP-E	857

Displaying MCT information	860
Displaying peer and client states	860
Displaying state machine information	861
Displaying cluster, peer, and client states	862
Displaying information about Ethernet interfaces.....	862
Displaying STP information	864
Displaying information for multicast snooping	864
MCT configuration examples	867
Single-level MCT example	867
Two-level MCT example	871
MCT configuration with VRRP-E example.....	876
Multicast snooping configuration example	879

Chapter 23

GVRP

GVRP overview.....	883
GVRP application examples	884
Dynamic core and fixed edge	885
Dynamic core and dynamic edge	886
Fixed core and dynamic edge	886
Fixed core and fixed edge	886
VLAN names created by GVRP	886
Configuration notes for GVRP.....	886
GVRP configuration	888
Changing the GVRP base VLAN ID	888
Increasing the maximum configurable value of the Leaveall timer	888
Enabling GVRP	889
Disabling VLAN advertising.....	889
Disabling VLAN learning	890
Changing the GVRP timers	890
Converting a VLAN created by GVRP into a statically-configured VLAN	892
Displaying GVRP information	893
Displaying GVRP configuration information	894
Displaying GVRP VLAN information.....	896
Displaying GVRP statistics.....	898
Displaying CPU utilization statistics	901
Clearing GVRP statistics	902
GVRP CLI examples	902
Dynamic core and fixed edge	902
Dynamic core and dynamic edge	903
Fixed core and dynamic edge	904
Fixed core and fixed edge	904

Chapter 24

MAC-based VLANs

MAC-based VLAN overview	905
Static and dynamic hosts	905
MAC-based VLAN feature structure	906
Dynamic MAC-based VLAN	907
Configuration notes and feature limitations for dynamic MAC-based VLAN	907
Dynamic MAC-based VLAN CLI commands	907
Dynamic MAC-based VLAN configuration example	908
MAC-based VLAN configuration	909
Using MAC-based VLANs and 802.1X security on the same port	910
Configuring generic and Brocade vendor-specific attributes on the RADIUS server	910
Aging for MAC-based VLAN	911
Disabling aging for MAC-based VLAN sessions	912
Configuring the maximum MAC addresses per port	913
Configuring a MAC-based VLAN for a static host	913
Configuring MAC-based VLAN for a dynamic host	914
Configuring dynamic MAC-based VLAN	914
Configuring MAC-based VLANs using SNMP	915
Displaying Information about MAC-based VLANs	915
Displaying the MAC-VLAN table	915
Displaying the MAC-VLAN table for a specific MAC address	916
Displaying allowed MAC addresses	916
Displaying denied MAC addresses	917
Displaying detailed MAC-VLAN data	918
Displaying MAC-VLAN information for a specific interface	919
Displaying MAC addresses in a MAC-based VLAN	920
Displaying MAC-based VLAN logging	921
Clearing MAC-VLAN information	921
Sample MAC-based VLAN application	921

Chapter 25

Port mirroring and Monitoring

Port mirroring and monitoring overview	925
Port mirroring and monitoring configuration	927
Configuration notes for port mirroring and monitoring	927
Command syntax for port mirroring and monitoring	929
mirroring configuration on an IronStack	930
Configuration notes for Ironstack mirroring	930
ACL-based inbound mirroring	931
Creating an ACL-based inbound mirror clause for FWS and FCX devices	931
ACL-based inbound mirror clauses for FastIron X Series devices	932
Destination mirror port	932

MAC address filter-based mirroring	936
Configuring MAC address filter-based mirroring	936
VLAN-based mirroring	937
VLAN-based mirroring on FastIron X Series devices	939

Chapter 26

IP Configuration

Basic IP configuration	946
IP configuration overview	947
Edge Layer 3 support	947
Full Layer 3 support	947
IP interfaces	948
IP packet flow through a Layer 3 Switch	949
IP route exchange protocols	954
IP multicast protocols	954
IP interface redundancy protocols	954
ACLs and IP access policies	955
Basic IP parameters and defaults – Layer 3 Switches	955
When parameter changes take effect	956
IP global parameters – Layer 3 Switches	956
IP interface parameters – Layer 3 Switches	959
Basic IP parameters and defaults – Layer 2 Switches	962
IP global parameters – Layer 2 Switches	962
Interface IP parameters – Layer 2 Switches	964
Configuring IP parameters – Layer 3 Switches	964
Configuring IP addresses	964
Configuring 31-bit subnet masks on point-to-point networks	968
Configuring DNS resolver	970
Configuring packet parameters	973
Changing the router ID	976
Specifying a single source interface for specified packet types	977
ARP parameter configuration	981
Configuring forwarding parameters	986
Disabling ICMP messages	989
Disabling ICMP Redirect Messages	990
Static routes configuration	991
Configuring a default network route	1000
Configuring IP load sharing	1001
ICMP Router Discovery Protocol configuration	1004
IRDP parameters	1005
Reverse Address Resolution Protocol configuration	1007
Configuring UDP broadcast and IP helper parameters	1009
BootP and DHCP relay parameter configuration	1011
DHCP Server	1013
Displaying DHCP Server information	1024
DHCP Client-Based Auto-Configuration and Flash image update	1028

Configuring IP parameters – Layer 2 Switches.....	1037
Configuring the management IP address and specifying the default gateway	1037
Configuring Domain Name Server (DNS) resolver.....	1038
Changing the TTL threshold	1039
DHCP Assist configuration.....	1040
IPv4 point-to-point GRE tunnels.....	1043
IPv4 GRE tunnel overview	1044
GRE packet structure and header format	1044
Path MTU Discovery (PMTUD) support.....	1045
Configuration considerations for PMTUD support.....	1045
Tunnel loopback ports for GRE tunnels	1046
Support for IPv4 multicast routing over GRE tunnels	1046
GRE support with other features	1047
Configuration considerations for GRE IP tunnels	1048
Configuration tasks for GRE tunnels	1050
Example point-to-point GRE tunnel configuration	1058
Displaying GRE tunneling information	1059
Clearing GRE statistics	1064
Displaying IP configuration information and statistics.....	1064
Changing the network mask display to prefix format	1065
Displaying IP information – Layer 3 Switches	1065
Displaying IP information – Layer 2 Switches	1080
Disabling IP checksum check.....	1084

Chapter 27

Spanning Tree Protocol

STP overview	1087
Standard STP parameter configuration.....	1088
STP parameters and defaults	1088
Enabling or disabling the Spanning Tree Protocol (STP) ...	1089
Changing STP bridge and port parameters	1091
STP protection enhancement	1092
Displaying STP information	1094
STP feature configuration.....	1103
Fast port span	1103
Fast Uplink Span	1106
802.1W Rapid Spanning Tree (RSTP).....	1109
802.1W Draft 3	1146
Single Spanning Tree (SSTP).....	1151
STP per VLAN group.....	1153
PVST/PVST+ compatibility	1157
Overview of PVST and PVST+	1157
VLAN tags and dual mode.....	1158
Configuring PVST+ support.....	1159
Displaying PVST+ support information.....	1160
PVST+ configuration examples	1160
PVRST compatibility	1163

BPDU guard	1163
Enabling BPDU protection by port	1163
Re-enabling ports disabled by BPDU guard	1164
Displaying the BPDU guard status	1164
BPDU guard status example console messages	1165
Root guard	1166
Enabling STP root guard	1166
Displaying the STP root guard	1166
Displaying the root guard by VLAN	1167
Error disable recovery	1167
Enabling error disable recovery	1167
Setting the recovery interval	1168
Displaying the error disable recovery state by interface ...	1168
Displaying the recovery state for all conditions	1168
Displaying the recovery state by port number and cause..	1169
Errdisable Syslog messages	1169
802.1s Multiple Spanning Tree Protocol	1169
Multiple spanning-tree regions	1170
Configuration notes	1171
Configuring MSTP mode and scope	1171
Reduced occurrences of MSTP reconvergence	1172
Configuring additional MSTP parameters	1174

Chapter 28

Base Layer 3 and Routing Protocols

TCAM entries in FWS devices	1186
Adding a static IP route	1186
Adding a static ARP entry	1187
Modifying and displaying Layer 3 system parameter limits ...	1188
Layer 3 configuration notes	1188
FWS with base Layer 3	1188
FastIron first generation modules	1189
FastIron second generation modules	1190
FastIron third generation modules	1191
Displaying Layer 3 system parameter limits	1191
Configuring RIP	1193
Enabling RIP	1193
Enabling redistribution of IP static routes into RIP	1193
Configuring a redistribution filter	1195
Enabling redistribution	1195
Enabling learning of default routes	1196
Changing the route loop prevention method	1196
Other Layer 3 protocols	1196
Enabling or disabling routing protocols	1196
Enabling or disabling Layer 2 switching	1197
Configuration notes and feature limitations for	
Layer 2 switching	1197
Command syntax for Layer 2 switching	1197

Chapter 29

RIP (IPv4)

RIP overview	1199
ICMP host unreachable message for undeliverable ARPs ..	1200
RIP parameters and defaults	1200
RIP global parameters	1200
RIP interface parameters	1201
RIP parameter configuration	1202
Enabling RIP	1202
Enabling ECMP for routes in RIP	1203
Configuring metric parameters	1203
Changing the administrative distance	1204
Configuring redistribution	1205
Route learning and advertising parameters	1207
Denying route advertisements for connected routes	1208
Changing the route loop prevention method	1209
Suppressing RIP route advertisement on a VRRP or VRRP-E backup interface	1209
Configuring RIP route filters	1210
Displaying RIP filters	1211
Displaying CPU utilization statistics	1212

Chapter 30

RIP (IPv6)

RIPng overview	1215
Summary of configuration tasks	1216
RIPng configuration	1216
RIPng timers	1217
Route learning and advertising parameters	1218
Configuring default route learning and advertising	1218
Advertising IPv6 address summaries	1218
Changing the metric of routes learned and advertised on an interface	1219
Redistributing routes into RIPng	1220
Controlling distribution of routes through RIPng	1220
Configuring poison reverse parameters	1221
Clearing RIPng routes from the IPv6 route table	1221
Displaying the RIPng configuration	1222
Displaying RIPng routing table	1223

Chapter 31

OSPF version 2 (IPv4)

OSPF overview	1226
OSPF point-to-point links	1228
Designated routers in multi-access networks	1228
Designated router election in multi-access networks	1228
OSPF RFC 1583 and 2178 compliance	1230
Reduction of equivalent AS External LSAs	1230
Support for OSPF RFC 2328 Appendix E	1232
Dynamic OSPF activation and configuration	1233
Dynamic OSPF memory	1234
OSPF graceful restart	1234
Configuring OSPF	1235
OSPF configuration rules	1235
OSPF parameters	1235
Enabling OSPF on the router	1236
Assigning OSPF areas	1237
Assigning an area range (optional)	1241
Assigning interfaces to an area	1242
Modifying interface defaults	1242
Changing the timer for OSPF authentication changes	1245
Block flooding of outbound LSAs on specific	
OSPF interfaces	1245
Configuring an OSPF non-broadcast interface	1246
Assigning virtual links	1247
Modifying virtual link parameters	1249
Changing the reference bandwidth for the cost	
on OSPF interfaces	1251
Defining redistribution filters	1252
Preventing specific OSPF routes from being installed	
in the IP route table	1255
Modifying the default metric for redistribution	1258
Enabling route redistribution	1258
Disabling or re-enabling load sharing	1260
Configuring external route summarization	1262
Configuring default route origination	1263
Modifying SPF timers	1264
Modifying the redistribution metric type	1265
Administrative distance	1265
Configuring OSPF group Link State Advertisement	
(LSA) pacing	1266
Modifying OSPF traps generated	1266
Specifying the types of OSPF Syslog messages to log	1267
Modifying the OSPF standard compliance setting	1268
Modifying the exit overflow interval	1268
Configuring an OSPF point-to-point link	1269
Configuring OSPF graceful restart	1269

Clearing OSPF information	1270
Clearing OSPF neighbor information	1270
Clearing OSPF topology information	1271
Clearing redistributed routes from the OSPF routing table ..	1271
Clearing information for OSPF areas	1271
Displaying OSPF information	1272
Displaying general OSPF configuration information	1272
Displaying CPU utilization statistics	1273
Displaying OSPF area information	1275
Displaying OSPF neighbor information	1275
Displaying OSPF interface information	1278
Displaying OSPF route information	1279
Displaying OSPF external link state information	1281
Displaying OSPF link state information	1282
Displaying the data in an LSA	1283
Displaying OSPF virtual neighbor information	1283
Displaying OSPF virtual link information	1284
Displaying OSPF ABR and ASBR information	1284
Displaying OSPF trap status	1284
Displaying OSPF graceful restart information	1285

Chapter 32

OSPF version 3 (IPv6)

OSPF (IPv6) overview	1287
Differences between OSPF V2 and OSPF V3	1288
Link state advertisement types for OSPF V3	1288
OSPF V3 configuration	1289
Enabling OSPF V3	1289
Assigning OSPF V3 areas	1290
Assigning interfaces to an area	1291
Configuring virtual links	1291
Changing the reference bandwidth for the cost on	
OSPF V3 interfaces	1294
Redistributing routes into OSPF V3	1295
External route summarization	1298
Filtering OSPF V3 routes	1299
Default route origination	1302
Shortest path first timers	1303
Administrative distance	1304
Configuring the OSPF V3 LSA pacing interval	1305
Modifying exit overflow interval	1305
Modifying external link state database limit	1305
Modifying OSPF V3 interface defaults	1306
Disabling or re-enabling event logging	1307
IPSec for OSPFv3	1307
IPsec for OSPFv3 configuration	1308

Displaying OSPF V3 Information	1314
Displaying OSPF V3 area information.....	1315
Displaying OSPF V3 database information.....	1316
Displaying OSPF V3 interface information.....	1321
Displaying OSPF V3 memory usage	1324
Displaying OSPF V3 neighbor information	1325
Displaying routes redistributed into OSPF V3	1327
Displaying OSPF V3 route information	1328
Displaying OSPF V3 SPF information	1330
Displaying IPv6 OSPF virtual link information	1333
Displaying OSPF V3 virtual neighbor information	1333
IPsec examples	1334

Chapter 33

BGP (IPv4)

BGP4 overview	1342
Relationship between the BGP4 route table and the IP route table	1343
How BGP4 selects a path for a route	1344
BGP4 message types.....	1345
BGP4 graceful restart.....	1347
Basic configuration and activation for BGP4	1348
Note regarding disabling BGP4.....	1348
BGP4 parameters	1349
BGP4 parameter changes.....	1350
BGP4 memory considerations	1351
Memory configuration options obsoleted by dynamic memory	1352
Basic configuration tasks required for BGP4	1352
Enabling BGP4 on the router	1352
Changing the router ID.....	1352
Setting the local AS number	1353
Adding a loopback interface	1353
Adding BGP4 neighbors.....	1354
Adding a BGP4 peer group	1361

Optional BGP4 configuration tasks	1365
Changing the Keep Alive Time and Hold Time	1365
Changing the BGP4 next-hop update timer	1365
Enabling fast external fallover.	1366
Changing the maximum number of paths for BGP4 load sharing.	1366
Customizing BGP4 load sharing	1368
Specifying a list of networks to advertise.	1368
Changing the default local preference	1370
Using the IP default route as a valid next hop for a BGP4 route	1370
Advertising the default route.	1371
Changing the default MED (Metric) used for route redistribution	1371
Enabling next-hop recursion	1371
Changing administrative distances	1374
Requiring the first AS to be the neighbor AS	1376
Disabling or re-enabling comparison of the AS-Path length	1376
Enabling or disabling comparison of the router IDs	1376
Configuring the Layer 3 switch to always compare Multi-Exit Discriminators (MEDs)	1377
Treating missing MEDs as the worst MEDs	1377
Route reflection parameter configuration	1378
Configuration notes for BGP4 autonomous systems	1381
Aggregating routes advertised to BGP4 neighbors	1384
Configuring BGP4 graceful restart.	1385
Configuring BGP4 graceful restart	1385
Configuring timers for BGP4 graceful restart (optional) ...	1385
BGP null0 routing	1386
Configuration steps for BGP null 0 routing.	1387
Configuration examples for BGP null 0 routing	1388
Show commands for BGP null 0 routing.	1389
Modifying redistribution parameters	1391
Redistributing connected routes.	1391
Redistributing RIP routes.	1392
Redistributing OSPF external routes.	1392
Redistributing static routes.	1393
Disabling or re-enabling re-advertisement of all learned BGP4 routes to all BGP4 neighbors	1393
Redistributing IBGP routes into RIP and OSPF.	1393
Filtering	1394
Specific IP address filtering.	1394
AS-path filtering	1395
BGP4 filtering communities	1399
Defining IP prefix lists	1401
Defining neighbor distribute lists	1402
Defining route maps	1403
Using a table map to set the rag value.	1411
Configuring cooperative BGP4 route filtering.	1411

Route flap dampening configuration	1414
Globally configuring route flap dampening	1415
Using a route map to configure route flap dampening for specific routes	1416
Using a route map to configure route flap dampening for a specific neighbor.	1417
Removing route dampening from a route.	1418
Removing route dampening from a neighbor routes suppressed due to aggregation	1418
Displaying and clearing route flap dampening statistics ..	1419
Generating traps for BGP	1421
Displaying BGP4 information	1421
Displaying summary BGP4 information	1422
Displaying the active BGP4 configuration	1425
Displaying CPU utilization statistics	1425
Displaying summary neighbor information	1427
Displaying BGP4 neighbor information.	1428
Displaying peer group information	1439
Displaying summary route information	1440
Displaying the BGP4 route table.	1441
Displaying BGP4 route-attribute entries.	1447
Displaying the routes BGP4 has placed in the IP route table	1448
Displaying route flap dampening statistics	1449
Displaying the active route map configuration	1450
Displaying BGP4 graceful restart neighbor information ...	1451
Updating route information and resetting a neighbor session ..	1451
Using soft reconfiguration.	1452
Dynamically requesting a route refresh from a BGP4 neighbor	1454
Closing or resetting a neighbor session.	1457
Clearing and resetting BGP4 routes in the IP route table ..	1458
Clearing traffic counters.	1458
Clearing route flap dampening statistics.	1459
Removing route flap dampening	1459
Clearing diagnostic buffers.	1460

IGMP snooping overview	1461
MAC-based implementation on	
FastIron X Series devices	1462
Queriers and non-queriers	1463
VLAN-specific configuration	1463
Tracking and fast leave	1463
Support for IGMP snooping and Layer 3 multicast routing	
together on the same device	1464
Configuration notes and feature limitations	
for IGMP snooping and Layer 3 multicast routing	1464
PIM SM traffic snooping overview	1465
Application examples of PIM SM traffic snooping	1465
Configuration notes and limitations for	
PIM SM snooping	1466
IGMP snooping configuration	1467
Enabling IGMP snooping globally on the device	1469
Configuring the IGMP mode	1469
Configuring the IGMP version	1470
Disabling IGMP snooping on a VLAN	1471
Disabling transmission and receipt of IGMP packets	
on a port	1471
Modifying the age interval for group membership entries	1471
Modifying the query interval (active IGMP snooping	
mode only)	1472
Modifying the maximum response time	1472
Configuring report control	1472
Modifying the wait time before stopping traffic when	
receiving a leave message	1473
Modifying the multicast cache age time	1473
Enabling or disabling error and warning messages	1473
Configuring static router ports	1473
Turning off static group proxy	1474
Enabling IGMP V3 membership tracking and	
fast leave for the VLAN	1474
Enabling fast leave for IGMP V2	1475
Enabling fast convergence	1475
PIM SM snooping configuration	1476
Enabling or disabling PIM SM snooping	1476
Enabling PIM SM snooping on a VLAN	1476
Disabling PIM SM snooping on a VLAN	1477
IGMP snooping show commands	1477
Displaying the IGMP snooping configuration	1477
Displaying IGMP snooping errors	1478
Displaying IGMP group information	1478
Displaying IGMP snooping mcache information	1480
Displaying software resource usage for VLANs	1480
Displaying the status of IGMP snooping traffic	1481
Displaying querier information	1482

	PIM SM snooping show commands	1486
	Displaying PIM SM snooping information.	1486
	Displaying PIM SM snooping information on a Layer 2 switch	1486
	Displaying PIM SM snooping information for a specific group or source group pair	1488
	Clear commands for IGMP snooping	1489
	Clearing the IGMP mcache	1489
	Clearing the mcache on a specific VLAN	1489
	Clearing traffic on a specific VLAN	1489
	Clearing IGMP counters on VLANs	1489
Chapter 35	IP Multicast Traffic Reduction for FastIron WS and Brocade FCX and ICX Switches	
	IGMP snooping overview.	1491
	Configuration notes for IGMP snooping	1493
	Querier and non-querier configuration	1494
	VLAN specific configuration	1495
	IGMPv2 with IGMPv3	1495
	PIM SM traffic snooping overview	1495
	Application example of PIM SM traffic snooping.	1495
	IGMP snooping configuration	1497
	Displaying IGMP snooping information	1505
	Displaying querier information	1510
	Clear IGMP snooping commands	1514
Chapter 36	IP Multicast Protocols	
	IP multicast overview	1516
	IPv4 multicast group addresses	1516
	Mapping of IPv4 Multicast group addresses to Ethernet MAC addresses.	1516
	Supported Layer 3 multicast routing protocols	1517
	Suppression of unregistered multicast packets	1517
	Multicast terms	1517
	Global IP multicast parameters	1517
	Changing dynamic memory allocation for IP multicast groups	1518
	Changing IGMP V1 and V2 parameters	1519

PIM Dense	1522
Initiating PIM multicasts on a network	1522
Pruning a multicast tree	1522
Grafts to a multicast Tree	1524
PIM DM versions	1524
PIM DM configuration	1525
Failover time in a multi-path topology	1529
Modifying the TTL	1529
Displaying basic PIM Dense configuration information	1530
Displaying all multicast cache entries in a pruned state	1531
PIM Sparse	1531
PIM Sparse switch types	1532
RP paths and SPT paths	1533
PIM Sparse configuration	1533
ACL based RP assignment	1539
Anycast RP	1540
Displaying PIM Sparse configuration information and statistics	1545
PIM Passive	1558
Multicast Source Discovery Protocol (MSDP)	1558
Peer Reverse Path Forwarding (RPF) flooding	1561
Source active caching	1561
MSDP configuration	1562
Designating an interface IP address as the RP IP address	1563
Filtering MSDP source-group pairs	1563
MSDP mesh groups	1567
Displaying MSDP information	1573
Clearing MSDP information	1578
Passive multicast route insertion	1579
DVMRP overview	1580
Initiating DVMRP multicasts on a network	1580
Pruning a multicast tree	1581
Grafts to a multicast tree	1582
DVMRP configuration on the Layer 3 switch and interface	1582
Modifying DVMRP global parameters	1583
Modifying DVMRP interface parameters	1586
Displaying information about an upstream neighbor device	1587
IP tunnel configuration	1587
Using ACLs to control multicast features	1588
Using ACLs to limit static RP groups	1588
Using ACLs to limit PIM RP candidate advertisement	1590

Disabling CPU processing for select multicast groups	1591
CLI command syntax to disable CPU processing	1592
Viewing disabled multicast addresses	1592
Configuring a static multicast route	1593
Displaying the multicast configuration for another multicast router	1595
IGMP V3	1596
Default IGMP version	1597
Compatibility with IGMP V1 and V2	1597
Globally enabling the IGMP version	1597
Enabling the IGMP version per interface setting	1598
Enabling the IGMP version on a physical port within a virtual routing interface	1598
Enabling membership tracking and fast leave	1598
Setting the query interval	1599
Setting the group membership time	1599
Setting the maximum response time	1600
IGMP V3 and source-specific multicast protocols	1600
Displaying IGMP V3 information on Layer 3 switches	1600
Clearing IGMP statistics	1604
IGMP Proxy	1605
IGMP proxy configuration notes	1605
IGMP proxy limitations	1605
Configuring IGMP Proxy	1605
Displaying IGMP Proxy traffic	1606
IP multicast protocols and IGMP snooping on the same device	1606
IP multicast protocols and IGMP snooping configuration example	1607
IP multicast protocols and IGMP snooping CLI commands	1608

Chapter 37

MLD Snooping on FastIron X Series Switches

MLD Snooping Overview	1611
How MLD snooping uses MAC addresses to forward multicast packets	1612
MLD snooping configuration notes and feature limitations	1613
MLD snooping-enabled queriers and non-queriers	1614
MLD and VLAN configuration	1615
MLDv1 with MLDv2	1615

MLD snooping configuration	1615
Configuring the hardware and software resource limits...	1616
Disabling transmission and receipt of MLD packets on a port	1616
Configuring the global MLD mode	1617
Modifying the age interval	1617
Modifying the query interval (active MLD snooping mode only)	1617
Configuring the global MLD version	1618
Configuring report control	1618
Modifying the wait time before stopping traffic when receiving a leave message	1618
Modifying the multicast cache (mcache) aging time	1619
Disabling error and warning messages	1619
Configuring the MLD mode for a VLAN	1619
Disabling MLD snooping for the VLAN	1620
Configuring the MLD version for the VLAN	1620
Configuring the MLD version for individual ports	1620
Configuring static groups to the entire VLAN or to individual ports	1620
Configuring static router ports	1621
Disabling static group proxy	1621
Enabling MLDv2 membership tracking and fast leave for the VLAN	1621
Configuring fast leave for MLDv1	1622
Enabling fast convergence	1622
Displaying MLD snooping information	1623
Clearing MLD snooping counters and mcache	1628

Chapter 38

MLD Snooping on FastIron WS and Brocade FCX and ICX Switches

MLD snooping overview	1631
Configuration notes for MLD snooping	1633
Configuring queriers and non-queriers on MLD snooping-enabled devices	1634
MLD snooping configuration on VLANs	1634
MLD snooping using MLDv1 with MLDv2	1635

MLD snooping configuration	1635
Global tasks for MLD Snooping	1635
VLAN-specific tasks for MLD Snooping	1635
Configuring the hardware and software resource limits...	1636
Disabling transmission and receipt of MLD packets on a port	1636
Configuring the global MLD mode	1636
Modifying the age interval	1637
Modifying the query interval (Active MLD snooping mode only)	1637
Configuring the global MLD version	1637
Configuring report control	1637
Modifying the wait time before stopping traffic when receiving a leave message	1638
Modifying the multicast cache (mcache) aging time	1638
Disabling error and warning messages	1638
Configuring the MLD mode for a VLAN	1639
Disabling MLD snooping for the VLAN	1639
Configuring the MLD version for the VLAN	1639
Configuring the MLD version for individual ports	1639
Configuring static groups to the entire VLAN or to individual ports	1640
Configuring static router ports	1640
Turning off static group proxy	1640
Enabling MLDv2 membership tracking and fast leave for the VLAN	1641
Configuring fast leave for MLDv1	1641
Enabling fast convergence	1642
Displaying MLD snooping information	1642
Clear MLD snooping commands	1647

Chapter 39

VRRP and VRRP-E

VRRP and VRRP-E overview	1650
VRRP overview	1650
VRRP-E overview	1655
ARP behavior with VRRP-E	1658
Comparison of VRRP and VRRP-E	1658
VRRP	1658
VRRP-E	1658
Architectural differences between VRRP and VRRP-E	1659
VRRP and VRRP-E parameters	1660
Note regarding disabling VRRP or VRRP-E	1663
Basic VRRP parameter configuration	1664
Configuration rules for VRRP	1664
Configuring the Owner for IPv4 VRRP	1664
Configuring the Owner for IPv6 VRRP	1665
Configuring a Backup for IPv4 VRRP	1666
Configuring a Backup for IPv6 VRRP	1666
Configuration considerations for IPv6 VRRP v3 and IPv6 VRRP-E v3 support on Brocade devices	1667

Basic VRRP-E parameter configuration	1668
Configuration rules for VRRP-E	1668
Configuring IPv4 VRRP-E	1668
Configuring IPv6 VRRP-E	1669
Additional VRRP and VRRP-E parameter configuration	1670
VRRP and VRRP-E authentication types	1671
VRRP router type	1673
Suppression of RIP advertisements	1674
Hello interval configuration	1675
Dead interval configuration	1676
Backup Hello message state and interval	1676
Track port configuration	1677
Track priority configuration	1677
Backup preempt configuration	1678
Changing the timer scale	1678
VRRP-E slow start timer	1679
VRRP-E Extension for Server Virtualization	1680
Forcing a Master router to abdicate to a Backup router	1683
Displaying VRRP and VRRP-E information	1684
Displaying summary information	1684
Displaying detailed information	1686
Displaying statistics	1692
Clearing VRRP or VRRP-E statistics	1694
Displaying CPU utilization statistics	1694
Displaying VRRP and VRRP-E information for IPv6	1696
Displaying detailed information for IPv6 VRRP v3 and IPv6 VRRP-E v3	1696
Configuration examples	1698
VRRP example	1698
VRRP-E example	1700

Chapter 40

Rule-Based IP ACLs

ACL overview	1705
Types of IP ACLs	1705
ACL IDs and entries	1706
Numbered and named ACLs	1706
Default ACL action	1707
How hardware-based ACLs work	1707
How fragmented packets are processed	1707
Hardware aging of Layer 4 CAM entries	1708
ACL configuration considerations	1708
Configuring standard numbered ACLs	1709
Standard numbered ACL syntax	1709
Configuration example for standard numbered ACLs	1711
Standard named ACL configuration	1711
Standard named ACL syntax	1711
Configuration example for standard named ACLs	1713

Extended numbered ACL configuration	1714
Extended numbered ACL syntax	1714
Configuration examples for extended numbered ACLs	1718
Extended named ACL configuration	1720
Extended named ACL syntax	1721
Configuration example for extended named ACLs	1725
Applying egress ACLs to Control (CPU) traffic	1725
Preserving user input for ACL TCP/UDP port numbers	1725
ACL comment text management	1726
Adding a comment to an entry in a numbered ACL	1726
Adding a comment to an entry in a named ACL	1727
Deleting a comment from an ACL entry	1727
Viewing comments in an ACL	1727
Applying an ACL to a virtual interface in a protocol- or subnet-based VLAN	1728
ACL logging	1729
Enabling strict control of ACL filtering of fragmented packets ..	1732
Enabling ACL support for switched traffic in the router image ..	1733
Enabling ACL filtering based on VLAN membership or VE port membership	1734
Configuration notes for ACL filtering	1734
Applying an IPv4 ACL to specific VLAN members on a port (Layer 2 devices only)	1734
Applying an IPv4 ACL to a subset of ports on a virtual interface (Layer 3 devices only)	1735
ACLs to filter ARP packets	1736
Configuration considerations for filtering ARP packets	1737
Configuring ACLs for ARP filtering	1737
Displaying ACL filters for ARP	1738
Clearing the filter count	1738
Filtering on IP precedence and ToS values	1739
TCP flags - edge port security	1739
QoS options for IP ACLs	1740
Configuration notes for QoS options on FCX and ICX devices	1740
Using an ACL to map the DSCP value (DSCP CoS mapping)	1741
Using an IP ACL to mark DSCP values (DSCP marking)	1742
DSCP matching	1744
ACL-based rate limiting	1744
ACL statistics	1745
ACLs to control multicast features	1745
Enabling and viewing hardware usage statistics for an ACL	1745
Displaying ACL information	1746
Troubleshooting ACLs	1747

	Policy-based routing (PBR)	1747
Chapter 41	IPv6 ACLs	
	IPv6 ACL overview	1755
	IPv6 ACL traffic filtering criteria	1756
	IPv6 protocol names and numbers.	1756
	IPv6 ACL configuration notes	1757
	Configuring an IPv6 ACL	1758
	Example IPv6 configurations.	1758
	Default and implicit IPv6 ACL action.	1759
	Creating an IPv6 ACL.	1761
	Syntax for creating an IPv6 ACL	1761
	Enabling IPv6 on an interface to which an ACL will be applied . .	1768
	Syntax for enabling IPv6 on an interface	1768
	Applying an IPv6 ACL to an interface.	1768
	Syntax for applying an IPv6 ACL	1769
	Applying an IPv6 ACL to a trunk group	1769
	Applying an IPv6 ACL to a virtual interface in a protocol-based or subnet-based VLAN	1769
	Adding a comment to an IPv6 ACL entry	1769
	Deleting a comment from an IPv6 ACL entry	1770
	Support for ACL logging	1770
	Displaying IPv6 ACLs.	1770
Chapter 42	Traffic Policies	
	Traffic policies overview	1773
	Configuration notes and feature limitations for traffic policies.	1774
	Maximum number of traffic policies supported on a device	1775
	Setting the maximum number of traffic policies supported on a Layer 3 device	1776
	ACL-based rate limiting using traffic policies.	1776
	Support for fixed rate limiting and adaptive rate limiting . .	1777
	Configuring ACL-based fixed rate limiting.	1777
	ACL-based adaptive rate limiting configuration	1778
	Specifying the action to be taken for packets that are over the limit.	1781
	ACL statistics and rate limit counting	1782
	Enabling ACL statistics	1783
	Enabling ACL statistics with rate limiting traffic policies.	1784
	Viewing ACL and rate limit counters	1784
	Clearing ACL and rate limit counters	1785
	Viewing traffic policies	1786

	CPU rate-limiting	1787
Chapter 43	802.1X Port Security	
	IETF RFC support.	1789
	How 802.1X port security works	1790
	Device roles in an 802.1X configuration	1790
	Communication between the devices	1791
	Controlled and uncontrolled ports	1791
	Message exchange during authentication.....	1793
	Authenticating multiple hosts connected to the same port .	1795
	802.1X port security and sFlow	1798
	802.1X accounting.....	1799
	802.1X port security configuration	1799
	Configuring an authentication method list for 802.1X	1800
	Setting RADIUS parameters	1800
	Dynamic VLAN assignment for 802.1X port configuration .	1802
	Dynamically applying IP ACLs and MAC address filters	
	to 802.1X ports	1806
	Enabling 802.1X port security.....	1810
	Setting the port control	1810
	Configuring periodic re-authentication.....	1811
	Re-authenticating a port manually.....	1812
	Setting the quiet period.....	1812
	Specifying the wait interval and number of EAP-request/	
	identity frame retransmissions from the Brocade device..	1812
	Wait interval and number of EAP-request/	
	identity frame retransmissions from the RADIUS server ..	1813
	Specifying a timeout for retransmission of messages	
	to the authentication server	1814
	Initializing 802.1X on a port	1814
	Allowing access to multiple hosts.....	1815
	MAC address filters for EAP frames	1817
	Configuring VLAN access for non-EAP-capable clients	1818
	802.1X accounting configuration.....	1818
	802.1X Accounting attributes for RADIUS	1819
	Enabling 802.1X accounting.....	1819
	Displaying 802.1X information.....	1821
	Displaying 802.1X configuration information	1821
	Displaying 802.1X statistics	1824
	Clearing 802.1X statistics.....	1825
	Displaying dynamically-assigned VLAN information	1825
	Displaying information about dynamically applied	
	MAC address filters and IP ACLs.....	1826
	Displaying 802.1X multiple-host	
	authentication information	1829
	Sample 802.1X configurations.....	1833
	Point-to-point configuration.....	1833
	Hub configuration	1834
	802.1X Authentication with dynamic VLAN assignment...	1835

	Multi-device port authentication and 802.1X security on the same port.	1836
Chapter 44	MAC Port Security	
	MAC port security overview	1838
	Local and global resources used for MAC port security ...	1838
	Configuration notes and feature limitations for MAC port security	1838
	MAC port security configuration.	1839
	Enabling the MAC port security feature	1839
	Setting the maximum number of secure MAC addresses for an interface	1840
	Setting the port security age timer	1840
	Specifying secure MAC addresses	1841
	Autosaving secure MAC addresses to the startup configuration	1841
	Specifying the action taken when a security violation occurs	1842
	Clearing port security statistics	1843
	Clearing restricted MAC addresses	1843
	Clearing violation statistics	1843
	Displaying port security information	1844
	Displaying port security settings	1844
	Displaying the secure MAC addresses	1844
	Displaying port security statistics	1845
	Displaying restricted MAC addresses on a port	1847
Chapter 45	Multi-Device Port Authentication	
	How multi-device port authentication works	1850
	RADIUS authentication	1850
	Authentication-failure actions	1851
	Supported RADIUS attributes	1851
	Support for dynamic VLAN assignment	1852
	Support for dynamic ACLs	1852
	Support for authenticating multiple MAC addresses on an interface	1852
	Support for dynamic ARP inspection with dynamic ACLs ..	1852
	Support for DHCP snooping with dynamic ACLs	1852
	Support for source guard protection	1853
	Multi-device port authentication and 802.1X security on the same port.	1853
	Configuring Brocade-specific attributes on the RADIUS server	1854

Multi-device port authentication configuration.....	1855
Enabling multi-device port authentication.....	1855
Specifying the format of the MAC addresses sent to the RADIUS server	1856
Specifying the authentication-failure action	1856
Generating traps for multi-device port authentication	1857
Defining MAC address filters.....	1857
Configuring dynamic VLAN assignment	1858
Dynamically applying IP ACLs to authenticated MAC addresses	1861
Enabling denial of service attack protection	1864
Enabling source guard protection.....	1864
Clearing authenticated MAC addresses.....	1866
Disabling aging for authenticated MAC addresses	1866
Changing the hardware aging period for blocked MAC addresses	1867
Specifying the aging time for blocked MAC addresses	1868
Specifying the RADIUS timeout action	1868
Multi-device port authentication password override	1870
Limiting the number of authenticated MAC addresses....	1870
Displaying multi-device port authentication information	1870
Displaying authenticated MAC address information	1871
Displaying multi-device port authentication configuration information	1871
Displaying multi-device port authentication information for a specific MAC address or port	1872
Displaying the authenticated MAC addresses.....	1873
Displaying the non-authenticated MAC addresses	1874
Displaying multi-device port authentication information for a port.....	1874
Displaying multi-device port authentication settings and authenticated MAC addresses	1875
Displaying the MAC authentication table for FCX devices..	1878
Example port authentication configurations.....	1879

About This Guide

Introduction

This guide describes the following product families from Brocade:

- FastIron X Series devices:
 - FastIron Edge Switch X Series (FESX) Layer 2/Layer 3 switch
 - FastIron Edge Switch X Series Expanded (FESXE) Layer 2/Layer 3 switch
 - FastIron SX 800 and 1600 Layer 2/Layer 3 switches
- FastIron WS (FWS) Layer 2, base Layer 3, and EPREM devices
- Brocade FCX Series (FCX) Stackable Switch
- Brocade ICX™ 6610 (ICX 6610) Stackable Switch
- Brocade ICX 6430 Series (ICX 6430)
- Brocade ICX 6450 Series (ICX 6450)

This guide includes procedures for configuring the software. The software procedures show how to perform tasks using the CLI. This guide also describes how to monitor Brocade products using statistics and summary screens.

This guide applies to the FastIron models listed in [Table 1](#).

Device nomenclature

[Table 1](#) lists the terms (product names) contained in this guide and the specific set of devices to which each term refers.

TABLE 1 FastIron family of switches

This name	Refers to these devices
FastIron X Series Devices	
NOTE: The FastIron X Series product family includes compact switch models and chassis models. The compact models are referred to as FESX switches. The chassis models are referred to as the FastIron SX switches. Chassis systems have these models: FastIron SX 800 and FastIron SX 1600.	
FastIron Edge Switch X Series (FESX)	FESX624, FESX624HF, FESX624-PREM, FESX624-PREM6, FESX624HF-PREM, FESX624HF-PREM6, FESX648, FESX648-PREM, FESX648-PREM6
FastIron SX Management Modules	FastIron SX 800/1600 Management modules with: <ul style="list-style-type: none">• 667MHz / 512MB NOTE: For a complete list of the SX 800/1600 Management modules and their part numbers, see the <i>Brocade FastIron X Series Chassis Hardware Installation Guide</i> .

Audience

This document is designed for system administrators with a working knowledge of Layer 2 and Layer 3 switching and routing.

If you are using a Brocade Layer 3 Switch, you should be familiar with the following protocols if applicable to your network – IP, RIP, OSPF, BGP, ISIS, IGMP, PIM, DVMRP, and VRRP.

What's new in this document

This document includes the information from IronWare software release 07.4.00.

Summary of enhancements in FastIron release 07.4.00a

[Table 2](#) lists the enhancements for FastIron release 07.4.00a.

TABLE 2 Summary of Enhancements in FastIron release 07.4.00a

Feature	Description	Described in
Stacking configuration for ICX 6430	This release supports including ICX 6430 48-port units and ICX 6430 24-port stacking units in an IronStack.	“Connecting ICX 6450 and ICX 6430 devices in a stack” on page 244 “Configuring an ICX 6430 and ICX 6450 IronStack” on page 266
IPv6 routing features	This release adds the following IPv6 routing features: <ul style="list-style-type: none">• IPv6 static routes• ECMP load sharing	“Static IPv6 route configuration” on page 373 “ECMP load sharing for IPv6” on page 381

Summary of enhancements in FastIron release 07.4.00

Table 3 lists the enhancements for FastIron release 07.4.00.

Feature	Description	Described in
New hardware	This release introduces the new Brocade ICX 6430 and ICX 6450 Series stackable switches.	<i>Brocade ICX 6430 and ICX 6450 Stackable Switches Hardware Installation Guide</i>
Optics for ICX 6430 and ICX 6450	<p>The following optics are supported on the Brocade ICX 6430 and ICX 6450 Series stackable switches:</p> <ul style="list-style-type: none"> • E1MG-TX • E1MG-SX-OM 1000Base-SX SFP optic • E1MG-LX-OM 1000Base-LX SFP optic • E1MG-LHA-OM 1000Base-LHA SFP optic • E1MG-LHB 1000Base-LHB SFP optic • 10G-SFPP-SR 10GBASE-SR, SFP+ optic (LC) • 10G-SFPP-LR 10GBASE-LR, SFP+ optic (LC) • 10G-SFPP-LRM 10GBASE-LRM, 1310NM SFP+ OPTIC (LC), • 10G-SFPP-ER 10GBASE-ER SFP+ optic (LC) • 10G-SFPP-USR • 1G-SFP-TWX-0101, 1G-SFP-TWX-0501 • 10G-SFPP-TWX-0101, 10G-SFPP-TWX-0301, 10G-SFPP-TWX-0501 	http://www.brocade.com/downloads/documents/data_sheets/product_data_sheets/Optics_DS.pdf
New optic	<p>The 10G-SFPP-USR is also supported on the following devices:</p> <ul style="list-style-type: none"> • FCX • FSX devices that have SX-FI-8XG or SX-FI-2XG modules installed • ICX 6610 • ICX 6450 • Turbolron 24X 	http://www.brocade.com/downloads/documents/data_sheets/product_data_sheets/Optics_DS.pdf
Multi-Chassis Trunking	<p>Multi-Chassis Trunking (MCT) is technology that allows multiple switches to appear as single logical switch connecting to another switch using a standard LAG. MCT is supported on FSX devices that have any of the following modules installed.</p> <ul style="list-style-type: none"> • SX-FI-24GPP • SX-FI-24HF • SX-FI-2XG • SX-FI-8XG • SX-FI48GPP 	“Multi-Chassis Trunking” on page 827
MAC address move notification	<p>MAC address movement notification allows you to monitor the movement of MAC addresses that migrate from port to port. It enables you to distinguish between legitimate movement and malicious movement by allowing you to define malicious use as a threshold number of times a MAC address moves within a specific interval.</p>	“Monitoring MAC address movement” on page 574

TABLE 3 Summary of Enhancements in FastIron release 07.4.00 (Continued)

Feature	Description	Described in
Maximum Trunk support and Maximum trunk port member support on FastIron SX interface modules	<p>The following Interface modules support up to 12 ports per trunk group on the FastIron SX chassis for both static and LACP trunks. A maximum of 256 trunks are supported when the following modules are installed on the chassis:</p> <ul style="list-style-type: none"> • SX-FI48GPP—48-port 10/100/1000 Mbps Ethernet PoE interface module • SX-FI24GPP—24-port Gigabit Ethernet copper interface module • SX-FI24HF—24-port Gigabit Ethernet fiber interface module • SX-FI2XG—2-port 10 Gigabit Ethernet interface module • SX-FI8XG—8-port 10 Gigabit Ethernet interface module 	“Trunk Groups and Dynamic Link Aggregation” on page 697
VRRP-E short-path forwarding and revertible option	Also known as ‘VRRP-E Extension for Server Virtualization,’ enables the Brocade device to bypass the master router and directly forward packets to their destination through interfaces on the backup router. If enabled, the traffic travels through the short-path forwarding (SPF) path to reach the client.	“VRRP and VRRP-E” on page 1649
CPU rate-limiting	Increases CPU efficiency by preventing unnecessary traffic from being sent to the CPU and by limiting the rate at which some packet types are delivered to the CPU.	“CPU rate-limiting” on page 1787.
Support for 16K Nexthops	<p>16,000 nexthops are supported on the following modules:</p> <ul style="list-style-type: none"> • SX-FI-24GPP • SX-FI-24HF • SX-FI-2XG • SX-FI-8XG • SX-FI48GPP 	Chapter 28, “Base Layer 3 and Routing Protocols”
Quality of Service (QoS) support for ICX 6430 and 6450 devices	<p>Differences are detailed for ICX 6430 devices in the following areas:</p> <ul style="list-style-type: none"> • Priority to hardware forwarding queue mapping • Default QoS mappings • Default values for scheduling type • Default scheduling configuration 	Chapter 51, “Quality of Service”
Dynamic buffer support for 6430 and 6450 devices	<p>Specific information is provided for the ICX 6430 and 6450 devices in the following areas:</p> <ul style="list-style-type: none"> • Port and buffer descriptor values • Buffer sharing levels • Configuring values for ICX devices 	Chapter 16, “Basic Layer 2 Features”

TABLE 3 Summary of Enhancements in FastIron release 07.4.00 (Continued)

Feature	Description	Described in
Stacking configuration for ICX 6430 and ICX 6450 devices	ICX 6430 and ICX 6450 devices have four ports on the front panel for stacking configuration. ICX 6430 and ICX 6450 devices ship with two default stacking ports configured. ICX 6430 and ICX 6450 devices support linear and ring stack topologies, and can also operate as standalone devices. When stacking is enabled, ports 1 and 3 are dedicated to stacking and cannot be used for data ports. If stacking is not enabled on the ports, then all four stacking ports can be used for data or uplink ports.	“Connecting ICX 6450 and ICX 6430 devices in a stack” on page 244 “Configuring an ICX 6430 and ICX 6450 IronStack” on page 266
Auto Image Copy for stack units	The Auto Image Copy feature ensures that all units in a stack are running the same flash image after a stack merge. This feature is introduced on the ICX and FCX devices.	“Auto Image Copy for stack units” on page 321
Software licensing enhancements	Software-based licensing is introduced on the ICX 6450 devices. The premium license is available on the ICX 6450 devices.	“Software-based Licensing” on page 199
Licensing for Ports on Demand	Licensing for Ports on Demand (POD) is introduced on the ICX 6450 devices. The ICX 6450 device has four active uplink and stacking ports on slot 2. By default, regardless of what SFP+ media optic is used, ports 1 and 3 are 10 Gbps ports. By default, without a license at bootup, ports 2 and 4 come up in 10 Gbps port speed in an error disabled state. To enable ports 2 and 4 to 10 Gbps port speed, purchase the ICX6450-2X10G-LIC-POD license. The PoD feature is not applicable to ICX 6430 devices because there are no 10 Gbps ports on the device.	“Licensed features and part numbers” on page 202 “Licensing for Ports on Demand” on page 208
31-bit subnet mask	31-bit subnet masks can be configured on point-to-point interfaces on FSX, FCX, and ICX 6610 devices running full layer 3 image	“Configuring 31-bit subnet masks on point-to-point networks” on page 968
Web Management Interface	Support for the Web Management Interface on the ICX 6430 and ICX 6450 devices.	<i>Brocade FCX, Brocade FastIron SX, Brocade ICX Web Management Interface User Guide</i>
MIB enhancement	Support for the registration MIBs on the ICX 6430 and ICX 6450 devices.	<i>Unified IP MIB Reference</i>
Diagnostic information	Support for “supportsave” CLI commands and RAS requirement debug commands.	<i>Brocade FastIron, FCX, ICX, Turbolron Diagnostic and Troubleshooting Reference</i>
VLAN-based mirroring	Support for VLAN-based mirroring for FastIron X Series modules.	“VLAN-based mirroring on FastIron X Series devices” on page 939
802.1x user name support	802.1x user name support for RADIUS accounting messages.	“Support for RADIUS user-name attribute in access-accept messages” on page 1795

Unsupported features

Features that are not documented in this guide are not supported. [Table 4](#) lists the features that are not supported on Brocade FastIron devices. If required, these features are available on other Brocade devices.

TABLE 4 Unsupported Features

Unsupported features
System-level features not supported:
<ul style="list-style-type: none">• ACL logging of permitted packets• Broadcast and multicast MAC address filters• Outbound ACLs on FWS devices
Layer 2 features not supported:
<ul style="list-style-type: none">• SuperSpan• VLAN-based priority
Layer 3 features not supported:
<ul style="list-style-type: none">• AppleTalk Routing• Foundry Standby Router Protocol (FSRP)• IPv6 Multicast Routing• IPX Routing• IS-IS• Multiprotocol Border Gateway Protocol (MBGP)• Multiprotocol Label Switching (MPLS)• Network Address Translation (NAT)

Document conventions

This section describes text formatting conventions and important notice formats used in this document.

Text formatting

The narrative-text formatting conventions that are used are as follows:

bold text	Identifies command names
	Identifies the names of user-manipulated GUI elements
	Identifies keywords
	Identifies text to enter at the GUI or CLI
<i>italic text</i>	Provides emphasis
	Identifies variables
	Identifies document titles
<code>code text</code>	Identifies CLI output

For readability, command names in the narrative portions of this guide are presented in bold: for example, **show version**.

Command syntax conventions

Command syntax in this manual follows these conventions:

command and parameters	Commands and parameters are printed in bold.
[]	Optional parameter.
<i>variable</i>	Variables are printed in italics enclosed in angled brackets < >.
...	Repeat the previous element, for example “member[;member...]”
	Choose from one of the parameters.

Notes, cautions, and danger notices

The following notices and statements are used in this manual. They are listed below in order of increasing severity of potential hazards.

NOTE

A note provides a tip, guidance or advice, emphasizes important information, or provides a reference to related information.

CAUTION

A Caution statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER

A Danger statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

To contact Technical Support, go to <http://www.brocade.com/services-support/index.page> for the latest e-mail and telephone contact information.

Table 5 lists the individual Brocade FastIron switches and the management application features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images.

TABLE 5 Supported management application features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Management port	Yes (FSX 800 and FSX 1600 only)	No	Yes	Yes	Yes
industry-standard Command Line Interface (CLI), including support for: <ul style="list-style-type: none">• Serial and Telnet access• Alias command• On-line help• Command completion• Scroll control• Line editing• Searching and filtering output• Special characters	Yes	Yes	Yes	Yes	Yes
Web-based GUI <ul style="list-style-type: none">• Web Management Interface	Yes	Yes	Yes	Yes	Yes

Management port overview

NOTE

The management port applies to FCX, SX 800, SX 1600, ICX 6430, and ICX 6450 devices.

The management port is an out-of-band port that customers can use to manage their devices without interfering with the in-band ports. The management port is widely used to download images and configurations, for Telnet sessions, and for Web management.

For FCX devices, the MAC address for the management port is derived from the base MAC address of the unit, plus the number of ports in the base module. For example, on a 48-port FCX standalone device, the base MAC address is 0000.1234.2200. The management port MAC address for this device would be 0000.1234.2200 plus 0x30, or 0000.1234.2230. The 0x30 in this case equals the 48 ports on the base module.

For SX 800 and SX 1600 devices, the MAC address for the management port is derived as if the management port is the last port on the management module where it is located. For example, on a 2 X 10G management module, the MAC address of the management port is that of the third port on that module.

How the management port works

The following rules apply to management ports:

- Only packets that are specifically addressed to the management port MAC address or the broadcast MAC address are processed by the Layer 2 switch or Layer 3 switch. All other packets are filtered out.
- No packet received on a management port is sent to any in-band ports, and no packets received on in-band ports are sent to a management port.
- A management port is not part of any VLAN
- Protocols are not supported on the management port.
- Creating a management VLAN disables the management port on the device.
- For FCX devices, all features that can be configured from the global configuration mode can also be configured from the interface level of the management port. Features that are configured through the management port take effect globally, not on the management port itself.

For switches, any in-band port may be used for management purposes. A router sends Layer 3 packets using the MAC address of the port as the source MAC address.

For stacking devices, (for example, an FCX stack) each stack unit has one out-of band management port. Only the management port on the Active Controller will actively send and receive packets. If a new Active Controller is elected, the new Active Controller management port will become the active management port. In this situation, the MAC address of the old Active Controller and the MAC address of the new controller will be different.

CLI Commands for use with the management port

The following CLI commands can be used with a management port.

To display the current configuration, use the **show running-config interface management** command.

Syntax: **show running-config interface management** <num>

```
Brocade(config-if-mgmt)#ip addr 10.44.9.64/24
Brocade(config)#show running-config interface management 1
interface management 1
ip address 10.44.9.64 255.255.255.0
```

To display the current configuration, use the **show interfaces management** command.

Syntax: **show interfaces management** <num>

```
Brocade(config)#show interfaces management 1
GigEthernetmgmt1 is up, line protocol is up
Hardware is GigEthernet, address is 0000.9876.544a (bia 0000.9876.544a)
Configured speed auto, actual 1Gbit, configured duplex fdx, actual fdx
Configured mdi mode AUTO, actual none
BPRU guard is disabled, ROOT protect is disabled
```

```

Link Error Dampening is Disabled
STP configured to OFF, priority is level0, mac-learning is enabled
Flow Control is config disabled, oper enabled
Mirror disabled, Monitor disabled
Not member of any active trunks
Not member of any configured trunks
No port name
IPG MII 0 bits-time, IPG GMII 0 bits-time
IP MTU 1500 bytes
300 second input rate: 83728 bits/sec, 130 packets/sec, 0.01% utilization
300 second output rate: 24 bits/sec, 0 packets/sec, 0.00% utilization
39926 packets input, 3210077 bytes, 0 no buffer
Received 4353 broadcasts, 32503 multicasts, 370 unicasts
0 input errors, 0 CRC, 0 frame, 0 ignored
0 runts, 0 giants
22 packets output, 1540 bytes, 0 underruns
Transmitted 0 broadcasts, 6 multicasts, 16 unicasts
0 output errors, 0 collisions

```

To display the management interface information in brief form, enter the **show interfaces brief management** command.

Syntax: **show interfaces brief management** <num>

```

Brocade(config)#show interfaces brief management 1
Port  Link  State  Dupl  Speed  Trunk  Tag  Pri  MAC  Name
mgmt1 Up    None   Full  1G     None   No   0    0000.9876.544a

```

To display management port statistics, enter the **show statistics management** command.

Syntax: **show statistics management** <num>

```

Brocade(config)#show statistics management 1
Port  Link  State  Dupl  Speed  Trunk  Tag  Pri  MAC  Name
mgmt1 Up    None   Full  1G     None   No   0    0000.9876.544a

```

```

  InPktsPerSec130OutPktsPerSec0
  InUtilization0.01%OutUtilization0.00%

```

To display the management interface statistics in brief form, enter the **show statistics brief management** command.

Syntax: **show statistics brief management** <num>

```
Brocade(config)#show statistics brief management 1
PortIn PacketsOut PacketsTrunkIn ErrorsOut Errors
mgmt1399462200

Total1399452200
```

Logging on through the CLI

Once an IP address is assigned to a Brocade device running Layer 2 software or to an interface on the Brocade device running Layer 3 software, you can access the CLI either through the direct serial connection to the device or through a local or remote Telnet session.

You can initiate a local Telnet or SNMP connection by attaching a cable to a port and specifying the assigned management station IP address.

The commands in the CLI are organized into the following levels:

- **User EXEC** – Lets you display information and perform basic tasks such as pings and traceroutes.
- **Privileged EXEC** – Lets you use the same commands as those at the User EXEC level plus configuration commands that do not require saving the changes to the system-config file.
- **CONFIG** – Lets you make configuration changes to the device. To save the changes across reboots, you need to save them to the system-config file. The CONFIG level contains sub-levels for individual ports, for VLANs, for routing protocols, and other configuration areas.

NOTE

By default, any user who can open a serial or Telnet connection to the Brocade device can access all these CLI levels. To secure access, you can configure Enable passwords or local user accounts, or you can configure the device to use a RADIUS or TACACS/TACACS+ server for authentication. Refer to [Chapter 4, “Security Access”](#).

Online help

To display a list of available commands or command options, enter “?” or press Tab. If you have not entered part of a command at the command prompt, all the commands supported at the current CLI level are listed. If you enter part of a command, then enter “?” or press Tab, the CLI lists the options you can enter at this point in the command string.

If you enter an invalid command followed by ?, a message appears indicating the command was unrecognized. An example is given below.

```
Brocade(config)#rooter ip
Unrecognized command
```

Command completion

The CLI supports command completion, so you do not need to enter the entire name of a command or option. As long as you enter enough characters of the command or option name to avoid ambiguity with other commands or options, the CLI understands what you are typing. This feature is not available in the boot loader prompt of ICX 6430 and ICX 6450 devices.

Scroll control

By default, the CLI uses a page mode to paginate displays that are longer than the number of rows in your terminal emulation window. For example, if you display a list of all the commands at the global CONFIG level but your terminal emulation window does not have enough rows to display them all at once, the page mode stops the display and lists your choices for continuing the display. An example is given below.

```
aaa
all-client
appletalk
arp
boot
some lines omitted for brevity...

ipx
lock-address
logging
mac
--More--, next page: Space, next line:
Return key, quit: Control-c
```

The software provides the following scrolling options:

- Press the **Space bar** to display the next page (one screen at a time).
- Press the **Return** or **Enter** key to display the next line (one line at a time).
- Press **Ctrl+C** or **Ctrl+Q** to cancel the display.

Line editing commands

The CLI supports the following line editing commands. To enter a line-editing command, use the CTRL+key combination for the command by pressing and holding the CTRL key, then pressing the letter associated with the command.

TABLE 6 CLI line editing commands

Ctrl+Key combination	Description
Ctrl+A	Moves to the first character on the command line.
Ctrl+B	Moves the cursor back one character.
Ctrl+C	Escapes and terminates command prompts and ongoing tasks (such as lengthy displays), and displays a fresh command prompt.
Ctrl+D	Deletes the character at the cursor.
Ctrl+E	Moves to the end of the current command line.
Ctrl+F	Moves the cursor forward one character.
Ctrl+K	Deletes all characters from the cursor to the end of the command line.
Ctrl+L; Ctrl+R	Repeats the current command line on a new line.
Ctrl+N	Enters the next command line in the history buffer.
Ctrl+P	Enters the previous command line in the history buffer.
Ctrl+U; Ctrl+X	Deletes all characters from the cursor to the beginning of the command line.

TABLE 6 CLI line editing commands (Continued)

Ctrl+Key combination	Description
Ctrl+W	Deletes the last word you typed.
Ctrl+Z	Moves from any CONFIG level of the CLI to the Privileged EXEC level; at the Privileged EXEC level, moves to the User EXEC level.

Using stack-unit, slot number, and port number with CLI commands

Many CLI commands require users to enter port numbers as part of the command syntax, and many **show** command outputs display port numbers. The port numbers are entered and displayed in one of the following formats:

- port number only
- slot number and port number
- stack-unit, slot number, and port number

The following sections show which format is supported on which devices. The ports are labelled on the front panels of the devices.

CLI nomenclature on Chassis-based models

Chassis-based models (FSX 800 and FSX 1600) use port numbering that consists of a slot number and a port number. When you enter CLI commands on these devices, you must specify both the slot number and the port number. The slot numbers used in the FSX CLI examples apply only to Chassis devices.

Here is an example. The following commands change the CLI from the global CONFIG level to the configuration level for the first port on the device:

- FSX commands

```
Brocade(config)#interface e 1/1
Brocade(config-if-1/1)#
```

Syntax: **ethernet** <slotnum>/<portnum>

CLI nomenclature on FESX Compact devices

The FESX compact devices use port numbers only. When you enter CLI commands that require port numbers as part of the syntax, just specify the port number.

Here are some examples. The following commands change the CLI from the global CONFIG level to the configuration level for the first port on the device:

```
Brocade(config)#interface e 1
Brocade(config-if-e1000-1)#
```

Syntax: **ethernet** <portnum>

CLI nomenclature on Stackable devices

Stackable devices (FCX and ICX) use the **stack-unit/slot/port** nomenclature. When you enter CLI commands that include the port number as part of the syntax, you must use the **stack-unit/slot/port** number format. For example, the following commands change the CLI from the global CONFIG level to the configuration level for the first port on the device:

```
Brocade(config)#interface e 1/1/1
Brocade(config-if-e1000-1/1/1)#
```

Syntax: **ethernet** <stack-unit>/<slotnum>/<portnum>

Refer to [Chapter 7, “Brocade Stackable Devices”](#) for more information about these devices.

Searching and filtering output from CLI commands

You can filter CLI output from **show** commands and at the **–More–** prompt. You can search for individual characters, strings, or construct complex regular expressions to filter the output.

Searching and filtering output from Show commands

You can filter output from **show** commands to display lines containing a specified string, lines that do not contain a specified string, or output starting with a line containing a specified string. The search string is a regular expression consisting of a single character or string of characters. You can use special characters to construct complex regular expressions. Refer to [“Using special characters in regular expressions”](#) on page 9 for information on special characters used with regular expressions.

Displaying lines containing a specified string

The following command filters the output of the **show interface** command for port 3/11 so it displays only lines containing the word “Internet”. This command can be used to display the IP address of the interface.

```
Brocade#show interface e 3/11 | include Internet
Internet address is 192.168.1.11/24, MTU 1518 bytes, encapsulation ethernet
```

Syntax: <show-command> | **include** <regular-expression>

NOTE

The vertical bar (|) is part of the command.

Note that the regular expression specified as the search string is case sensitive. In the example above, a search string of “Internet” would match the line containing the IP address, but a search string of “internet” would not.

Displaying lines that do not contain a specified string

The following command filters the output of the **show who** command so it displays only lines that do not contain the word “closed”. This command can be used to display open connections to the Brocade device.

```
Brocade#show who | exclude closed
Console connections:
    established
    you are connecting to this session
    2 seconds in idle
Telnet connections (inbound):
    1      established, client ip address 192.168.9.37
    27 seconds in idle
Telnet connection (outbound):
SSH connections:
```

Syntax: <show-command> | **exclude** <regular-expression>

Displaying lines starting with a specified string

The following command filters the output of the **show who** command so it displays output starting with the first line that contains the word “SSH”. This command can be used to display information about SSH connections to the Brocade device.

```
Brocade#show who | begin SSH
SSH connections:
    1      established, client ip address 192.168.9.210
    7 seconds in idle
    2      closed
    3      closed
    4      closed
    5      closed
```

Syntax: <show-command> | **begin** <regular-expression>

Searching and filtering output at the --More-- prompt

The --More-- prompt displays when output extends beyond a single page. From this prompt, you can press the Space bar to display the next page, the Return or Enter key to display the next line, or Ctrl+C or Q to cancel the display. In addition, you can search and filter output from this prompt.

At the --More-- prompt, you can press the forward slash key (/) and then enter a search string. The Brocade device displays output starting from the first line that contains the search string, similar to the **begin** option for **show** commands. An example is given below.

```
--More--, next page: Space, next line: Return key, quit: Control-c
/telnet
```

The results of the search are displayed.

```
searching...
telnet          Telnet by name or IP address
temperature     temperature sensor commands
terminal        display syslog
traceroute      TraceRoute to IP node
undebg          Disable debugging functions (see also 'debug')
undetele        Undetele flash card files
whois           WHOIS lookup
write           Write running configuration to flash or terminal
```

To display lines containing only a specified search string (similar to the **include** option for **show** commands) press the plus sign key (+) at the --More-- prompt and then enter the search string.

```
--More--, next page: Space, next line: Return key, quit: Control-c
+telnet
```

The filtered results are displayed.

```
filtering...
telnet                               Telnet by name or IP address
```

To display lines that do not contain a specified search string (similar to the **exclude** option for **show** commands) press the minus sign key (-) at the **--More--** prompt and then enter the search string.

```
--More--, next page: Space, next line: Return key, quit: Control-c
-telnet
```

The filtered results are displayed.

```
filtering...
temperature                         temperature sensor commands
terminal                           display syslog
traceroute                         TraceRoute to IP node
undebg                             Disable debugging functions (see also 'debug')
undete                             Undelete flash card files
whois                              WHOIS lookup
write                              Write running configuration to flash or terminal
```

As with the commands for filtering output from **show** commands, the search string is a regular expression consisting of a single character or string of characters. You can use special characters to construct complex regular expressions. See the next section for information on special characters used with regular expressions.

Using special characters in regular expressions

You use a regular expression to specify a single character or multiple characters as a search string. In addition, you can include special characters that influence the way the software matches the output against the search string. These special characters are listed in the following table.

TABLE 7 Special characters for regular expressions

Character	Operation
.	The period matches on any single character, including a blank space. For example, the following regular expression matches "aaz", "abz", "acz", and so on, but not just "az": a.z
*	The asterisk matches on zero or more sequential instances of a pattern. For example, the following regular expression matches output that contains the string "abc", followed by zero or more Xs: abcX*
+	The plus sign matches on one or more sequential instances of a pattern. For example, the following regular expression matches output that contains "de", followed by a sequence of "g"s, such as "deg", "degg", "deggg", and so on: deg+

TABLE 7 Special characters for regular expressions (Continued)

Character	Operation
?	<p>The question mark matches on zero occurrences or one occurrence of a pattern. For example, the following regular expression matches output that contains "dg" or "deg": de?g</p> <p>NOTE: Normally when you type a question mark, the CLI lists the commands or options at that CLI level that begin with the character or string you entered. However, if you enter Ctrl+V and then type a question mark, the question mark is inserted into the command line, allowing you to use it as part of a regular expression.</p>
^	<p>A caret (when not used within brackets) matches on the beginning of an input string. For example, the following regular expression matches output that begins with "deg": ^deg</p>
\$	<p>A dollar sign matches on the end of an input string. For example, the following regular expression matches output that ends with "deg": deg\$</p>
_	<p>An underscore matches on one or more of the following:</p> <ul style="list-style-type: none"> • , (comma) • { (left curly brace) • } (right curly brace) • ((left parenthesis) •) (right parenthesis) • The beginning of the input string • The end of the input string • A blank space <p>For example, the following regular expression matches on "100" but not on "1002", "2100", and so on. _100_</p>
[]	<p>Square brackets enclose a range of single-character patterns. For example, the following regular expression matches output that contains "1", "2", "3", "4", or "5": [1-5]</p> <p>You can use the following expression symbols within the brackets. These symbols are allowed only inside the brackets.</p> <ul style="list-style-type: none"> • ^ – The caret matches on any characters except the ones in the brackets. For example, the following regular expression matches output that does not contain "1", "2", "3", "4", or "5": [^1-5] • - The hyphen separates the beginning and ending of a range of characters. A match occurs if any of the characters within the range is present. See the example above.
	<p>A vertical bar separates two alternative values or sets of values. The output can match one or the other value. For example, the following regular expression matches output that contains either "abc" or "defg": abc defg</p>
()	<p>Parentheses allow you to create complex expressions. For example, the following complex expression matches on "abc", "abcabc", or "defg", but not on "abcdefgdefg": ((abc)+) ((defg)?)</p>

If you want to filter for a special character instead of using the special character as described in the table above, enter "\ " (backslash) in front of the character. For example, to filter on output containing an asterisk, enter the asterisk portion of the regular expression as "*".

```
Brocade#show ip route bgp | include \*
```

Creating an alias for a CLI command

You can create **aliases** for CLI commands. An alias serves as a shorthand version of a longer CLI command. For example, you can create an alias called **shoro** for the CLI command **show ip route**. Then when you enter **shoro** at the command prompt, the **show ip route** command is executed.

To create an alias called **shoro** for the CLI command **show ip route**, enter the **alias shoro = show ip route** command.

```
Brocade(config)#alias shoro = show ip route
```

Syntax: [no] **alias** <alias-name> = <cli-command>

The <alias-name> must be a single word, without spaces.

After the alias is configured, entering **shoro** at either the Privileged EXEC or CONFIG levels of the CLI, executes the **show ip route** command.

To create an alias called **wrsbc** for the CLI command **copy running-config tftp 10.10.10.10 test.cfg**, enter the following command.

```
Brocade(config)#alias wrsbc = copy running-config tftp 10.10.10.10 test.cfg
```

To remove the **wrsbc** alias from the configuration, enter one of the following commands.

```
Brocade(config)#no alias wrsbc
```

or

```
Brocade(config)#unalias wrsbc
```

Syntax: **unalias** <alias-name>

The specified <alias-name> must be the name of an alias already configured on the Brocade device.

To display the aliases currently configured on the Brocade device, enter the following command at either the Privileged EXEC or CONFIG levels of the CLI.

```
Brocade#alias
      wrsbc      copy running-config tftp 10.10.10.10 test.cfg
      shoro      show ip route
```

Syntax: **alias**

Configuration notes for creating a command alias

The following configuration notes apply to this feature:

- You cannot include additional parameters with the alias at the command prompt. For example, after you create the **shoro** alias, **shoro bgp** would not be a valid command.
- If configured on the Brocade device, authentication, authorization, and accounting is performed on the actual command, not on the alias for the command.
- To save an alias definition to the startup-config file, use the **write memory** command.

Logging on through the Web Management Interface

To use the Web Management Interface, open a Web browser and enter the IP address of the management port on the Brocade device in the Location or Address field. The Web browser contacts the Brocade device and displays a Login panel, such as the one shown below.

FIGURE 1 Web Management Interface login panel

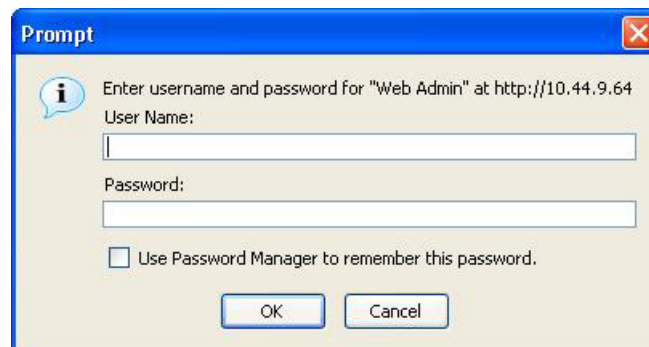

NOTE

If you are unable to connect with the device through a Web browser due to a proxy problem, it may be necessary to set your Web browser to direct Internet access instead of using a proxy. For information on how to change a proxy setting, refer to the on-line help provided with your Web browser.

To log in, click on the Login link. The following dialog box is displayed.

FIGURE 2 Web Management Interface login dialog

The login username and password you enter depends on whether your device is configured with AAA authentication for SNMP. If AAA authentication for SNMP is not configured, you can use the user name "get" and the default read-only password "public" for read-only access. However, for read-write access, you must enter "set" for the user name, and enter a read-write community string you have configured on the device for the password. There is no default read-write community string. You must add one using the CLI.

As an alternative to using the SNMP community strings to log in, you can configure the Brocade device to secure Web management access using local user accounts or Access Control Lists (ACLs).

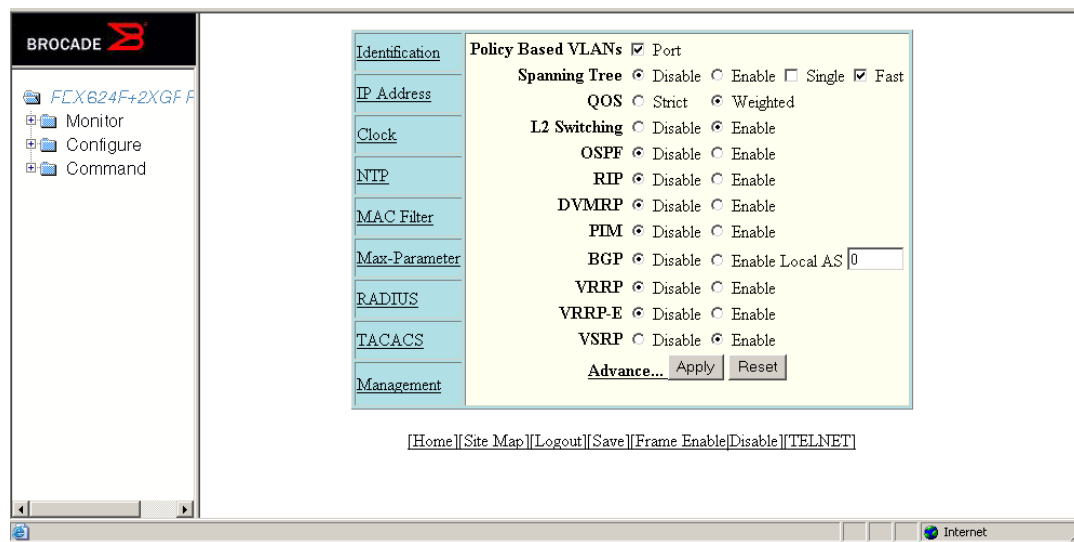

Navigating the Web Management Interface

When you log into a device, the System configuration panel is displayed. This panel allows you to enable or disable major system features. You can return to this panel from any other panel by selecting the Home link.

The Site Map link gives you a view of all available options on a single screen.

Figure 3 displays the first Web Management Interface panel for Layer 3 Switch features, while Figure 4 displays the first panel for Layer 2 switch features. These panels allow you to configure the features supported by the Layer 3 switch and Layer 2 switch software.

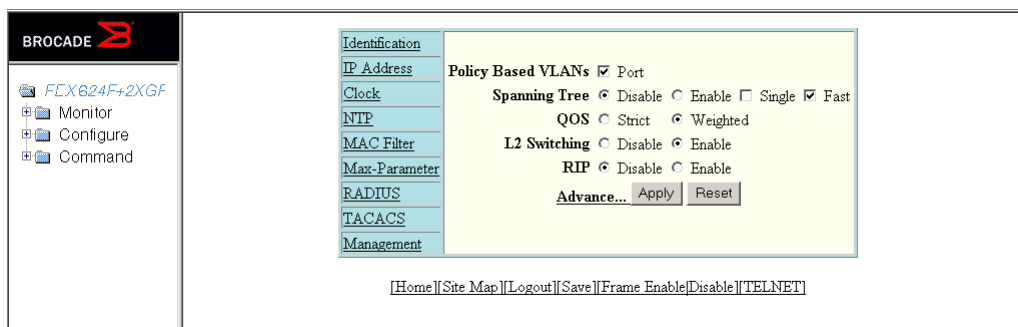

FIGURE 3 First panel for Layer 3 switch features

NOTE

If you are using Internet Explorer 6.0 to view the Web Management Interface, make sure the version you are running includes the latest service packs. Otherwise, the navigation tree (the left-most pane in Figure 3) will not display properly. For information on how to load the latest service packs, refer to the on-line help provided with your Web browser.

FIGURE 4 First panel for Layer 2 switch features

NOTE

If you are using Internet Explorer 6.0 to view the Web Management Interface, make sure the version you are running includes the latest service packs. Otherwise, the navigation tree (the left-most pane in [Figure 3](#)) will not display properly. For information on how to load the latest service packs, refer to the on-line help provided with your Web browser.

The left pane of the Web Management Interface window contains a “tree view,” similar to the one found in Windows Explorer. Configuration options are grouped into folders in the tree view. These folders, when expanded, reveal additional options. To expand a folder, click on the plus sign to the left of the folder icon.

You can configure the appearance of the Web Management Interface by using one of the following methods.

Using the CLI, you can modify the appearance of the Web Management Interface with the **web-management** command.

To cause the Web Management Interface to display the List view by default, enter the **web-management list-menu** command.

```
Brocade(config)#web-management list-menu
```

To disable the front panel frame, enter the **no web-management front-panel** command.

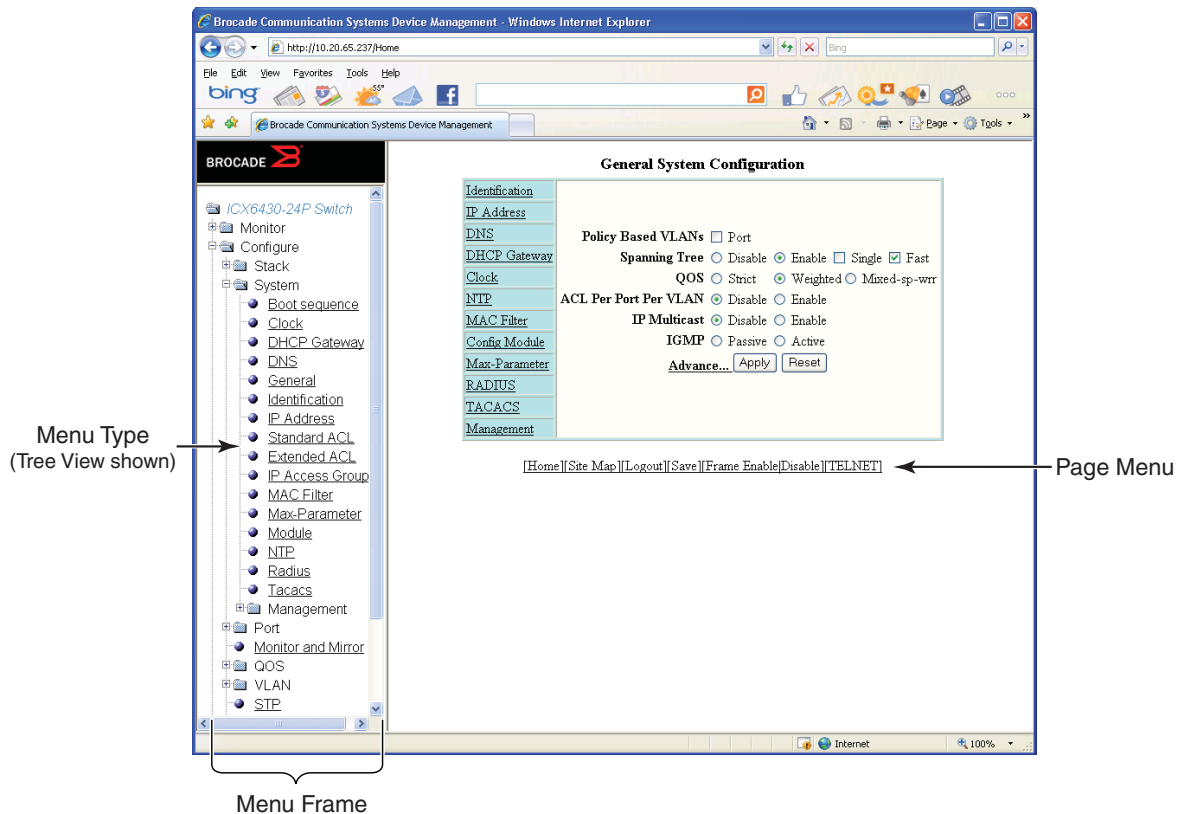

```
Brocade(config)#no web-management front-panel
```

When you save the configuration with the **write memory** command, the changes will take place the next time you start the Web Management Interface, or if you are currently running the Web Management Interface, the changes will take place when you click the Refresh button on your browser.

Using the Web Management Interface

1. Click on the **plus sign** next to Configure in the tree view to expand the list of configuration options.
2. Click on the **plus sign** next to System in the tree view to expand the list of system configuration links.
3. Click on the **plus sign** next to Management in the tree view to expand the list of system management links.
4. Click on the **Web Preference** link to display the Web Management Preferences panel.
5. **Enable** or **disable** elements on the Web Management Interface by clicking on the appropriate radio buttons on the panel. The following figure identifies the elements you can change.

Logging on through the Web Management Interface

NOTE

The tree view is available when you use the Web Management Interface with Netscape 4.0 or higher or Internet Explorer 4.0 or higher browsers. If you use the Web Management Interface with an older browser, the Web Management Interface displays the List view only, and the Web Management Preferences panel does not include an option to display the tree view.

- When you have finished, click the Apply button on the panel, then click the Refresh button on your browser to activate the changes.
- To save the configuration, click the plus sign next to the Command folder, then click the Save to Flash link.

NOTE

The only changes that become permanent are the settings to the Menu Type and the Front Panel Frame. Any other elements you enable or disable will go back to their default settings the next time you start the Web Management Interface.

Logging on through the Web Management Interface

Basic Software Features

Table 8 lists the individual Brocade FastIron switches and the basic software features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 8 Supported basic software features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Basic System Parameters					
System name, contact, and location	Yes	Yes	Yes	Yes	Yes
SNMP trap receiver and trap source address	Yes	Yes	Yes	Yes	Yes
Virtual routing interface statistics via SNMP	Yes	No	No	No	No
Disable Syslog messages and traps for CLI access	Yes	Yes	Yes	Yes	Yes
Cancelling an outbound Telnet session	Yes	Yes	Yes	Yes	Yes
System time using a Simple Network Time Protocol (SNTP) server or local system counter	Yes	Yes	Yes	Yes	Yes
Enabling broadcast mode for SNTP client	No	No	Yes	Yes	Yes
System clock	Yes	Yes	Yes	Yes	Yes
Byte-based broadcast, multicast, and unknown-unicast limits	Yes	No	No	No	No
Packet-based broadcast, multicast, and unknown-unicast limits	Yes	Yes	Yes	Yes	Yes
CLI banners	Yes	Yes	Yes	Yes	Yes
Local MAC address for Layer 2 management traffic	No	Yes	Yes	Yes	Yes
Basic Port Parameters					
Port name	Yes	Yes	Yes	Yes	Yes
10/100/1000 port speed	Yes	Yes	Yes	Yes	Yes
Auto-negotiation	Yes	Yes	Yes	Yes	Yes
Auto-negotiation maximum port speed advertisement and down-shift	Yes	Yes	Yes	Yes	Yes
Duplex mode	Yes	Yes	Yes	Yes	Yes
Auto MDI/MDIX detection	Yes	Yes	Yes	Yes	Yes

TABLE 8 Supported basic software features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Port status (enable or disable)	Yes	Yes	Yes	Yes	Yes
Flow control: <ul style="list-style-type: none"> Responds to flow control packets, but does not generate them 	Yes	Yes	Yes	Yes	Yes
Symmetric flow control <ul style="list-style-type: none"> Can transmit and receive 802.3x PAUSE frames 	No	No	Yes	Yes	Yes
Auto-negotiation and advertisement of flow control	Yes	Yes	Yes	Yes	Yes
PHY FIFO Rx and TX Depth	No	Yes	Yes	Yes	Yes
Interpacket Gap (IPG) adjustment	Yes	Yes	Yes	Yes	Yes
CLI support for 100BaseTX and 100BaseFX	Yes	Yes	Yes	Yes	No
Gbps fiber negotiate mode	Yes	Yes	Yes	Yes	No
QoS priority	Yes	Yes	Yes	Yes	Yes
VOIP autoconfiguration and CDP	Yes	Yes	Yes	Yes	Yes
Port flap dampening	Yes	Yes	Yes	Yes	Yes
Port loop detection	Yes	Yes	Yes	Yes	Yes

Basic system parameter configuration

Brocade devices are configured at the factory with default parameters that allow you to begin using the basic features of the system immediately. However, many of the advanced features such as VLANs or routing protocols for the device must first be enabled at the system (global) level before they can be configured. If you use the Command Line Interface (CLI) to configure system parameters, you can find these system level parameters at the Global CONFIG level of the CLI.

NOTE

Before assigning or modifying any router parameters, you must assign the IP subnet (interface) addresses for each port.

NOTE

For information about configuring IP addresses, DNS resolver, DHCP assist, and other IP-related parameters, refer to [Chapter 26, “IP Configuration”](#).

NOTE

For information about the Syslog buffer and messages, refer to [Appendix A, “Syslog messages”](#).

The procedures in this section describe how to configure the basic system parameters listed in [Table 8](#).

Entering system administration information

You can configure a system name, contact, and location for a Brocade device and save the information locally in the configuration file for future reference. This information is not required for system operation but is suggested. When you configure a system name, the name replaces the default system name in the CLI command prompt.

The name, contact, and location each can be up to 255 alphanumeric characters.

Here is an example of how to configure a system name, system contact, and location.

```
Brocade(config)# hostname zappa
zappa(config)# snmp-server contact Support Services
zappa(config)# snmp-server location Centerville
zappa(config)# end
zappa# write memory
```

Syntax: `hostname <string>`

Syntax: `snmp-server contact <string>`

Syntax: `snmp-server location <string>`

The text strings can contain blanks. The SNMP text strings do not require quotation marks when they contain blanks but the host name does.

NOTE

The **chassis name** command does not change the CLI prompt. Instead, the command assigns an administrative ID to the device.

SNMP parameter configuration

Use the procedures in this section to perform the following configuration tasks:

- Specify a Simple Network Management Protocol (SNMP) trap receiver.
- Specify a source address and community string for all traps sent by the device.
- Change the holddown time for SNMP traps
- Disable individual SNMP traps. (All traps are enabled by default.)
- Disable traps for CLI access that is authenticated by a local user account, a RADIUS server, or a TACACS/TACACS+ server.

NOTE

To add and modify “get” (read-only) and “set” (read-write) community strings, refer to [Chapter 4, “Security Access”](#).

Specifying an SNMP trap receiver

You can specify a trap receiver to ensure that all SNMP traps sent by the Brocade device go to the same SNMP trap receiver or set of receivers, typically one or more host devices on the network. When you specify the host, you also specify a community string. The Brocade device sends all the SNMP traps to the specified hosts and includes the specified community string. Administrators can therefore filter for traps from a Brocade device based on IP address or community string.

When you add a trap receiver, the software automatically encrypts the community string you associate with the receiver when the string is displayed by the CLI or Web Management Interface. If you want the software to show the community string in the clear, you must explicitly specify this when you add a trap receiver. In either case, the software does not encrypt the string in the SNMP traps sent to the receiver.

To specify the host to which the device sends all SNMP traps, use one of the following methods.

To add a trap receiver and encrypt the display of the community string, enter commands such as the following.

To specify an SNMP trap receiver and change the UDP port that will be used to receive traps, enter a command such as the following.

```
Brocade(config)# snmp-server host 2.2.2.2 0 mypublic port 200
Brocade(config)# write memory
```

Syntax: `snmp-server host <ip-addr> [0 | 1] <string> [port <value>]`

The `<ip-addr>` parameter specifies the IP address of the trap receiver.

The `0 | 1` parameter specifies whether you want the software to encrypt the string (`1`) or show the string in the clear (`0`). The default is `0`.

The `<string>` parameter specifies an SNMP community string configured on the Brocade device. The string can be a read-only string or a read-write string. The string is not used to authenticate access to the trap host but is instead a useful method for filtering traps on the host. For example, if you configure each of your Brocade devices that use the trap host to send a different community string, you can easily distinguish among the traps from different Brocade devices based on the community strings.

The command in the example above adds trap receiver 2.2.2.2 and configures the software to encrypt display of the community string. When you save the new community string to the startup-config file (using the **write memory** command), the software adds the following command to the file.

```
snmp-server host 2.2.2.2 1 <encrypted-string>
```

To add a trap receiver and configure the software to encrypt display of the community string in the CLI and Web Management Interface, enter commands such as the following.

```
Brocade(config)# snmp-server host 2.2.2.2 0 FastIron-12
Brocade(config)# write memory
```

The **port <value>** parameter allows you to specify which UDP port will be used by the trap receiver. This parameter allows you to configure several trap receivers in a system. With this parameter, a network management application can coexist in the same system. Brocade devices can be configured to send copies of traps to more than one network management application.

Specifying a single trap source

You can specify a single trap source to ensure that all SNMP traps sent by the Layer 3 switch use the same source IP address. For configuration details, refer to [“Specifying a single source interface for specified packet types”](#) on page 977

Setting the SNMP trap holddown time

When a Brocade device starts up, the software waits for Layer 2 convergence (STP) and Layer 3 convergence (OSPF) before beginning to send SNMP traps to external SNMP servers. Until convergence occurs, the device might not be able to reach the servers, in which case the messages are lost.

By default, a Brocade device uses a one-minute holddown time to wait for the convergence to occur before starting to send SNMP traps. After the holddown time expires, the device sends the traps, including traps such as “cold start” or “warm start” that occur before the holddown time expires.

You can change the holddown time to a value from one second to ten minutes.

To change the holddown time for SNMP traps, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)# snmp-server enable traps holddown-time 30
```

The command in this example changes the holddown time for SNMP traps to 30 seconds. The device waits 30 seconds to allow convergence in STP and OSPF before sending traps to the SNMP trap receiver.

Syntax: [no] snmp-server enable traps holddown-time <secs>

The <secs> parameter specifies the number of seconds and can be from 1 – 600 (ten minutes). The default is 60 seconds.

Disabling SNMP traps

Brocade devices come with SNMP trap generation enabled by default for all traps. You can selectively disable one or more of the following traps.

NOTE

By default, all SNMP traps are enabled at system startup.

SNMP Layer 2 traps

The following traps are generated on devices running Layer 2 software:

- SNMP authentication keys
- Power supply failure
- Fan failure
- Cold start
- Link up
- Link down
- Bridge new root
- Bridge topology change
- Locked address violation

SNMP Layer 3 traps

The following traps are generated on devices running Layer 3 software:

- SNMP authentication key
- Power supply failure
- Fan failure
- Cold start
- Link up
- Link down
- Bridge new root
- Bridge topology change
- Locked address violation
- BGP4
- OSPF
- VRRP
- VRRP-E

To stop link down occurrences from being reported, enter the following.

```
Brocade(config)# no snmp-server enable traps link-down
```

Syntax: [no] snmp-server enable traps <trap-type>

Displaying virtual routing interface statistics

NOTE

This feature is supported on FastIron X Series devices only.

You can enable SNMP to extract and display virtual routing interface statistics from the ifXTable (64-bit counters).

The following describes the limitations of this feature:

- The Brocade device counts traffic from all virtual interfaces (VEs). For example, in a configuration with two VLANs (VLAN 1 and VLAN 20) on port 1, when traffic is sent on VLAN 1, the counters (VE statistics) increase for both VE 1 and VE 20.
- The counters include all traffic on each virtual interface, even if the virtual interface is disabled.
- The counters include traffic that is denied by ACLs or MAC address filters.

To enable SNMP to display VE statistics, enter the **enable snmp ve-statistics** command.

```
Brocade(config)# enable snmp ve-statistics
```

Syntax: [no] enable snmp ve-statistics

Use the **no** form of the command to disable this feature once it is enabled.

Note that the above CLI command enables SNMP to display virtual interface statistics. It does not enable the CLI or Web Management Interface to display the statistics.

Disabling Syslog messages and traps for CLI access

Brocade devices send Syslog messages and SNMP traps when a user logs into or out of the User EXEC or Privileged EXEC level of the CLI. The feature applies to users whose access is authenticated by an authentication-method list based on a local user account, RADIUS server, or TACACS/TACACS+ server.

NOTE

The Privileged EXEC level is sometimes called the “Enable” level, because the command for accessing this level is **enable**.

The feature is enabled by default.

Examples of Syslog messages for CLI access

When a user whose access is authenticated by a local user account, a RADIUS server, or a TACACS or TACACS+ server logs into or out of the CLI User EXEC or Privileged EXEC mode, the software generates a Syslog message and trap containing the following information:

- The time stamp
- The user name
- Whether the user logged in or out
- The CLI level the user logged into or out of (User EXEC or Privileged EXEC level)

NOTE

Messages for accessing the User EXEC level apply only to access through Telnet. The device does not authenticate initial access through serial connections but does authenticate serial access to the Privileged EXEC level. Messages for accessing the Privileged EXEC level apply to access through the serial connection or Telnet.

The following examples show login and logout messages for the User EXEC and Privileged EXEC levels of the CLI.

```
Brocade# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
Buffer logging: level ACDMEINW, 12 messages logged
level code: A=alert C=critical D=debugging M=emergency E=error
I=informational N=notification W=warning
Static Log Buffer:
Dec 15 19:04:14:A:Fan 1, fan on right connector, failed

Dynamic Log Buffer (50 entries):
Oct 15 18:01:11:info:dg logout from USER EXEC mode
Oct 15 17:59:22:info:dg logout from PRIVILEGE EXEC mode
Oct 15 17:38:07:info:dg login to PRIVILEGE EXEC mode
Oct 15 17:38:03:info:dg login to USER EXEC mode
```

Syntax: show logging

The first message (the one on the bottom) indicates that user “dg” logged in to the CLI User EXEC level on October 15 at 5:38 PM and 3 seconds (Oct 15 17:38:03). The same user logged into the Privileged EXEC level four seconds later.

The user remained in the Privileged EXEC mode until 5:59 PM and 22 seconds. (The user could have used the CONFIG modes as well. Once you access the Privileged EXEC level, no further authentication is required to access the CONFIG levels.) At 6:01 PM and 11 seconds, the user ended the CLI session.

Disabling the Syslog messages and traps

Logging of CLI access is enabled by default. If you want to disable the logging, enter the following commands.

```
Brocade(config)# no logging enable user-login
Brocade(config)# write memory
Brocade(config)# end
Brocade# reload
```

Syntax: [no] logging enable user-login

Cancelling an outbound Telnet session

If you want to cancel a Telnet session from the console to a remote Telnet server (for example, if the connection is frozen), you can terminate the Telnet session by doing the following.

1. At the console, press **Ctrl+^** (Ctrl+Shift-6).
2. Press the **X** key to terminate the Telnet session.

Pressing **Ctrl+^** twice in a row causes a single **Ctrl+^** character to be sent to the Telnet server. After you press **Ctrl+^**, pressing any key other than **X** or **Ctrl+^** returns you to the Telnet session.

Specifying an SNTP server

The Brocade device can be configured as a Simple Network Time Protocol (SNTP) client. You can configure the Brocade device to consult up to three SNTP servers for the current system time and date. The first server configured will be used unless it becomes unreachable, in which case the Brocade device will attempt to synchronize with the other SNTP servers (if any) in the order in which they were configured.

NOTE

Brocade devices do not retain time and date information across power cycles. Unless you want to reconfigure the system time counter each time the system is reset, Brocade recommends that you use the SNTP feature as described below.

To identify an SNTP server with IP address 208.99.8.95 to act as the clock reference for a Brocade device, enter the following.

```
Brocade(config)# sntp server 208.99.8.95
```

Syntax: [no] sntp server { <ip-address> | <hostname> | ipv6 <ipv6-address> } [<sntp-version>] [authentication-key <key-ID> <key-string>]

The <sntp-version> parameter specifies the SNTP version the server is running and can be from 1 – 4. The default is 4. The SNTP version is automatically set to 4, unless a different SNTP version is specified in the device startup configuration. You can configure up to three SNTP servers by entering three separate **sntp server** commands.

The order in which the SNTP servers are configured is the order in which they are consulted. The server that was configured first is the first server consulted after the poll cycle; the next server will be consulted only if a positive ACK is not received from the first one.

To specify an IPv6 address for the SNTP server, use the **ipv6** option.

The **authentication-key** option allows you to configure an authentication key for communication with the SNTP server. When the authentication key is configured for an SNTP client, it is used only for an SNTP unicast client. You must assign a unique server *<key-ID>* and pre-share *<key-string>*. The *<key-ID>* and pre-share *<key-string>* are used together to create the MD5 checksum. The MD5 checksum is used for authentication for request and reply messages with the SNTP server. The *<key-ID>* is the symmetric key shared with the upstream server, and accepts values from 1 to 4,294,967,295. The *<key-string>* is the authentication string itself, and can take up to 16 characters. If the *<key-string>* variable consists of only numerical characters, you must enclose the numerical characters in double quotes.

Modification of the authentication key fields is not supported. To change the key ID or key string, remove the time server using the **no sntp server...** command, then reconfigure the server with the new key.

By default, the Brocade device polls its SNTP server every 30 minutes (1800 seconds). To configure the Brocade device to poll for clock updates from a SNTP server every 15 minutes, enter the following.

```
Brocade(config)# sntp poll-interval 900
```

Syntax: [no] sntp poll-interval <16-131072>

To display information about SNTP associations, enter the **show sntp associations** command.

```
Brocade# show sntp associations
  address      ref clock      st  when  poll  delay  disp
~207.95.6.102  0.0.0.0         16  202    4    0.0    5.45
~207.95.6.101  0.0.0.0         16  202    0    0.0    0.0
* synced, ~ configured
```

Syntax: show sntp associations

The following table describes the information displayed by the **show sntp associations** command.

TABLE 9 Output from the **show sntp associations** command

Field	Description
(leading character)	One or both of the following: * Synchronized to this peer ~ Peer is statically configured
address	IP address of the peer
ref clock	IP address of the peer reference clock, or the reference ID of the external clock source if the peer is stratum 1. Examples of external clock source IDs: GPS, CDMA, WWV (Ft.Collins US Radio 2.5, 5, 10, 15 MHz), CESM (calibrated Cesium clock), etc.
st	NTP stratum level of the peer
when	Amount of time since the last NTP packet was received from the peer. A negative number indicates the system has never received any synchronization message from the specified server.
poll	The poll interval of the peer relative to the server.

TABLE 9 Output from the **show sntp associations** command (Continued)

Field	Description
delay	The total delay time in milliseconds along the path to the root clock.
disp	The dispersion of the root path in milliseconds.

To display detailed information about SNTP associations, enter the **show sntp associations details** command.

```
Brocade# show sntp associations details
208.99.8.95 configured,insane, unsynched,invalid, stratum 16
ref ID 0.0.0.0,time 0.0 (Jan 1 00:00:00)
our mode client, peer mode unspec, our poll intvl 15, peer poll intvl 0
root delay 0.0 msec, root disp 0.0
delay 0 msec, offset 0 msec
precision 2**0, version 0
org time 0.0 (Jan 1 00:00:00)
rcv time 0.0 (Jan 1 00:00:00)
xmt time 0.0 (Jan 1 00:00:00)
```

Syntax: show sntp associations details

The following table describes the information displayed by the **show sntp associations details** command.

TABLE 10 Output from the **show sntp associations details** command

Field	Description
IP address	The IP address of the SNTP server. The IP address is an IPv4 or an IPv6 address.
configured or dynamic	The SNTP server is either configured, or the last responsive broadcast server that is found dynamically.
authenticated	If MD5 authentication is enabled for the peer.
sane or insane	If the SNTP server passes sanity checks.
synched or unsynched	If the system is synchronized or unsynchronized to the NTP peer.
valid or invalid	If the peer time is valid or invalid.
stratum	The NTP stratum level of the peer.
reference ID	The IP address of the peer (if any) to which the unit is synchronized. The reference ID can also refer to the external clock source if the peer is stratum 1. Examples of external clock source IDs: GPS, CDMA, WWV (Ft.Collins US Radio 2.5, 5, 10, 15 MHz), CESM (calibrated Cesium clock), etc.
time	The reference time stamp.
our mode	The mode relative to the peer. The mode can be a client or a broadcast client.
peer mode	Peer mode relative to us.
our poll intvl	The system poll interval relative to the peer.
peer poll intv	The poll interval of the peer relative to the server.

Field	Description
root delay	The total delay time in milliseconds along the path to the root clock.
root disp	The dispersion of the root path in milliseconds.
delay	The round trip delay to the peer in milliseconds.
offset	The offset of the peer clock relative to the system clock.
precision	The precision of the system clock in Hz.
version	The NTP version of the peer. The version can be from 1 - 4.
org time	The original timestamp of the system clock. The original timestamp is what the client has sent to the server.
rcv time	The receive timestamp of the system clock.
xmt time	The transmit timestamp of the system clock.

To display information about SNTP status, enter the **show sntp status** command.

```
Brocade# show sntp status
Clock is synchronized, stratum = 4, reference clock = 10.70.20.23
precision is 2**-20
reference time is 3489354594.3780510747
clock offset is 0.0000 msec, root delay is 0.41 msec
root dispersion is 0.11 msec, peer dispersion is 0.00 msec
sntp poll-interval is 10 secs
```

Syntax: show sntp status

The following table describes the information displayed by the **show sntp status** command.

TABLE 11 Output from the **show sntp status** command

Field	Description
unsynchronized	System is not synchronized to an NTP peer.
synchronized	System is synchronized to an NTP peer.
stratum	NTP stratum level of the upstream time server.
reference clock	IP address of the peer reference clock, or the reference ID of the external clock source if the peer is stratum 1. Examples of external clock source IDs: GPS, CDMA, WWV (Ft. Collins US Radio 2.5, 5, 10, 15 MHz), CESM (calibrated Cesium clock), etc.
precision	Precision of this system's clock (in Hz)
reference time	Reference time stamp
clock offset	Offset of clock to synchronized peer
root delay	Total delay along the path to the root clock
root dispersion	Dispersion of the root path
peer dispersion	Dispersion of the synchronized peer
sntp poll-interval	Shows how often the Brocade device polls for clock updates from an SNTP server.

Configuring the device as an SNTP server

You can configure the Brocade device to function as an SNTP server to its downstream clients. When using the device as an SNTP server, you can also set it to use its own internal clock as the reference source if an upstream server becomes unavailable.

To use the device as a an SNTP server, enter a command such as the following at the Privileged EXEC level.

```
Brocade(config)# sntp server-mode use-local-clock authentication-key abc123
Brocade(config)# write memory
```

The above example configures the device to operate as an SNTP server with the local clock as a reference backup and an authentication key of “abc123” and writes the configuration changes to memory.

Syntax: [no] sntp server-mode [use-local-clock [stratum <stratum-number>]] [authentication-key <key-string>]

- The **use-local-clock** option causes the Brocade device to use the local clock as a reference source if an upstream reference source becomes unavailable. The SNTP stratum number is set to 1 by default. You may specify a different stratum number using the **stratum** option; <stratum-number> must be between 1 and 15. When the internal clock is serving as the SNTP reference source, the Brocade device will use the specified stratum number (or the default value of 1). When it is synchronized with the upstream server, the Brocade device will use the upstream server’s stratum number plus 1.
If you do not include the **use-local-clock** option the Brocade device will function as specified by RFC 4330: when the Brocade device loses upstream synchronization, it will respond to client SNTP requests with a “kiss-of-death” response (stratum value=0).

NOTE

To enable the **use-local-clock** option, you must set the internal clock of the Brocade device either by SNTP synchronization (see [“Specifying an SNTP server”](#) on page 24) or by using the **clock set** command (see [“Setting the system clock”](#) on page 30). Until the internal clock is set, the Brocade device will continue to rely exclusively on an upstream SNTP server if one is reachable. If none, the SNTP server of the Brocade device is disabled (down).

- To require a code string for authentication of SNTP communication from clients, use the **authentication-key** option and enter a key string of up to 16 characters. When this option is used, authentication parameters are required in clients’ SNTP request messages. If authentication fails, the Brocade device will reply with stratum 0 and a reference ID code of “CRYP” (cryptographic authentication or identification failed), and messages received without the required parameters will be dropped.

NOTE

Once entered, the authentication key cannot be viewed. Using the **show running-config** command will show output similar to the following when an authentication key has been set:

```
sntp server-mode authentication-key 2 $QHMiR3NzQA=
```

The **2** indicates that the key is encrypted using base-64 encryption; the characters following the **2** are the encrypted authentication string.

NOTE

You cannot enable or disable the **use-local-clock** option (or its stratum number) or change the authentication string when the SNTP server is up. To change these settings after enabling SNTP server mode, you must disable server mode using the command **no sntp server-mode**, then re-enable it with the new parameters.

Displaying SNTP server information

Use the **show sntp server-mode** command to display the status of the SNTP server and its configuration.

```
Brocade# show sntp server-mode
Status           : up
Stratum          : 4
Authentication    : md5
Clock source     : 10.50.2.121
Last upstream sync: 15:55:00 Pacific Sun Jul 5 2009

Last 5 unique responses sent to downstream clients :
Client Address      Reference Time
10.1.50.23          16:10:32 Pacific Sun Jul 5 2009
10.1.52.34          15:50:40 Pacific Sun Jul 5 2009
10.1.50.41          10:22:08 Pacific Fri Jul 3 2009
10.1.50.10          06:21:03 Pacific Fri Jul 3 2009
10.1.50.29          21:17:39 Pacific Fri Jul 2 2009
```

Syntax: show sntp server-mode

TABLE 12 Output from the **show sntp server-mode** command

Field	Description
status	The operational state of the SNTP server. “ Up ” means that the SNTP port is open; “ down ” means that the SNTP port is closed. (If sntp server-mode is disabled, the show sntp server-mode command will display the message “SNTP server is not operational.”)
stratum	Stratum number of this server. The range is from 1 through 15. If the device is synchronized to an upstream SNTP server, this will show that server’s stratum number +1. If the device is unsynchronized and using the use-local-clock option, this will show the user-specified stratum number (or the default value of “ 1 ” if no stratum has been configured).
authentication	Authentication key used. If authentication has been configured successfully, this displays “ md5 .” If not, it displays “ none .”
clock source	The source of the reference time. When the reference source is an upstream SNTP server, this will show the IP address of the upstream server. When the internal clock of the device is being used as the reference, this will show “ local-clock .”
last upstream sync	The last upstream time-server synchronization, displayed in timestamp format. This field is not displayed if the time source is the local clock.
last responses sent to clients	The last responses sent to downstream clients (maximum of five unique clients), displayed in reverse chronological order. Each entry shows the IP address of the client and the timestamp sent.

Enabling broadcast mode for an SNTP client

The Brocade device can be configured as an SNTP client. You can enable an SNTP client to function in a broadcast mode when the NTP server is within the same LAN, and the expected delay in response to calibrate the system clock is minimal. In a broadcast mode, the SNTP client will not send queries to the NTP server. The SNTP client will listen to any number of NTP servers on the network until the last message is received from the system clock. To update the system clock with the last message received, you can enable the SNTP client to either listen to all NTP broadcast servers on any interface, or enable the SNTP client to listen to only one specific NTP broadcast server.

To enable an SNTP client in a broadcast mode to listen to all NTP servers on any interface, enter the **sntp broadcast client** command.

```
Brocade(config)#sntp broadcast client
```

Syntax: sntp broadcast client

The **sntp broadcast client** command enables an SNTP client to listen to all NTP servers, and update the client's clock with the last message received from any NTP server.

To enable an SNTP client to listen to only one specific IPv4 NTP broadcast server, enter the following commands.

```
Brocade(config)#sntp broadcast client
Brocade(config)#sntp broadcast server 1.1.1.1
```

To enable an SNTP client to listen to only one specific IPv6 NTP broadcast server, enter the following commands.

```
Brocade(config)#sntp broadcast client
Brocade(config)#sntp broadcast server ipv6 2001:179:2:1::1
```

Syntax: sntp broadcast server [<ip-address> | ipv6 <ipv6-address>]

The **sntp broadcast client** command must be configured with the **sntp broadcast server** command to allow for an SNTP client to listen to only one specific NTP server.

When both unicast and broadcast modes are enabled for an SNTP client, the priority by which the NTP server is used to update the client's clock is as follows.

1. The last responsive unicast server.
2. The broadcast server on any interface.

Setting the system clock

In addition to SNTP support, Brocade switches and routers also allow you to set the system time counter. Using the **clock set** command starts the system clock with the time and date you specify.

NOTE

The time counter setting is not retained across power cycles. For more details about SNTP, refer to [“Specifying an SNTP server”](#) on page 24.

To set the system time and date to 10:15:05 on October 15, 2003, enter the following command.

```
Brocade# clock set 10:15:05 10-15-2003
```

Syntax: [no] clock set <hh:mm:ss> <mm-dd-yy> | <mm-dd-yyyy>

To synchronize the time counter with your SNTP server time, enter the following command.

```
Brocade# sntp sync
```

Syntax: sntp sync

By default, Brocade switches and routers do not change the system time for daylight saving time. To enable daylight saving time, enter the **clock summer-time** command.

```
Brocade(config)# clock summer-time
```

Syntax: [no] clock summer-time

Although SNTP servers typically deliver the time and date in Greenwich Mean Time (GMT), you can configure the Brocade device to adjust the time for any one-hour offset from GMT or for one of the following U.S. time zones:

- US Pacific (default)
- Alaska
- Aleutian
- Arizona
- Central
- East-Indiana
- Eastern
- Hawaii
- Michigan
- Mountain
- Pacific
- Samoa

The default is US Pacific.

To change the time zone to Australian East Coast time (which is normally 10 hours ahead of GMT), enter the **clock timezone gmt** command.

```
Brocade(config)# clock timezone gmt gmt+10
```

Syntax: [no] clock timezone gmt | us <time-zone>

You can enter one of the following values for <time-zone>:

- US time zones (**us**): alaska, aleutian, arizona, central, east-indiana, eastern, hawaii, michigan, mountain, pacific, samoa.
- GMT time zones (**gmt**): gmt+0:00 to gmt+12:00 in increments of 1, and gmt-0:00 to gmt-12:00 in decrements of 1 are supported.

New start and end dates for US daylight saving time

NOTE

This feature applies to US time zones only.

The system will automatically change the system clock to Daylight Saving Time (DST), in compliance with the new federally mandated start of daylight saving time, which is extended one month beginning in 2007. The DST will start at 2:00am on the second Sunday in March and will end at 2:00am on the first Sunday in November.

The DST feature is automatic, but to trigger the device to the correct time, the device must be configured to the US time zone, not the GMT offset. To configure your device to use the US time zone, enter the **clock timezone us pacific** command.

```
Brocade(config)# clock timezone us pacific
```

Syntax: [no] **clock timezone us** <timezone-type>

Enter pacific, eastern, central, or mountain for <timezone-type>.

This command must be configured on every device that follows the US DST.

To verify the change, run a **show clock** command.

```
Brocade# show clock
```

Refer to October 19, 2006 - Daylight Saving Time 2007 Advisory, posted on kp.foundrynet.com for more information.

Limiting broadcast, multicast, and unknown unicast traffic

Brocade devices can forward all flooded traffic at wire speed within a VLAN. However, some third-party networking devices cannot handle high rates of broadcast, multicast, or unknown-unicast traffic. If high rates of traffic are being received by the Brocade device on a given port of that VLAN, you can limit the number of broadcast, multicast, or unknown-unicast packets or bytes received each second on that port. This can help to control the number of such packets or bytes that are flooded on the VLAN to other devices.

Broadcast, multicast, and unknown unicast configuration notes and feature limitations

The following describes feature differences on FastIron devices:

- **FastIron X Series devices, except for the SX-FI48GPP interface module**
 - Unknown unicast limiting is independent of broadcast and multicast limiting. To enable multicast limiting, enable it after enabling broadcast limiting. Multicast limiting uses the limit defined in broadcast limiting. You cannot set a separate limit for multicast limiting.
 - FastIron X Series devices support packet-based and byte-based limiting per port, as well as simultaneously on the same port. For example, you can configure the broadcast limit in packet-based mode and the unknown unicast limit in the byte-based mode on the same port.
 - On FastIron X Series devices, when you configure unknown-unicast limiting, the rate applies to all ports in the **port range** for which unknown unicast is enabled. Also, when you enable multicast limiting, it is enabled on all the ports in the port range for which broadcast limiting is enabled. A 1-Gbps port range consists of 12 ports.
- **SX-FI48GPP interface module**
 - ❑ To enable multicast or unknown-unicast limiting, enable it after enabling broadcast limiting. Multicast and unknown-unicast limiting use the limit defined in broadcast limiting. You cannot set a separate limit for unknown-unicast limiting and multicast limiting.
 - ❑ The SX-FI48GPP module supports packet-based limiting only. It does not support byte-based limiting.
 - ❑ Each port on the SX-FI48GPP module can be configured individually.
- **FastIron WS, Brocade FCX Series, and ICX 6430 devices**
 - To enable unknown-unicast limiting or multicast limiting, enable it after enabling broadcast limiting. Unknown-unicast limiting and multicast limiting use the limit defined in broadcast limiting. You cannot set a separate limit for unknown-unicast limiting and multicast limiting.
 - FastIron WS, Brocade FCX Series, and ICX 6430 devices support packet-based limiting only.
- **Brocade ICX 6610 and ICX 6450 devices support byte based limiting only**

Command syntax for packet-based limiting on FastIron X-Series devices

To enable broadcast limiting on a group of ports by counting the number of packets received, enter commands such as the following.

```
Brocade(config)# interface ethernet 1 to 8
Brocade(config-mif-e1000-1-8)# broadcast limit 65536
```

These commands configure packet-based broadcast limiting on ports 1 – 8. On each port, the maximum number of broadcast packets per second cannot exceed 65,536 packets per second.

To include multicasts in the 65536 packets per second limit on each of the ports, enter the **multicast limit** command after enabling broadcast limiting.

```
Brocade(config-mif-e1000-1-8)# multicast limit
```

To enable unknown unicast limiting by counting the number of packets received, enter commands such as the following.

```
Brocade(config)# interface ethernet 1
Brocade(config-if-e1000-1)# unknown-unicast limit 65536
The combined number of inbound Unknown Unicast packets permitted
    for ports 1 to 12 is now set to 65536
Brocade(config-if-e1000-1)#
```

NOTE

On the SX-FI48GPP module, multicast and unknown-unicast limiting use the value defined in broadcast limiting. You cannot set a separate limit for unknown-unicast limiting and multicast limiting.

Syntax: [no] broadcast limit <num>

Syntax: [no] multicast limit

Syntax: [no] unknown-unicast limit <num>

The <num> variable specifies the maximum number of packets per second. It can be any number that is a multiple of 8192, up to a maximum value of 2147418112. If you enter the **multicast limit** or **unknown-unicast limit** command, multicast packets or unknown-unicast limit are included in the corresponding limit. If you specify 0, limiting is disabled. If you specify a number that is not a multiple of 8192, the software rounds the number to the next multiple of 8192. Limiting is disabled by default.

Command syntax for packet-based limiting on FastIron WS and Brocade FCX Series and ICX 6430 devices

To enable broadcast limiting on a group of ports by counting the number of packets received, enter commands such as the following.

```
Brocade(config)# interface ethernet 1/1/1 to 1/1/8
Brocade(config-mif-e1000-1/1/1-1/1/8)# broadcast limit 65536
```

To include unknown unicast limiting by counting the number of packets received, enter commands such as the following.

```
Brocade(config-mif-e1000-1/1/1-1/1/8)# unknown-unicast limit
```

To include multicasts limiting, enter the **multicast limit** command after enabling broadcast limiting.

```
Brocade(config-mif-e1000-1-8)# multicast limit
```

Syntax: [no]broadcast limit <num>

Syntax: [no] multicast limit

Syntax: [no] unknown-unicast limit

The <num> variable specifies the maximum number of packets per second. It can be any number that is a multiple of 65536, up to a maximum value of 2147418112. If you enter the **multicast limit** command, multicast packets are included in the corresponding limit. If you specify 0, limiting is disabled. If you specify a number that is not a multiple of 65536, the software rounds the number to the next multiple of 65536. Limiting is disabled by default.

Command syntax for packet-based limiting on Brocade ICX 6610 and 6450 devices

To enable broadcast limiting on a group of ports by counting the number of bytes received, enter commands such as the following.

```
Brocade(config)# interface ethernet 1/1/1 to 1/1/8
Brocade(config-mif-e1000-1/1/1-1/1/8)# broadcast limit 8192
```

To include unknown-unicast limiting, enter the unknown-unicast limit command after enabling broadcast limiting.

```
Brocade(config-mif-e1000-1/1/1-1/1/8)# unknown-unicast limit
```

To include multicasts limiting, enter the multicast limit command after enabling broadcast limiting.

```
Brocade(config-mif-e1000-1-8)# multicast limit
```

Syntax: [no]broadcast limit <num>

Syntax: [no] multicast limit

Syntax: [no] unknown-unicast limit

The <num> variable specifies the maximum number of Kilo bytes per second. It can be any number that is a multiple of 8192, up to a maximum value of 2147418112. If you enter the **multicast limit** or **unknown-unicast limit** command, multicast or unknown-unicast packets are included in the corresponding limit. If you specify 0, limiting is disabled. If you specify a number that is not a multiple of 8192, the software rounds the number to the next multiple of 8192. Limiting is disabled by default.

Command syntax for byte-based limiting

NOTE

Byte-based limiting is supported on FSX and FESX devices only. Byte-based limiting is not supported on the FastIron WS, Brocade FCX Series, ICX 6430 devices and the SX-FI48GPP module.

Byte-based limiting provides the ability to rate limit traffic based on byte count. When the byte mode is enabled, packets will be received on a port as long as the number of bytes received per second is less than the corresponding limit. Once the limit is reached, further packets will be dropped.

To enable broadcast limiting on a group of ports by counting the number of bytes received, enter commands such as the following.

```
Brocade(config)# interface ethernet 9 to 10
Brocade(config-mif-e1000-9-10)# broadcast limit 131072 bytes
```

These commands configure byte-based broadcast limiting on ports 9 and 10. On each port, the total number of bytes received from broadcast packets cannot exceed 131,072 per second.

To include multicasts in the 131072 bytes per second limit on each of the ports, enter the **multicast limit** command after enabling broadcast limiting.

```
Brocade(config-mif-e1000-1-8)# multicast limit
```

To enable unknown unicast limiting, enter commands such as the following.

Configuring the device as an SNMP server

```
Brocade# config terminal
Brocade(config)# interface ethernet 13
Brocade(config-if-e1000-13)# unknown-unicast limit 65536 bytes
The combined number of bytes of inbound Unknown Unicast packets
    permitted for ports 13 to 24 is now set to 65536
Brocade((config-if-e1000-13)#
```

Syntax: [no] broadcast limit <num> bytes

Syntax: [no] multicast limit

Syntax: [no] unknown-unicast limit <num> bytes

The <num> variable can be any number that is a multiple of 65536, up to a maximum value of 2147418112. If you enter the **multicast limit** command, multicast packets are included in the limit you specify. If you specify 0, limiting is disabled. If you specify a number that is not a multiple of 65536, the software rounds the number to the next multiple of 65536. Limiting is disabled by default. The **unknown-unicast limit <num> bytes** command is supported on FSX and FESX devices.

Viewing broadcast, multicast, and unknown unicast limits

You can use the **show run interface** command to display the broadcast, multicast, and unknown-unicast limits configured on the device.

You can use the following commands, in addition to the **show run interface** command, to display the broadcast, multicast, and unknown-unicast limits configured on the device:

- **show rate-limit unknown-unicast**
- **show rate-limit broadcast**

NOTE

The **show rate-limit unknown-unicast** command is only supported on FSX and FESX devices.

Use the **show run interface** command to view the broadcast, multicast, and unknown-unicast limit configured on each port.

Example

```
Brocade# show run interface
interface ethernet 4
broadcast limit 1245184 bytes
multicast limit
!
interface ethernet 5
broadcast limit 1245184 bytes
multicast limit
!
interface ethernet 12
unknown-unicast limit 524288
!
interface ethernet 13
unknown-unicast limit 65536 bytes
!
interface ethernet 14
broadcast limit 65536
!
interface ethernet 23
broadcast limit 131072
multicast limit
```

Syntax: show run interface

Use the **show rate-limit unknown-unicast** command to display the unknown unicast limit for each port region to which it applies.

Example

```
Brocade# show rate-limit unknown-unicast
Unknown Unicast Limit Settings:
Port Region Combined Limit Packets/Bytes
  1 - 12          524288      Packets
 13 - 24          65536       Bytes
```

Syntax: show rate-limit unknown-unicast

Use the **show rate-limit broadcast** command to display the broadcast limit or broadcast and multicast limit for each port to which it applies.

Example

```
Brocade# show rate-limit broadcast
Broadcast/Multicast Limit Settings:
Port    Limit    Packets/Bytes    Packet Type(s)
  4      1245184      Bytes    Broadcast + Multicast
  5      1245184      Bytes    Broadcast + Multicast
 14        65536      Packets    Broadcast only
 23      131072      Packets    Broadcast + Multicast
```

Syntax: show rate-limit broadcast

CLI banner configuration

Brocade devices can be configured to display a greeting message on users' terminals when they enter the Privileged EXEC CLI level or access the device through Telnet. In addition, a Brocade device can display a message on the Console when an incoming Telnet CLI session is detected.

Setting a message of the day banner

You can configure the Brocade device to display a message on a user terminal when he or she establishes a Telnet CLI session. For example, to display the message "Welcome to FESX!" when a Telnet CLI session is established.

```
Brocade(config)# banner motd $ (Press Return)
Enter TEXT message, End with the character '$'.
Welcome to FESX! $
```

A delimiting character is established on the first line of the **banner motd** command. You begin and end the message with this delimiting character. The delimiting character can be any character except " (double-quotation mark) and cannot appear in the banner text. In this example, the delimiting character is \$ (dollar sign). The text in between the dollar signs is the contents of the banner. The banner text can be up to 4000 characters long, which can consist of multiple lines.

Syntax: [no] banner motd <delimiting-character>

To remove the banner, enter the **no banner motd** command.

NOTE

The **banner** <delimiting-character> command is equivalent to the **banner motd** <delimiting-character> command.

When you access the Web Management Interface, the banner is displayed.

Click the [Login] link to accept and continue the login process..

[\[Login\]](#)

NOTE

If you are using a Web client to view the message of the day, and your banners are very wide, with large borders, you may need to set your PC display resolution to a number greater than the width of your banner. For example, if your banner is 100 characters wide and the display is set to 80 characters, the banner may distort, or wrap, and be difficult to read. If you set your display resolution to 120 characters, the banner will display correctly.

Requiring users to press the Enter key after the message of the day banner

In earlier IronWare software releases, users were required to press the Enter key after the Message of the Day (MOTD) was displayed, prior to logging in to the Brocade device on a console or from a Telnet session. Now, this requirement is disabled by default. Unless configured, users do not have to press Enter after the MOTD banner is displayed.

For example, if the MOTD "Authorized Access Only" is configured, by default, the following messages are displayed when a user tries to access the Brocade device from a Telnet session.

```
Authorized Access Only ...
Username:
```

The user can then login to the device.

However, if the requirement to press the **Enter key** is enabled, the following messages are displayed when accessing the switch from Telnet.

```
Authorized Access Only ...
Press <Enter> to accept and continue the login process....
```

The user must press the **Enter key** before the login prompt is displayed.

Also, on the console, the following messages are displayed if the requirement to press the **Enter key** is disabled.

```
Press Enter key to login
Authorized Access Only ...
User Access Verification
Please Enter Login Name:
```

However, if the requirement to press the **Enter key** after a MOTD is enabled, the following messages are displayed when accessing the switch on the console.

```
Press Enter key to login
Authorized Access Only ...
Press <Enter> to accept and continue the login process....
```

The user must press the Enter key to continue to the login prompt.

To enable the requirement to press the **Enter key** after the MOTD is displayed, enter a command such as the following.

```
Brocade(config)# banner motd require-enter-key
```

Syntax: [no] banner motd require-enter-key

Use the **no** form of the command to disable the requirement.

Setting a privileged EXEC CLI level banner

You can configure the Brocade device to display a message when a user enters the Privileged EXEC CLI level.

Example

```
Brocade(config)# banner exec_mode # (Press Return)
Enter TEXT message, End with the character '#'.
You are entering Privileged EXEC level
Do not foul anything up! #
```

As with the **banner motd** command, you begin and end the message with a delimiting character; in this example, the delimiting character is #(pound sign). The delimiting character can be any character except “ (double-quotation mark) and cannot appear in the banner text. The text in between the pound signs is the contents of the banner. Banner text can be up to 4000 characters, which can consist of multiple lines.

Syntax: [no] banner exec_mode <delimiting-character>

To remove the banner, enter the **no banner exec_mode** command.

Displaying a console message when an incoming Telnet session is detected

You can configure the Brocade device to display a message on the Console when a user establishes a Telnet session. This message indicates where the user is connecting from and displays a configurable text message.

Example

```
Brocade(config)# banner incoming $ (Press Return)
Enter TEXT message, End with the character '$'.
Incoming Telnet Session!! $
```

When a user connects to the CLI using Telnet, the following message appears on the Console.

```
Telnet from 209.157.22.63
Incoming Telnet Session!!
```

As with the **banner motd** command, you begin and end the message with a delimiting character; in this example, the delimiting character is \$(dollar sign). The delimiting character can be any character except " (double-quotation mark) and cannot appear in the banner text. The text in between the dollar signs is the contents of the banner. Banner text can be up to 4000 characters, which can consist of multiple lines.

Syntax: [no] **banner incoming** <delimiting-character>

To remove the banner, enter the **no banner incoming** command.

Local MAC address for Layer 2 management traffic

By default, Brocade Layer 2 devices use the MAC address of the first port as the MAC address for Layer 2 management traffic. For example, when the Brocade device receives an ARP request for its management IP address, it responds with the first port MAC address. This may cause problems in some configurations where the Brocade device uses the same MAC address for management traffic as for switched traffic.

You can configure the Brocade device to use a different MAC address for Layer 2 management traffic than for switched traffic. When you issue the **use-local-management-mac**, the Brocade device changes a local bit in the first port MAC address and uses this MAC address for management traffic. The second bit of the first port MAC address is changed to 2. For example, if the MAC address is 00e0.5201.9900 after the feature is enabled, the switch uses 02e0.5201.9900 for management functions. Switched traffic will continue to use the first port MAC address without the local bit setting.

Example

```
Brocade(config)# use-local-management-mac
Brocade(config)# write memory
Brocade(config)# end
Brocade# reload
```

Syntax: [no] **use-local-management-mac**

NOTE

You must save the configuration and reload the software to place the change into effect.

NOTE

This feature is only available for the switch code. It is not available for router code.

Basic port parameter configuration

The procedures in this section describe how to configure the port parameters shown in [Table 8](#).

All Brocade ports are pre-configured with default values that allow the device to be fully operational at initial startup without any additional configuration. However, in some cases, changes to the port parameters may be necessary to adjust to attached devices or other network requirements.

Assigning a port name

A port name can be assigned to help identify interfaces on the network. You can assign a port name to physical ports, virtual interfaces, and loopback interfaces.

To assign a name to a port.

```
Brocade(config)# interface ethernet 2
Brocade(config-if-e1000-2)# port-name Marsha
```

Syntax: `port-name <text>`

The `<text>` parameter is an alphanumeric string. The name can be up to 64 characters long. The name can contain blanks. You do not need to use quotation marks around the string, even when it contains blanks.

Port speed and duplex mode modification

The Gigabit Ethernet copper ports are designed to auto-sense and auto-negotiate the speed and duplex mode of the connected device. If the attached device does not support this operation, you can manually enter the port speed to operate at either 10, 100, or 1000 Mbps. The default and recommended setting is 10/100/1000 auto-sense.

NOTE

You can modify the port speed of copper ports only; this feature does not apply to fiber ports.

NOTE

For optimal link operation, copper ports on devices that do not support 803.3u must be configured with like parameters, such as speed (10,100,1000), duplex (half, full), MDI/MDIX, and Flow Control.

Port speed and duplex mode configuration syntax

The following commands change the port speed of copper interface 8 on a FastIron from the default of 10/100/1000 auto-sense, to 100 Mbps operating in full-duplex mode.

```
Brocade(config)# interface ethernet 8
Brocade(config-if-e1000-8)# speed-duplex 100-full
```

Syntax: `speed-duplex <value>`

where `<value>` can be one of the following:

- 10-full – 10 Mbps, full duplex
- 10-half – 10 Mbps, half duplex
- 100-full – 100 Mbps, full duplex
- 100-half – 100 Mbps, half duplex
- 1000-full-master – 1 Gbps, full duplex master
- 1000-full-slave – 1 Gbps, full duplex slave
- auto – auto-negotiation

The default is **auto** (auto-negotiation).

Use the **no** form of the command to restore the default.

NOTE

On FastIron devices, when setting the speed and duplex-mode of an interface to 1000-full, configure one side of the link as master (**1000-full-master**) and the other side as slave (**1000-full-slave**).

NOTE

Auto negotiated FESX combo ports may flap for a few seconds before the link is up.

NOTE

On Brocade ICX 6610 and Series devices, after you remove 10 Gbps speed from the running configuration, plugging in a 1G optic SFP transceiver into a 10 Gbps port causes the software to fail to revert the ports back from the default 10G LRM mode to 1 Gbps speed. Remove the 1G SFP transceiver and plug in the 10G optic SFP+transceiver so that the Brocade ICX 6610 devices go into default 10 Gbps LRM mode..

Enabling auto-negotiation maximum port speed advertisement and down-shift

NOTE

For optimal link operation, link ports on devices that do not support 803.3u must be configured with like parameters, such as speed (10,100,1000), duplex (half, full), MDI/MDIX, and Flow Control.

NOTE

Auto negotiated FESX combo ports may flap for a few seconds before the link is up.

Maximum Port speed advertisement and **Port speed down-shift** are enhancements to the auto-negotiation feature, a mechanism for accommodating multi-speed network devices by automatically configuring the highest performance mode of inter-operation between two connected devices.

Port speed down-shift enables Gbps copper ports on the Brocade device to establish a link at 1000 Mbps over a 4-pair wire when possible, or to down-shift to 100 Mbps if the medium is a 2-pair wire.

Maximum port speed advertisement enables you to configure an auto-negotiation maximum speed that Gbps copper ports on the Brocade device will advertise to the connected device. You can configure a port to advertise a maximum speed of either 100 Mbps or 10 Mbps. When the maximum port speed advertisement feature is configured on a port that is operating at 100 Mbps maximum speed, the port will advertise 10/100 Mbps capability to the connected device. Similarly, if a port is configured at 10 Mbps maximum speed, the port will advertise 10 Mbps capability to the connected device.

The port speed down-shift and maximum port speed advertisement features operate dynamically at the physical link layer between two connected network devices. They examine the cabling conditions and the physical capabilities of the remote link, then configure the speed of the link segment according to the highest physical-layer technology that both devices can accommodate.

The port speed down-shift and maximum port speed advertisement features operate dynamically at the physical link layer, independent of logical trunk group configurations. Although Brocade recommends that you use the same cable types and auto-negotiation configuration on all members of a trunk group, you could utilize the auto-negotiation features conducive to your cabling environment. For example, in certain circumstances, you could configure each port in a trunk group to have its own auto-negotiation maximum port speed advertisement or port speed down-shift configuration.

Maximum port speed application notes

- Port speed down-shift and maximum port speed advertisement work only when auto-negotiation is enabled (CLI command **speed-duplex auto**). If auto-negotiation is OFF, the device will reject the port speed down-shift and maximum port speed advertisement configuration.
- When port speed down-shift or maximum port speed advertisement is enabled on a port, the device will reject any configuration attempts to set the port to a forced speed mode (100 Mbps or 1000 Mbps).
- When the port speed down-shift feature is enabled on a combo port, the port will not support true media automatic detection, meaning the device will not be able to detect and select the fiber or copper connector based on link availability.

Enabling port speed down-shift

To enable port speed down-shift on a port that has auto-negotiation enabled, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)# link-config gig copper autoneg-control down-shift ethernet 1
ethernet 2
```

The above command configures Gbps copper ports 1 and 2 to establish a link at 1000 Mbps over a 4-pair wire when possible, or to down-shift (reduce the speed) to 100 Mbps when the medium is a 2-pair wire.

Syntax: [no] link-config gig copper autoneg-control down-shift ethernet <port> [ethernet <port>] | to <port>...

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both.

You can enable port speed down-shift on one or two ports at a time.

To disable port speed down-shift after it has been enabled, enter the **no** form of the command.

Configuring port speed down-shift and auto-negotiation for a range of ports

Port speed down-shift and auto-negotiation can be configured for an entire range of ports with a single command.

For example, to configure down-shift on ports 0/1/1 to 0/1/10 and 0/1/15 to 0/1/20 on the device, enter the following.

```
Brocade(config)# link-config gig copper autoneg-control down-shift ethernet 0/1/1
to 0/1/10 ethernet 0/1/15 to 0/1/20
```

To configure down-shift on ports 5 to 13 and 17 to 19 on a compact switch, enter the following.

```
Brocade(config)# link-config gig copper autoneg-control down-shift ethernet 5 to
13 ethernet 17 to 19
```

Syntax: [no] link-config gig copper autoneg-control [down-shift | 100m-auto | 10m-auto] ethernet <port-list>

The <port-list> is the list of ports to which the command will be applied.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

The output from the **show run** command for this configuration will resemble the following.

```
Brocade# show run
Current configuration:
!
ver 04.0.00b64T7e1
!
module 1 fgs-48-port-management-module
module 2 fgs-cx4-2-port-10g-module
!
link-config gig copper autoneg-control down-shift ethernet 0/1/1 to 0/1/10
ethernet 0/1/15 to 0/1/20
!
!
ip address 10.44.9.11 255.255.255.0
ip default-gateway 10.44.9.1
!
end
```

To disable selective auto-negotiation of 100m-auto on ports 0/1/21 to 0/1/25 and 0/1/30, enter the following.

```
Brocade(config)# no link-config gig copper autoneg-control 100m-auto ethernet
0/1/21 to 0/1/25 ethernet 0/1/30
```

Configuring maximum port speed advertisement

To configure a maximum port speed advertisement of 10 Mbps on a port that has auto-negotiation enabled, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)# link-config gig copper autoneg-control 10m ethernet 1
```

To configure a maximum port speed advertisement of 100 Mbps on a port that has auto-negotiation enabled, enter the following command at the Global CONFIG level of the CLI.

```
Brocade(config)# link-config gig copper autoneg-control 100m ethernet 2
```

Syntax: [no] link-config gig copper autoneg-control 10m | 100m ethernet <port> [ethernet <port>]

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*

- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both.

You can enable maximum port speed advertisement on one or two ports at a time.

To disable maximum port speed advertisement after it has been enabled, enter the **no** form of the command.

Modifying port duplex mode

You can manually configure a 10/100 Mbps port to accept either full-duplex (bi-directional) or half-duplex (uni-directional) traffic.

NOTE

You can modify the port duplex mode of copper ports only. This feature does not apply to fiber ports.

Port duplex mode and port speed are modified by the same command.

Port duplex mode configuration syntax

To change the port speed of interface 8 from the default of 10/100/1000 auto-sense to 10 Mbps operating at full-duplex, enter the following.

```
Brocade(config)# interface ethernet 8
Brocade(config-if-e1000-8)# speed-duplex 10-full
```

Syntax: **speed-duplex** <value>

The <value> can be one of the following:

- 10-full
- 10-half
- 100-full
- 100-half
- auto (default)

MDI and MDIX configuration

Brocade devices support automatic Media Dependent Interface (MDI) and Media Dependent Interface Crossover (MDIX) detection on all Gbps Ethernet Copper ports.

MDI/MDIX is a type of Ethernet port connection using twisted pair cabling. The standard wiring for end stations is MDI, whereas the standard wiring for hubs and switches is MDIX. MDI ports connect to MDIX ports using straight-through twisted pair cabling. For example, an end station connected to a hub or a switch uses a straight-through cable. MDI-to-MDI and MDIX-to-MDIX connections use crossover twisted pair cabling. So, two end stations connected to each other, or two hubs or switches connected to each other, use crossover cable.

The auto MDI/MDIX detection feature can automatically correct errors in cable selection, making the distinction between a straight-through cable and a crossover cable insignificant.

MDI and MDIX configuration notes

- This feature applies to copper ports only.
- The **mdi-mdix mdi** and **mdi-mdix mdix** commands work independently of auto-negotiation. Thus, these commands work whether auto-negotiation is turned ON or OFF.

MDI and MDIX configuration syntax

The auto MDI/MDIX detection feature is enabled on all Gbps copper ports by default. For each port, you can disable auto MDI/MDIX, designate the port as an MDI port, or designate the port as an MDIX port.

To turn off automatic MDI/MDIX detection and define a port as an MDI only port.

```
Brocade(config-if-e1000-2)# mdi-mdix mdi
```

To turn off automatic MDI/MDIX detection and define a port as an MDIX only port.

```
Brocade(config-if-e1000-2)# mdi-mdix mdix
```

To turn on automatic MDI/MDIX detection on a port that was previously set as an MDI or MDIX port.

```
Brocade(config-if-e1000-2)# mdi-mdix auto
```

Syntax: **mdi-mdix** <mdi | mdix | auto>

After you enter the **mdi-mdix** command, the Brocade device resets the port and applies the change.

To display the MDI/MDIX settings, including the configured value and the actual resolved setting (for mdi-mdix auto), enter the command **show interface** at any level of the CLI.

Disabling or re-enabling a port

A port can be made inactive (disable) or active (enable) by selecting the appropriate status option. The default value for a port is enabled.

To disable port 8 of a Brocade device, enter the following.

```
Brocade(config)# interface ethernet 8
Brocade(config-if-e1000-8)# disable
```

You also can disable or re-enable a virtual interface. To do so, enter commands such as the following.

```
Brocade(config)# interface ve v1
Brocade(config-vif-1)# disable
```

Syntax: **disable**

To re-enable a virtual interface, enter the **enable** command at the Interface configuration level. For example, to re-enable virtual interface v1, enter the **enable** command.

```
Brocade(config-vif-1)# enable
```

Syntax: **enable**

Flow control configuration

Flow control (802.3x) is a QoS mechanism created to manage the flow of data between two full-duplex Ethernet devices. Specifically, a device that is oversubscribed (is receiving more traffic than it can handle) sends an 802.3x PAUSE frame to its link partner to temporarily reduce the amount of data the link partner is transmitting. Without flow control, buffers would overflow, packets would be dropped, and data retransmission would be required.

All FastIron devices support *asymmetric* flow control, meaning they can receive PAUSE frames but cannot transmit them. In addition, FCX devices also support *symmetric* flow control, meaning they can both receive and transmit 802.3x PAUSE frames. For details about symmetric flow control, refer to [“Symmetric flow control on FCX devices”](#) on page 49.

Flow control configuration notes

- Auto-negotiation of flow control is not supported on 10 Gbps ports, fiber ports, and copper or fiber combination ports.
- When any of the flow control commands are applied to a port that is up, the port will be disabled and re-enabled.
- For 10 Gbps ports, the **show interface <port>** display shows Flow Control is enabled or Flow Control is disabled, depending on the configuration.
- When flow-control is enabled, the hardware can only advertise PAUSE frames. It does not advertise Asym.

Disabling or re-enabling flow control

You can configure the Brocade device to operate with or without flow control. Flow control is enabled by default globally and on all full-duplex ports. You can disable and re-enable flow control at the Global CONFIG level for all ports. When enabled globally, you can disable and re-enable flow control on individual ports.

To disable flow control, enter the **no flow-control** command.

```
Brocade(config)# no flow-control
```

To turn the feature back on, enter the **flow-control** command.

```
Brocade(config)# flow-control
```

Syntax: [no] flow-control

NOTE

For optimal link operation, link ports on devices that do not support 803.3u must be configured with like parameters, such as speed (10,100,1000), duplex (half, full), MDI/MDIX, and Flow Control.

Negotiation and advertisement of flow control

By default, when flow control is enabled globally and auto-negotiation is ON, flow control is enabled and advertised on 10/100/1000M ports. If auto-negotiation is OFF or if the port speed was configured manually, then flow control is not negotiated with or advertised to the peer. For details about auto-negotiation, refer to [“Port speed and duplex mode modification”](#) on page 41.

To disable flow control capability on a port, enter the following commands.

Basic port parameter configuration

```
Brocade(config)# interface ethernet 0/1/21
Brocade(config-if-e1000-0/1/21)# no flow-control
```

To enable flow control negotiation, enter the following commands.

```
Brocade(config)# interface ethernet 0/1/21
Brocade(config-if-e1000-0/1/21)# flow-control neg-on
```

Syntax: [no] flow-control [neg-on]

- **flow-control** [default] - Enable flow control, flow control negotiation, and advertise flow control
- **no flow-control neg-on** - Disable flow control negotiation
- **no flow-control** - Disable flow control, flow control negotiation, and advertising of flow control

After flow control negotiation is enabled using the **flow-control neg-on** command option, flow control is enabled or disabled depending on the peer advertisement.

Commands may be entered in IF (single port) or MIF (multiple ports at once) mode.

Example

```
Brocade(config)# interface ethernet 0/1/21
Brocade(config-if-e1000-0/1/21)# no flow-control
```

This command disables flow control on port 0/1/21.

```
Brocade(config)# interface ethernet 0/1/11 to 0/1/15
Brocade(config-mif-0/1/11-0/1/15)# no flow-control
```

This command disables flow control on ports 0/1/11 to 0/1/15.

Displaying flow-control status

The **show interface <port>** command displays configuration, operation, and negotiation status where applicable.

For example, on a FastIron Stackable device, issuing the command for 10/100/1000M port 0/1/21 displays the following output.

```
Brocade# show interfaces ethernet 0/1/21
GigabitEthernet0/1/21 is up, line protocol is up
  Hardware is GigabitEthernet, address is 00e0.5204.4014 (bia 00e0.5204.4014)
  Configured speed auto, actual 100Mbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual MDIX
  Member of L2 VLAN ID 1, port is untagged, port state is LISTENING
  BPDU Guard is disabled, Root Protect is disabled
  STP configured to ON, priority is level0
  Flow Control is config enabled, oper enabled, negotiation disabled
  Mirror disabled, Monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  Inter-Packet Gap (IPG) is 96 bit times
  300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  300 second output rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 input errors, 0 CRC, 0 frame, 0 ignored
```

```

0 runts, 0 giants
5 packets output, 320 bytes, 0 underruns
Transmitted 0 broadcasts, 5 multicasts, 0 unicasts
0 output errors, 0 collisions

```

Issuing the **show interface <port>** command on a FSX device displays the following output:

```

Brocade# show interface ethernet 18/1
GigabitEthernet18/1 is up, line protocol is up
  Hardware is GigabitEthernet, address is 0012.f228.0600 (bia 0012.f228.0798)
  Configured speed auto, actual 1Gbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual MDIX
  Member of 4 L2 VLANs, port is tagged, port state is FORWARDING
  BPDU guard is Disabled, ROOT protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, flow control enabled
  Flow Control is config enabled, oper enabled, negotiation disabled
  mirror disabled, monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  IPG MII 96 bits-time, IPG GMII 96 bits-time
  IP MTU 1500 bytes, encapsulation ethernet
  300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  300 second output rate: 848 bits/sec, 0 packets/sec, 0.00% utilization
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 input errors, 0 CRC, 0 frame, 0 ignored
  0 runts, 0 giants
  10251 packets output, 1526444 bytes, 0 underruns
  Transmitted 1929 broadcasts, 8293 multicasts, 29 unicasts
  0 output errors, 0 collisions

```

The line highlighted in bold will resemble one of the following, depending on the configuration:

- If flow control negotiation is enabled (and a neighbor advertises “Pause-Not Capable”), the display shows:
Flow Control is config enabled, oper disabled, negotiation enabled
- If flow control negotiation is enabled (and a neighbor advertises “Pause-Capable”), the display shows:
Flow Control is config enabled, oper enabled, negotiation enabled
- If flow control is enabled, and flow control negotiation is disabled, the display shows:
Flow Control is config enabled, oper enabled, negotiation disabled
- If flow control is disabled, the display shows:
Flow control is config disabled, oper disabled

Symmetric flow control on FCX devices

In addition to *asymmetric* flow control, FCX devices support *symmetric* flow control, meaning they can both receive and transmit 802.3x PAUSE frames.

By default on FCX devices, packets are dropped from the end of the queue at the egress port (tail drop mode), when the maximum queue limit is reached. Conversely, when symmetric flow control is enabled, packets are guaranteed delivery since they are managed at the ingress port and no packets are dropped.

Symmetric flow control addresses the requirements of a lossless service class in an Internet Small Computer System Interface (iSCSI) environment. It is supported on FCX standalone units as well as on all FCX units in an IronStack.

About XON and XOFF thresholds

An 802.3x PAUSE frame is generated when the buffer limit at the ingress port reaches or exceeds the port's upper watermark threshold (XOFF limit). The PAUSE frame requests that the sender stop transmitting traffic for a period of time. The time allotted enables the egress and ingress queues to be cleared. When the ingress queue falls below the port's lower watermark threshold (XON limit), an 802.3x PAUSE frame with a quanta of 0 (zero) is generated. The PAUSE frame requests that the sender resume sending traffic normally.

Each 1G and 10G port is configured with a default total number of buffers as well as a default XOFF and XON threshold. The defaults are different for 1G ports versus 10G ports. Also, the default XOFF and XON thresholds are different for jumbo mode versus non-jumbo mode. The defaults are shown in Table 13.

TABLE 13 XON and XOFF default thresholds

	Limit when Jumbo disabled / % of buffer limit	Limit when Jumbo enabled / % of buffer limit
1G ports		
Total buffers	272	272
XOFF	240 / 91%	216 / 82%
XON	200 / 75%	184 / 70%
10G ports		
Total buffers	416	416
XOFF	376 / 91%	336 / 82%
XON	312 / 75%	288 / 70%

If necessary, you can change the total buffer limits and the XON and XOFF default thresholds. Refer to [“Changing the total buffer limits”](#) on page 52 and [“Changing the XON and XOFF thresholds”](#) on page 51, respectively.

Configuration notes and feature limitations for symmetric flow control

Note the following configuration notes and feature limitations before enabling symmetric flow control.

- Symmetric flow control is supported on FCX and ICX devices only. It is not supported on other FastIron models.
- Symmetric flow control is supported on all 1G and 10G data ports on FCX and ICX devices.
- Symmetric flow control is not supported on stacking ports or across units in a stack.
- To use this feature, 802.3x flow control must be enabled globally and per interface on the FCX. By default, 802.3x flow control is enabled, but can be disabled with the **no flow-control** command.

- The following QoS features are not supported together with symmetric flow control:
 - Dynamic buffer allocation (CLI commands **qd-descriptor** and **qd-buffer**)
 - Buffer profiles (CLI command **buffer-profile port-region**)
 - DSCP-based QoS (CLI command **trust dscp**)

NOTE

Although the above QoS features are not supported with symmetric flow control, the CLI will still accept these commands. The last command issued will be the one placed into effect on the device. For example, if **trust dscp** is enabled after **symmetric-flow-control** is enabled, symmetric flow control will be disabled and trust dscp will be placed into effect. Make sure you do not enable incompatible QoS features when symmetric flow control is enabled on the device.

- Head of Line (HOL) blocking may occur when symmetric flow control is enabled. This means that a peer can stop transmitting traffic streams unrelated to the congestion stream.

Enabling and disabling symmetric flow control

By default, symmetric flow control is disabled and tail drop mode is enabled. However, because flow control is enabled by default on all full-duplex ports, these ports will always honor received 802.3x Pause frames, whether or not symmetric flow control is enabled.

To enable symmetric flow control globally on all full-duplex data ports of a standalone unit, enter the **symmetric-flow-control enable** command.

```
Brocade(config)# symmetric-flow-control enable
```

To enable symmetric flow control globally on all full-duplex data ports of a particular unit in an IronStack, enter the **symmetric-flow-control enable <stack-unit>** command.

```
Brocade(config)# symmetric-flow-control enable unit 4
```

Syntax: [no] **symmetric-flow-control enable** [unit <stack-unit>]

The <stack-unit> parameter specifies one of the units in a stacking system. Master/Standby/Members are examples of a stack-unit

To disable symmetric flow control once it has been enabled, use the **no** form of the command.

Changing the XON and XOFF thresholds

This section describes how to change the XON and XOFF thresholds described in [“About XON and XOFF thresholds”](#) on page 50.

To change the thresholds for all 1G ports, enter a command such as the following.

```
Brocade(config)# symmetric-flow-control set 1 xoff 91 xon 75
```

To change the thresholds for all 10G ports, enter a command such as the following.

```
Brocade(config)# symmetric-flow-control set 2 xoff 91 xon 75
```

In the above configuration examples, when the XOFF limit of 91% is reached or exceeded, the Brocade device will send PAUSE frames to the sender telling it to stop transmitting data temporarily. When the XON limit of 75% is reached, the Brocade device will send PAUSE frames to the sender telling it to resume sending data.

Syntax: `symmetric-flow-control set 1 | 2 xoff <%> xon <%>`

symmetric-flow-control set 1 sets the XOFF and XON limits for 1G ports.

symmetric-flow-control set 2 sets the XOFF and XON limits for 10G ports.

For **xoff <%>**, the <%> minimum value is 60% and the maximum value is 95%.

For **xon <%>**, the <%> minimum value is 50% and the maximum value is 90%.

Use the **show symmetric** command to view the default or configured XON and XOFF thresholds. Refer to [“Displaying symmetric flow control status”](#) on page 52.

Changing the total buffer limits

This section describes how to change the total buffer limits described in [“About XON and XOFF thresholds”](#) on page 50. You can change the limits for all 1G ports and for all 10G ports.

To change the total buffer limit for all 1G ports, enter a command such as the following.

```
Brocade(config)# symmetric-flow-control set 1 buffers 320
Total buffers modified, 1G: 320, 10G: 128
```

To change the total buffer limit for all 10G ports, enter a command such as the following.

```
Brocade(config)# symmetric-flow-control set 2 buffers 128
Total buffers modified, 1G: 320, 10G: 128
```

Syntax: `symmetric-flow-control set 1 | 2 buffers <value>`

symmetric-flow-control set 1 buffers <value> sets the total buffer limits for 1G ports. The default <value> is 272. You can specify a number from 64 – 320.

symmetric-flow-control set 2 buffers <value> sets the total buffer limits for 10G ports. The default <value> is 416. You can specify a number from 64 – 1632.

Use the **show symmetric** command to view the default or configured total buffer limits. Refer to [“Displaying symmetric flow control status”](#) on page 52.

Displaying symmetric flow control status

The **show symmetric-flow-control** command displays the status of symmetric flow control as well as the default or configured total buffer limits and XON and XOFF thresholds.

```

Brocade(config)# show symmetric
Symmetric Flow Control Information:
-----
Symmetric Flow Control is enabled on units: 2 3
Buffer parameters:
1G Ports:
    Total Buffers : 272
    XOFF Limit    : 240(91%)
    XON Limit     : 200(75%)
10G Ports:
    Total Buffers : 416
    XOFF Limit    : 376(91%)
    XON Limit     : 312(75%)

```

Syntax: `show symmetric-flow-control`

PHY FIFO Rx and Tx depth configuration

PHY devices on FWS devices contain transmit and receive synchronizing FIFOs to adjust for frequency differences between clocks. The **phy-fifo-depth** command allows you to configure the depth of the transmit and receive FIFOs. There are 4 settings (0-3) with 0 as the default. A higher setting indicates a deeper FIFO.

The default setting works for most connections. However, if the clock differences are greater than the default will handle, CRCs and errors will begin to appear on the ports. Raising the FIFO depth setting will adjust for clock differences.

Brocade recommends that you disable the port before applying this command, and re-enable the port. Applying the command while traffic is flowing through the port can cause CRC and other errors for any packets that are actually passing through the PHY while the command is being applied.

Syntax: `[no] phy-fifo-depth <setting>`

- `<setting>` is a value between 0 and 3. (0 is the default.)

This command can be issued for a single port from the IF config mode or for multiple ports from the MIF config mode.

NOTE

Higher settings give better tolerance for clock differences with the partner phy, but may marginally increase latency as well.

Interpacket Gap (IPG) on a FastIron X Series switch

IPG is the time delay, in bit time, between frames transmitted by the device. You configure IPG at the interface level. The command you use depends on the interface type on which IPG is being configured.

The default interpacket gap is 96 bits-time, which is 9.6 microseconds for 10 Mbps Ethernet, 960 nanoseconds for 100 Mbps Ethernet, 96 nanoseconds for 1 Gbps Ethernet, and 9.6 nanoseconds for 10 Gbps Ethernet.

IPG on a FastIron X series switch configuration notes

- The CLI syntax for IPG differs on FastIron X Series devices compared to FastIron Stackable devices. This section describes the configuration procedures for FastIron X Series devices. For FastIron Stackable devices, refer to [“IPG on FastIron Stackable devices”](#) on page 55.
- IPG configuration commands are based on "port regions". All ports within the same port region should have the same IPG configuration. If a port region contains two or more ports, changes to the IPG configuration for one port are applied to all ports in the same port region. When you enter a value for IPG, the CLI displays the ports to which the IPG configuration is applied.

Example

```
Brocade(config-if-e1000-7/1)# ipg-gmii 120
IPG 120(112) has been successfully configured for ports 7/1 to 7/12
```

- When you enter a value for IPG, the device applies the closest valid IPG value for the port mode to the interface. For example, if you specify 120 for a 1 Gbps Ethernet port in 1 Gbps mode, the device assigns 112 as the closest valid IPG value to program into hardware.

Configuring IPG on a Gbps Ethernet port

On a Gbps Ethernet port, you can configure IPG for 10/100 mode and for Gbps Ethernet mode.

10/100M mode

To configure IPG on a Gbps Ethernet port for 10/100M mode, enter the following command.

```
Brocade(config)# interface ethernet 7/1
Brocade(config-if-e1000-7/1)# ipg-mii 120
IPG 120(120) has been successfully configured for ports 7/1 to 7/12
```

Syntax: [no] ipg-mii <bit time>

Enter 12-124 for <bit time>. The default is 96 bit time.

1G mode

To configure IPG on a Gbps Ethernet port for 1-Gbps Ethernet mode, enter commands such as the following.

```
Brocade(config)# interface ethernet 7/1
Brocade(config-if-e1000-7/1)# ipg-gmii 120
IPG 120(112) has been successfully configured for ports 0/7/1 to 7/12
```

Syntax: [no] ipg-gmii <bit time>

Enter 48 - 112 for <bit time>. The default is 96 bit time.

Configuring IPG on a 10 Gbps Ethernet interface

To configure IPG on a 10 Gbps Ethernet interface, enter commands such as the following.

```
Brocade(config)# interface ethernet 9/1
Brocade(config-if-e10000-9/1)# ipg-xgmii 120
IPG 120(128) has been successfully configured for port 9/1
```

Syntax: [no] ipg-xgmii <bit time>

Enter 96-192 for <bit time>. The default is 96 bit time.

IPG on FastIron Stackable devices

On FWS, FCX, and ICX devices, you can configure an IPG for each port. An IPG is a configurable time delay between successive data packets.

You can configure an IPG with a range from 48-120 bit times in multiples of 8, with a default of 96. The IPG may be set from either the interface configuration level or the multiple interface level.

IPG configuration notes

- The CLI syntax for IPG differs on FastIron Stackable devices compared to FastIron X Series devices. This section describes the configuration procedures for FastIron Stackable devices. For FastIron X Series devices, refer to [“Interpacket Gap \(IPG\) on a FastIron X Series switch”](#) on page 53.
- When an IPG is applied to a trunk group, it applies to all ports in the trunk group. When you are creating a new trunk group, the IPG setting on the primary port is automatically applied to the secondary ports.
- This feature is supported on 10/100/1000M ports.

Configuring IPG on a 10/100/1000M port

To configure an IPG of 112 on Ethernet interface 0/1/21, for example, enter the following command.

```
Brocade(config)# interface ethernet 0/1/21
Brocade(config-if-e1000-0/1/21)# ipg 112
```

For multiple interface levels, to configure IPG for ports 0/1/11 and 0/1/14 through 0/1/17, enter the following commands.

```
Brocade(config)# interface ethernet 0/1/11 ethernet 0/1/14 to 0/1/17
Brocade(config-mif-0/1/11,0/1/14-0/1/17)# ipg 104
```

Syntax: [no] ipg <value>

For *value*, enter a number in the range from 48-120 bit times in multiples of 8. The default is 96.

As a result of the above configuration, the output from the show interface Ethernet 0/1/21 command is as follows.

```
Brocade# show interfaces ethernet 0/1/21
GigabitEthernet 0/1/21 is up, line protocol is up
  Hardware is GigabitEthernet, address is 00e0.5204.4014 (bia 00e0.5204.4014)
  Configured speed auto, actual 100Mbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual MDIX
  Member of L2 VLAN ID 1, port is untagged, port state is FORWARDING
  BPDU Guard is disabled, Root Protect is disabled
  STP configured to ON, priority is level0
  Flow Control is config enabled, oper enabled, negotiation disabled
  Mirror disabled, Monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  Inter-Packet Gap (IPG) is 112 bit times
  IP MTU 10222 bytes
  300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  300 second output rate: 248 bits/sec, 0 packets/sec, 0.00% utilization
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 input errors, 0 CRC, 0 frame, 0 ignored
  0 runts, 0 giants
  80 packets output, 5120 bytes, 0 underruns
  Transmitted 0 broadcasts, 80 multicasts, 0 unicasts
  0 output errors, 0 collisions
```

Enabling and disabling support for 100BaseTX

For FastIron X Series devices, you can configure a 1000Base-TX SFP (part number E1MG-TX) to operate at a speed of 100 Mbps. To do so, enter the **100-tx** command at the Interface level of the CLI.

```
Brocade(config-if-e1000-11)# 100-tx
```

After the link is up, it will be in 100M/full-duplex mode, as shown in the following example.

```
Brocade# show interface brief ethernet 11
Port Link State Dupl Speed Trunk Tag Priori MAC Name
11 Up Forward Full 100M None No level10 0000.d213.c74b
```

The **show media** command will display the SFP transceiver as **1G M-TX**.

Syntax: [no] **100-tx**

To disable support, enter the **no** form of the command.

100BaseTX configuration notes

- This feature requires that autonegotiation be enabled on the other end of the link.
- Although combo ports (ports 1 – 4) on Hybrid Fiber (HF) models support the 1000Base-TX SFP, they cannot be configured to operate at 100 Mbps. The 100 Mbps operating speed is supported only with non-combo ports (ports 5-24).
- The FCX624S-F is the only FCX model that supports the 1000Base-TX SFP module, and only on the non-combo ports (ports 5-24). The FCX624S-F does not have a specific command to enable the 1000Base-TX SFP optic at 100 Mbps. You must manually configure it with the **speed-duplex 100-full** command. Refer to “[Port speed and duplex mode configuration syntax](#)” on page 41.
- 1000Base-TX modules must be configured individually, one interface at a time.
- 1000Base-TX modules do not support Digital Optical Monitoring.
- This module requires a Cat5 cable and uses an RJ45 connector.
- Hotswap is supported for this module when it is configured in 100M mode.

Enabling and disabling support for 100BaseFX

Some Brocade devices support 100BaseFX fiber transceivers. After you physically install a 100BaseFX transceiver, you must enter a CLI command to enable it.

NOTE

The CLI syntax for enabling and disabling 100BaseFX support on a FESX Compact device differs from the syntax for Chassis-based and Stackable devices. Follow the appropriate instructions below.

Enabling and disabling support for 100BaseFX is not supported on ICX devices. For information about supported SFP and SFP+ transceivers on ICX devices, refer to the following Brocade website:

http://www.brocade.com/downloads/documents/data_sheets/product_data_sheets/Optics_DS.pdf

Enabling and disabling 100BaseFX on FESX Compact device

This section shows how to enable 100BaseFX on a FESX Compact device.

The Brocade device supports the following types of SFPs for 100BaseFX:

- Multimode SFP – maximum distance is 2 kilometers
- Long Reach (LR) – maximum distance is 40 kilometers
- Intermediate Reach (IR) – maximum distance is 15 kilometers

For information about supported SFP and SFP+ transceivers on FastIron devices, refer to the following Brocade website:

http://www.brocade.com/downloads/documents/data_sheets/product_data_sheets/Optics_DS.pdf

NOTE

Connect the 100BaseFX fiber transceiver *after* configuring both sides of the link. Otherwise, the link could become unstable, fluctuating between up and down states.

To enable 100BaseFX on a fiber port, enter the following command at the Global CONFIG level of the CLI.

```
Brocade(config)# link-config gig fiber 100base-fx ethernet 4
```

The above command enables 100BaseFX on port 4.

The following command enables 100BaseFX on ports 3 and 4

```
Brocade(config)# link-config gig fiber 100base-fx ethernet 3 ethernet 4
```

Syntax: [no] link-config gig fiber 100base-fx ethernet [<port>] ethernet [<port>]

The <port> variable is a valid port number. You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both.

To disable 100BaseFX support on a fiber port, enter the **no** form of the command. Note that you must disable 100BaseFX support before inserting a different type of module in the same port. Otherwise, the device will not recognize traffic traversing the port.

Enabling and disabling 100BaseFX on Chassis-based and stackable devices

NOTE

The following procedure applies to Stackable devices and to Chassis-based 100/1000 Fiber interface modules only. The CLI syntax for enabling and disabling 100BaseFX support on these devices differs than on a Compact device. Make sure you refer to the appropriate procedures. These are not supported on ICX 6430 and ICX 6450 devices.

FastIron devices support the following types of SFPs for 100BaseFX:

- **Multimode SFP** – maximum distance is 2 kilometers
- **Long Reach (LR)** – maximum distance is 40 kilometers
- **Intermediate Reach (IR)** – maximum distance is 15 kilometers

For information about supported SFP and SFP+ transceivers on FastIron devices, refer to the following Brocade website:

http://www.brocade.com/downloads/documents/data_sheets/product_data_sheets/Optics_DS.pdf

NOTE

Connect the 100BaseFX fiber transceiver *after* configuring both sides of the link. Otherwise, the link could become unstable, fluctuating between up and down states.

To enable support for 100BaseFX on an FSX fiber port or on a Stackable switch, enter commands such as the following.

```
Brocade(config)# interface ethernet 1/6
Brocade(config-if-1/6)# 100-fx
```

The above commands enable 100BaseFX on port 6 in slot 1.

Syntax: [no] 100-fx

To disable 100BaseFX support on a fiber port, enter the **no** form of the command. Note that you must disable 100BaseFX support before inserting a different type of module in the same port. Otherwise, the device will not recognize traffic traversing the port.

Changing the Gbps fiber negotiation mode

The globally configured Gbps negotiation mode is the default mode for all Gbps fiber ports. You can override the globally configured default and set individual ports to the following:

NOTE

Gbps negotiation is not supported on ICX 6430 and ICX 6450 devices.

- **Negotiate-full-auto** – The port first tries to perform a handshake with the other port to exchange capability information. If the other port does not respond to the handshake attempt, the port uses the manually configured configuration information (or the defaults if an administrator has not set the information). This is the default.
- **Auto-Gbps** – The port tries to perform a handshake with the other port to exchange capability information.
- **Negotiation-off** – The port does not try to perform a handshake. Instead, the port uses configuration information manually configured by an administrator.

To change the mode for individual ports, enter commands such as the following.

```
Brocade(config)# interface ethernet 1 to 4
Brocade(config-mif-1-4)# gig-default auto-gig
```

This command overrides the global setting and sets the negotiation mode to auto-Gbps for ports 1 – 4.

Syntax: gig-default neg-full-auto | auto-gig | neg-off

NOTE

When Gbps negotiation mode is turned off (CLI command **gig-default neg-off**), the Brocade device may inadvertently take down both ends of a link. This is a hardware limitation for which there is currently no workaround.

Port priority (QoS) modification

You can give preference to the inbound traffic on specific ports by changing the Quality of Service (QoS) level on those ports. For information and procedures, refer to [Chapter 51, “Quality of Service”](#).

Dynamic configuration of Voice over IP (VoIP) phones

You can configure a FastIron device to automatically detect and re-configure a VoIP phone when it is physically moved from one port to another within the same device. To do so, you must configure a **voice VLAN ID** on the port to which the VoIP phone is connected. The software stores the voice VLAN ID in the port database for retrieval by the VoIP phone.

The dynamic configuration of a VoIP phone works in conjunction with the VoIP phone discovery process. Upon installation, and sometimes periodically, a VoIP phone will query the Brocade device for VoIP information and will advertise information about itself, such as, device ID, port ID, and platform. When the Brocade device receives the VoIP phone query, it sends the voice VLAN ID in a reply packet back to the VoIP phone. The VoIP phone then configures itself within the voice VLAN.

As long as the port to which the VoIP phone is connected has a voice VLAN ID, the phone will configure itself into that voice VLAN. If you change the voice VLAN ID, the software will immediately send the new ID to the VoIP phone, and the VoIP phone will re-configure itself with the new voice VLAN.

VoIP configuration notes

- This feature works with any VoIP phone that:
 - Runs CDP
 - Sends a VoIP VLAN query message
 - Can configure its voice VLAN after receiving the VoIP VLAN reply
- Automatic configuration of a VoIP phone will not work if one of the following applies:
 - You do not configure a voice VLAN ID for a port with a VoIP phone
 - You remove the configured voice VLAN ID from a port without configuring a new one
 - You remove the port from the voice VLAN
- Make sure the port is able to intercept CDP packets (**cdp run** command).
- Some VoIP phones may require a reboot after configuring or re-configuring a voice VLAN ID. For example, if your VoIP phone queries for VLAN information only once upon boot up, you must reboot the VoIP phone before it can accept the VLAN configuration. If your phone is powered by a PoE device, you can reboot the phone by disabling then re-enabling the port.

Enabling dynamic configuration of a Voice over IP (VoIP) phone

You can create a voice VLAN ID for a port, or for a group of ports.

To create a voice VLAN ID for a port, enter commands such as the following.

```
Brocade(config)# interface ethernet 2
Brocade(config-if-e1000-2)# voice-vlan 1001
```

To create a voice VLAN ID for a group of ports, enter commands such as the following.

```
Brocade(config)# interface ethernet 1-8
Brocade(config-mif-1-8)# voice-vlan 1001
```

Syntax: [no] **voice-vlan** <voice-vlan-num>

where <voice-vlan-num> is a valid VLAN ID between 1 – 4095.

To remove a voice VLAN ID, use the **no** form of the command.

Viewing voice VLAN configurations

You can view the configuration of a voice VLAN for a particular port or for all ports.

To view the voice VLAN configuration for a port, specify the port number with the **show voice-vlan** command. The following example shows the command output results.

```
Brocade# show voice-vlan ethernet 2
Voice vlan ID for port 2: 1001
```

The following example shows the message that appears when the port does not have a configured voice VLAN.

```
Brocade# show voice-vlan ethernet 2
Voice vlan is not configured for port 2.
```

To view the voice VLAN for all ports, use the **show voice-vlan** command. The following example shows the command output results.

```
Brocade# show voice-vlan
Port ID      Voice-vlan
2            1001
8            150
15           200
```

Syntax: **show voice-vlan** [ethernet <port>]

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both.

Port flap dampening configuration

Port Flap Dampening increases the resilience and availability of the network by limiting the number of port state transitions on an interface.

If the port link state toggles from up to down for a specified number of times within a specified period, the interface is physically disabled for the specified wait period. Once the wait period expires, the port link state is re-enabled. However, if the wait period is set to zero (0) seconds, the port link state will remain disabled until it is manually re-enabled.

Port flap dampening configuration notes

- When a flap dampening port becomes a member of a trunk group, that port, as well as all other member ports of that trunk group, will inherit the primary port configuration. This means that the member ports will inherit the primary port flap dampening configuration, regardless of any previous configuration.
- The Brocade device counts the number of times a port link state toggles from "up to down", and not from "down to up".
- The sampling time or window (the time during which the specified toggle threshold can occur before the wait period is activated) is triggered when the first "up to down" transition occurs.
- "Up to down" transitions include UDLD-based toggles, as well as the physical link state.

Configuring port flap dampening on an interface

This feature is configured at the interface level.

```
Brocade(config)# interface ethernet 2/1
Brocade(config-if-e10000-2/1)# link-error-disable 10 3 10
```

Syntax: [no] **link-error-disable** <toggle-threshold> <sampling-time-in-sec> <wait-time-in-sec>

The <toggle-threshold> is the number of times a port link state goes from up to down and down to up before the wait period is activated. Enter a value from 1 - 50.

The <sampling-time-in-sec> is the amount of time during which the specified toggle threshold can occur before the wait period is activated. The default is 0 seconds. Enter 1 – 65535 seconds.

The <wait-time-in-sec> is the amount of time the port remains disabled (down) before it becomes enabled. Enter a value from 0 – 65535 seconds; 0 indicates that the port will stay down until an administrative override occurs.

Configuring port flap dampening on a trunk

You can configure the port flap dampening feature on the primary port of a trunk using the **link-error-disable** command. Once configured on the primary port, the feature is enabled on all ports that are members of the trunk. You cannot configure port flap dampening on port members of the trunk.

Enter commands such as the following on the primary port of a trunk.

```
Brocade(config)# interface ethernet 2/1
Brocade(config-if-e10000-2/1)# link-error-disable 10 3 10
```

Re-enabling a port disabled by port flap dampening

A port disabled by port flap dampening is automatically re-enabled once the wait period expires; however, if the wait period is set to zero (0) seconds, you must re-enable the port by entering the following command on the disabled port.

```
Brocade(config)# interface ethernet 2/1
Brocade(config-if-e10000-2/1)# no link-error-disable 10 3 10
```

Displaying ports configured with port flap dampening

Ports that have been disabled due to the port flap dampening feature are identified in the output of the **show link-error-disable** command. The following shows an example output.

```
Brocade# show link-error-disable
Port 2/1 is forced down by link-error-disable.
```

Use the **show link-error-disable all** command to display the ports with the port flap dampening feature enabled.

For FastIron Stackable devices, the output of the command shows the following.

```
Brocade# show link-error-disable all
Port8/1 is configured for link-error-disable
      threshold:1, sampling_period:10, waiting_period:0
Port8/2 is configured for link-error-disable
      threshold:1, sampling_period:10, waiting_period:0
Port8/3 is configured for link-error-disable
      threshold:1, sampling_period:10, waiting_period:0
Port8/4 is configured for link-error-disable
      threshold:1, sampling_period:10, waiting_period:0
Port8/5 is configured for link-error-disable
      threshold:4, sampling_period:10, waiting_period:2
Port8/9 is configured for link-error-disable
      threshold:2, sampling_period:20, waiting_period:0
```

For FastIron X Series devices, the output of the command shows the following.

```
Brocade# show link-error-disable all
Port  # Threshold Sampling-Time Shutoff-Time State Counter
-----
  11           3           120           600   Idle   N/A
  12           3           120           500   Down   424
```

[Table 14](#) defines the port flap dampening statistics displayed by the **show link-error-disable all** command.

TABLE 14 Output of show link-error-disable

Column	Description
Port #	The port number.
Threshold	The number of times the port link state will go from up to down and down to up before the wait period is activated.
Sampling-Time	The number of seconds during which the specified toggle threshold can occur before the wait period is activated.
Shutoff-Time	The number of seconds the port will remain disabled (down) before it becomes enabled. A zero (0) indicates that the port will stay down until an administrative override occurs.

TABLE 14 Output of show link-error-disable (Continued)

Column	Description
State	<p>The port state can be one of the following:</p> <ul style="list-style-type: none"> • Idle – The link is normal and no link state toggles have been detected or sampled. • Down – The port is disabled because the number of sampled errors exceeded the configured threshold. • Err – The port sampled one or more errors.
Counter	<ul style="list-style-type: none"> • If the port state is Idle, this field displays N/A. • If the port state is Down, this field shows the remaining value of the shutoff timer. • If the port state is Err, this field shows the number of errors sampled.

Syntax: `show link-error-disable [all]`

Also, in FastIron X Series devices, the **show interface** command indicates if the port flap dampening feature is enabled on the port.

Example

```

Brocade# show interface ethernet 15
GigabitEthernet15 is up, line protocol is up
  Link Error Dampening is Enabled
  Hardware is GigabitEthernet, address is 00e0.5200.010e (bia 00e0.5200.010e)
  Configured speed auto, actual 1Gbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual MDIX

Brocade# show interface ethernet 17
GigabitEthernet17 is ERR-DISABLED, line protocol is down
  Link Error Dampening is Enabled
  Hardware is GigabitEthernet, address is 00e0.5200.010e (bia 00e0.5200.010e)
  Configured speed auto, actual unknown, configured duplex fdx, actual unknown

```

The line “Link Error Dampening” displays “Enabled” if port flap dampening is enabled on the port or “Disabled” if the feature is disabled on the port. The feature is enabled on the ports in the two examples above. Also, the characters “ERR-DISABLED” is displayed for the “GbpsEthernet” line if the port is disabled because of link errors.

Syntax: `show interface ethernet <port-number>`

In addition to the show commands above, the output of the **show interface brief** command for FastIron X Series indicates if a port is down due to link errors.

Example

```

Brocade# show interface brief e17

Port  Link    State    Dupl Speed Trunk Tag Priori MAC          Name
17    ERR-DIS None    None None  15    Yes level0 00e0.5200.010e

```

The ERR-DIS entry under the “Link” column indicates the port is down due to link errors.

NOTE

If a port name is longer than five characters, the port name is truncated in the output of the **show interface brief** command.

Syslog messages for port flap dampening

The following Syslog messages are generated for port flap dampening.

- If the threshold for the number of times that a port link toggles from “up” to “down” then “down” to “up” has been exceeded, the following Syslog message is displayed.

```
0d00h02m10s:I:ERR_DISABLE: Link flaps on port ethernet 16 exceeded threshold;
port in err-disable state
```
- If the wait time (port is down) expires and the port is brought up the following Syslog message is displayed.

```
0d00h02m41s:I:ERR_DISABLE: Interface ethernet 16, err-disable recovery timeout
```

Port loop detection

This feature allows the Brocade device to disable a port that is on the receiving end of a loop by sending test packets. You can configure the time period during which test packets are sent.

Types of loop detection

There are two types of loop detection; Strict Mode and Loose Mode. In Strict Mode, a port is disabled only if a packet is looped back to that same port. Strict Mode overcomes specific hardware issues where packets are echoed back to the input port. In Strict Mode, loop detection must be configured on the physical port.

In Loose Mode, loop detection is configured on the VLAN of the receiving port. Loose Mode disables the receiving port if packets originate from any port or VLAN on the same device. The VLAN of the receiving port must be configured for loop detection in order to disable the port.

Recovering disabled ports

Once a loop is detected on a port, it is placed in Err-Disable state. The port will remain disabled until one of the following occurs:

- You manually disable and enable the port at the Interface Level of the CLI.
- You enter the command **clear loop-detection**. This command clears loop detection statistics and enables all Err-Disabled ports.
- The device automatically re-enables the port. To set your device to automatically re-enable Err-Disabled ports, refer to [“Configuring the device to automatically re-enable ports”](#) on page 67.

Port loopback detection configuration notes

- Loopback detection packets are sent and received on both tagged and untagged ports. Therefore, this feature cannot be used to detect a loop across separate devices.

The following information applies to Loose Mode loop detection:

- With Loose Mode, two ports of a loop are disabled.
- Different VLANs may disable different ports. A disabled port affects every VLAN using it.
- Loose Mode floods test packets to the entire VLAN. This can impact system performance if too many VLANs are configured for Loose Mode loop detection.

NOTE

Brocade recommends that you limit the use of Loose Mode. If you have a large number of VLANs, configuring loop detection on all of them can significantly affect system performance because of the flooding of test packets to all configured VLANs. An alternative to configuring loop detection in a VLAN-group of many VLANs is to configure a separate VLAN with the same tagged port and configuration, and enable loop detection on this VLAN only.

NOTE

When loop detection is used with L2 loop prevention protocols, such as spanning tree (STP), the L2 protocol takes higher priority. Loop detection cannot send or receive probe packets if ports are blocked by L2 protocols, so it does not detect L2 loops when STP is running because loops within a VLAN have been prevented by STP. Loop detection running in Loose Mode can detect and break L3 loops because STP cannot prevent loops across different VLANs. In these instances, the ports are not blocked and loop detection is able to send out probe packets in one VLAN and receive packets in another VLAN. In this way, loop detection running in Loose Mode disables both ingress and egress ports.

Enabling loop detection

Use the **loop-detection** command to enable loop detection on a physical port (Strict Mode) or a VLAN (Loose Mode). Loop detection is disabled by default. The following example shows a Strict Mode configuration.

```
Brocade(config)# interface ethernet 1/1
Brocade(config-if-e1000-1/1)# loop-detection
```

The following example shows a Loose Mode configuration.

```
Brocade(config)# vlan20
Brocade(config-vlan-20)# loop-detection
```

By default, the port will send test packets every one second, or the number of seconds specified by the **loop-detection-interval** command. Refer to [“Configuring a global loop detection interval”](#) on page 66.

Syntax: [no] loop-detection

Use the [no] form of the command to disable loop detection.

Configuring a global loop detection interval

The loop detection interval specifies how often a test packet is sent on a port. When loop detection is enabled, the loop detection time unit is 0.1 second, with a default of 10 (one second). The range is from 1 (one tenth of a second) to 100 (10 seconds). You can use the **show loop-detection status** command to view the loop detection interval.

To configure the global loop detection interval, enter a command similar to the following.

```
Brocade(config)# loop-detection-interval 50
```

This command sets the loop-detection interval to 5 seconds (50 x 0.1).

To revert to the default global loop detection interval of 10, enter one of the following.

```
Brocade(config)# loop-detection-interval 10
```

OR

```
Brocade(config)# no loop-detection-interval 50
```

Syntax: [no] **loop-detection-interval** <number>

where <number> is a value from 1 to 100. The system multiplies your entry by 0.1 to calculate the interval at which test packets will be sent.

Configuring the device to automatically re-enable ports

To configure the Brocade device to automatically re-enable ports that were disabled because of a loop detection, enter the **errdisable recovery cause loop-detection** command.

```
Brocade(config)# errdisable recovery cause loop-detection
```

The above command will cause the Brocade device to automatically re-enable ports that were disabled because of a loop detection. By default, the device will wait 300 seconds before re-enabling the ports. You can optionally change this interval to a value from 10 to 65535 seconds. Refer to [“Specifying the recovery time interval”](#) on page 67.

Syntax: [no] **errdisable recovery cause loop-detection**

Use the [no] form of the command to disable this feature.

Specifying the recovery time interval

The recovery time interval specifies the number of seconds the Brocade device will wait before automatically re-enabling ports that were disabled because of a loop detection. (Refer to [“Configuring the device to automatically re-enable ports”](#) on page 67.) By default, the device will wait 300 seconds. To change the recovery time interval, enter a command such as the following.

```
Brocade(config)# errdisable recovery interval 120
```

The above command configures the device to wait 120 seconds (2 minutes) before re-enabling the ports.

To revert back to the default recovery time interval of 300 seconds (5 minutes), enter one of the following commands.

```
Brocade(config)# errdisable recovery interval 300
```

OR

```
Brocade(config)# no errdisable recovery interval 120
```

Syntax: [no] **errdisable recovery interval** <seconds>

where <seconds> is a number from 10 to 65535.

Clearing loop-detection

To clear loop detection statistics and re-enable all ports that are in Err-Disable state because of a loop detection, enter the **clear loop-detection** command.

```
Brocade# clear loop-detection
```

Displaying loop-detection information

Use the **show loop-detection status** command to display loop detection status, as shown.

```
Brocade# show loop-detection status
loop detection packets interval: 10 (unit 0.1 sec)
Number of err-disabled ports: 3
You can re-enable err-disable ports one by one by "disable" then "enable"
under interface config, re-enable all by "clear loop-detect", or
configure "errdisable recovery cause loop-detection" for automatic recovery
```

index	port/vlan	status	#errdis	sent-pkts	recv-pkts
1	1/13	untag, LEARNING	0	0	0
2	1/15	untag, BLOCKING	0	0	0
3	1/17	untag, DISABLED	0	0	0
4	1/18	ERR-DISABLE by itself	1	6	1
5	1/19	ERR-DISABLE by vlan 12	0	0	0
6	vlan12	2 ERR-DISABLE ports	2	24	2

If a port is errdisabled in Strict mode, it shows "ERR-DISABLE by itself". If it is errdisabled due to its associated vlan, it shows "ERR-DISABLE by vlan ?"

The following command displays the current disabled ports, including the cause and the time.

```
Brocade# show loop-detection disable
Number of err-disabled ports: 3
You can re-enable err-disable ports one by one by "disable" then "enable"
under interface config, re-enable all by "clear loop-detect", or
configure "errdisable recovery cause loop-detection" for automatic recovery
```

index	port	caused-by	disabled-time
1	1/18	itself	00:13:30
2	1/19	vlan 12	00:13:30
3	1/20	vlan 12	00:13:30

This example shows the disabled ports, the cause, and the time the port was disabled. If loop-detection is configured on a physical port, the disable cause will show "itself". For VLANs configured for loop-detection, the cause will be a VLAN.

The following command shows the hardware and software resources being used by the loop-detection feature.

```
Vlans configured loop-detection use 1 HW MAC
Vlans not configured but use HW MAC: 1 10
```

	alloc	in-use	avail	get-fail	limit	get-mem	size	init
configuration pool	16	6	10	0	3712	6	15	16
linklist pool	16	10	6	0	3712	10	16	16

Displaying loop detection resource information

Use the **show loop-detection resource** command to display the hardware and software resource information on loop detection.

```
Brocade# show loop-detection resource
Vlans configured loop-detection use 1 HW MAC
Vlans not configured but use HW MAC: 1 10
```

	alloc	in-use	avail	get-fail	limit	get-mem	size	init
configuration pool	16	6	10	0	3712	6	15	16
linklist pool	16	10	6	0	3712	10	16	16

Syntax: **show loop-detection resource**

Table 15 describes the output fields for this command.

TABLE 15 Field definitions for the **show loop-detection resource** command

Field	Description
This command displays the following information for the configuration pool and the linklist pool.	
alloc	Memory allocated
in-use	Memory in use
avail	Available memory
get-fail	The number of get requests that have failed
limit	The maximum memory allocation
get-mem	The number of get-memory requests
size	The size
init	The number of requests initiated

Displaying loop detection configuration status on an interface

Use the **show interface** command to display the status of loop detection configuration on a particular interface.

```
Brocade# show interface ethernet 2/1
10GigabitEthernet2/1 is up, line protocol is up
Hardware is 10GigabitEthernet, address is 0024.3889.1100 (bia 0024.3889.1118)
Configured speed 10Gbit, actual 10Gbit, configured duplex fdx, actual fdx
Member of 9 L2 VLANs, port is tagged, port state is FORWARDING
BPDU guard is Disabled, ROOT protect is Disabled
Link Error Dampening is Disabled
STP configured to ON, priority is level0
Loop Detection is ENABLED
Flow Control is enabled
Mirror disabled, Monitor disabled
Member of active trunk ports 2/1,2/2, primary port
Member of configured trunk ports 2/1,2/2, primary port
No port name
IPG XGMII 96 bits-time
MTU 1500 bytes, encapsulation ethernet
ICL port for BH1 in cluster id 1
300 second input rate: 2064 bits/sec, 3 packets/sec, 0.00% utilization
300 second output rate: 768 bits/sec, 1 packets/sec, 0.00% utilization
171319 packets input, 12272674 bytes, 0 no buffer
```

Basic port parameter configuration

```
Received 0 broadcasts, 63650 multicasts, 107669 unicasts  
0 input errors, 0 CRC, 0 frame, 0 ignored  
0 runts, 0 giants  
51094 packets output, 3925313 bytes, 0 underruns  
Transmitted 2 broadcasts, 42830 multicasts, 8262 unicasts  
0 output errors, 0 collisions  
Relay Agent Information option: Disabled
```

Syslog message due to disabled port in loop detection

The following message is logged when a port is disabled due to loop detection. This message also appears on the console.

```
loop-detect: port ?\?\? vlan ?, into errdisable state
```

The Errdisable function logs a message whenever it re-enables a port.

Operations, Administration, and Maintenance

Table 16 lists the individual Brocade FastIron switches and the operations, administration, and maintenance (OAM) features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 16 Supported operations, administration, and maintenance features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Flash and boot code verification	Yes	Yes	Yes	Yes	Yes
Flash image verification	Yes	Yes	Yes	Yes	Yes
Software upgrade via CLI	Yes	Yes	Yes	Yes	Yes
Software upgrade via SNMP	Yes	Yes	Yes	Yes	Yes
Hitless management: <ul style="list-style-type: none"> • Hitless switchover • Hitless failover • Hitless OS upgrade 	Yes (FSX 800 and FSX 1600 only)	No	Yes (Hitless switchover and Hitless failover only; Hitless OS upgrade is not supported) Refer to “ Hitless stacking ” on page 329		
Hitless support: <ul style="list-style-type: none"> • PBR • GRE Tunnels • IPv6 to IPv4 Tunnels 	Yes (FSX 800 and FSX 1600 only)	No	Yes (PBR only)	Yes (PBR only)	No
Boot code synchronization for active and redundant management modules	Yes	No	No	No	No
Software reboot	Yes	Yes	Yes	Yes	Yes
Show boot preference	Yes	Yes	Yes	Yes	Yes
Load and save configuration files	Yes	Yes	Yes	Yes	Yes
System reload scheduling	Yes	Yes	Yes	Yes	Yes
Diagnostic error codes and remedies for TFTP transfers	Yes	Yes	Yes	Yes	Yes
IPv4 ping	Yes	Yes	Yes	Yes	Yes
IPv4 traceroute	Yes	Yes	Yes	Yes	Yes

OAM Overview

For easy software image management, all Brocade devices support the download and upload of software images between the flash modules on the devices and a Trivial File Transfer Protocol (TFTP) server on the network.

Brocade devices have two flash memory modules:

- **Primary flash** – The default local storage device for image files and configuration files.
- **Secondary flash** – A second flash storage device. You can use the secondary flash to store redundant images for additional booting reliability or to preserve one software image while testing another one.

Only one flash device is active at a time. By default, the primary image will become active upon reload.

You can update the software contained on a flash module using TFTP to copy the update image from a TFTP server onto the flash module. In addition, you can copy software images and configuration files from a flash module to a TFTP server.

NOTE

Brocade devices are TFTP clients but not TFTP servers. You must perform the TFTP transaction from the Brocade device. You cannot “put” a file onto the Brocade device using the interface of your TFTP server.

NOTE

If you are attempting to transfer a file using TFTP but have received an error message, refer to [“Diagnostic error codes and remedies for TFTP transfers”](#) on page 93.

Software versions installed and running on a device

Use the following methods to display the software versions running on the device and the versions installed in flash memory.

Determining the flash image version running on the device

To determine the flash image version running on a device, enter the **show version** command at any level of the CLI. Some examples are shown below.

Compact devices

To determine the flash image version running on a Compact device, enter the **show version** command at any level of the CLI. The following shows an example output.

```
Brocade#show version
Copyright (c) 1996-2012 Brocade Communications Systems, Inc. All rights reserved.
  UNIT 1: compiled on Mar  2 2012 at 12:38:17 labeled as ICX64S07400
          (10360844 bytes) from Primary ICX64S07400.bin
  SW: Version 07.4.00T311
  Boot-Monitor Image size = 774980, Version:07.4.00T310 (kxz07400)
  HW: Stackable ICX6450-24
=====
UNIT 1: SL 1: ICX6450-24 24-port Management Module
      Serial #: BZS0442G00G
      License: BASE_SOFT_PACKAGE (LID: dbuFJJHiFFi)
      P-ENGINE 0: type DEF0, rev 01
=====
UNIT 1: SL 2: ICX6450-SFP-Plus 4port 40G Module
=====
      800 MHz ARM processor ARMv5TE, 400 MHz bus
      65536 KB flash memory
```

```
512 MB DRAM
STACKID 1  system uptime is 3 minutes 39 seconds
The system : started=warm start  reloaded=by "reload"
```

The version information is shown in bold type in this example:

- “03.0.00T53” indicates the flash code version number. The “T53” is used by Brocade for record keeping.
- “labeled as FER03000” indicates the flash code image label. The label indicates the image type and version and is especially useful if you change the image file name.
- “Primary fer03000.bin” indicates the flash code image file name that was loaded.

Displaying flash image version on chassis devices

To determine the flash image version running on a chassis device, enter the **show version** command at any level of the CLI. The following is an example output.

```

Brocade#show version

Active Management Module:
  660 MHz Power PC processor 8541 (version 0020/0020) 66 MHz bus

```

Software versions installed and running on a device

```
512 KB boot flash memory
16384 KB code flash memory
512 MB DRAM
Standby Management Module:
660 MHz Power PC processor 8541 (version 0020/0020) 66 MHz bus
512 KB boot flash memory
16384 KB code flash memory
512 MB DRAM
The system uptime is 1 minutes 2 seconds
The system : started=warm start    reloaded=by "reload"
```

The version information is shown in bold type in this example:

- “03.1.00aT3e3” indicates the flash code version number. The “T3e3” is used by Brocade for record keeping.
- “labeled as SXR03100a” indicates the flash code image label. The label indicates the image type and version and is especially useful if you change the image file name.
- “Primary SXR03100a.bin” indicates the flash code image file name that was loaded.

Displaying the boot image version running on the device

To determine the boot image running on a device, enter the **show flash** command at any level of the CLI. The following shows an example output.

```
Brocade#show flash
Active Management Module (Slot 9):
Compressed Pri Code size = 3613675, Version 03.1.00aT3e3 (sxr03100a.bin)
Compressed Sec Code size = 2250218, Version 03.1.00aT3e1 (sxs03100a.bin)
Compressed BootROM Code size = 524288, Version 03.0.01T3e5
Code Flash Free Space = 9699328
Standby Management Module (Slot 10):
Compressed Pri Code size = 3613675, Version 03.1.00aT3e3 (sxr03100a.bin)
Compressed Sec Code size = 2250218, Version 03.1.00aT3e1 (sxs03100a.bin)
Compressed BootROM Code size = 524288, Version 03.0.01T3e5
Code Flash Free Space = 524288
```

The boot code version is shown in bold type.

Displaying the image versions installed in flash memory

Enter the **show flash** command to display the boot and flash images installed on the device. An example of the command output is shown in [“Displaying the boot image version running on the device”](#) on page 74:

- The “Compressed Pri Code size” line lists the flash code version installed in the primary flash area.
- The “Compressed Sec Code size” line lists the flash code version installed in the secondary flash area.
- The “Boot Monitor Image size” line lists the boot code version installed in flash memory. The device does not have separate primary and secondary flash areas for the boot image. The flash memory module contains only one boot image.

NOTE

To minimize the boot-monitor image size on FastIron devices, the **ping** and **tftp** operations performed in the boot-monitor mode are restricted to copper ports on the FastIron Chassis management modules and to copper ports on the FastIron stackable switch combination copper and fiber ports. The fiber ports on these devices do not have the ability to **ping** or **tftp** from the boot-monitor mode.

Flash image verification

The Flash Image Verification feature allows you to verify boot images based on hash codes, and to generate hash codes where needed. This feature lets you select from three data integrity verification algorithms:

- **MD5** - Message Digest algorithm (RFC 1321)
- **SHA1** - US Secure Hash Algorithm (RFC 3174)
- **CRC** - Cyclic Redundancy Checksum algorithm

Flash image CLI commands

Use the following command syntax to verify the flash image:

Syntax: **verify md5 | sha1 | crc32** <ASCII string> | **primary** | **secondary** [<hash code>]

- **md5** – Generates a 16-byte hash code
- **sha1** – Generates a 20-byte hash code
- **crc32** – Generates a 4 byte checksum
- **ascii string** – A valid image filename
- **primary** – The primary boot image (primary.img)
- **secondary** – The secondary boot image (secondary.img)
- **hash code** – The hash code to verify

The following examples show how the **verify** command can be used in a variety of circumstances.

To generate an MD5 hash value for the secondary image, enter the following command.

```
Brocade#verify md5 secondary
Brocade#.....Done
Size = 2044830, MD5 01c410d6d153189a4a5d36c955653862
```

To generate a SHA-1 hash value for the secondary image, enter the following command.

```
Brocade#verify sha secondary
Brocade#.....Done
Size = 2044830, SHA1 49d12d26552072337f7f5fcaef4cf4b742a9f525
```

To generate a CRC32 hash value for the secondary image, enter the following command.

```
Brocade#verify crc32 secondary
Brocade#.....Done
Size = 2044830, CRC32 b31fcbcb0
```

To verify the hash value of a secondary image with a known value, enter the following commands.

Image file types

```
Brocade#verify md5 secondary 01c410d6d153189a4a5d36c955653861
Brocade#.....Done
Size = 2044830, MD5 01c410d6d153189a4a5d36c955653862
Verification FAILED.
```

In the previous example, the codes did not match, and verification failed. If verification succeeds, the output will look like this.

```
Brocade#verify md5 secondary 01c410d6d153189a4a5d36c955653861
Brocade#.....Done
Size = 2044830, MD5 01c410d6d153189a4a5d36c955653861
Verification SUCCEEDED.
```

The following examples show this process for SHA-1 and CRC32 algorithms.

```
Brocade#verify sha secondary 49d12d26552072337f7f5fcaef4cf4b742a9f525
Brocade#.....Done
Size = 2044830, sha 49d12d26552072337f7f5fcaef4cf4b742a9f525
Verification SUCCEEDED.
```

and

```
Brocade#verify crc32 secondary b31fcbbc0
Brocade#.....Done
Size = 2044830, CRC32 b31fcbbc0
Verification SUCCEEDED.
```

Image file types

This section lists the boot and flash image file types supported and how to install them on the FastIron family of switches. For information about a specific version of code, refer to the release notes.

TABLE 17 Software image files

Product	Boot image ¹	Flash image
FESX FSX 800 FSX 1600	sxzxxxxx.bin	SXSxxxxx.bin (Layer 2) or SXLxxxxx.bin (base Layer 3) or SXRxxxxx.bin (full Layer 3)
FWS	fgzxxxxx.bin	FGSxxxxx.bin (Layer 2) or FGLxxxxx.bin (base Layer 3) or FGRxxxxx.bin (edge Layer 3)
FCX ICX 6610	grzxxxxx.bin	FCXSxxxxx.bin (Layer 2) or FCXRxxxxx.bin (Layer 3)
ICX 6430 ICX 6450	kxz07400.bin	ICX64S07400.bin (Layer 2) or ICX64R07400.bin (Layer 3 - ICX 6450 only)

1. These images are applicable to these devices only and are not interchangeable. For example, you cannot load FCX boot or flash images on a FSX device, and vice versa.

Software upgrades

Refer to the release notes for instructions about upgrading the software.

Boot code synchronization feature

The Brocade device supports automatic synchronization of the boot image in the active and redundant management modules. When the new boot image is copied into the active module, it is automatically synchronized with the redundant management module.

NOTE

There is currently no option for manual synchronization of the boot image.

To activate the boot synchronization process, enter the following command.

```
Brocade#copy tftp flash 10.20.65.194 /GA/SXZ07200.bin bootrom
```

The system responds with the following message.

```
Brocade#Load to buffer (8192 bytes per dot)
.....Write to boot flash.....
TFTP to Flash Done.
Brocade#Synchronizing with standby module...
Boot image synchronization done.
```

Viewing the contents of flash files

The **copy flash console** command can be used to display the contents of a configuration file, backup file, or renamed file stored in flash memory. The file contents are displayed on the console when the command is entered at the CLI.

To display a list of files stored in flash memory, do one of the following:

- For devices other than FCX and ICX, enter the **dir** command at the monitor mode. To enter monitor mode from any level of the CLI, press the **Shift** and **Control+Y** keys simultaneously then press the **M** key. Enter the **dir** command to display a list of the files stored in flash memory. To exit monitor mode and return to the CLI, press **Control+Z**.
- For FCX devices, enter the **show dir** command at any level of the CLI, or enter the **dir** command at the monitor mode.
- For ICX devices, enter the **show files** command at the device configuration prompt.

The following shows an example command output.

Viewing the contents of flash files

```
Brocade#show dir
133 [38f4] boot-parameter
    0 [ffff] bootrom
    3802772 [0000] primary
    4867691 [0000] secondary
    163 [dd8e] stacking.boot
    1773 [0d2d] startup-config
    1808 [acfa] startup-config.backup
    8674340 bytes 7 File(s)
56492032 bytes free
```

Syntax: show dir

To display the contents of a flash configuration file, enter a command such as the following from the User EXEC or Privileged EXEC mode of the CLI:

```
Brocade#copy flash console startup-config.backup

!
...
some lines omitted for brevity...
```

Syntax: `copy flash console <filename>`

For `<filename>`, enter the name of a file stored in flash memory.

Using SNMP to upgrade software

You can use a third-party SNMP management application such as HP OpenView to upgrade software on a Brocade device.

NOTE

The syntax shown in this section assumes that you have installed HP OpenView in the “/usr” directory.

NOTE

Brocade recommends that you make a backup copy of the startup-config file before you upgrade the software. If you need to run an older release, you will need to use the backup copy of the startup-config file.

1. Configure a read-write community string on the Brocade device, if one is not already configured. To configure a read-write community string, enter the following command from the global CONFIG level of the CLI.

snmp-server community <string> ro | rw

where <string> is the community string and can be up to 32 characters long.

2. On the Brocade device, enter the following command from the global CONFIG level of the CLI.

no snmp-server pw-check

This command disables password checking for SNMP set requests. If a third-party SNMP management application does not add a password to the password field when it sends SNMP set requests to a Brocade device, by default the Brocade device rejects the request.

3. From the command prompt in the UNIX shell, enter the following command.

**/usr/OV/bin/snmpset -c <rw-community-string> <brcd-ip-addr> 1.3.6.1.4.1.1991.1.1.2.1.5.0
ipaddress <tftp-ip-addr> 1.3.6.1.4.1.1991.1.1.2.1.6.0 octetstringascii <file-name>
1.3.6.1.4.1.1991.1.1.2.1.7.0 integer <command-integer>**

where

<rw-community-string> is a read-write community string configured on the Brocade device.

<brcd-ip-addr> is the IP address of the Brocade device.

<tftp-ip-addr> is the TFTP server IP address.

<file-name> is the image file name.

<command-integer> is one of the following.

20 – Download the flash code into the primary flash area.

22 – Download the flash code into the secondary flash area.

Software reboot

You can use boot commands to immediately initiate software boots from a software image stored in primary or secondary flash on a Brocade device or from a BootP or TFTP server. You can test new versions of code on a Brocade device or choose the preferred boot source from the console boot prompt without requiring a system reset.

NOTE

It is very important that you verify a successful TFTP transfer of the boot code **before** you reset the system. If the boot code is not transferred successfully but you try to reset the system, the system will not have the boot code with which to successfully boot.

By default, the Brocade device first attempts to boot from the image stored in its primary flash, then its secondary flash, and then from a TFTP server. You can modify this booting sequence at the global CONFIG level of the CLI using the **boot system...** command.

To initiate an immediate boot from the CLI, enter one of the **boot system...** commands.

NOTE

When using the **boot system tftp** command, the IP address of the device and the TFTP server should be in the same subnet.

Software boot configuration notes

- In FastIron X Series devices, the **boot system tftp** command is supported on ports e 1 through e 12 only.
- If you are booting the device from a TFTP server through a fiber connection, use the following command: **boot system tftp <ip-address> <filename> fiber-port**.
- The **boot system tftp** command is not supported in a stacking environment.

Displaying the boot preference

Use the **show boot-preference** command to display the boot sequence in the startup config and running config files. The boot sequence displayed is also identified as either user-configured or the default.

The following example shows the default boot sequence preference.

```
Brocade#show boot-preference
Boot system preference (Configured):
  Use Default
Boot system preference(Default):
  Boot system flash primary
  Boot system flash secondary
```

The following example shows a user-configured boot sequence preference.

```
Brocade#show boot-preference
Boot system preference(Configured):
  Boot system flash secondary
  Boot system tftp 10.1.1.1 FGS04000b1.bin
  Boot system flash primary
```

```
Boot system preference (Default)
  Boot system flash primary
  Boot system flash secondary
```

Syntax: show boot-preference

The results of the **show run** command for the configured example above appear as follows.

```
Brocade#show run
Current Configuration:
!
ver 04.0.00x1T7e1
!
module 1 fgs-48-port-copper-base-module
module 2 fgs-xfp-1-port-10g-module
module 3 fgs-xfp-1-port-10g-module
!
alias cp=copy tf 10.1.1.1 FGS04000bl.bin pri
!
!
boot sys fl sec
boot sys df 10.1.1.1 FGS04000bl.bin
boot sys fl pri
ip address 10.1.1.4 255.255.255.0
snmp-client 10.1.1.1
!
end
```

Loading and saving configuration files

For easy configuration management, all Brocade devices support both the download and upload of configuration files between the devices and a TFTP server on the network.

You can upload either the startup configuration file or the running configuration file to the TFTP server for backup and use in booting the system:

- **Startup configuration file** – This file contains the configuration information that is currently saved in flash. To display this file, enter the **show configuration** command at any CLI prompt.
- **Running configuration file** – This file contains the configuration active in the system RAM but not yet saved to flash. These changes could represent a short-term requirement or general configuration change. To display this file, enter the **show running-config** or **write terminal** command at any CLI prompt.

Each device can have one startup configuration file and one running configuration file. The startup configuration file is shared by both flash modules. The running configuration file resides in DRAM.

When you load the startup-config file, the CLI parses the file three times.

1. During the first pass, the parser searches for **system-max** commands. A **system-max** command changes the size of statically configured memory.
2. During the second pass, the parser implements the **system-max** commands if present and also implements trunk configuration commands (**trunk** command) if present.
3. During the third pass, the parser implements the remaining commands.

Replacing the startup configuration with the running configuration

After you make configuration changes to the active system, you can save those changes by writing them to flash memory. When you write configuration changes to flash memory, you replace the startup configuration with the running configuration.

To replace the startup configuration with the running configuration, enter the following command at any Enable or CONFIG command prompt.

```
Brocade#write memory
```

Replacing the running configuration with the startup configuration

If you want to back out of the changes you have made to the running configuration and return to the startup configuration, enter the following command at the Privileged EXEC level of the CLI.

```
Brocade#reload
```

Logging changes to the startup-config file

You can configure a Brocade device to generate a Syslog message when the startup-config file is changed. The trap is enabled by default.

The following Syslog message is generated when the startup-config file is changed.

```
startup-config was changed
```

If the startup-config file was modified by a valid user, the following Syslog message is generated.

```
startup-config was changed by <username>
```

To disable or re-enable Syslog messages when the startup-config file is changed, use the following command.

Syntax: [no] logging enable config-changed

Copying a configuration file to or from a TFTP server

To copy the startup-config or running-config file to or from a TFTP server, use one of the following methods.

NOTE

For details about the **copy** and **ncopy** commands used with IPv6, refer to [“Using the IPv6 copy command”](#) on page 87 and [“IPv6 ncopy command”](#) on page 89.

NOTE

You can name the configuration file when you copy it to a TFTP server. However, when you copy a configuration file from the server to a Brocade device, the file is always copied as “startup-config” or “running-config”, depending on which type of file you saved to the server.

To initiate transfers of configuration files to or from a TFTP server using the CLI, enter one of the following commands:

- **copy startup-config tftp** <tftp-ip-addr> <filename> – Use this command to upload a copy of the startup configuration file from the Layer 2 Switch or Layer 3 Switch to a TFTP server.
- **copy running-config tftp** <tftp-ip-addr> <filename> – Use this command to upload a copy of the running configuration file from the Layer 2 Switch or Layer 3 Switch to a TFTP server.
- **copy tftp startup-config** <tftp-ip-addr> <filename> – Use this command to download a copy of the startup configuration file from a TFTP server to a Layer 2 Switch or Layer 3 Switch.

Dynamic configuration loading

You can load dynamic configuration commands (commands that do not require a reload to take effect) from a file on a TFTP server into the running-config on the Brocade device. You can make configuration changes off-line, then load the changes directly into the device running-config, without reloading the software.

Dynamic configuration usage considerations

- Use this feature only to load configuration information that does not require a software reload to take effect. For example, you cannot use this feature to change statically configured memory (**system-max** command) or to enter trunk group configuration information into the running-config.
- Do not use this feature if you have deleted a trunk group but have not yet placed the changes into effect by saving the configuration and then reloading. When you delete a trunk group, the command to configure the trunk group is removed from the device running-config, but the trunk group remains active. To finish deleting a trunk group, save the configuration (to the startup-config file), then reload the software. After you reload the software, then you can load the configuration from the file.
- Do not load port configuration information for secondary ports in a trunk group. Since all ports in a trunk group use the port configuration settings of the primary port in the group, the software cannot implement the changes to the secondary port.

Preparing the configuration file

A configuration file that you create must follow the same syntax rules as the startup-config file the device creates.

- The configuration file is a script containing CLI configuration commands. The CLI reacts to each command entered from the file in the same way the CLI reacts to the command if you enter it. For example, if the command results in an error message or a change to the CLI configuration level, the software responds by displaying the message or changing the CLI level.
- The software retains the running-config that is currently on the device, and changes the running-config only by adding new commands from the configuration file. If the running config already contains a command that is also in the configuration file you are loading, the CLI rejects the new command as a duplicate and displays an error message. For example, if the running-config already contains a command that configures ACL 1, the software rejects ACL 1 in the configuration file, and displays a message that ACL 1 is already configured.
- The file can contain global CONFIG commands or configuration commands for interfaces, routing protocols, and so on. You cannot enter User EXEC or Privileged EXEC commands.

- The default CLI configuration level in a configuration file is the global CONFIG level. Thus, the first command in the file must be a global CONFIG command or “!”. The ! (exclamation point) character means “return to the global CONFIG level”.

NOTE

You can enter text following “!” as a comment. However, the “!” is not a comment marker. It returns the CLI to the global configuration level.

NOTE

If you copy-and-paste a configuration into a management session, the CLI ignores the “!” instead of changing the CLI to the global CONFIG level. As a result, you might get different results if you copy-and-paste a configuration instead of loading the configuration using TFTP.

- Make sure you enter each command at the correct CLI level. Since some commands have identical forms at both the global CONFIG level and individual configuration levels, if the CLI response to the configuration file results in the CLI entering a configuration level you did not intend, then you can get unexpected results.

For example, if a trunk group is active on the device, and the configuration file contains a command to disable STP on one of the secondary ports in the trunk group, the CLI rejects the commands to enter the interface configuration level for the port and moves on to the next command in the file you are loading. If the next command is a spanning-tree command whose syntax is valid at the global CONFIG level as well as the interface configuration level, then the software applies the command globally. Here is an example.

The configuration file contains these commands.

```
interface ethernet 2
no spanning-tree
```

The CLI responds like this.

```
Brocade(config)#interface ethernet 2
Error - cannot configure secondary ports of a trunk
Brocade(config)#no spanning-tree
Brocade(config)#
```

- If the file contains commands that must be entered in a specific order, the commands must appear in the file in the required order. For example, if you want to use the file to replace an IP address on an interface, you must first remove the old address using “no” in front of the **ip address** command, then add the new address. Otherwise, the CLI displays an error message and does not implement the command. Here is an example.

The configuration file contains these commands.

```
interface ethernet 11
ip address 10.10.10.69/24
```

The running-config already has a command to add an address to port 11, so the CLI responds like this.

```
Brocade(config)#interface ethernet 11
Brocade(config-if-e1000-11)#ip add 10.10.10.69/24
Error: can only assign one primary ip address per subnet
Brocade(config-if-e1000-11)#
```

To successfully replace the address, enter commands into the file as follows.

```
interface ethernet 11
no ip address 20.20.20.69/24
ip address 10.10.10.69/24
```

This time, the CLI accepts the command, and no error message is displayed.

```
Brocade(config)#interface ethernet 11
Brocade(config-if-e1000-11)#no ip add 20.20.20.69/24
Brocade(config-if-e1000-11)#ip add 10.10.10.69/24
Brocade(config-if-e1000-11)
```

- Always use the **end** command at the end of the file. The **end** command must appear on the last line of the file, by itself.

Loading the configuration information into the running-config

To load the file from a TFTP server, use either of the following commands:

- **copy tftp running-config** <ip-addr> <filename>
- **ncopy tftp** <ip-addr> <filename> **running-config**

NOTE

If you are loading a configuration file that uses a truncated form of the CLI command **access-list**, the software will not go into batch mode.

For example, the following command line *will initiate* batch mode.

```
access-list 131 permit host pc1 host pc2
```

The following command line *will not* initiate batch mode.

```
acc 131 permit host pc1 host pc2
```

Maximum file sizes for startup-config file and running-config

Each Brocade device has a maximum allowable size for the running-config and the startup-config file. If you use TFTP to load additional information into a device running-config or startup-config file, it is possible to exceed the maximum allowable size. If this occurs, you will not be able to save the configuration changes.

The maximum size for the running-config and the startup-config file is 512K each.

To determine the size of a running-config or startup-config file, copy it to a TFTP server, then use the directory services on the server to list the size of the copied file. To copy the running-config or startup-config file to a TFTP server, use one of the following commands:

- Commands to copy the running-config to a TFTP server:
 - **copy running-config tftp** <ip-addr> <filename>
 - **ncopy running-config tftp** <ip-addr> <from-name>
- Commands to copy the startup-config file to a TFTP server:
 - **copy startup-config tftp** <ip-addr> <filename>
 - **ncopy startup-config tftp** <ip-addr> <from-name>

Loading and saving configuration files with IPv6

This section describes the IPv6 **copy** and **ncopy** commands.

Using the IPv6 copy command

The **copy** command for IPv6 allows you to do the following:

- Copy a file from a specified source to an IPv6 TFTP server
- Copy a file from an IPv6 TFTP server to a specified destination

Copying a file to an IPv6 TFTP server

You can copy a file from the following sources to an IPv6 TFTP server:

- Flash memory
- Running configuration
- Startup configuration

Copying a file from flash memory

For example, to copy the primary or secondary boot image from the device flash memory to an IPv6 TFTP server, enter a command such as the following.

```
Brocade#copy flash tftp 2001:7382:e0ff:7837::3 test.img secondary
```

This command copies the secondary boot image named test.img from flash memory to a TFTP server with the IPv6 address of 2001:7382:e0ff:7837::3.

Syntax: **copy flash tftp** <ipv6-address> <source-file-name> **primary** | **secondary**

The <ipv6-address> parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The <source-file-name> parameter specifies the name of the file you want to copy to the IPv6 TFTP server.

The **primary** keyword specifies the primary boot image, while the **secondary** keyword specifies the secondary boot image.

Copying a file from the running or startup configuration

For example, to copy the running configuration to an IPv6 TFTP server, enter a command such as the following.

```
Brocade#copy running-config tftp 2001:7382:e0ff:7837::3 newrun.cfg
```

This command copies the running configuration to a TFTP server with the IPv6 address of 2001:7382:e0ff:7837::3 and names the file on the TFTP server newrun.cfg.

Syntax: **copy running-config** | **startup-config tftp** <ipv6-address> <destination-file-name>

Specify the **running-config** keyword to copy the running configuration file to the specified IPv6 TFTP server.

Specify the **startup-config** keyword to copy the startup configuration file to the specified IPv6 TFTP server.

The `tftp <ipv6-address>` parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<destination-file-name>` parameter specifies the name of the file that is copied to the IPv6 TFTP server.

Copying a file from an IPv6 TFTP server

You can copy a file from an IPv6 TFTP server to the following destinations:

- Flash memory
- Running configuration
- Startup configuration

Copying a file to flash memory

For example, to copy a boot image from an IPv6 TFTP server to the primary or secondary storage location in the device flash memory, enter a command such as the following.

```
Brocade#copy tftp flash 2001:7382:e0ff:7837::3 test.img secondary
```

This command copies a boot image named `test.img` from an IPv6 TFTP server with the IPv6 address of `2001:7382:e0ff:7837::3` to the secondary storage location in the device flash memory.

Syntax: `copy tftp flash <ipv6-address> <source-file-name> primary | secondary`

The `<ipv6-address>` parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<source-file-name>` parameter specifies the name of the file you want to copy from the IPv6 TFTP server.

The **primary** keyword specifies the primary storage location in the device flash memory, while the **secondary** keyword specifies the secondary storage location in the device flash memory.

Copying a file to the running or startup configuration

For example, to copy a configuration file from an IPv6 TFTP server to the running or startup configuration, enter a command such as the following.

```
Brocade#copy tftp running-config 2001:7382:e0ff:7837::3 newrun.cfg overwrite
```

This command copies the `newrun.cfg` file from the IPv6 TFTP server and overwrites the running configuration file with the contents of `newrun.cfg`.

NOTE

To activate this configuration, you must reload (reset) the device.

Syntax: `copy tftp running-config | startup-config <ipv6-address> <source-file-name> [overwrite]`

Specify the **running-config** keyword to copy the running configuration from the specified IPv6 TFTP server.

The `<ipv6-address>` parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<source-file-name>` parameter specifies the name of the file that is copied from the IPv6 TFTP server.

The **overwrite** keyword specifies that the device should overwrite the current configuration file with the copied file. If you do not specify this parameter, the device copies the file into the current running or startup configuration but does not overwrite the current configuration.

IPv6 ncopy command

The **ncopy** command for IPv6 allows you to do the following:

- Copy a primary or secondary boot image from flash memory to an IPv6 TFTP server.
- Copy the running configuration to an IPv6 TFTP server.
- Copy the startup configuration to an IPv6 TFTP server
- Upload various files from an IPv6 TFTP server.

Copying a primary or secondary boot Image from flash memory to an IPv6 TFTP server

For example, to copy the primary or secondary boot image from the device flash memory to an IPv6 TFTP server, enter a command such as the following.

```
Brocade#ncopy flash primary tftp 2001:7382:e0ff:7837::3 primary.img
```

This command copies the primary boot image named `primary.img` from flash memory to a TFTP server with the IPv6 address of `2001:7382:e0ff:7837::3`.

Syntax: `ncopy flash primary | secondary tftp <ipv6-address> <source-file-name>`

The **primary** keyword specifies the primary boot image, while the **secondary** keyword specifies the secondary boot image.

The **tftp** `<ipv6-address>` parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<source-file-name>` parameter specifies the name of the file you want to copy from flash memory.

Copying the running or startup configuration to an IPv6 TFTP server

For example, to copy a device running or startup configuration to an IPv6 TFTP server, enter a command such as the following.

```
Brocade#ncopy running-config tftp 2001:7382:e0ff:7837::3 bakrun.cfg
```

This command copies a device running configuration to a TFTP server with the IPv6 address of `2001:7382:e0ff:7837::3` and names the destination file `bakrun.cfg`.

Syntax: `ncopy running-config | startup-config tftp <ipv6-address> <destination-file-name>`

Specify the **running-config** keyword to copy the device running configuration or the **startup-config** keyword to copy the device startup configuration.

The **tftp** *<ipv6-address>* parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The *<destination-file-name>* parameter specifies the name of the running configuration that is copied to the IPv6 TFTP server.

IPv6 TFTP server file upload

You can upload the following files from an IPv6 TFTP server:

- Primary boot image.
- Secondary boot image.
- Running configuration.
- Startup configuration.

Uploading a primary or secondary boot image from an IPv6 TFTP server

For example, to upload a primary or secondary boot image from an IPv6 TFTP server to a device flash memory, enter a command such as the following.

```
Brocade#ncopy tftp 2001:7382:e0ff:7837::3 primary.img flash primary
```

This command uploads the primary boot image named primary.img from a TFTP server with the IPv6 address of 2001:7382:e0ff:7837::3 to the device primary storage location in flash memory.

Syntax: **ncopy tftp** *<ipv6-address>* *<source-file-name>* **flash primary | secondary**

The **tftp** *<ipv6-address>* parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The *<source-file-name>* parameter specifies the name of the file you want to copy from the TFTP server.

The **primary** keyword specifies the primary location in flash memory, while the **secondary** keyword specifies the secondary location in flash memory.

Uploading a running or startup configuration from an IPv6 TFTP server

For example to upload a running or startup configuration from an IPv6 TFTP server to a device, enter a command such as the following.

```
Brocade#ncopy tftp 2001:7382:e0ff:7837::3 newrun.cfg running-config
```

This command uploads a file named newrun.cfg from a TFTP server with the IPv6 address of 2001:7382:e0ff:7837::3 to the device.

Syntax: **ncopy tftp** *<ipv6-address>* *<source-file-name>* **running-config | startup-config**

The **tftp** *<ipv6-address>* parameter specifies the address of the TFTP server. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The *<source-file-name>* parameter specifies the name of the file you want to copy from the TFTP server.

Specify the **running-config** keyword to upload the specified file from the IPv6 TFTP server to the device. The device copies the specified file into the current running configuration but does not overwrite the current configuration.

Specify the **startup-config** keyword to upload the specified file from the IPv6 TFTP server to the device. The device copies the specified file into the current startup configuration but does not overwrite the current configuration.

Using SNMP to save and load configuration information

You can use a third-party SNMP management application such as HP OpenView to save and load a configuration on a Brocade device. To save and load configuration information using HP OpenView, use the following procedure.

NOTE

The syntax shown in this section assumes that you have installed HP OpenView in the “/usr” directory.

1. Configure a read-write community string on the Brocade device, if one is not already configured. To configure a read-write community string, enter the following command from the global CONFIG level of the CLI.

snmp-server community <string> ro | rw

where <string> is the community string and can be up to 32 characters long.

2. On the Brocade device, enter the following command from the global CONFIG level of the CLI.

no snmp-server pw-check

This command disables password checking for SNMP set requests. If a third-party SNMP management application does not add a password to the password field when it sends SNMP set requests to a Brocade device, by default the Brocade device rejects the request.

3. From the command prompt in the UNIX shell, enter the following command.

```
/usr/OV/bin/snmpset -c <rw-community-string> <fdry-ip-addr> 1.3.6.1.4.1.1991.1.1.2.1.5.0
ipaddress <tftp-ip-addr> 1.3.6.1.4.1.1991.1.1.2.1.8.0 octetstringascii <config-file-name>
1.3.6.1.4.1.1991.1.1.2.1.9.0 integer <command-integer>
```

where

<rw-community-string> is a read-write community string configured on the Brocade device.

<fdry-ip-addr> is the IP address of the Brocade device.

<tftp-ip-addr> is the TFTP server IP address.

<config-file-name> is the configuration file name.

<command-integer> is one of the following:

20 – Upload the startup-config file from the flash memory of the Brocade device to the TFTP server.

21 – Download a startup-config file from a TFTP server to the flash memory of the Brocade device.

22 – Upload the running-config from the flash memory of the Brocade device to the TFTP server.

23 – Download a configuration file from a TFTP server into the running-config of the Brocade device.

NOTE

Option **23** adds configuration information to the running-config on the device, and does not replace commands. If you want to replace configuration information in the device, use “no” forms of the configuration commands to remove the configuration information, then use configuration commands to create the configuration information you want. Follow the guidelines in [“Dynamic configuration loading”](#) on page 84.

Erasing image and configuration files

To erase software images or configuration files, use the commands described below. These commands are valid at the Privileged EXEC level of the CLI:

- **erase flash primary** erases the image stored in primary flash of the system.
- **erase flash secondary** erases the image stored in secondary flash of the system.
- **erase startup-config** erases the configuration stored in the startup configuration file; however, the running configuration remains intact until system reboot.

System reload scheduling

In addition to reloading the system manually, you can configure the Brocade device to reload itself at a specific time or after a specific amount of time has passed.

NOTE

The scheduled reload feature requires the system clock. You can use a Simple Network Time Protocol (SNTP) server to set the clock or you can set the device clock manually. Refer to [“Specifying an SNTP server”](#) on page 24 or [“Setting the system clock”](#) on page 30.

Reloading at a specific time

To schedule a system reload for a specific time, use the **reload at** command. For example, to schedule a system reload from the primary flash module for 6:00:00 AM, April 1, 2003, enter the following command at the global CONFIG level of the CLI.

```
Brocade#reload at 06:00:00 04-01-03
```

Syntax: **reload at** <hh:mm:ss> <mm-dd-yy> [**primary** | **secondary**]

<hh:mm:ss> is the hours, minutes, and seconds.

<mm-dd-yy> is the month, day, and year.

primary | **secondary** specifies whether the reload is to occur from the primary code flash module or the secondary code flash module. The default is **primary**.

Reloading after a specific amount of time

To schedule a system reload to occur after a specific amount of time has passed on the system clock, use **reload after** command. For example, to schedule a system reload from the secondary flash one day and 12 hours later, enter the following command at the global CONFIG level of the CLI.

```
Brocade#reload after 01:12:00 secondary
```

Syntax: **reload after** <dd:hh:mm> [primary | secondary]

<dd:hh:mm> is the number of days, hours, and minutes.

primary | secondary specifies whether the reload is to occur from the primary code flash module or the secondary code flash module.

Displaying the amount of time remaining before a scheduled reload

To display how much time is remaining before a scheduled system reload, enter the following command from any level of the CLI.

```
Brocade#show reload
```

Canceling a scheduled reload

To cancel a scheduled system reload using the CLI, enter the following command at the global CONFIG level of the CLI.

```
Brocade#reload cancel
```

Diagnostic error codes and remedies for TFTP transfers

This section describes the error messages associated with TFTP transfer of configuration files, software images or flash images to or from a Brocade device.

Error code	Message	Explanation and action
1	Flash read preparation failed.	A flash error occurred during the download. Retry the download. If it fails again, contact customer support.
2	Flash read failed.	
3	Flash write preparation failed.	
4	Flash write failed.	
5	TFTP session timeout.	TFTP failed because of a time out. Check IP connectivity and make sure the TFTP server is running.
6	TFTP out of buffer space.	The file is larger than the amount of room on the device or TFTP server. If you are copying an image file to flash, first copy the other image to your TFTP server, then delete it from flash. (Use the erase flash... CLI command at the Privileged EXEC level to erase the image in the flash.) If you are copying a configuration file to flash, edit the file to remove unnecessary information, then try again.

Diagnostic error codes and remedies for TFTP transfers

Error code	Message	Explanation and action
7	TFTP busy, only one TFTP session can be active.	Another TFTP transfer is active on another CLI session, or Web management session, or network management system. Wait, then retry the transfer.
8	File type check failed.	You accidentally attempted to copy the incorrect image code into the system. For example, you might have tried to copy a Chassis image into a Compact device. Retry the transfer using the correct image.
16	TFTP remote - general error.	The TFTP configuration has an error. The specific error message describes the error. Correct the error, then retry the transfer.
17	TFTP remote - no such file.	
18	TFTP remote - access violation.	
19	TFTP remote - disk full.	
20	TFTP remote - illegal operation.	
21	TFTP remote - unknown transfer ID.	
22	TFTP remote - file already exists.	
23	TFTP remote - no such user.	

This section describes the error messages associated with the TFTP transfer of PoE firmware file to a Brocade device.

Message	Explanation and action
Firmware TFTP timeout.	TFTP failed because of a time out. Check IP connectivity and make sure the TFTP server is running.
Firmware is not valid for this platform.	TFTP failed because the specified file is not found on the TFTP server.
Firmware is not valid for the IEEE 802.3at (PoE-Plus) controller type.	Each PoE firmware file delivered by Brocade is meant to be used on the specific platform only. If the file is used on a platform for which it is not meant, then this error message will display. Download the correct file, then retry the transfer.
Firmware is not valid for the IEEE 802.3af PoE controller type.	
Firmware type cannot be detected from the firmware content.	Each PoE firmware file delivered by Brocade is meant to be used on the specific platform and the specific PoE controller on the specified module. If the file is used for a platform for which it is meant, but the PoE controller is not same then this error message will display. Download the correct file, then retry the transfer.
TFTP File not Valid for PoE Controller Type.	
Firmware tftp remote file access failed.	The TFTP server needs read access on the PoE firmware file. Check the permissions on the file, then try again.

Network connectivity testing

After you install the network cables, you can test network connectivity to other devices by pinging those devices. You also can observe the LEDs related to network connection and perform trace routes.

For more information about observing LEDs, refer to the *Brocade FastIron X Series Chassis Hardware Installation Guide* and the *Brocade FastIron Compact Switch Hardware Installation Guide*.

Pinging an IPv4 address

NOTE

This section describes the *IPv4 ping* command. For details about *IPv6 ping*, refer to [“Pinging an IPv6 address”](#) on page 370.

To verify that a Brocade device can reach another device through the network, enter a command such as the following at any level of the CLI on the Brocade device:

```
Brocade> ping 192.33.4.7
```

Syntax: `ping <ip addr> | <hostname> [source <ip addr>] [count <num>] [timeout <msec>] [ttl <num>] [size <byte>] [quiet] [numeric] [no-fragment] [verify] [data <1-to-4 byte hex>] [brief [max-print-per-sec <number>]]`

NOTE

If the device is a Brocade Layer 2 Switch or Layer 3 Switch, you can use the host name only if you have already enabled the Domain Name Server (DNS) resolver feature on the device from which you are sending the ping. Refer to [“IP Configuration”](#) on page 945.

The required parameter is the IP address or host name of the device.

The **source** `<ip addr>` specifies an IP address to be used as the origin of the ping packets.

The **count** `<num>` parameter specifies how many ping packets the device sends. You can specify from 1 – 4294967296. The default is 1.

The **timeout** `<msec>` parameter specifies how many milliseconds the Brocade device waits for a reply from the pinged device. You can specify a timeout from 1 – 4294967296 milliseconds. The default is 5000 (5 seconds).

The **ttl** `<num>` parameter specifies the maximum number of hops. You can specify a TTL from 1 – 255. The default is 64.

The **size** `<byte>` parameter specifies the size of the ICMP data portion of the packet. This is the payload and does not include the header. You can specify from 0 – 4000. The default is 16.

The **no-fragment** parameter turns on the “don’t fragment” bit in the IP header of the ping packet. This option is disabled by default.

The **quiet** parameter hides informational messages such as a summary of the ping parameters sent to the device and instead only displays messages indicating the success or failure of the ping. This option is disabled by default.

The **verify** parameter verifies that the data in the echo packet (the reply packet) is the same as the data in the echo request (the ping). By default the device does not verify the data.

The **data** *<1 – 4 byte hex>* parameter lets you specify a specific data pattern for the payload instead of the default data pattern, “abcd”, in the packet data payload. The pattern repeats itself throughout the ICMP message (payload) portion of the packet.

NOTE

For numeric parameter values, the CLI does not check that the value you enter is within the allowed range. Instead, if you do exceed the range for a numeric value, the software rounds the value to the nearest valid value.

The **brief** parameter causes ping test characters to be displayed. The following ping test characters are supported:

- ! Indicates that a reply was received.
- . Indicates that the network server timed out while waiting for a reply.
- U Indicates that a destination unreachable error PDU was received.
- I Indicates that the user interrupted ping.

NOTE

The number of ! characters displayed may not correspond to the number of successful replies by the **ping** command. Similarly, the number of . characters displayed may not correspond to the number of server timeouts that occurred while waiting for a reply. The "success" or "timeout" results are shown in the display as “Success rate is XX percent (X/Y)”.

The optional **max-print-per-sec** *<number>* parameter specifies the maximum number of target responses the Brocade device can display per second while in brief mode. You can specify from 0 – 2047. The default is 511.

NOTE

If you address the ping to the IP broadcast address, the device lists the first four responses to the ping.

NOTE

On 48GC modules in non-jumbo mode, the maximum size of ping packets is 1486 bytes and the maximum frame size of tagged traffic is no larger than 1581 bytes.

Tracing an IPv4 route

NOTE

This section describes the **IPv4 traceroute** command. For details about **IPv6 traceroute**, refer to [“IPv6 traceroute”](#) on page 368.

Use the **traceroute** command to determine the path through which a Brocade device can reach another device. Enter the command at any level of the CLI.

The CLI displays trace route information for each hop as soon as the information is received. Traceroute requests display all responses to a given TTL. In addition, if there are multiple equal-cost routes to the destination, the Brocade device displays up to three responses by default.

```
Brocade> traceroute 192.33.4.7
```

Syntax: **traceroute** *<host-ip-addr>* [**maxttl** *<value>*] [**minttl** *<value>*] [**numeric**] [**timeout** *<value>*] [**source-ip** *<ip-addr>*]

Possible and default values are as follows.

minttl – minimum TTL (hops) value: Possible values are 1 – 255. Default value is 1 second.

maxttl – maximum TTL (hops) value: Possible values are 1 – 255. Default value is 30 seconds.

timeout – Possible values are 1 – 120. Default value is 2 seconds.

numeric – Lets you change the display to list the devices by their IP addresses instead of their names.

source-ip <ip-addr> – Specifies an IP address to be used as the origin for the traceroute.

Hitless management on the FSX 800 and FSX 1600

Hitless management is supported on the FSX 800 and FSX 1600 chassis with dual management modules. It is a high-availability feature set that ensures no loss of data traffic during the following events:

- Management module failure or role change
- Software failure
- Addition or removal of modules
- Operating system upgrade

During such events, the standby management module takes over the active role and the system continues to forward traffic seamlessly, as if no failure or topology change has occurred. In software releases that do not support hitless management, events such as these could cause a system reboot, resulting in an impact to data traffic.

The following Hitless management features are supported:

Hitless Switchover – A manually controlled (CLI-driven) switchover of the active and standby management modules without any packet loss to the services and protocols that are supported by Hitless management. A switchover is activated by the CLI command **switch-over-active-role**.

Hitless Failover – An automatic, forced switchover of the active and standby management modules because of a failure or abnormal termination of the active management module. In the event of a failover, the active management module abruptly leaves and the standby management module immediately assumes the active role. Like a switchover, a failover occurs without any packet loss to hitless-supported services and protocols. Unlike a switchover, a failover generally happens without warning.

Hitless Operating System (OS) Upgrade – An operating system upgrade and controlled switchover without any packet loss to the services and protocols that are supported by Hitless management.

The services and protocols supported by Hitless management are listed in [Table 18](#) on page 99.

Hitless failover and hitless switchover are disabled by default. To enable these features, refer to [“Enabling hitless failover on the FSX 800 and FSX 1600”](#) on page 103 and [“Executing a hitless switchover on the FSX 800 and FSX 1600”](#) on page 104.

Benefits of hitless management

The benefits of Hitless management include the following:

- The standby management module (the module that takes over the active role) and all interface modules in the chassis are not reset
- Existing data traffic flows continue uninterrupted with no traffic loss
- Port link states remain UP for the duration of the hitless management event
- System configurations applied through Console/SNMP/HTTP interfaces remain intact
- Hitless switchover can be used by a system administrator, for example, to perform maintenance on a management module that has been functioning as the active management module. Some advantages of a hitless switchover over a hitless software reload are:
 - A manual switchover is quicker, since the standby module does not have to reboot.
 - Switched traffic through the Ethernet interfaces on the standby management module is not interrupted.

NOTE

All traffic going through Ethernet interfaces (if present) on the management modules will be interrupted during a hitless OS upgrade. This is because both management modules must be reloaded with the new image. This applies to hitless OS upgrade only. It does not apply to hitless switchover or failover, which does not interrupt traffic going through Ethernet interfaces on the standby management module (the module that takes over the active role).

Supported protocols and services for hitless management events

[Table 18](#) lists the services and protocols that are supported by Hitless management. [Table 18](#) also highlights the impact of *Hitless management events* (switchover, failover, and OS upgrade) to the system's major functions.

NOTE

Services and protocols that are not listed in [Table 18](#) may be disrupted, but will resume normal operation once the new active management module is back up and running.

TABLE 18 Hitless-supported services and protocols – FSX 800 and FSX 1600

Traffic type	Supported protocols and services	Impact
Layer 2 switched traffic, including unicast and multicast + System-level + Layer 4	<ul style="list-style-type: none"> • 802.1p and 802.1Q • 802.3ad – LACP • 802.3af – PoE • 802.3at – PoE+ • DSCP honoring and Diffserv • Dual-mode VLAN • IGMP v1, v2, and v3 snooping • IPv4 ACLs • IPv6 ACLs • Layer 2 switching (VLAN and 802.1Q-in-Q) • MLD v1 and v2 snooping • MRP • Multiple spanning tree (MSTP) • Physical port/link state • PIM SM snooping • Port mirroring and monitoring • Port trunking • Rapid spanning tree (RSTP) • Spanning tree (STP) • ToS-based QoS • Policy Based Routing • Traffic policies • UDLD • VSRP 	<p>Layer 2 switched traffic is not impacted during a Hitless management event. All existing switched traffic flows continue uninterrupted.</p> <p>New switched flows are not learned by the FastIron switch during the switchover process and are flooded to the VLAN members in hardware. After the new active management module becomes operational, new switched flows are learned and forwarded accordingly. The Layer 2 control protocol states are not interrupted during the switchover process.</p> <p>Configured ACLs, PBR or GRE & IPv6 to IPv4 Tunnels will operate in a hitless manner.</p>
Layer 3 IPv4 routed traffic	<ul style="list-style-type: none"> • BGP4 • IPv4 unicast forwarding • OSPF v2 • OSPF v2 with ECMP • Static routes • VRRP • VRRP-E • GRE • IPv6 to IPv4 Tunnels 	<p>Layer 3 routed traffic for supported protocols is not impacted during a Hitless management event.</p> <p>All existing Layer 3 IPv4 multicast flows and receivers will be interrupted. Traffic will converge to normalcy after the new active module becomes operational.</p> <p>Other Layer 3 protocols that are not supported will be interrupted during the switchover or failover.</p> <p>If BGP4 graceful restart or OSPF graceful restart is enabled, it will be gracefully restarted and traffic will converge to normalcy after the new active module becomes operational. For details about OSPF graceful restart, refer to “OSPF graceful restart” on page 1234. For details about BGP4 graceful restart, refer to “BGP4 graceful restart” on page 1347.</p> <p>Configured ACLs, PBR or GRE & IPv6 to IPv4 Tunnels will operate in a hitless manner.</p>
Management traffic	N/A	All existing management sessions (SNMP, TELNET, HTTP, HTTPS, FTP, TFTP, SSH etc.), are interrupted during the switchover or failover process. All such sessions are terminated and can be re-established after the new Active Controller takes over.

TABLE 18 Hitless-supported services and protocols – FSX 800 and FSX 1600

Traffic type	Supported protocols and services	Impact
Security	<ul style="list-style-type: none"> • 802.1X, including use with dynamic ACLs and VLANs • IPv4 ACLs • IPv6 ACLs • DHCP snooping • Dynamic ARP inspection • EAP with RADIUS • IP source guard • Multi-device port authentication, including use with dynamic ACLs and VLANs 	<p>Supported security protocols and services are not impacted during a switchover or failover.</p> <p>NOTE: If 802.1X and multi-device port authentication are enabled together on the same port, both will be impacted during a switchover or failover. Hitless support for these features applies to ports with 802.1X <i>only</i> or multi-device port authentication <i>only</i>.</p> <p>Configured ACLs will operate in a hitless manner, meaning the system will continue to permit and deny traffic during the switchover or failover process.</p>
Other services to Management	<ul style="list-style-type: none"> • AAA • DHCP • sFlow • SNMP v1, v2, and v3 • SNMP traps • SNTP • Traceroute 	<p>Supported protocols and services are not impacted during a switchover or failover.</p> <p>DNS lookups will continue after a switchover or failover. This information is not synchronized.</p> <p>Ping traffic will be minimally impacted.</p>

Hitless management configuration notes and feature limitations

The following limitations apply to hitless management support.

- All traffic going through Ethernet interfaces (if present) on the management modules will be interrupted during a hitless OS upgrade. This is because both management modules must be reloaded with the new image. This applies to hitless OS upgrade only. It does not apply to hitless switchover or failover, which does not interrupt traffic going through Ethernet interfaces on the standby management module (the module that takes over the active role).
- Static and dynamic multi-slot trunks will flap during a hitless switchover if any of the trunk port members reside on the management module.
- Layer 3 multicast traffic is not supported by Hitless management.

Hitless reload or switchover requirements and limitations

The section describes the design limitation on devices with the following configuration:

- 0-port management modules
- One or more first or second generation line cards
- One or more third generation line cards

For hitless reload or switch-over-active-role to succeed, the following requirements and limitations must be met:

- The standby management module must be up and in an "OK (Enabled)" state.
- A configuration requiring a reload must not be pending.

- A hitless-reload must not have already been issued on the previous active management module.
- POE firmware must not be in progress.
- The SXR running configuration must not be classified as too large (greater than 512KB).
- A TFTP session must not be in progress.
- An image sync session must not be in progress.
- The current active management card cannot have a memory utilization of greater than 90% of available memory.
- A line card hotswap must not be in progress.

If any of these conditions are not met, an appropriate error message is printed to the console and hitless-reload or switch-over will not succeed.

What happens during a Hitless switchover or failover

This section describes the internal events that enable a controlled or forced switchover (failover) to take place in a hitless manner, as well as the events that occur during the switchover.

Separate data and control planes

The FSX 800 and FSX 1600 management modules have separate data and control planes. The *data plane* forwards traffic between the switch fabric modules and all of the Interface modules in the chassis. The *control plane* carries traffic that is destined for the CPU of the active management module. Control plane traffic includes the following:

- Management traffic
- Control protocol traffic
- In some cases, the first packet of a data flow

During a controlled or forced switchover, the data plane is not affected. Traffic in the forwarding plane will continue to run without interruption while the standby management module takes over operation of the system. However, traffic in the control plane will be minimally impacted.

Real-time synchronization between management modules

Hitless management requires that the active and standby management modules are fully synchronized at any given point in time. This is accomplished by *baseline* and *dynamic synchronization* of the modules.

When a standby management module is inserted and becomes operational in the FSX 800 or FSX 1600 chassis, the standby module sends a baseline synchronization request to the active management module. The request prompts the active management module to copy the current state of its CPU to the standby CPU, including:

- Start-up and run-time configuration (CLI)
- Layer 2 protocols – Layer 2 protocols such as STP, RSTP, MRP, and VSRP run concurrently on both the active and standby management modules.
- Hardware Abstraction Layer (HAL) – This includes the prefix-based routing table, next hop information for outgoing interfaces, and tunnel information.

- Layer 3 IP forwarding information – This includes the routing table, IP cache table, and ARP table, as well as static and connected routes.
- Layer 3 routing protocols are not copied to the standby management module, but remain in init state on the standby module until a switchover occurs. Peer adjacency will be restored after a switchover. If BGP4 or OSPF graceful restart are enabled during a switchover, the standby management module (new active module) will initiate a graceful restart and a new set of routes will be relearned. The new set of routes will be the same as the old routes, except in the case of a network change.

As baseline synchronization is performed, the console of the active management module displays the progress of the synchronization.

```
ACTIVE: Detected Stdbby heart-beat
ACTIVE: Standby is ready for baseline synchronization.
ACTIVE: Baseline SYNC is completed. Protocol Sync is in progress.
ACTIVE: State synchronization is complete.
```

The first message indicates that the active management module has detected the standby management module. The second message indicates that the standby module has been hot-inserted and is ready for baseline synchronization. The third message is seen when baseline synchronization is completed, and the fourth message is seen when protocol synchronization is completed.

The console of the standby management module also displays the progress of the synchronization.

```
STBY: Baseline SYNC is completed. Protocol Sync is in progress.
STBY: State synchronization is complete.
```

The first message indicates that baseline synchronization is completed, and the second message indicates that protocol synchronization is completed.

When control protocols are synchronized and protocol synchronization timers expire, the standby management module will be in *hot-standby* mode, meaning the standby module is ready to take over as the active management module. In the event of a switchover, the standby module will pick up where the active module left off, without interrupting data traffic.

After baseline synchronization, any new events that occur on the active CPU will be dynamically synchronized on the standby CPU. Examples of such events include:

- CLI/HTTP/SNMP configurations
- CPU receive packets
- Link events
- Interrupts
- Layer 2 and Layer 3 forwarding table updates
- Dynamic user authentication updates such as 802.1X or multi-device port authentication

Dynamic events are synchronized in such a way that if the active CPU fails before fully executing an event, the standby CPU (newly active CPU) will execute the event after the failover. Also, if the active CPU aborts the event, the standby CPU will abort the event as well.

NOTE

Since both the standby and active management modules run the same code, a command that brings down the active management module will most likely bring down the standby management module. Because all configuration commands are synchronized from active to standby management module in real time, both management modules will reload at almost the same time. This in turn will cause the system to reset all interface modules (similar to the behavior when the **reboot** command is executed) and will cause packet loss associated with a system reboot.

NOTE

If the new active management module becomes out-of-sync with an interface module, information on the interface module can be overwritten in some cases, which can cause an interruption of traffic forwarding.

How a Hitless switchover or failover impacts system functions

For a description of the feature's impact to major system functions, refer to [Table 18](#) on page 99.

Enabling hitless failover on the FSX 800 and FSX 1600

Hitless failover is disabled by default. When disabled, the following limitations are in effect:

- If a failover occurs, the system will reload. The following message will display on the console prior to a reload.

```
STBY:- - - - Active Hitless Failover is disabled. Re-setting the system - -
```

- Manual switchover (CLI command **switch-over-active-role**) is not allowed. If this command is entered, the following message will display on the console:

```
Switch-over is not allowed. Reason: hitless-failover not configured.
```

NOTE

Hitless OS upgrade is *not* impacted by this option and is supported whether or not hitless failover is enabled.

NOTE

Synchronization between the active management module and standby management module will occur whether or not hitless failover is enabled.

To enable hitless failover, enter the following command at the Global CONFIG level of the CLI:

```
Brocade(config)#hitless-failover enable
```

The command takes effect immediately. Manual switchover is allowed, and in the event of a failover, the standby management module will take over the active role without reloading the system.

Syntax: **[no] hitless-failover enable**

Use the **no** form of the command to disable hitless failover once it has been enabled.

Executing a hitless switchover on the FSX 800 and FSX 1600

Hitless failover must be enabled before a hitless switchover can be executed. To enable hitless failover, refer to [“Enabling hitless failover on the FSX 800 and FSX 1600”](#) on page 103.

To switch over to the standby module (and thus make it the active module), enter the following command.

```
Brocade# switch-over-active-role
```

Once you enter this command, the system will prompt you as follows.

```
Are you sure? (enter 'y' or 'n'): y
Running Config data has been changed. Do you want to continue
the switch-over without saving the running config? (enter 'y' or 'n'): n
Please save the running config and try switch-over again
```

Syntax: switch-over-active role

If this command is entered when hitless failover is disabled, the following message will appear on the console:

```
Switch-over is not allowed. Reason: hitless-failover not configured.
```

Hitless OS upgrade on the FSX 800 and FSX 1600

Hitless Operating System (OS) Upgrade enables an operating system upgrade and switchover without any packet loss to the services and protocols that are supported by Hitless management.

What happens during a Hitless OS upgrade

The following steps describe the internal events that occur during a hitless OS upgrade.

1. The standby management module resets and reloads with the new software image in its flash memory.
2. The Ethernet interfaces (if present) on the standby module become operational and start carrying data traffic.
3. The active management module synchronizes the standby management module with all the information required to take over the active role.
4. The Layer 2 and Layer 3 control protocols on the standby management module converge. This process takes approximately 70 seconds.
5. The standby management module takes over the active role.
6. The old active management module resets and reloads with the same software image running on the newly active management module.
7. The FastIron switch is now operating with the new software image. The management module that was initially configured as the standby management module is now the active management module and the management module that was initially configured as the active management module is now the standby.

NOTE

The events described above occur internally and do not create or affect the external network topology.

Hitless OS upgrade considerations

Consider the following when using the hitless OS upgrade feature:

- Hitless OS upgrade allows for upgrading the software in a system between two releases of the OS that support this functionality and have compatible data structures. A hitless O/S downgrade may also be supported if the current and target code releases have compatible data structures. From time to time it may be necessary, when enhancing the software or adding new features, to change or add data structures that may cause some releases to be incompatible. In such cases, an upgrade or downgrade will not be hitless, and the software will use the regular Brocade upgrade process - relying on fast reboot.
- For a description of how this feature impacts major system functions, refer to [Table 18](#) on page 99.
- You must have both active and standby management modules installed to use this feature.
- Hitless OS upgrade is supported in software release FSX 05.0.00 or higher, with boot image FSX 05.0.00 or higher. In general, it is supported with patch upgrades, for example, when upgrading from release 07.0.01a to 07.0.01b. It is not supported during major release upgrades, for example when upgrading from release 07.0.00 to 07.1.00.
- This feature can be used to upgrade an image to a higher or lower compatible version of the software. However, if hitless upgrade to a particular software version is not supported, the software upgrade must be performed through a fast reload of the system.
- Hitless OS upgrade between different types of software images is not supported. For example, hitless OS upgrade is supported when upgrading the Layer 2 image to another Layer 2 image. It is not supported when upgrading the Layer 2 image to a Layer 3 image, or the base Layer 3 image to a full Layer 3 image, and so on.
- Hitless OS upgrade should be performed locally, since remote connectivity will be lost during the upgrade. During a reload, HTTP, SSH, Telnet, SNMP, and ping sessions will be dropped.
- The active management module switches from the initial active management module to the standby management module during the hitless upgrade process. Therefore, a connection to the console interface on both management modules is required.
- Upon being reset, any traffic going through the ports on the management module will be interrupted. Once the management module is up and running, it will be able to send and receive packets, even before the hitless upgrade process is complete.
- The running configuration is not allowed to be changed any time during the hitless upgrade process.
- System-max configuration changes require a system reload. System-max configuration changes do not take effect by the hitless upgrade. Even if a system-max parameter is changed and saved in the startup configuration, the FastIron switch will revert to the default system-max value upon a hitless software upgrade. The new system-max value will only take effect after a regular system reload.
- Other commands requiring a software reload, such as CAM mode changes, also do not take effect upon hitless upgrade and require a system reload before being placed in effect.

Hitless OS upgrade configuration steps

The following is a summary of the configuration steps for a hitless OS software upgrade.

1. Copy the software image that supports hitless software upgrade from a TFTP server to the FastIron switch. Refer to [“Loading the software onto the switch”](#).
2. Install the software image in flash memory on the active and standby management modules.
3. Enter the **hitless-reload** command on the active management module. The command triggers the events described in the section [“What happens during a Hitless OS upgrade”](#) on page 104.

Loading the software onto the switch

Hitless OS upgrade loads from the primary and secondary images on the FSX 800 and FSX 1600 Management modules. If you will be using the **hitless-reload** command to perform the hitless upgrade, you must first copy the software image that supports hitless software upgrade onto the flash memory of the active and standby management modules. For instructions, refer to the release notes.

Performing a hitless upgrade

After loading the software image onto the flash memory of the active and standby management modules, you can begin the process of performing a hitless OS upgrade using the **hitless-reload** command. For example,

```
Brocade#hitless-reload primary
```

Syntax: **hitless-reload primary | secondary**

The **primary** parameter specifies that the management module will be reloaded with the **primary** image.

The **secondary** parameter specifies that the management module will be reloaded with the **secondary** image.

NOTE

The **hitless-reload** command is accepted only when the running configuration and startup configuration files match. If the configuration file has changed, you must first save the file (**write mem**) before executing a hitless reload. Otherwise, the following message will display on the console.

```
Error: Running config and start-up config differs. Please reload the system or save the configuration before attempting hitless reload.
```

Syslog message for Hitless management events

The following Syslog message is generated as a result of a switchover or hitless OS upgrade.

```
SWITCHOVER COMPLETED - by admin - Mgmt Module in slot <slotnum> is now Active
```

The following Syslog message is generated as a result of a failover.

```
SWITCHOVER COMPLETED - by active CPU failure - Mgmt Module in slot <slotnum> is now Active
```

Displaying diagnostic information

Use the following commands to display diagnostic information for a hitless switchover or failover.

```
Brocade#show ipc

Security Access

Table 19 lists the individual Brocade FastIron switches and the security access features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 19 Supported security access features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Authentication, Authorization and Accounting (AAA):	Yes	Yes	Yes	Yes	Yes
• RADIUS					
• TACACS/TACACS+					
AAA support for console commands	Yes	No	Yes	Yes	Yes
Restricting remote access to management functions	Yes	Yes	Yes	Yes	Yes
Disabling TFTP access	Yes	No	Yes	Yes	Yes
Using ACLs to restrict remote access	Yes	Yes	Yes	Yes	Yes
Local user accounts	Yes	Yes	Yes	Yes	Yes
Local user passwords	Yes	Yes	Yes	Yes	Yes
SSL security for the Web Management Interface	Yes	Yes	Yes	Yes	Yes
AAA authentication-method lists	Yes	Yes	Yes	Yes	Yes
Packet filtering on TCP flags	No	Yes	Yes	Yes	Yes

This chapter explains how to secure access to management functions on a Brocade device.

NOTE

For all Brocade devices, RADIUS Challenge is supported for 802.1x authentication but not for login authentication. Also, multiple challenges are supported for TACACS+ login authentication.

Securing access methods

The following table lists the management access methods available on a Brocade device, how they are secured by default, and the ways in which they can be secured.

TABLE 20 Ways to secure management access to Brocade devices

Access method	How the access method is secured by default	Ways to secure the access method	See page
Serial access to the CLI	Not secured	Establish passwords for management privilege levels	page 125
Access to the Privileged EXEC and CONFIG levels of the CLI	Not secured	Establish a password for Telnet access to the CLI	page 124
		Establish passwords for management privilege levels	page 125
		Set up local user accounts	page 129
		Configure TACACS/TACACS+ security	page 139
		Configure RADIUS security	page 157
Telnet access	Not secured	Regulate Telnet access using ACLs	page 113
		Allow Telnet access only from specific IP addresses	page 116
		Restrict Telnet access based on a client MAC address	page 117
		Allow Telnet access only from specific MAC addresses	page 119
		Define the Telnet idle time	page 118
		Change the Telnet login timeout period	page 118
		Specify the maximum number of login attempts for Telnet access	page 118
		Disable Telnet access	page 123
		Establish a password for Telnet access	page 124
		Establish passwords for privilege levels of the CLI	page 125
		Set up local user accounts	page 129
		Configure TACACS/TACACS+ security	page 139
		Configure RADIUS security	page 157

TABLE 20 Ways to secure management access to Brocade devices (Continued)

Access method	How the access method is secured by default	Ways to secure the access method	See page
Secure Shell (SSH) access	Not configured	Configure SSH	page 1419
		Regulate SSH access using ACLs	page 113
		Allow SSH access only from specific IP addresses	page 116
		Allow SSH access only from specific MAC addresses	page 117
		Establish passwords for privilege levels of the CLI	page 125
		Set up local user accounts	page 129
		Configure TACACS/TACACS+ security	page 139
		Configure RADIUS security	page 157
Web management access	SNMP read or read-write community strings	Regulate Web management access using ACLs	page 114
		Allow Web management access only from specific IP addresses	page 116
		Allow Web management access only to clients connected to a specific VLAN	page 119
		Disable Web management access	page 123
		Configure SSL security for the Web Management Interface	page 136
		Set up local user accounts	page 129
		Establish SNMP read or read-write community strings for SNMP versions 1 and 2	page 421
		Establishing user groups for SNMP version 3	page 427
		Configure TACACS/TACACS+ security	page 139
		Configure RADIUS security	page 157
SNMP access	SNMP read or read-write community strings and the password to the Super User privilege level NOTE: SNMP read or read-write community strings are always required for SNMP access to the device.	Regulate SNMP access using ACLs	page 114
		Allow SNMP access only from specific IP addresses	page 116
		Disable SNMP access	page 124
		Allow SNMP access only to clients connected to a specific VLAN	page 119
		Establish passwords to management levels of the CLI	page 125
		Set up local user accounts	page 129
		Establish SNMP read or read-write community strings	page 139

TABLE 20 Ways to secure management access to Brocade devices (Continued)

Access method	How the access method is secured by default	Ways to secure the access method	See page
TFTP access	Not secured	Allow TFTP access only to clients connected to a specific VLAN	page 120
		Disable TFTP access	page 124
Access for Stacked Devices	Access to multiple consoles must be secured after AAA is enabled	Extra steps must be taken to secure multiple consoles in an IronStack.	page 140

Remote access to management function restrictions

You can restrict access to management functions from remote sources, including Telnet, the Web Management Interface, and SNMP. The following methods for restricting remote access are supported:

- Using ACLs to restrict Telnet, Web Management Interface, or SNMP access
- Allowing remote access only from specific IP addresses
- Allowing Telnet and SSH access only from specific MAC addresses
- Allowing remote access only to clients connected to a specific VLAN
- Specifically disabling Telnet, Web Management Interface, or SNMP access to the device

The following sections describe how to restrict remote access to a Brocade device using these methods.

ACL usage to restrict remote access

You can use standard ACLs to control the following access methods to management functions on a Brocade device:

- Telnet
- SSH
- Web management
- SNMP

Consider the following to configure access control for these management access methods.

1. Configure an ACL with the IP addresses you want to allow to access the device.
2. Configure a Telnet access group, SSH access group, Web access group, and SNMP community strings. Each of these configuration items accepts an ACL as a parameter. The ACL contains entries that identify the IP addresses that can use the access method.

The following sections present examples of how to secure management access using ACLs. Refer to [Chapter 40, “Rule-Based IP ACLs”](#) for more information on configuring ACLs.

Using an ACL to restrict Telnet access

To configure an ACL that restricts Telnet access to the device, enter commands such as the following.

```
Brocade(config)#access-list 10 deny host 209.157.22.32 log
Brocade(config)#access-list 10 deny 209.157.23.0 0.0.0.255 log
Brocade(config)#access-list 10 deny 209.157.24.0 0.0.0.255 log
Brocade(config)#access-list 10 deny 209.157.25.0/24 log
Brocade(config)#access-list 10 permit any
Brocade(config)#telnet access-group 10
Brocade(config)#write memory
```

Syntax: `telnet access-group <num>`

The `<num>` parameter specifies the number of a standard ACL and must be from 1 – 99.

The commands above configure ACL 10, then apply the ACL as the access list for Telnet access. The device allows Telnet access to all IP addresses except those listed in ACL 10.

To configure a more restrictive ACL, create permit entries and omit the **permit any** entry at the end of the ACL.

Example

```
Brocade(config)#access-list 10 permit host 209.157.22.32
Brocade(config)#access-list 10 permit 209.157.23.0 0.0.0.255
Brocade(config)#access-list 10 permit 209.157.24.0 0.0.0.255
Brocade(config)#access-list 10 permit 209.157.25.0/24
Brocade(config)#telnet access-group 10
Brocade(config)#write memory
```

The ACL in this example permits Telnet access only to the IP addresses in the **permit** entries and denies Telnet access from all other IP addresses.

Using an ACL to restrict SSH access

To configure an ACL that restricts SSH access to the device, enter commands such as the following.

```
Brocade(config)#access-list 12 deny host 209.157.22.98 log
Brocade(config)#access-list 12 deny 209.157.23.0 0.0.0.255 log
Brocade(config)#access-list 12 deny 209.157.24.0/24 log
Brocade(config)#access-list 12 permit any
Brocade(config)#ssh access-group 12
Brocade(config)#write memory
```

Syntax: `ssh access-group <num>`

The `<num>` parameter specifies the number of a standard ACL and must be from 1 – 99.

These commands configure ACL 12, then apply the ACL as the access list for SSH access. The device denies SSH access from the IP addresses listed in ACL 12 and permits SSH access from all other IP addresses. Without the last ACL entry for permitting all packets, this ACL would deny SSH access from all IP addresses.

NOTE

In this example, the command **ssh access-group 10** could have been used to apply the ACL configured in the example for Telnet access. You can use the same ACL multiple times.

Using an ACL to restrict Web management access

To configure an ACL that restricts Web management access to the device, enter commands such as the following.

```
Brocade(config)#access-list 12 deny host 209.157.22.98 log
Brocade(config)#access-list 12 deny 209.157.23.0 0.0.0.255 log
Brocade(config)#access-list 12 deny 209.157.24.0/24 log
Brocade(config)#access-list 12 permit any
Brocade(config)#web access-group 12
Brocade(config)#write memory
```

Syntax: `web access-group <num>`

The `<num>` parameter specifies the number of a standard ACL and must be from 1 – 99.

These commands configure ACL 12, then apply the ACL as the access list for Web management access. The device denies Web management access from the IP addresses listed in ACL 12 and permits Web management access from all other IP addresses. Without the last ACL entry for permitting all packets, this ACL would deny Web management access from all IP addresses.

Using ACLs to restrict SNMP access

To restrict SNMP access to the device using ACLs, enter commands such as the following.

NOTE

The syntax for using ACLs for SNMP access is different from the syntax for controlling Telnet, SSH, and Web management access using ACLs.

```
Brocade(config)#access-list 25 deny host 209.157.22.98 log
Brocade(config)#access-list 25 deny 209.157.23.0 0.0.0.255 log
Brocade(config)#access-list 25 deny 209.157.24.0 0.0.0.255 log
Brocade(config)#access-list 25 permit any
Brocade(config)#access-list 30 deny 209.157.25.0 0.0.0.255 log
Brocade(config)#access-list 30 deny 209.157.26.0/24 log
Brocade(config)#access-list 30 permit any
Brocade(config)#snmp-server community public ro 25
Brocade(config)#snmp-server community private rw 30
Brocade(config)#write memory
```

Syntax: `snmp-server community <string> ro | rw <num>`

The `<string>` parameter specifies the SNMP community string the user must enter to gain SNMP access.

The `ro` parameter indicates that the community string is for read-only (“get”) access. The `rw` parameter indicates the community string is for read-write (“set”) access.

The `<num>` parameter specifies the number of a standard ACL and must be from 1 – 99.

These commands configure ACLs 25 and 30, then apply the ACLs to community strings.

ACL 25 is used to control read-only access using the “public” community string. ACL 30 is used to control read-write access using the “private” community string.

NOTE

When **snmp-server community** is configured, all incoming SNMP packets are validated first by their community strings and then by their bound ACLs.

Defining the console idle time

By default, a Brocade device does not time out serial console sessions. A serial session remains open indefinitely until you close it. You can however define how many minutes a serial management session can remain idle before it is timed out.

NOTE

You must enable AAA support for console commands, AAA authentication, and Exec authorization in order to set the console idle time.

To configure the idle time for a serial console session, use the following command.

```
Brocade(config)#console timeout 120
```

Syntax: [no] console timeout <0 – 240>

Possible values: 0 – 240 minutes

Default value: 0 minutes (no timeout)

NOTE

In RADIUS, the standard attribute Idle-Timeout is used to define the console session timeout value. The attribute Idle-Timeout value is specified in seconds. Within the switch, it is truncated to the nearest minute, because the switch configuration is defined in minutes.

Remote access restrictions

By default, a Brocade device does not control remote management access based on the IP address of the managing device. You can restrict remote management access to a single IP address for the following access methods:

- Telnet access
- SSH access
- Web management access
- SNMP access

In addition, you can restrict all access methods to the same IP address using a single command.

The following examples show the CLI commands for restricting remote access. You can specify only one IP address with each command. However, you can enter each command ten times to specify up to ten IP addresses.

NOTE

You cannot restrict remote management access using the Web Management Interface.

Restricting Telnet access to a specific IP address

To allow Telnet access to the Brocade device only to the host with IP address 209.157.22.39, enter the following command.

```
Brocade(config)#telnet-client 209.157.22.39
```

Syntax: [no] telnet-client <ip-addr> | <ipv6-addr>

Restricting SSH access to a specific IP address

To allow SSH access to the Brocade device only to the host with IP address 209.157.22.39, enter the following command.

```
Brocade(config)#ip ssh client 209.157.22.39
```

Syntax: [no] ip ssh client <ip-addr> | <ipv6-addr>

Restricting Web management access to a specific IP address

To allow Web management access to the Brocade device only to the host with IP address 209.157.22.26, enter the following command.

```
Brocade(config)#web-client 209.157.22.26
```

Syntax: [no] web-client <ip-addr> | <ipv6-addr>

Restricting SNMP access to a specific IP address

To allow SNMP access only to the host with IP address 209.157.22.14, enter the following command.

```
Brocade(config)#snmp-client 209.157.22.14
```

Syntax: [no] snmp-client <ip-addr> | <ipv6-addr>

Restricting all remote management access to a specific IP address

To allow Telnet, Web, and SNMP management access to the Brocade device only to the host with IP address 209.157.22.69, enter three separate commands (one for each access type) or enter the following command.

```
Brocade(config)#all-client 209.157.22.69
```

Syntax: [no] all-client <ip-addr> | <ipv6-addr>

Restricting access to the device based on IP or MAC address

You can restrict remote management access to the Brocade device, using Telnet, SSH, HTTP, and HTTPS, based on the connecting client IP or MAC address.

Restricting Telnet connection

You can restrict Telnet connection to a device based on the client IP address or MAC address.

To allow Telnet access to the Brocade device only to the host with IP address 209.157.22.39 **and** MAC address 0007.e90f.e9a0, enter the following command.

```
Brocade(config)#telnet client 209.157.22.39 0007.e90f.e9a0
```

Syntax: [no] telnet client <ip-addr> | <ipv6-addr> <mac-addr>

NOTE

For FCX devices, this feature applies only to IPv4 clients.

The following command allows Telnet access to the Brocade device to a host with any IP address and MAC address 0007.e90f.e9a0.

```
Brocade(config)#telnet client any 0007.e90f.e9a0
```

Syntax: [no] telnet client any <mac-addr>

Restricting SSH connection

You can restrict SSH connection to a device based on the client IP address or MAC address.

To allow SSH access to the Brocade device only to the host with IP address 209.157.22.39 **and** MAC address 0007.e90f.e9a0, enter the following command.

```
Brocade(config)#ip ssh client 209.157.22.39 0007.e90f.e9a0
```

Syntax: [no] ip ssh client <ip-addr> | <ipv6-addr> <mac-addr>

To allow SSH access to the Brocade device to a host with any IP address and MAC address 0007.e90f.e9a0, enter the following command.

```
Brocade(config)#ip ssh client any 0007.e90f.e9a0
```

Syntax: [no] ip ssh client any <mac-addr>

Restricting HTTP and HTTPS connection

You can restrict an HTTP or HTTPS connection to a device based on the client IP address or MAC address.

To allow HTTP and HTTPS access to the Brocade device only to the host with IP address 209.157.22.40 **and** MAC address 0007.e90f.ab1c, enter the following command.

```
Brocade(config)#web client 209.157.22.40 0007.e90f.ab1c
```

Syntax: [no] web client <ip-addr> | <ipv6-addr> <mac-addr>

The following command allows HTTP and HTTPS access to the Brocade device to a host with any IP address and MAC address 0007.e90f.10ba.

```
Brocade(config)#web client any 0007.e90f.10ba
```

Syntax: [no] web client any <mac-addr>

Defining the Telnet idle time

You can define how many minutes a Telnet session can remain idle before it is timed out. An idle Telnet session is a session that is still sending TCP ACKs in response to keepalive messages from the device, but is not being used to send data.

To configure the idle time for a Telnet session, use the following command.

```
Brocade(config)#telnet timeout 120
```

Syntax: [no] telnet timeout <minutes>

For <minutes> enter a value from 0 – 240. The default value is 0 minutes (no timeout).

Changing the login timeout period for Telnet sessions

By default, the login timeout period for a Telnet session is 1 minute. To change the login timeout period, use the following command.

```
Brocade(config)#telnet login-timeout 5
```

Syntax: [no] telnet login-timeout <minutes>

For <minutes>, enter a value from 1 to 10. The default timeout period is 1 minute.

Specifying the maximum number of login attempts for Telnet access

If you are connecting to the Brocade device using Telnet, the device prompts you for a username and password. By default, you have up to 4 chances to enter a correct username and password. If you do not enter a correct username or password after 4 attempts, the Brocade device disconnects the Telnet session.

You can specify the number of attempts a Telnet user has to enter a correct username and password before the device disconnects the Telnet session. For example, to allow a Telnet user up to 5 chances to enter a correct username and password, enter the following command.

```
Brocade(config)#telnet login-retries 5
```

Syntax: [no] telnet login-retries <number>

You can specify from 0 – 5 attempts. The default is 4 attempts.

Changing the login timeout period for Telnet sessions

To change the login timeout period for Telnet sessions to 5 minutes, enter the following command:

```
Brocade(config)# telnet login-timeout 5
```

Syntax: [no] telnet login-timeout <minutes>

For <minutes>, specify a value from 1 – 10. The default is 2 minutes.

Restricting remote access to the device to specific VLAN IDs

You can restrict management access to a Brocade device to ports within a specific port-based VLAN. VLAN-based access control applies to the following access methods:

- Telnet access
- Web management access
- SNMP access
- TFTP access

By default, access is allowed for all the methods listed above on all ports. Once you configure security for a given access method based on VLAN ID, access to the device using that method is restricted to only the ports within the specified VLAN.

VLAN-based access control works in conjunction with other access control methods. For example, suppose you configure an ACL to permit Telnet access only to specific client IP addresses, and you also configure VLAN-based access control for Telnet access. In this case, the only Telnet clients that can access the device are clients that have one of the IP addresses permitted by the ACL **and** are connected to a port that is in a permitted VLAN. Clients who have a permitted IP address but are connected to a port in a VLAN that is not permitted still cannot access the device through Telnet.

Restricting Telnet access to a specific VLAN

To allow Telnet access only to clients in a specific VLAN, enter a command such as the following.

```
Brocade(config)#telnet server enable vlan 10
```

The command in this example configures the device to allow Telnet management access only to clients connected to ports within port-based VLAN 10. Clients connected to ports that are not in VLAN 10 are denied management access.

Syntax: [no] telnet server enable vlan <vlan-id>

Restricting Web management access to a specific VLAN

To allow Web management access only to clients in a specific VLAN, enter a command such as the following.

```
Brocade(config)#web-management enable vlan 10
```

The command in this example configures the device to allow Web management access only to clients connected to ports within port-based VLAN 10. Clients connected to ports that are not in VLAN 10 are denied management access.

Syntax: [no] web-management enable vlan <vlan-id>

Restricting SNMP access to a specific VLAN

To allow SNMP access only to clients in a specific VLAN, enter a command such as the following.

```
Brocade(config)#snmp-server enable vlan 40
```

The command in this example configures the device to allow SNMP access only to clients connected to ports within port-based VLAN 40. Clients connected to ports that are not in VLAN 40 are denied access.

Syntax: [no] snmp-server enable vlan <vlan-id>

Restricting TFTP access to a specific VLAN

To allow TFTP access only to clients in a specific VLAN, enter a command such as the following.

```
Brocade(config)#tftp client enable vlan 40
```

The command in this example configures the device to allow TFTP access only to clients connected to ports within port-based VLAN 40. Clients connected to ports that are not in VLAN 40 are denied access.

Syntax: [no] tftp client enable vlan <vlan-id>

Designated VLAN for Telnet management sessions to a Layer 2 Switch

All Brocade FastIron devices support the creation of management VLANs. By default, the management IP address you configure on a Layer 2 Switch applies globally to all the ports on the device. This is true even if you divide the device ports into multiple port-based VLANs.

If you want to restrict the IP management address to a specific port-based VLAN, you can make that VLAN the designated management VLAN for the device. When you configure a VLAN to be the designated management VLAN, the management IP address you configure on the device is associated only with the ports in the designated VLAN. To establish a Telnet management session with the device, a user must access the device through one of the ports in the designated VLAN.

You also can configure up to five default gateways for the designated VLAN, and associate a metric with each one. The software uses the gateway with the lowest metric. The other gateways reside in the configuration but are not used. To use one of the other gateways, modify the configuration so that the gateway you want to use has the lowest metric.

If more than one gateway has the lowest metric, the gateway that appears first in the running-config is used.

NOTE

If you have already configured a default gateway globally and you do not configure a gateway in the VLAN, the software uses the globally configured gateway and gives the gateway a metric value of 1.

To configure a designated management VLAN, enter commands such as the following.

```
Brocade(config)#vlan 10 by port
Brocade(config-vlan-10)#untag ethernet 1/1 to 1/4
Brocade(config-vlan-10)#management-vlan
Brocade(config-vlan-10)#default-gateway 10.10.10.1 1
Brocade(config-vlan-10)#default-gateway 20.20.20.1 2
```

These commands configure port-based VLAN 10 to consist of ports 1/1 – 1/4 and to be the designated management VLAN. The last two commands configure default gateways for the VLAN. Since the 10.10.10.1 gateway has a lower metric, the software uses this gateway. The other gateway remains in the configuration but is not used. You can use the other one by changing the metrics so that the 20.20.20.1 gateway has the lower metric.

Syntax: `[no] default-gateway <ip-addr> <metric>`

The `<ip-addr>` parameters specify the IP address of the gateway router.

The `<metric>` parameter specifies the metric (cost) of the gateway. You can specify a value from 1 – 5. There is no default. The software uses the gateway with the lowest metric.

Device management security

By default, all management access is disabled. Each of the following management access methods must be specifically enabled as required in your installation:

- SSHv2
- SNMP
- Web management through HTTP
- Web management through HTTPS

The commands for granting access to each of these management interfaces is described in the following.

Allowing SSHv2 access to the Brocade device

To allow SSHv2 access to the Brocade device, you must generate a Crypto Key as shown in the following command.

```
Brocade(config)#crypto key generate
```

Syntax: `crypto key [generate | zeroize]`

The **generate** parameter generates a dsa key pair.

The **zeroize** parameter deletes the currently operative dsa key pair.

In addition, you must use AAA authentication to create a password to allow SSHv2 access. For example the following command configures AAA authentication to use TACACS+ for authentication as the default or local if TACACS+ is not available.

```
Brocade(config)#aaa authentication login default tacacs+ local
```

Allowing SNMP access to the Brocade device

To allow SNMP access to the Brocade device, enter the following command.

```
Brocade(config)#snmp-server
```

Syntax: `[no] snmp-server`

Allowing Web management through HTTP for the Brocade device

To allow web management through HTTP for the Brocade device, you enable web management as shown in the following command.

```
Brocade(config)#web-management http
```

Syntax: [no] web-management http | https

When using the web-management command, specify the **http** or **https** parameters.

The **http** parameter specifies that web management is enabled for HTTP access.

The **https** parameter specifies that web management is enabled for HTTPS access.

Allowing Web management through HTTPS

To allow web management through HTTPS, you must enable web management as shown in [“Allowing Web management through HTTP for the Brocade device”](#). Additionally, you must generate a crypto SSL certificate or import digital certificates issued by a third-party Certificate Authority (CA).

To generate a crypto SSL certificate use the following command.

```
Brocade(config)#crypto-ssl certificate generate
```

Syntax: crypto-ssl certificate [generate | zeroize]

Using the web-management command without the http or https option makes web management available for both.

The **generate** parameter generates an ssl certificate.

The **zeroize** parameter deletes the currently operative ssl certificate.

To import a digital certificate issued by a third-party Certificate Authority (CA) and save it in the flash memory, use the following command.

```
Brocade(config)#ip ssl certificate-data-file tftp 10.10.10.1 cacert.pem
```

Syntax: ip ssl certificate-data-file tftp <ip-addr> <file-name>

The <ip-addr> variable is the IP address of the TFTP server from which the digital certificate file is being downloaded.

The <file-name> variable is the file name of the digital certificate that you are importing to the router.

Disabling specific access methods

You can specifically disable the following access methods:

- Telnet access
- Web management access
- SNMP access
- TFTP

NOTE

If you disable Telnet access, you will not be able to access the CLI except through a serial connection to the management module. If you disable SNMP access, you will not be able to use an SNMP-based management applications.

Disabling Telnet access

You can use a Telnet client to access the CLI on the device over the network. If you do not plan to use the CLI over the network and want to disable Telnet access to prevent others from establishing CLI sessions with the device, enter the following command.

```
Brocade(config)#no telnet server
```

To re-enable Telnet operation, enter the following command.

```
Brocade(config)#telnet server
```

Syntax: [no] telnet server

Disabling Web management access

If you want to prevent access to the device through the Web Management Interface, you can disable the Web Management Interface.

NOTE

As soon as you make this change, the device stops responding to Web management sessions. If you make this change using your Web browser, your browser can contact the device, but the device will not reply once the change takes place.

To disable the Web Management Interface, enter the following command.

```
Brocade(config)#no web-management
```

Syntax: [no] web-management [http | https]

Use the **no web-management** command with no option specified to disable both web management through http access and web management through https access.

Use the command **no web-management http** to disable only web management through http access.

Use the command **no web-management https** to disable only web management through https access.

Disabling Web management access by HP ProCurve Manager

By default, TCP ports 80 and 280 are enabled on the Brocade device. TCP port 80 (HTTP) allows access to the device Web Management Interface. TCP port 280 allows access to the device by HP ProCurve Manager.

The **no web-management** command disables both TCP ports. However, if you want to disable only port 280 and leave port 80 enabled, use the **hp-top-tools** option with the command. Here is an example.

```
Brocade(config)#no web-management hp-top-tools
```

Syntax: [no] web-management [allow-no-password | enable [vlan <vlan-id>] | front-panel | hp-top-tools | list-menu]

The **hp-top-tools** parameter disables TCP port 280.

Disabling SNMP access

To disable SNMP management of the device.

```
Brocade(config)#no snmp-server
```

To later re-enable SNMP management of the device.

```
Brocade(config)#snmp-server
```

Syntax: no snmp-server

Disabling TFTP access

You can globally disable TFTP to block TFTP client access. By default, TFTP client access is enabled.

To disable TFTP client access, enter the following command at the Global CONFIG level of the CLI.

```
Brocade(config)#tftp disable
```

When TFTP is disabled, users are prohibited from using the **copy tftp** command to copy files to the system flash. If users enter this command while TFTP is disabled, the system will reject the command and display an error message.

To re-enable TFTP client access once it is disabled, enter the following command.

```
Brocade(config)#no tftp disable
```

Syntax: [no] tftp disable

Passwords used to secure access

Passwords can be used to secure the following access methods:

- Telnet access can be secured by setting a Telnet password. Refer to [“Setting a Telnet password”](#) on page 124.
- Access to the Privileged EXEC and CONFIG levels of the CLI can be secured by setting passwords for management privilege levels. Refer to [“Setting passwords for management privilege levels”](#) on page 125.

This section also provides procedures for enhancing management privilege levels, recovering from a lost password, and disabling password encryption.

NOTE

You also can configure up to 16 user accounts consisting of a user name and password, and assign each user account a management privilege level. Refer to [“Local user accounts”](#) on page 129.

Setting a Telnet password

By default, the device does not require a user name or password when you log in to the CLI using Telnet. You can assign a password for Telnet access using one of the following methods.

Set the password “letmein” for Telnet access to the CLI using the following command at the global CONFIG level.

```
Brocade(config)#enable telnet password letmein
```

Syntax: [no] enable telnet password <string>

Suppressing Telnet connection rejection messages

By default, if a Brocade device denies Telnet management access to the device, the software sends a message to the denied Telnet client. You can optionally suppress the rejection message. When you enable the option, a denied Telnet client does not receive a message from the Brocade device. Instead, the denied client simply does not gain access.

To suppress the connection rejection message, use the following CLI method.

To suppress the connection rejection message sent by the device to a denied Telnet client, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)#telnet server suppress-reject-message
```

Syntax: [no] telnet server suppress-reject-message

Setting passwords for management privilege levels

You can set one password for each of the following management privilege levels:

- **Super User level** – Allows complete read-and-write access to the system. This is generally for system administrators and is the only management privilege level that allows you to configure passwords.
- **Port Configuration level** – Allows read-and-write access for specific ports but not for global (system-wide) parameters.
- **Read Only level** – Allows access to the Privileged EXEC mode and User EXEC mode of the CLI but only with read access.

You can assign a password to each management privilege level. You also can configure up to 16 user accounts consisting of a user name and password, and assign each user account to one of the three privilege levels. Refer to [“Local user accounts”](#) on page 129.

NOTE

You must use the CLI to assign a password for management privilege levels. You cannot assign a password using the Web Management Interface.

If you configure user accounts in addition to privilege level passwords, the device will validate a user access attempt using one or both methods (local user account or privilege level password), depending on the order you specify in the authentication-method lists. Refer to [“Authentication-method lists”](#) on page 174.

Follow the steps given below to set passwords for management privilege levels.

1. At the opening CLI prompt, enter the following command to change to the Privileged level of the EXEC mode.

```
Brocade> enable
Brocade#
```

2. Access the CONFIG level of the CLI by entering the following command.

```
Brocade#configure terminal
Brocade(config)#
```

3. Enter the following command to set the Super User level password.

```
Brocade(config)#enable super-user-password <text>
```

NOTE

You must set the Super User level password before you can set other types of passwords. The Super User level password can be an alphanumeric string, but cannot begin with a number.

4. Enter the following commands to set the Port Configuration level and Read Only level passwords.

```
Brocade(config)#enable port-config-password <text>
Brocade(config)#enable read-only-password <text>
```

Syntax: enable super-user-password <text>

Syntax: enable port-config-password <text>

Syntax: enable read-only-password <text>

NOTE

If you forget your Super User level password, refer to [“Recovering from a lost password”](#) on page 127.

Augmenting management privilege levels

Each management privilege level provides access to specific areas of the CLI by default:

- Super User level provides access to all commands and displays.
- Port Configuration level gives access to:
 - The User EXEC and Privileged EXEC levels
 - The port-specific parts of the CONFIG level
 - All interface configuration levels
- Read Only level gives access to:
 - The User EXEC and Privileged EXEC levels

You can grant additional access to a privilege level on an individual command basis. To grant the additional access, you specify the privilege level you are enhancing, the CLI level that contains the command, and the individual command.

NOTE

This feature applies only to management privilege levels on the CLI. You cannot augment management access levels for the Web Management Interface.

Enhance the Port Configuration privilege level so users also can enter IP commands at the global CONFIG level.

```
Brocade(config)#privilege configure level 4 ip
```

In this command, **configure** specifies that the enhanced access is for a command at the global CONFIG level of the CLI. The **level 4** parameter indicates that the enhanced access is for management privilege level 4 (Port Configuration). All users with Port Configuration privileges will have the enhanced access. The **ip** parameter indicates that the enhanced access is for the IP commands. Users who log in with valid Port Configuration level user names and passwords can enter commands that begin with “ip” at the global CONFIG level.

Syntax: `[no] privilege <cli-level> level <privilege-level> <command-string>`

The `<cli-level>` parameter specifies the CLI level and can be one of the following values:

- **exec** – EXEC level; for example, Brocade> or Brocade#
- **configure** – CONFIG level; for example, Brocade(config)#
- **interface** – Interface level; for example, Brocade(config-if-6)#
- **loopback-interface** – loopback interface level
- **virtual-interface** – Virtual-interface level; for example, Brocade(config-vif-6)#
- **dot1x** – 802.1X configuration level
- **ipv6-access-list** – IPv6 access list configuration level
- **rip-router** – RIP router level; for example, Brocade(config-rip-router)#
- **ospf-router** – OSPF router level; for example, Brocade(config-ospf-router)#
- **dvmrp-router** – DVMRP router level; for example, Brocade(config-dvmrp-router)#
- **pim-router** – PIM router level; for example, Brocade(config-pim-router)#
- **bgp-router** – BGP4 router level; for example, Brocade(config-bgp-router)#
- **vrrp-router** – VRRP configuration level
- **gvrp** – GVRP configuration level
- **trunk** – trunk configuration level
- **port-vlan** – Port-based VLAN level; for example, Brocade(config-vlan)#
- **protocol-vlan** – Protocol-based VLAN level

The `<privilege-level>` indicates the number of the management privilege level you are augmenting. You can specify one of the following:

- **0** – Super User level (full read-write access)
- **4** – Port Configuration level
- **5** – Read Only level

The `<command-string>` parameter specifies the command you are allowing users with the specified privilege level to enter. To display a list of the commands at a CLI level, enter “?” at that level's command prompt.

Recovering from a lost password

Recovery from a lost password requires direct access to the serial port and a system reset.

NOTE

You can perform this procedure only from the CLI.

Follow the steps given below to recover from a lost password.

1. Start a CLI session over the serial interface to the device.
2. Reboot the device.
3. At the initial boot prompt at system startup, enter **b** to enter the boot monitor mode.
4. Enter **no password** at the prompt. (You cannot abbreviate this command.) This command will cause the device to bypass the system password check.

5. Enter **boot system flash primary** at the prompt. On ICX 6430 and ICX 6450 devices, enter **boot_primary**.
6. After the console prompt reappears, assign a new password.

Displaying the SNMP community string

If you want to display the SNMP community string, enter the following commands.

```
Brocade(config)#enable password-display  
Brocade#show snmp server
```

The **enable password-display** command enables display of the community string, but only in the output of the **show snmp server** command. Display of the string is still encrypted in the startup-config file and running-config. Enter the command at the global CONFIG level of the CLI.

Specifying a minimum password length

By default, the Brocade device imposes no minimum length on the Line (Telnet), Enable, or Local passwords. You can configure the device to require that Line, Enable, and Local passwords be at least a specified length.

For example, to specify that the Line, Enable, and Local passwords be at least 8 characters, enter the following command.

```
Brocade(config)#enable password-min-length 8
```

Syntax: **enable password-min-length** *<number-of-characters>*

The *<number-of-characters>* can be from 1 – 48.

Local user accounts

You can define up to 16 local user accounts on a Brocade device. User accounts regulate who can access the management functions in the CLI using the following methods:

- Telnet access
- Web management access
- SNMP access

Local user accounts provide greater flexibility for controlling management access to Brocade devices than do management privilege level passwords and SNMP community strings of SNMP versions 1 and 2. You can continue to use the privilege level passwords and the SNMP community strings as additional means of access authentication. Alternatively, you can choose not to use local user accounts and instead continue to use only the privilege level passwords and SNMP community strings. Local user accounts are backward-compatible with configuration files that contain privilege level passwords. Refer to [“Setting passwords for management privilege levels”](#) on page 125.

If you configure local user accounts, you also need to configure an authentication-method list for Telnet access, Web management access, and SNMP access. Refer to [“Authentication-method lists”](#) on page 174.

For each local user account, you specify a user name. You also can specify the following parameters:

- A password
- A management privilege level, which can be one of the following:
 - **Super User level (default)** – Allows complete read-and-write access to the system. This is generally for system administrators and is the only privilege level that allows you to configure passwords.
 - **Port Configuration level** – Allows read-and-write access for specific ports but not for global parameters.
 - **Read Only level** – Allows access to the Privileged EXEC mode and User EXEC mode with read access only.
- You can set additional username and password rules. Refer to [“Enhancements to username and password”](#).

Enhancements to username and password

This section describes the enhancements to the username and password features introduced in earlier releases.

The following rules are enabled by default:

- Users are required to accept the message of the day.
- Users are locked out (disabled) if they fail to login after three attempts. This feature is automatically enabled. Use the **disable-on-login-failure** command to change the number of login attempts (up to 10) before users are locked out.

The following rules are disabled by default:

- Enhanced user password combination requirements
- User password masking

- Quarterly updates of user passwords
- You can configure the system to store up to 15 previously configured passwords for each user.
- You can use the **disable-on-login-failure** command to change the number of login attempts (up to 10) before users are locked out.
- A password can now be set to expire.

Enabling enhanced user password combination requirements

When strict password enforcement is enabled on the Brocade device, you must enter a minimum of eight characters containing the following combinations when you create an enable and a user password:

- At least two upper case characters
- At least two lower case characters
- At least two numeric characters
- At least two special characters

NOTE

Password minimum and combination requirements are strictly enforced.

Use the **enable strict-password-enforcement** command to enable the password security feature.

```
Brocade(config)#enable strict-password-enforcement
```

Syntax: [no] **enable strict-password-enforcement**

This feature is disabled by default.

The following security upgrades apply to the **enable strict-password-enforcement** command:

- Passwords must not share four or more concurrent characters with any other password configured on the router. If the user tries to create a password with four or more concurrent characters, the following error message will be returned.

```
Error - The substring <str> within the password has been used earlier, please  
choose a different password.
```

For example, the previous password was Mali4aYa&, the user cannot use any of the following as his or her new password:

- Malimai\$D because “Mail” were used consecutively in the previous password
- &3B9aYa& because “aYa&” were used consecutively in the previous password
- i4aYEv#8 because “i4aY” were used consecutively in the previous password
- If the user tries to configure a password that was previously used, the Local User Account configuration will not be allowed and the following message will be displayed.

```
This password was used earlier for same or different user, please choose a  
different password.
```

Enabling user password masking

By default, when you use the CLI to create a user password, the password displays on the console as you type it. For enhanced security, you can configure the Brocade device to mask the password characters entered at the CLI. When password masking is enabled, the CLI displays asterisks (*) on the console instead of the actual password characters entered.

The following shows the default CLI behavior when configuring a username and password.

```
Brocade(config)#username kelly password summertime
```

The following shows the CLI behavior when configuring a username and password when **password-masking** is enabled.

```
Brocade(config)#username kelly password
Enter Password: *****
```

NOTE

When password masking is enabled, press the [Enter] key before entering the password.

Syntax: `username <name> password [Enter]`

For [Enter], press the Enter key. Enter the password when prompted.

If **strict-password-enforcement** is enabled, enter a password which contains the required character combination. Refer to [“Enabling enhanced user password combination requirements”](#) on page 130.

To enable password masking, enter the following command.

```
Brocade(config)#enable user password-masking
```

Syntax: `[no] enable user password-masking`

Enabling user password aging

For enhanced security, password aging enforces quarterly updates of all user passwords. After 180 days, the CLI will automatically prompt users to change their passwords when they attempt to sign on.

When password aging is enabled, the software records the system time that each user password was configured or last changed. The time displays in the output of the **show running configuration** command, indicated by `set-time <time>`.

Example

```
Brocade#show run
Current configuration:
....
username waldo password .....
username raveen set-time 2086038248
....
```

The password aging feature uses the SNTP server clock to record the set-time. If the network does not have an SNTP server, then set-time will appear as **set-time 0** in the output of the **show running configuration** command.

A username set-time configuration is removed when:

- The username and password is deleted from the configuration
- The username password expires

When a username set-time configuration is removed, it no longer appears in the **show running configuration** output.

Note that if a username does not have an assigned password, the username will not have a set-time configuration.

Password aging is disabled by default. To enable it, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)#enable user password-aging
```

Syntax: [no] enable user password-aging

Configuring password history

By default, the Brocade device stores the last five user passwords for each user. When changing a user password, the user cannot use any of the five previously configured passwords.

For security purposes, you can configure the Brocade device to store up to 15 passwords for each user, so that users do not use the same password multiple times. If a user attempts to use a password that is stored, the system will prompt the user to choose a different password.

To configure enhanced password history, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#enable user password-history 15
```

Syntax: [no] enable user password-history <1 - 15>

Enhanced login lockout

The CLI provides up to three login attempts. If a user fails to login after three attempts, that user is locked out (disabled). If desired, you can increase or decrease the number of login attempts before the user is disabled. To do so, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#enable user disable-on-login-failure 7
```

Syntax: enable user disable-on-login-failure <1 - 10>

To re-enable a user that has been locked out, do one of the following:

- Reboot the Brocade device to re-enable all disabled users.
- Enable the user by entering the following command.

```
Brocade(config)#username sandy enable
```

Example

```

Brocade(config)#user sandy enable
Brocade#show user
Username Password Encrypt Priv Status Expire Time
=====
sandy $1$Gz...uX/$wQ44fVGtsqbKWkQknzAZ6. enabled 0 enabled 90 days

```

Syntax: `username <name> enable`

Setting passwords to expire

You can set a user password to expire. Once a password expires, the administrator must assign a new password to the user. To configure a user password to expire, enter the following.

```
Brocade(config)#username sandy expires 20
```

Syntax: `username <name> expires <days>`

Enter 1 – 365 for number of days. The default is 90 days.

Example

```

Brocade(config)#username sandy expires 20
Brocade#show user
Username Password Encrypt Priv Status Expire Time
=====
sandy $1$Gz...uX/$wQ44fVGtsqbKWkQknzAZ6. enabled 0 enabled 20 days

```

Requirement to accept the message of the day

If a message of the day (MOTD) is configured, a user will be required to press the Enter key before he or she can login. MOTD is configured using the **banner motd** command.

There are no new CLI commands for this feature.

NOTE

This requirement is disabled by default, unless configured. Users are not required to press Enter after the MOTD banner is displayed. Refer to [“Requiring users to press the Enter key after the message of the day banner”](#) on page 38.

Local user account configuration

You can create accounts for local users with or without passwords. Accounts with passwords can have encrypted or unencrypted passwords.

You can assign privilege levels to local user accounts, but on a new device, you must create a local user account that has a Super User privilege before you can create accounts with other privilege levels.

NOTE

You must grant Super User level privilege to at least one account before you add accounts with other privilege levels. You need the Super User account to make further administrative changes.

Local user accounts with no passwords

To create a user account without a password, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)#username wonka nopassword
```

Syntax: [no] **username** <user-string> **privilege** <privilege-level> **nopassword**

Local user accounts with unencrypted passwords

If you want to use unencrypted passwords for local user accounts, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#username wonka password willy
```

If password masking is enabled, press the [Enter] key before entering the password.

```
Brocade(config)#username wonka
Enter Password: willy
```

The above commands add a local user account with the user name “wonka” and the password “willy”. This account has the Super User privilege level; this user has full access to all configuration and display features.

```
Brocade(config)#username waldo privilege 5 password whereis
```

This command adds a user account for user name “waldo”, password “whereis”, with the Read Only privilege level. Waldo can look for information but cannot make configuration changes.

Syntax: [no] **username** <user-string> **privilege** <privilege-level> **password** | **nopassword** <password-string>

You can enter up to 48 characters for <user-string>.

The **privilege** <privilege-level> parameter specifies the privilege level for the account. You can specify one of the following:

- **0** – Super User level (full read-write access)
- **4** – Port Configuration level
- **5** – Read Only level

The default privilege level is **0**. If you want to assign Super User level access to the account, you can enter the command without **privilege 0**, as shown in the command example above.

The **password** | **nopassword** parameter indicates whether the user must enter a password. If you specify **password**, enter the string for the user's password. You can enter up to 48 characters for <password-string>. If **strict password enforcement** is enabled on the device, you must enter a minimum of eight characters containing the following combinations:

- At least two upper case characters
- At least two lower case characters

- At least two numeric characters
- At least two special characters

NOTE

You must be logged on with Super User access (privilege level 0) to add user accounts or configure other access parameters.

To display user account information, enter the following command.

```
Brocade#show users
```

Syntax: `show users`

Local accounts with encrypted passwords

You can create local user accounts with MD5 encrypted passwords using one of the following methods:

- Issuing the **service password-encryption** command after creating the local user account with a **username <user-string> [privilege <privilege-level>] password 0** command
- Using the **username <user-string> create-password** command

NOTE

To create an encrypted all-numeric password, use the **username <user-string> create-password** command.

If you create a local user account using the commands discussed in [“Local user accounts with unencrypted passwords”](#) on page 134, you can issue the **service password-encryption** command to encrypt all passwords that have been previously entered.

Example

```
Brocade(config)#username wonka privilege 5 password willy
Brocade(config)#service password-encryption
```

Creating a password option

As an alternative to the commands above, the **create-password** option allows you to create an encrypted password in one line of command. Also, this new option allows you to create an all-numeric, encrypted password.

You can enter.

```
Brocade(config)#username wonka privilege 5 create-password willy
```

Syntax: `[no] username <user-string> [privilege <privilege-level>] create-password <password-string>`

You can enter up to 48 characters for <user-string>. This string can be alphanumeric or all-numeric.

The **privilege** parameter specifies the privilege level for the account. You can specify one of the following:

- **0** – Super User level (full read-write access)
- **4** – Port Configuration level

- 5 – Read Only level

Enter up to 255 alphanumeric characters for *<password-string>*.

Changing a local user password

To change a local user password for an existing local user account, enter a command such as the following at the global CONFIG level of the CLI.

NOTE

You must be logged on with Super User access (privilege level 0) to change user passwords.

```
Brocade(config)#username wonka password willy
```

If password masking is enabled, enter the username, press the [Enter] key, then enter the password.

```
Brocade(config)#username wonka password
Enter Password: willy
```

The above commands change wonka's user name password to "willy".

Syntax: [no] **username** *<user-string>* **password** *<password-string>*

Enter up to 48 characters for *<user-string>*.

The *<password-string>* parameter is the user password. The password can be up to 48 characters and must differ from the current password and two previously configured passwords.

When a password is changed, a message such as the following is sent to the Syslog.

```
SYSLOG: <14>Jan 1 00:00:00 10.44.9.11 Security: Password has been changed for user
tester from console session.
```

The message includes the name of the user whose password was changed and during which session type, such as Console, Telnet, SSH, Web, SNMP, or others, the password was changed.

SSL security for the Web Management Interface

The Brocade device supports Secure Sockets Layer / Transport Level Security (SSL 3.0 / TLS 1.0) for configuring the device using the Web Management Interface.

When enabled, the SSL protocol uses digital certificates and public-private key pairs to establish a secure connection to the Brocade device. Digital certificates serve to prove the identity of a connecting client, and public-private key pairs provide a means to encrypt data sent between the device and the client.

Configuring SSL for the Web Management Interface consists of the following tasks:

- Optionally enabling the SSL server on the Brocade device

NOTE

The SSL server is automatically enabled when an SSL certificate is generated.

- Importing an RSA certificate and private key file from a client (optional)
- Generating a certificate

Enabling the SSL server on the Brocade device

To enable the SSL server on the Brocade device, enter the following command.

```
Brocade(config)#web-management https
```

Syntax: [no] web-management http | https

You can enable either the HTTP or HTTPS servers with this command. You can disable both the HTTP and HTTPS servers by entering the following command.

```
Brocade(config)#no web-management
```

Syntax: no web-management

Specifying a port for SSL communication

By default, SSL protocol exchanges occur on TCP port 443. You can optionally change the port number used for SSL communication.

For example, the following command causes the device to use TCP port 334 for SSL communication.

```
Brocade(config)#ip ssl port 334
```

Syntax: [no] ip ssl port <port-number>

The default port for SSL communication is 443.

Changing the SSL server certificate key size

The default key size for Brocade-issued and imported digital certificates is 1024 bits. If desired, you can change the default key size to a value of 512, 2048, or 4096 bits. To do so, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#ip ssl cert-key-size 512
```

Syntax: ip ssl cert-key-size <512/ 1024/ 2048/ 4096>

NOTE

The SSL server certificate key size applies only to digital certificates issued by Brocade and does not apply to imported certificates.

Support for SSL digital certificates larger than 2048 bits

Brocade devices have the ability to store and retrieve SSL digital certificates that are up to 4000 bits in size.

Support for SSL certificates larger than 2048 bits is automatically enabled. You do not need to perform any configuration procedures to enable it.

Importing digital certificates and RSA private key files

To allow a client to communicate with other Brocade device using an SSL connection, you configure a set of digital certificates and RSA public-private key pairs on the device. A digital certificate is used for identifying the connecting client to the server. It contains information about the issuing Certificate Authority, as well as a public key. You can either import digital certificates and private keys from a server, or you can allow the Brocade device to create them.

If you want to allow the Brocade device to create the digital certificates, refer to the next section, [“Generating an SSL certificate”](#). If you choose to import an RSA certificate and private key file from a client, you can use TFTP to transfer the files.

For example, to import a digital certificate using TFTP, enter a command such as the following.

```
Brocade(config)#ip ssl certificate-data-file tftp 192.168.9.210 certfile
```

Syntax: [no] ip ssl certificate-data-file tftp <ip-addr> <certificate-filename>

NOTE

The digital certificate can be up to 4096 bits. Refer to [“Support for SSL digital certificates larger than 2048 bits”](#) on page 138.

To import an RSA private key from a client using TFTP, enter a command such as the following.

```
Brocade(config)#ip ssl private-key-file tftp 192.168.9.210 keyfile
```

Syntax: [no] ip ssl private-key-file tftp <ip-addr> <key-filename>

The <ip-addr> is the IP address of a TFTP server that contains the digital certificate or private key.

NOTE

The RSA key can be up to 4096 bits.

Generating an SSL certificate

After you have imported the digital certificate, it should automatically generate.

If the certificate does not automatically generate, enter the following command to generate it.

```
Brocade(config)#crypto-ssl certificate generate
```

Syntax: [no] crypto-ssl certificate generate

If you did not already import a digital certificate from a client, the device can create a default certificate. To do this, enter the following command.

```
Brocade(config)#crypto-ssl certificate generate default_cert
```

Syntax: [no] crypto-ssl certificate generate default_cert

Deleting the SSL certificate

To delete the SSL certificate, enter the following command.

```
Brocade(config)#crypto-ssl certificate zeroize
```

Syntax: [no] crypto-ssl certificate zeroize

TACACS and TACACS+ security

You can use the security protocol Terminal Access Controller Access Control System (TACACS) or TACACS+ to authenticate the following kinds of access to the Brocade device:

- Telnet access
- SSH access
- Console access
- Web management access
- Access to the Privileged EXEC level and CONFIG levels of the CLI

The TACACS and TACACS+ protocols define how authentication, authorization, and accounting information is sent between a Brocade device and an authentication database on a TACACS/TACACS+ server. TACACS/TACACS+ services are maintained in a database, typically on a UNIX workstation or PC with a TACACS/TACACS+ server running.

How TACACS+ differs from TACACS

TACACS is a simple UDP-based access control protocol originally developed by BBN for MILNET. TACACS+ is an enhancement to TACACS and uses TCP to ensure reliable delivery.

TACACS+ is an enhancement to the TACACS security protocol. TACACS+ improves on TACACS by separating the functions of authentication, authorization, and accounting (AAA) and by encrypting all traffic between the Brocade device and the TACACS+ server. TACACS+ allows for arbitrary length and content authentication exchanges, which allow any authentication mechanism to be utilized with the Brocade device. TACACS+ is extensible to provide for site customization and future development features. The protocol allows the Brocade device to request very precise access control and allows the TACACS+ server to respond to each component of that request.

NOTE

TACACS+ provides for authentication, authorization, and accounting, but an implementation or configuration is not required to employ all three.

TACACS/TACACS+ authentication, authorization, and accounting

When you configure a Brocade device to use a TACACS/TACACS+ server for **authentication**, the device prompts users who are trying to access the CLI for a user name and password, then verifies the password with the TACACS/TACACS+ server.

If you are using TACACS+, Brocade recommends that you also configure **authorization**, in which the Brocade device consults a TACACS+ server to determine which management privilege level (and which associated set of commands) an authenticated user is allowed to use. You can also optionally configure **accounting**, which causes the Brocade device to log information on the TACACS+ server when specified events occur on the device.

NOTE

By default, a user logging into the device from Telnet or SSH would first enter the User EXEC level. The user can enter the **enable** command to get to the Privileged EXEC level.

A user that is successfully authenticated can be automatically placed at the Privileged EXEC level after login. Refer to [“Entering privileged EXEC mode after a Telnet or SSH login”](#) on page 150.

Configuring TACACS/TACACS+ for devices in a Brocade IronStack

Because devices operating in a Brocade IronStack topology present multiple console ports, you must take additional steps to secure these ports when configuring TACACS/TACACS+.

The following is a sample AAA console configuration using TACACS+.

```
aaa authentication login default tacacs+ enable
aaa authentication login privilege-mode
aaa authorization commands 0 default tacacs+
aaa authorization exec default tacacs+
aaa accounting commands 0 default start-stop tacacs+
aaa accounting exec default start-stop tacacs+
aaa accounting system default start-stop tacacs+
enable aaa console
hostname Fred
ip address 144.10.6.56/255
tacacs-server host 255.253.255
tacacs-server key 1 $Gsig@U\
```

kill console

Syntax: kill console [all | unit]

- **all** - logs out all console port on stack units that are not the Active Controller
- **unit** - logs out the console port on a specified unit

Once AAA console is enabled, you should log out any open console ports on your IronStack using the **kill console** command:

```
Brocade(config)#kill console all
```

In case a user forgets to log out or a console is left unattended, you can also configure the console timeout (in minutes) on all stack units (including the Active Controller).

```
Brocade(config)#stack unit 3
Brocade(config-unit-3)#console timeout 5
Brocade(config-unit-3)#exit
Brocade(config)#stack unit 4
Brocade(config-unit-4)#console timeout 5
```

Use the **show who** and the **show telnet** commands to confirm the status of console sessions.

```

stack9#show who
Console connections (by unit number):
 1      established
      you are connecting to this session
      4 seconds in idle
 2      established
      1 hours 3 minutes 12 seconds in idle
 3      established
      1 hours 3 minutes 9 seconds in idle
 4      established
      1 hours 3 minutes 3 seconds in idle
Telnet connections (inbound):
 1      closed
 2      closed
 3      closed
 4      closed
 5      closed
Telnet connection (outbound):
 6      closed
SSH connections:
 1      closed
 2      closed
 3      closed
 4      closed
 5      closed
stack9#

```

```

stack9#show telnet
Console connections (by unit number):
 1      established
      you are connecting to this session
      1 minutes 5 seconds in idle
 2      established
      1 hours 4 minutes 18 seconds in idle
 3      established
      1 hours 4 minutes 15 seconds in idle
 4      established
      1 hours 4 minutes 9 seconds in idle
Telnet connections (inbound):
 1      closed
 2      closed
 3      closed
 4      closed
 5      closed
Telnet connection (outbound):
 6      closed
SSH connections:
 1      closed
 2      closed
 3      closed
 4      closed
 5      closed
stack9#

```

TACACS authentication

NOTE

Also, multiple challenges are supported for TACACS+ login authentication.

When TACACS authentication takes place, the following events occur.

1. A user attempts to gain access to the Brocade device by doing one of the following:
 - Logging into the device using Telnet, SSH, or the Web Management Interface
 - Entering the Privileged EXEC level or CONFIG level of the CLI
2. The user is prompted for a username and password.
3. The user enters a username and password.
4. The Brocade device sends a request containing the username and password to the TACACS server.
5. The username and password are validated in the TACACS server database.
6. If the password is valid, the user is authenticated.

TACACS+ authentication

When TACACS+ authentication takes place, the following events occur.

1. A user attempts to gain access to the Brocade device by doing one of the following:
 - Logging into the device using Telnet, SSH, or the Web Management Interface
 - Entering the Privileged EXEC level or CONFIG level of the CLI
2. The user is prompted for a username.
3. The user enters a username.
4. The Brocade device obtains a password prompt from a TACACS+ server.
5. The user is prompted for a password.
6. The user enters a password.
7. The Brocade device sends the password to the TACACS+ server.
8. The password is validated in the TACACS+ server database.
9. If the password is valid, the user is authenticated.

TACACS+ authorization

Brocade devices support two kinds of TACACS+ authorization:

- Exec authorization determines a user privilege level when they are authenticated
- Command authorization consults a TACACS+ server to get authorization for commands entered by the user

When TACACS+ exec authorization takes place, the following events occur.

1. A user logs into the Brocade device using Telnet, SSH, or the Web Management Interface
2. The user is authenticated.

3. The Brocade device consults the TACACS+ server to determine the privilege level of the user.
4. The TACACS+ server sends back a response containing an A-V (Attribute-Value) pair with the privilege level of the user.
5. The user is granted the specified privilege level.

When TACACS+ command authorization takes place, the following events occur.

1. A Telnet, SSH, or Web Management Interface user previously authenticated by a TACACS+ server enters a command on the Brocade device.
2. The Brocade device looks at its configuration to see if the command is at a privilege level that requires TACACS+ command authorization.
3. If the command belongs to a privilege level that requires authorization, the Brocade device consults the TACACS+ server to see if the user is authorized to use the command.
4. If the user is authorized to use the command, the command is executed.

TACACS+ accounting

TACACS+ accounting works as follows.

1. One of the following events occur on the Brocade device:
 - A user logs into the management interface using Telnet or SSH
 - A user enters a command for which accounting has been configured
 - A system event occurs, such as a reboot or reloading of the configuration file
2. The Brocade device checks the configuration to see if the event is one for which TACACS+ accounting is required.
3. If the event requires TACACS+ accounting, the Brocade device sends a TACACS+ Accounting Start packet to the TACACS+ accounting server, containing information about the event.
4. The TACACS+ accounting server acknowledges the Accounting Start packet.
5. The TACACS+ accounting server records information about the event.
6. When the event is concluded, the Brocade device sends an Accounting Stop packet to the TACACS+ accounting server.
7. The TACACS+ accounting server acknowledges the Accounting Stop packet.

AAA operations for TACACS/TACACS+

The following table lists the sequence of authentication, authorization, and accounting operations that take place when a user gains access to a Brocade device that has TACACS/TACACS+ security configured.

User action	Applicable AAA operations
User attempts to gain access to the Privileged EXEC and CONFIG levels of the CLI	Enable authentication: aaa authentication enable default <method-list> <hr/> Exec authorization (TACACS+): aaa authorization exec default tacacs+ <hr/> System accounting start (TACACS+): aaa accounting system default start-stop <method-list>
User logs in using Telnet/SSH	Login authentication: aaa authentication login default <method-list> <hr/> Exec authorization (TACACS+): aaa authorization exec default tacacs+ <hr/> Exec accounting start (TACACS+): aaa accounting exec default <method-list> System accounting start (TACACS+): aaa accounting system default start-stop <method-list>
User logs into the Web Management Interface	Web authentication: aaa authentication web-server default <method-list> <hr/> Exec authorization (TACACS+): aaa authorization exec default tacacs+
User logs out of Telnet/SSH session	Command accounting (TACACS+): aaa accounting commands <privilege-level> default start-stop <method-list> EXEC accounting stop (TACACS+): aaa accounting exec default start-stop <method-list>
User enters system commands (for example, reload , boot system)	Command authorization (TACACS+): aaa authorization commands <privilege-level> default <method-list> <hr/> Command accounting (TACACS+): aaa accounting commands <privilege-level> default start-stop <method-list> System accounting stop (TACACS+): aaa accounting system default start-stop <method-list>
User enters the command: [no] aaa accounting system default start-stop <method-list>	Command authorization (TACACS+): aaa authorization commands <privilege-level> default <method-list> <hr/> Command accounting (TACACS+): aaa accounting commands <privilege-level> default start-stop <method-list> System accounting start (TACACS+): aaa accounting system default start-stop <method-list>
User enters other commands	Command authorization (TACACS+): aaa authorization commands <privilege-level> default <method-list> <hr/> Command accounting (TACACS+): aaa accounting commands <privilege-level> default start-stop <method-list>

AAA security for commands pasted into the running-config

If AAA security is enabled on the device, commands pasted into the running-config are subject to the same AAA operations as if they were entered manually.

When you paste commands into the running-config, and AAA command authorization or accounting, or both, are configured on the device, AAA operations are performed on the pasted commands. The AAA operations are performed before the commands are actually added to the running-config. The server performing the AAA operations should be reachable when you paste the commands into the running-config file. If the device determines that a pasted command is invalid, AAA operations are halted on the remaining commands. The remaining commands may not be executed if command authorization is configured.

TACACS/TACACS+ configuration considerations

- You must deploy at least one TACACS/TACACS+ server in your network.
- Brocade devices support authentication using up to eight TACACS/TACACS+ servers. The device tries to use the servers in the order you add them to the device configuration.
- You can select only one primary authentication method for each type of access to a device (CLI through Telnet, CLI Privileged EXEC and CONFIG levels). For example, you can select TACACS+ as the primary authentication method for Telnet CLI access, but you cannot also select RADIUS authentication as a primary method for the same type of access. However, you can configure backup authentication methods for each access type.
- You can configure the Brocade device to authenticate using a TACACS or TACACS+ server, not both.

Configuring TACACS

Follow the procedure given below for TACACS configurations.

1. Identify TACACS servers. Refer to [“Identifying the TACACS/TACACS+ servers”](#) on page 146.
2. Set optional parameters. Refer to [“Setting optional TACACS and TACACS+ parameters”](#) on page 147.
3. Configure authentication-method lists. Refer to [“Configuring authentication-method lists for TACACS and TACACS+”](#) on page 149.

Configuring TACACS+

Follow the procedure given below for TACACS+ configurations.

1. Identify TACACS+ servers. Refer to [“Identifying the TACACS/TACACS+ servers”](#) on page 146.
2. Set optional parameters. Refer to [“Setting optional TACACS and TACACS+ parameters”](#) on page 147.
3. Configure authentication-method lists. Refer to [“Configuring authentication-method lists for TACACS and TACACS+”](#) on page 149.
4. Optionally configure TACACS+ authorization. Refer to [“Configuring TACACS+ authorization”](#) on page 151.
5. Optionally configure TACACS+ accounting. Refer to [“TACACS+ accounting configuration”](#) on page 154.

Enabling TACACS

TACACS is disabled by default. To configure TACACS/TACACS+ authentication parameters, you must enable TACACS by entering the following command.

```
Brocade(config)#enable snmp config-tacacs
```

Syntax: `[no] enable snmp <config-radius | config-tacacs>`

The `<config-radius>` parameter specifies the RADIUS configuration mode. RADIUS is disabled by default.

The `<config-tacacs>` parameter specifies the TACACS configuration mode. TACACS is disabled by default.

Identifying the TACACS/TACACS+ servers

To use TACACS/TACACS+ servers to authenticate access to a Brocade device, you must identify the servers to the Brocade device.

For example, to identify three TACACS/TACACS+ servers, enter commands such as the following.

```
Brocade(config)#tacacs-server host 207.94.6.161
Brocade(config)#tacacs-server host 207.94.6.191
Brocade(config)#tacacs-server host 207.94.6.122
```

Syntax: `tacacs-server host <ip-addr> | <ipv6-addr> | <hostname> [auth-port <number>]`

The `<ip-addr> | <ipv6-addr> | <hostname>` parameter specifies the IP address or host name of the server. You can enter up to eight **tacacs-server host** commands to specify up to eight different servers.

NOTE

To specify the server's host name instead of its IP address, you must first identify a DNS server using the **ip dns server-address <ip-addr>** command at the global CONFIG level.

If you add multiple TACACS/TACACS+ authentication servers to the Brocade device, the device tries to reach them in the order you add them. For example, if you add three servers in the following order, the software tries the servers in the same order.

1. 207.94.6.161
2. 207.94.6.191
3. 207.94.6.122

You can remove a TACACS/TACACS+ server by entering **no** followed by the **tacacs-server** command. For example, to remove 207.94.6.161, enter the following command.

```
Brocade(config)#no tacacs-server host 207.94.6.161
```

NOTE

If you erase a **tacacs-server** command (by entering “no” followed by the command), make sure you also erase the **aaa** commands that specify TACACS/TACACS+ as an authentication method. (Refer to [“Configuring authentication-method lists for TACACS and TACACS+”](#) on page 149.) Otherwise, when you exit from the CONFIG mode or from a Telnet session, the system continues to believe it is TACACS/TACACS+ enabled and you will not be able to access the system.

The **auth-port** parameter specifies the UDP (for TACACS) or TCP (for TACACS+) port number of the authentication port on the server. The default port number is 49.

Specifying different servers for individual AAA functions

In a TACACS+ configuration, you can designate a server to handle a specific AAA task. For example, you can designate one TACACS+ server to handle authorization and another TACACS+ server to handle accounting. You can set the TACACS+ key for each server.

To specify different TACACS+ servers for authentication, authorization, and accounting, enter the command such as following.

```
Brocade(config)#tacacs-server host 1.2.3.4 auth-port 49 authentication-only key
abc
Brocade(config)#tacacs-server host 1.2.3.5 auth-port 49 authorization-only key
def
Brocade(config)#tacacs-server host 1.2.3.6 auth-port 49 accounting-only key ghi
```

Syntax: `tacacs-server host <ip-addr> | <ipv6-addr> | <server-name> [auth-port <num>] [authentication-only | authorization-only | accounting-only | default] [key 0 | 1 <string>]`

The default parameter causes the server to be used for all AAA functions.

After authentication takes place, the server that performed the authentication is used for authorization and accounting. If the authenticating server cannot perform the requested function, then the next server in the configured list of servers is tried; this process repeats until a server that can perform the requested function is found, or every server in the configured list has been tried.

Setting optional TACACS and TACACS+ parameters

You can set the following optional parameters in a TACACS and TACACS+ configuration:

- **TACACS+ key** – This parameter specifies the value that the Brocade device sends to the TACACS+ server when trying to authenticate user access.
- **Retransmit interval** – This parameter specifies how many times the Brocade device will resend an authentication request when the TACACS/TACACS+ server does not respond. The retransmit value can be from 1 – 5 times. The default is 3 times.
- **Dead time** – This parameter specifies how long the Brocade device waits for the primary authentication server to reply before deciding the server is dead and trying to authenticate using the next server. The dead-time value can be from 1 – 5 seconds. The default is 3 seconds.
- **Timeout** – This parameter specifies how many seconds the Brocade device waits for a response from a TACACS/TACACS+ server before either retrying the authentication request, or determining that the TACACS/TACACS+ servers are unavailable and moving on to the next authentication method in the authentication-method list. The timeout can be from 1 – 15 seconds. The default is 3 seconds.

Setting the TACACS+ key

The **key** parameter in the **tacacs-server** command is used to encrypt TACACS+ packets before they are sent over the network. The value for the **key** parameter on the Brocade device should match the one configured on the TACACS+ server. The key can be from 1 – 32 characters in length and cannot include any space characters.

NOTE

The **tacacs-server key** command applies only to TACACS+ servers, not to TACACS servers. If you are configuring TACACS, do not configure a key on the TACACS server and do not enter a key on the Brocade device.

To specify a TACACS+ server key, enter a command such as following.

```
Brocade(config)#tacacs-server key rk Wong
```

Syntax: **tacacs-server key** [0 | 1] <string>

When you display the configuration of the Brocade device, the TACACS+ keys are encrypted. For example.

```
Brocade(config)#tacacs-server key 1 abc
Brocade(config)#write terminal
...
tacacs-server host 1.2.3.5 auth-port 49
tacacs key 1 $!2d
```

NOTE

Encryption of the TACACS+ keys is done by default. The **0** parameter disables encryption. The **1** parameter is not required; it is provided for backwards compatibility.

Setting the retransmission limit

The **retransmit** parameter specifies how many times the Brocade device will resend an authentication request when the TACACS/TACACS+ server does not respond. The retransmit limit can be from 1 – 5 times. The default is 3 times.

To set the TACACS and TACACS+ retransmit limit, enter a command such as the following.

```
Brocade(config)#tacacs-server retransmit 5
```

Syntax: **tacacs-server retransmit** <number>

Setting the timeout parameter

The **timeout** parameter specifies how many seconds the Brocade device waits for a response from the TACACS/TACACS+ server before either retrying the authentication request, or determining that the TACACS/TACACS+ server is unavailable and moving on to the next authentication method in the authentication-method list. The timeout can be from 1 – 15 seconds. The default is 3 seconds.

```
Brocade(config)#tacacs-server timeout 5
```

Syntax: **tacacs-server timeout** <number>

Configuring authentication-method lists for TACACS and TACACS+

You can use TACACS/TACACS+ to authenticate Telnet/SSH access and access to Privileged EXEC level and CONFIG levels of the CLI. When configuring TACACS/TACACS+ authentication, you create authentication-method lists specifically for these access methods, specifying TACACS/TACACS+ as the primary authentication method.

Within the authentication-method list, TACACS/TACACS+ is specified as the primary authentication method and up to six backup authentication methods are specified as alternates. If TACACS/TACACS+ authentication fails due to an error, the device tries the backup authentication methods in the order they appear in the list.

When you configure authentication-method lists for TACACS/TACACS+ authentication, you must create a separate authentication-method list for Telnet/SSH CLI access, and for access to the Privileged EXEC level and CONFIG levels of the CLI.

To create an authentication method list that specifies TACACS/TACACS+ as the primary authentication method for securing Telnet/SSH access to the CLI.

```
Brocade(config)#enable telnet authentication
Brocade(config)#aaa authentication login default tacacs local
```

The commands above cause TACACS/TACACS+ to be the primary authentication method for securing Telnet/SSH access to the CLI. If TACACS/TACACS+ authentication fails due to an error with the server, authentication is performed using local user accounts instead.

To create an authentication-method list that specifies TACACS/TACACS+ as the primary authentication method for securing access to Privileged EXEC level and CONFIG levels of the CLI.

```
Brocade(config)#aaa authentication enable default tacacs local none
```

The command above causes TACACS/TACACS+ to be the primary authentication method for securing access to Privileged EXEC level and CONFIG levels of the CLI. If TACACS/TACACS+ authentication fails due to an error with the server, local authentication is used instead. If local authentication fails, no authentication is used; the device automatically permits access.

Syntax: [no] **aaa authentication enable | login default** <method1> [<method2>] [<method3>] [<method4>] [<method5>] [<method6>] [<method7>]

The **web-server | enable | login** parameter specifies the type of access this authentication-method list controls. You can configure one authentication-method list for each type of access.

NOTE

If you configure authentication for Web management access, authentication is performed each time a page is requested from the server. When frames are enabled on the Web Management Interface, the browser sends an HTTP request for each frame. The Brocade device authenticates each HTTP request from the browser. To limit authentications to one per page, disable frames on the Web Management Interface.

The <method1> parameter specifies the primary authentication method. The remaining optional <method> parameters specify additional methods to try if an error occurs with the primary method. A method can be one of the values listed in the Method Parameter column in the following table.

TABLE 21 Authentication method values

Method parameter	Description
line	Authenticate using the password you configured for Telnet access. The Telnet password is configured using the enable telnet password... command. Refer to “Setting a Telnet password” on page 124.
enable	Authenticate using the password you configured for the Super User privilege level. This password is configured using the enable super-user-password... command. Refer to “Setting passwords for management privilege levels” on page 125.
local	Authenticate using a local user name and password you configured on the device. Local user names and passwords are configured using the username... command. Refer to “Local user account configuration” on page 133.
tacacs	Authenticate using the database on a TACACS server. You also must identify the server to the device using the tacacs-server command.
tacacs+	Authenticate using the database on a TACACS+ server. You also must identify the server to the device using the tacacs-server command.
radius	Authenticate using the database on a RADIUS server. You also must identify the server to the device using the radius-server command.
none	Do not use any authentication method. The device automatically permits access.

NOTE

For examples of how to define authentication-method lists for types of authentication other than TACACS/TACACS+, refer to [“Authentication-method lists”](#) on page 174.

Entering privileged EXEC mode after a Telnet or SSH login

By default, a user enters User EXEC mode after a successful login through Telnet or SSH. Optionally, you can configure the device so that a user enters Privileged EXEC mode after a Telnet or SSH login. To do this, use the following command.

```
Brocade(config)#aaa authentication login privilege-mode
```

Syntax: `aaa authentication login privilege-mode`

The user privilege level is based on the privilege level granted during login.

Configuring enable authentication to prompt for password only

If Enable authentication is configured on the device, when a user attempts to gain Super User access to the Privileged EXEC and CONFIG levels of the CLI, by default he or she is prompted for a username and password. You can configure the Brocade device to prompt only for a password. The device uses the username entered at login, if one is available. If no username was entered at login, the device prompts for both username and password.

To configure the Brocade device to prompt only for a password when a user attempts to gain Super User access to the Privileged EXEC and CONFIG levels of the CLI.

```
Brocade(config)#aaa authentication enable implicit-user
```

Syntax: `[no] aaa authentication enable implicit-user`

Telnet and SSH prompts when the TACACS+ Server is unavailable

When TACACS+ is the first method in the authentication method list, the device displays the login prompt received from the TACACS+ server. If a user attempts to login through Telnet or SSH, but none of the configured TACACS+ servers are available, the following takes place:

- If the next method in the authentication method list is "enable", the login prompt is skipped, and the user is prompted for the Enable password (that is, the password configured with the **enable super-user-password** command).
- If the next method in the authentication method list is "line", the login prompt is skipped, and the user is prompted for the Line password (that is, the password configured with the **enable telnet password** command).

Configuring TACACS+ authorization

Brocade devices support TACACS+ authorization for controlling access to management functions in the CLI. Two kinds of TACACS+ authorization are supported:

- Exec authorization determines a user privilege level when they are authenticated
- Command authorization consults a TACACS+ server to get authorization for commands entered by the user

Configuring exec authorization

When TACACS+ exec authorization is performed, the Brocade device consults a TACACS+ server to determine the privilege level of the authenticated user. To configure TACACS+ exec authorization on the Brocade device, enter the following command.

```
Brocade(config)#aaa authorization exec default tacacs+
```

Syntax: **aaa authorization exec default tacacs+ | none**

If you specify **none**, or omit the **aaa authorization exec** command from the device configuration, no exec authorization is performed.

A user privilege level is obtained from the TACACS+ server in the "foundry-privlvl" A-V pair. If the **aaa authorization exec default tacacs** command exists in the configuration, the device assigns the user the privilege level specified by this A-V pair. If the command does not exist in the configuration, then the value in the "foundry-privlvl" A-V pair is ignored, and the user is granted Super User access.

NOTE

If the **aaa authorization exec default tacacs+** command exists in the configuration, following successful authentication the device assigns the user the privilege level specified by the "foundry-privlvl" A-V pair received from the TACACS+ server. If the **aaa authorization exec default tacacs+** command does not exist in the configuration, then the value in the "foundry-privlvl" A-V pair is ignored, and the user is granted Super User access.

Also note that in order for the **aaa authorization exec default tacacs+** command to work, either the **aaa authentication enable default tacacs+** command, or the **aaa authentication login privilege-mode** command must also exist in the configuration.

Configuring an Attribute-Value pair on the TACACS+ server

During TACACS+ exec authorization, the Brocade device expects the TACACS+ server to send a response containing an A-V (Attribute-Value) pair that specifies the privilege level of the user. When the Brocade device receives the response, it extracts an A-V pair configured for the Exec service and uses it to determine the user privilege level.

To set a user privilege level, you can configure the “foundry-privlvl” A-V pair for the Exec service on the TACACS+ server.

Example

```
user=bob {
    default service = permit
    member admin
    #Global password
    global = cleartext "cat"
    service = exec {
        foundry-privlvl = 0
    }
}
```

In this example, the A-V pair `foundry-privlvl = 0` grants the user full read-write access. The value in the `foundry-privlvl` A-V pair is an integer that indicates the privilege level of the user. Possible values are 0 for super-user level, 4 for port-config level, or 5 for read-only level. If a value other than 0, 4, or 5 is specified in the `foundry-privlvl` A-V pair, the default privilege level of 5 (read-only) is used. The `foundry-privlvl` A-V pair can also be embedded in the group configuration for the user. See your TACACS+ documentation for the configuration syntax relevant to your server.

If the `foundry-privlvl` A-V pair is not present, the Brocade device extracts the last A-V pair configured for the Exec service that has a numeric value. The Brocade device uses this A-V pair to determine the user privilege level.

Example

```
user=bob {
    default service = permit
    member admin
    #Global password
    global = cleartext "cat"
    service = exec {
        privlvl = 15
    }
}
```

The attribute name in the A-V pair is not significant; the Brocade device uses the last one that has a numeric value. However, the Brocade device interprets the value for a non-“foundry-privlvl” A-V pair differently than it does for a “foundry-privlvl” A-V pair. The following table lists how the Brocade device associates a value from a non-“foundry-privlvl” A-V pair with a Brocade privilege level.

TABLE 22 Brocade equivalents for non-“foundry-privlvl” A-V pair values

Value for non-“foundry-privlvl” A-V pair	Brocade privilege level
15	0 (super-user)
From 14 – 1	4 (port-config)
Any other number or 0	5 (read-only)

In the example above, the A-V pair configured for the Exec service is `privlvl = 15`. The Brocade device uses the value in this A-V pair to set the user privilege level to 0 (super-user), granting the user full read-write access.

In a configuration that has both a “foundry-privlvl” A-V pair and a non-“foundry-privlvl” A-V pair for the Exec service, the non-“foundry-privlvl” A-V pair is ignored.

Example

```
user=bob {
    default service = permit
    member admin
    #Global password
    global = cleartext "cat"
    service = exec {
        foundry-privlvl = 4
        privlvl = 15
    }
}
```

In this example, the user would be granted a privilege level of 4 (port-config level). The `privlvl = 15` A-V pair is ignored by the Brocade device.

If the TACACS+ server has no A-V pair configured for the Exec service, the default privilege level of 5 (read-only) is used.

Configuring command authorization

When TACACS+ command authorization is enabled, the Brocade device consults a TACACS+ server to get authorization for commands entered by the user.

You enable TACACS+ command authorization by specifying a privilege level whose commands require authorization. For example, to configure the Brocade device to perform authorization for the commands available at the Super User privilege level (that is, all commands on the device), enter the following command.

```
Brocade(config)#aaa authorization commands 0 default tacacs+
```

Syntax: `aaa authorization commands <privilege-level> default tacacs+ | radius | none`

The `<privilege-level>` parameter can be one of the following:

- **0** – Authorization is performed for commands available at the Super User level (all commands)
- **4** – Authorization is performed for commands available at the Port Configuration level (port-config and read-only commands)
- **5** – Authorization is performed for commands available at the Read Only level (read-only commands)

NOTE

TACACS+ command authorization can be performed only for commands entered from Telnet or SSH sessions, or from the console. No authorization is performed for commands entered at the Web Management Interface.

TACACS+ command authorization is not performed for the following commands:

- At all levels: **exit**, **logout**, **end**, and **quit**.
- At the Privileged EXEC level: **enable** or **enable <text>**, where `<text>` is the password configured for the Super User privilege level.

If configured, command accounting is performed for these commands.

AAA support for console commands

NOTE

This feature is not supported on FastIron WS Series devices.

AAA support for commands entered at the console includes the following:

- Login prompt that uses AAA authentication, using authentication-method Lists
- Exec Authorization
- Exec Accounting
- Command authorization
- Command accounting
- System Accounting

To enable AAA support for commands entered at the console, enter the following command.

```
Brocade(config)#enable aaa console
```

Syntax: [no] enable aaa console

TACACS+ accounting configuration

Brocade devices support TACACS+ accounting for recording information about user activity and system events. When you configure TACACS+ accounting on a Brocade device, information is sent to a TACACS+ accounting server when specified events occur, such as when a user logs into the device or the system is rebooted.

Configuring TACACS+ accounting for Telnet/SSH (Shell) access

To send an Accounting Start packet to the TACACS+ accounting server when an authenticated user establishes a Telnet or SSH session on the Brocade device, and an Accounting Stop packet when the user logs out.

```
Brocade(config)#aaa accounting exec default start-stop tacacs+
```

Syntax: aaa accounting exec default start-stop radius | tacacs+ | none

Configuring TACACS+ accounting for CLI commands

You can configure TACACS+ accounting for CLI commands by specifying a privilege level whose commands require accounting. For example, to configure the Brocade device to perform TACACS+ accounting for the commands available at the Super User privilege level (that is; all commands on the device), enter the following command.

```
Brocade(config)#aaa accounting commands 0 default start-stop tacacs+
```

An Accounting Start packet is sent to the TACACS+ accounting server when a user enters a command, and an Accounting Stop packet is sent when the service provided by the command is completed.

NOTE

If authorization is enabled, and the command requires authorization, then authorization is performed before accounting takes place. If authorization fails for the command, no accounting takes place.

Syntax: `aaa accounting commands <privilege-level> default start-stop radius | tacacs+ | none`

The `<privilege-level>` parameter can be one of the following:

- **0** – Records commands available at the Super User level (all commands)
- **4** – Records commands available at the Port Configuration level (port-config and read-only commands)
- **5** – Records commands available at the Read Only level (read-only commands)

Configuring TACACS+ accounting for system events

You can configure TACACS+ accounting to record when system events occur on the Brocade device. System events include rebooting and when changes to the active configuration are made.

The following command causes an Accounting Start packet to be sent to the TACACS+ accounting server when a system event occurs, and a Accounting Stop packet to be sent when the system event is completed.

```
Brocade(config)#aaa accounting system default start-stop tacacs+
```

Syntax: `aaa accounting system default start-stop radius | tacacs+ | none`

Configuring an interface as the source for all TACACS and TACACS+ packets

You can designate the lowest-numbered IP address configured an Ethernet port, loopback interface, or virtual interface as the source IP address for all TACACS/TACACS+ packets from the Layer 3 Switch. For configuration details, see [“Specifying a single source interface for specified packet types”](#) on page 977.

Displaying TACACS/TACACS+ statistics and configuration information

The **show aaa** command displays information about all TACACS+ and RADIUS servers identified on the device.

```
Brocade#show aaa
Tacacs+ key: foundry
Tacacs+ retries: 1
Tacacs+ timeout: 15 seconds
Tacacs+ dead-time: 3 minutes
Tacacs+ Server: 207.95.6.90 Port:49:
                  opens=6 closes=3 timeouts=3 errors=0
                  packets in=4 packets out=4
no connection
Radius key: networks
Radius retries: 3
Radius timeout: 3 seconds
Radius dead-time: 3 minutes
Radius Server: 207.95.6.90 Auth Port=1645 Acct Port=1646:
                  opens=2 closes=1 timeouts=1 errors=0
                  packets in=1 packets out=4
no connection
```

The following table describes the TACACS/TACACS+ information displayed by the **show aaa** command.

TABLE 23 Output of the show aaa command for TACACS/TACACS+

Field	Description
Tacacs+ key	The setting configured with the tacacs-server key command. At the Super User privilege level, the actual text of the key is displayed. At the other privilege levels, a string of periods (....) is displayed instead of the text.
Tacacs+ retries	The setting configured with the tacacs-server retransmit command.
Tacacs+ timeout	The setting configured with the tacacs-server timeout command.
Tacacs+ dead-time	The setting configured with the tacacs-server dead-time command.
Tacacs+ Server	For each TACACS/TACACS+ server, the IP address, port, and the following statistics are displayed: <ul style="list-style-type: none"> • opens - Number of times the port was opened for communication with the server • closes - Number of times the port was closed normally • timeouts - Number of times port was closed due to a timeout • errors - Number of times an error occurred while opening the port • packets in - Number of packets received from the server • packets out - Number of packets sent to the server
connection	The current connection status. This can be "no connection" or "connection active".

The **show web connection** command displays the privilege level of Web Management Interface users.

Example

```
Brocade#show web-connection
```

We management Sessions:

User	Privilege	IP address	MAC address	Timeout(secs)	Connection
roy	READ-WRITE	10.1.1.3	0030.488.b84d9	279	HTTPS

Syntax: show web connection

Use the following command to clear web connections:

```
Brocade#clear web-connection
```

Syntax: clear web connection

After issuing the **clear web connection** command, the **show web connection** command displays the following output:

```
Brocade#show web-connection
```

```
No WEB-MANAGEMENT sessions are currently established!
```

RADIUS security

You can use a Remote Authentication Dial In User Service (RADIUS) server to secure the following types of access to the Brocade Layer 2 Switch or Layer 3 Switch:

- Telnet access
- SSH access
- Web management access
- Access to the Privileged EXEC level and CONFIG levels of the CLI

RADIUS authentication, authorization, and accounting

When RADIUS **authentication** is implemented, the Brocade device consults a RADIUS server to verify user names and passwords. You can optionally configure RADIUS **authorization**, in which the Brocade device consults a list of commands supplied by the RADIUS server to determine whether a user can execute a command he or she has entered, as well as **accounting**, which causes the Brocade device to log information on a RADIUS accounting server when specified events occur on the device.

RADIUS authentication

When RADIUS authentication takes place, the following events occur.

1. A user attempts to gain access to the Brocade device by doing one of the following:
 - Logging into the device using Telnet, SSH, or the Web Management Interface
 - Entering the Privileged EXEC level or CONFIG level of the CLI
2. The user is prompted for a username and password.

3. The user enters a username and password.
4. The Brocade device sends a RADIUS Access-Request packet containing the username and password to the RADIUS server.
5. The RADIUS server validates the Brocade device using a shared secret (the RADIUS key).
6. The RADIUS server looks up the username in its database.
7. If the username is found in the database, the RADIUS server validates the password.
8. If the password is valid, the RADIUS server sends an Access-Accept packet to the Brocade device, authenticating the user. Within the Access-Accept packet are three Brocade vendor-specific attributes that indicate:
 - The privilege level of the user
 - A list of commands
 - Whether the user is allowed or denied usage of the commands in the list

The last two attributes are used with RADIUS authorization, if configured.

9. The user is authenticated, and the information supplied in the Access-Accept packet for the user is stored on the Brocade device. The user is granted the specified privilege level. If you configure RADIUS authorization, the user is allowed or denied usage of the commands in the list.

RADIUS authorization

When RADIUS authorization takes place, the following events occur.

1. A user previously authenticated by a RADIUS server enters a command on the Brocade device.
2. The Brocade device looks at its configuration to see if the command is at a privilege level that requires RADIUS command authorization.
3. If the command belongs to a privilege level that requires authorization, the Brocade device looks at the list of commands delivered to it in the RADIUS Access-Accept packet when the user was authenticated. (Along with the command list, an attribute was sent that specifies whether the user is permitted or denied usage of the commands in the list.)

NOTE

After RADIUS authentication takes place, the command list resides on the Brocade device. The RADIUS server is not consulted again once the user has been authenticated. This means that any changes made to the user command list on the RADIUS server are not reflected until the next time the user is authenticated by the RADIUS server, and the new command list is sent to the Brocade device.

4. If the command list indicates that the user is authorized to use the command, the command is executed.

RADIUS accounting

RADIUS accounting works as follows.

1. One of the following events occur on the Brocade device:
 - A user logs into the management interface using Telnet or SSH
 - A user enters a command for which accounting has been configured

- A system event occurs, such as a reboot or reloading of the configuration file
2. The Brocade device checks its configuration to see if the event is one for which RADIUS accounting is required.
 3. If the event requires RADIUS accounting, the Brocade device sends a RADIUS Accounting Start packet to the RADIUS accounting server, containing information about the event.
 4. The RADIUS accounting server acknowledges the Accounting Start packet.
 5. The RADIUS accounting server records information about the event.
 6. When the event is concluded, the Brocade device sends an Accounting Stop packet to the RADIUS accounting server.
 7. The RADIUS accounting server acknowledges the Accounting Stop packet.

AAA operations for RADIUS

The following table lists the sequence of authentication, authorization, and accounting operations that take place when a user gains access to a Brocade device that has RADIUS security configured.

User action	Applicable AAA operations
User attempts to gain access to the Privileged EXEC and CONFIG levels of the CLI	Enable authentication: aaa authentication enable default <method-list>
	System accounting start: aaa accounting system default start-stop <method-list>
User logs in using Telnet/SSH	Login authentication: aaa authentication login default <method-list>
	EXEC accounting Start: aaa accounting exec default start-stop <method-list>
	System accounting Start: aaa accounting system default start-stop <method-list>
User logs into the Web Management Interface	Web authentication: aaa authentication web-server default <method-list>
User logs out of Telnet/SSH session	Command authorization for logout command: aaa authorization commands <privilege-level> default <method-list>
	Command accounting: aaa accounting commands <privilege-level> default start-stop <method-list>
	EXEC accounting stop: aaa accounting exec default start-stop <method-list>
User enters system commands (for example, reload , boot system)	Command authorization: aaa authorization commands <privilege-level> default <method-list>
	Command accounting: aaa accounting commands <privilege-level> default start-stop <method-list>
	System accounting stop: aaa accounting system default start-stop <method-list>

User action	Applicable AAA operations
User enters the command: [no] aaa accounting system default start-stop <method-list>	Command authorization: aaa authorization commands <privilege-level> default <method-list> <hr/> Command accounting: aaa accounting commands <privilege-level> default start-stop <method-list> System accounting start: aaa accounting system default start-stop <method-list>
User enters other commands	Command authorization: aaa authorization commands <privilege-level> default <method-list> <hr/> Command accounting: aaa accounting commands <privilege-level> default start-stop <method-list>

AAA security for commands pasted Into the running-config

If AAA security is enabled on the device, commands pasted into the running-config are subject to the same AAA operations as if they were entered manually.

When you paste commands into the running-config, and AAA command authorization or accounting, or both, are configured on the device, AAA operations are performed on the pasted commands. The AAA operations are performed before the commands are actually added to the running-config. The server performing the AAA operations should be reachable when you paste the commands into the running-config file. If the device determines that a pasted command is invalid, AAA operations are halted on the remaining commands. The remaining commands may not be executed if command authorization is configured.

NOTE

Since RADIUS command authorization relies on a list of commands received from the RADIUS server when authentication is performed, it is important that you use RADIUS authentication when you also use RADIUS command authorization.

RADIUS configuration considerations

- You must deploy at least one RADIUS server in your network.
- Brocade devices support authentication using up to eight RADIUS servers, including those used for 802.1X authentication and for management. The device tries to use the servers in the order you add them to the device configuration. If one RADIUS server times out (does not respond), the Brocade device tries the next one in the list. Servers are tried in the same sequence each time there is a request.
- You can optionally configure a RADIUS server as a **port server**, indicating that the server will be used only to authenticate users on ports to which it is mapped, as opposed to globally authenticating users on all ports of the device. In earlier releases, all configured RADIUS servers are “global” servers and apply to users on all ports of the device. Refer to [“RADIUS server per port”](#) on page 164.
- You can map up to eight RADIUS servers to each port on the Brocade device. The port will authenticate users using only the RADIUS servers to which it is mapped. If there are no RADIUS servers mapped to a port, it will use the “global” servers for authentication. In earlier releases, all RADIUS servers are “global” servers and cannot be bound to individual ports. Refer to [“RADIUS server to individual ports mapping”](#) on page 165.

- You can select only one primary authentication method for each type of access to a device (CLI through Telnet, CLI Privileged EXEC and CONFIG levels). For example, you can select RADIUS as the primary authentication method for Telnet CLI access, but you cannot also select TACACS+ authentication as the primary method for the same type of access. However, you can configure backup authentication methods for each access type.

Configuring RADIUS

Follow the procedure given below to configure a Brocade device for RADIUS.

1. Configure Brocade vendor-specific attributes on the RADIUS server. Refer to [“Brocade-specific attributes on the RADIUS server”](#) on page 161.
2. Identify the RADIUS server to the Brocade device. Refer to [“Identifying the RADIUS server to the Brocade device”](#) on page 163.
3. Optionally specify different servers for individual AAA functions. Refer to [“Specifying different servers for individual AAA functions”](#) on page 163.
4. Optionally configure the RADIUS server as a “port only” server. Refer to [“RADIUS server per port”](#) on page 164.
5. Optionally bind the RADIUS servers to ports on the Brocade device. Refer to [“RADIUS server to individual ports mapping”](#) on page 165.
6. Set RADIUS parameters. Refer to [“RADIUS parameters”](#) on page 166.
7. Configure authentication-method lists. Refer to [“Setting authentication-method lists for RADIUS”](#) on page 167.
8. Optionally configure RADIUS authorization. Refer to [“RADIUS authorization”](#) on page 169.
9. Optionally configure RADIUS accounting. [“RADIUS accounting”](#) on page 171.

Brocade-specific attributes on the RADIUS server

NOTE

For all Brocade devices, RADIUS Challenge is supported for 802.1x authentication but not for login authentication.

During the RADIUS authentication process, if a user supplies a valid username and password, the RADIUS server sends an Access-Accept packet to the Brocade device, authenticating the user. Within the Access-Accept packet are three Brocade vendor-specific attributes that indicate:

- The privilege level of the user
- A list of commands
- Whether the user is allowed or denied usage of the commands in the list

You must add these three Brocade vendor-specific attributes to your RADIUS server configuration, and configure the attributes in the individual or group profiles of the users that will access the Brocade device.

Brocade Vendor-ID is 1991, with Vendor-Type 1. The following table describes the Brocade vendor-specific attributes.

TABLE 24 Brocade vendor-specific attributes for RADIUS

Attribute name	Attribute ID	Data type	Description
foundry-privilege-level	1	integer	<p>Specifies the privilege level for the user. This attribute can be set to one of the following:</p> <ul style="list-style-type: none"> • 0 - Super User level – Allows complete read-and-write access to the system. This is generally for system administrators and is the only management privilege level that allows you to configure passwords. • 4 - Port Configuration level – Allows read-and-write access for specific ports but not for global (system-wide) parameters. • 5 - Read Only level – Allows access to the Privileged EXEC mode and User EXEC mode of the CLI but only with read access.
foundry-command-string	2	string	<p>Specifies a list of CLI commands that are permitted or denied to the user when RADIUS authorization is configured.</p> <p>The commands are delimited by semi-colons (;). You can specify an asterisk (*) as a wildcard at the end of a command string.</p> <p>For example, the following command list specifies all show and debug ip commands, as well as the write terminal command:</p> <p>show *; debug ip *; write term*</p>
foundry-command-exception-flag	3	integer	<p>Specifies whether the commands indicated by the foundry-command-string attribute are permitted or denied to the user. This attribute can be set to one of the following:</p> <ul style="list-style-type: none"> • 0 - Permit execution of the commands indicated by foundry-command-string, deny all other commands. • 1 - Deny execution of the commands indicated by foundry-command-string, permit all other commands.
foundry-access-list	5	string	<p>Specifies the access control list to be used for RADIUS authorization. Enter the access control list in the following format.</p> <p>type=string, value="ipacl.[e s].[in out] = [<acl-name> <acl-number>] <separator> macfilter.in = [<acl-name> <acl-number>]</p> <p>Where:</p> <ul style="list-style-type: none"> • separator can be a space, newline, semicolon, comma, or null character • ipacl.e is an extended ACL; ipacl.s is a standard ACL.
foundry-MAC-authent-needs-802x	6	integer	<p>Specifies whether or not 802.1x authentication is required and enabled.</p> <p>0 - Disabled</p> <p>1 - Enabled</p>

TABLE 24 Brocade vendor-specific attributes for RADIUS (Continued)

Attribute name	Attribute ID	Data type	Description
foundry-802.1x-valid-lookup	7	integer	Specifies if 802.1x lookup is enabled: 0 - Disabled 1 - Enabled
foundry-MAC-based-VLAN-QOS	8	integer	Specifies the priority for MAC-based VLAN QOS: 0 - qos_priority_0 1 - qos_priority_1 2 - qos_priority_2 3 - qos_priority_3 4 - qos_priority_4 5 - qos_priority_5 6 - qos_priority_6 7 - qos_priority_7

Enabling SNMP to configure RADIUS

To enable SNMP access to RADIUS MIB objects on the device, enter a command such as the following.

```
Brocade(config)#enable snmp config-radius
```

Syntax: [no] enable snmp <config-radius | config-tacacs>

The <config-radius> parameter specifies the RADIUS configuration mode. RADIUS is disabled by default.

The <config-tacacs> parameter specifies the TACACS configuration mode. TACACS is disabled by default.

Identifying the RADIUS server to the Brocade device

To use a RADIUS server to authenticate access to a Brocade device, you must identify the server to the Brocade device.

Example

```
Brocade(config)#radius-server host 209.157.22.99
```

Syntax: radius-server host <ip-addr> | <ipv6-addr> | <server-name> [auth-port <number>] [acct-port <number>]

The **host** <ip-addr> | <ipv6-addr> | <server-name> parameter is either an IP address or an ASCII text string.

The <auth-port> parameter is the Authentication port number. The default is 1645.

The <acct-port> parameter is the Accounting port number. The default is 1646.

Specifying different servers for individual AAA functions

In a RADIUS configuration, you can designate a server to handle a specific AAA task. For example, you can designate one RADIUS server to handle authorization and another RADIUS server to handle accounting. You can specify individual servers for authentication and accounting, but not for authorization. You can set the RADIUS key for each server.

To specify different RADIUS servers for authentication, authorization, and accounting, enter commands such as the following.

```
Brocade(config)#radius-server host 1.2.3.4 authentication-only key abc
Brocade(config)#radius-server host 1.2.3.5 authorization-only key def
Brocade(config)#radius-server host 1.2.3.6 accounting-only key ghi
```

Syntax: `radius-server host <ip-addr> | <ipv6-addr> | <server-name> [auth-port <number>] [acct-port <number>] [authentication-only | accounting-only | default] [key 0 | 1 <string>]`

The **default** parameter causes the server to be used for all AAA functions.

After authentication takes place, the server that performed the authentication is used for authorization and accounting. If the authenticating server cannot perform the requested function, then the next server in the configured list of servers is tried; this process repeats until a server that can perform the requested function is found, or every server in the configured list has been tried.

RADIUS server per port

You can optionally configure a RADIUS server per port, indicating that it will be used only to authenticate users on ports to which it is mapped. A RADIUS server that is not explicitly configured as a RADIUS server per port is a **global server**, and can be used to authenticate users on ports to which no RADIUS servers are mapped.

RADIUS server per port configuration notes

- This feature works with 802.1X and multi-device port authentication only.
- You can define up to eight RADIUS servers per Brocade device.

RADIUS configuration example and command syntax

The following shows an example configuration.

```
Brocade(config)#radius-server host 10.10.10.103 auth-port 1812 acct-port 1813
default key mykeyword dot1x port-only
Brocade(config)#radius-server host 10.10.10.104 auth-port 1812 acct-port 1813
default key mykeyword dot1x port-only
Brocade(config)#radius-server host 10.10.10.105 auth-port 1812 acct-port 1813
default key mykeyword dot1x
Brocade(config)#radius-server host 10.10.10.106 auth-port 1812 acct-port 1813
default key mykeyword dot1x
```

The above configuration has the following affect:

- RADIUS servers 10.10.10.103 and 10.10.10.104 will be used only to authenticate users on ports to which the servers are mapped. To map a RADIUS server to a port, refer to [“RADIUS server to individual ports mapping”](#) on page 165.
- RADIUS servers 10.10.10.105 and 10.10.10.106 will be used to authenticate users on ports to which no RADIUS servers are mapped. For example, port e 9, to which no RADIUS servers are mapped, will send a RADIUS request to the first configured RADIUS server, 10.10.10.105. If the request fails, it will go to the second configured RADIUS server, 10.10.10.106. It will not send requests to 10.10.10.103 or 10.10.10.104, since these servers are configured as port servers.

Syntax: `radius-server host <ip-addr> | <server-name> [auth-port <number>] [acct-port <number>] [default key <string> dot1x] [port-only]`

The **host** `<ip-addr>` is the IPv4 address.

The **auth-port** `<number>` parameter is the Authentication port number; it is an optional parameter. The default is 1645.

The **acct-port** `<number>` parameter is the Accounting port number; it is an optional parameter. The default is 1646.

The **default key** `<string> dot1x` parameter indicates that this RADIUS server supports the 802.1X standard. A RADIUS server that supports the 802.1X standard can also be used to authenticate non-802.1X authentication requests.

The **port-only** parameter is optional and specifies that the server will be used only to authenticate users on ports to which it is mapped.

RADIUS server to individual ports mapping

You can map up to eight RADIUS servers to each port on the Brocade device. The port will authenticate users using only the RADIUS servers to which the port is mapped. If there are no RADIUS servers mapped to a port, it will use the “global” servers for authentication.

As in previous releases, a port goes through the list of servers in the order in which it was mapped or configured, until a server that can perform the requested function is found, or until every server in the list has been tried.

RADIUS server-to-ports configuration notes

- This feature works with 802.1X and multic-device port authentication only.
- You can map a RADIUS server to a physical port only. You cannot map a RADIUS server to a VE.

RADIUS server-to-ports configuration example and command syntax

To map a RADIUS server to a port, enter commands such as the following.

```
Brocade(config)#int e 3
Brocade(config-if-e1000-3)#dot1x port-control auto
Brocade(config-if-e1000-3)#use-radius-server 10.10.10.103
Brocade(config-if-e1000-3)#use-radius-server 10.10.10.110
```

With the above configuration, port e 3 would send a RADIUS request to 10.10.10.103 first, since it is the first server mapped to the port. If it fails, it will go to 10.10.10.110.

Syntax: `use-radius-server <ip-addr>`

The **host** `<ip-addr>` is an IPv4 address.

RADIUS parameters

You can set the following parameters in a RADIUS configuration:

- **RADIUS key** – This parameter specifies the value that the Brocade device sends to the RADIUS server when trying to authenticate user access.
- **Retransmit interval** – This parameter specifies how many times the Brocade device will resend an authentication request when the RADIUS server does not respond. The retransmit value can be from 1 – 5 times. The default is 3 times.
- **Timeout** – This parameter specifies how many seconds the Brocade device waits for a response from a RADIUS server before either retrying the authentication request, or determining that the RADIUS servers are unavailable and moving on to the next authentication method in the authentication-method list. The timeout can be from 1 – 15 seconds. The default is 3 seconds.

Setting the RADIUS key

The **key** parameter in the **radius-server** command is used to encrypt RADIUS packets before they are sent over the network. The value for the **key** parameter on the Brocade device should match the one configured on the RADIUS server. The key can be from 1 – 32 characters in length and cannot include any space characters.

To specify a RADIUS server key, enter a command such as the following.

```
Brocade(config)#radius-server key mirabeau
```

Syntax: **radius-server key** [0 | 1] <string>

When you display the configuration of the Brocade device, the RADIUS key is encrypted.

Example

```
Brocade(config)#radius-server key 1 abc
Brocade(config)#write terminal
...
radius-server host 1.2.3.5
radius key 1 $!2d
```

NOTE

Encryption of the RADIUS keys is done by default. The **0** parameter disables encryption. The **1** parameter is not required; it is provided for backwards compatibility.

Setting the retransmission limit

The **retransmit** parameter specifies the maximum number of retransmission attempts. When an authentication request times out, the Brocade software will retransmit the request up to the maximum number of retransmissions configured. The default retransmit value is 3 retries. The range of retransmit values is from 1 – 5.

To set the RADIUS retransmit limit, enter a command such as the following.

```
Brocade(config)#radius-server retransmit 5
```

Syntax: **radius-server retransmit** <number>

Setting the timeout parameter

The **timeout** parameter specifies how many seconds the Brocade device waits for a response from the RADIUS server before either retrying the authentication request, or determining that the RADIUS server is unavailable and moving on to the next authentication method in the authentication-method list. The timeout can be from 1 – 15 seconds. The default is 3 seconds.

```
Brocade(config)#radius-server timeout 5
```

Syntax: **radius-server timeout** *<number>*

Setting RADIUS over IPv6

Brocade devices support the ability to send RADIUS packets over an IPv6 network.

To enable the Brocade device to send RADIUS packets over IPv6, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#radius-server host ipv6 3000::300
```

Syntax: **radius-server host ipv6** *<ipv6-host address>*

The *<ipv6-host address>* is the IPv6 address of the RADIUS server. When you enter the IPv6 host address, you do not need to specify the prefix length. A prefix length of 128 is implied.

Setting authentication-method lists for RADIUS

You can use RADIUS to authenticate Telnet/SSH access and access to Privileged EXEC level and CONFIG levels of the CLI. When configuring RADIUS authentication, you create authentication-method lists specifically for these access methods, specifying RADIUS as the primary authentication method.

Within the authentication-method list, RADIUS is specified as the primary authentication method and up to six backup authentication methods are specified as alternates. If RADIUS authentication fails due to an error, the device tries the backup authentication methods in the order they appear in the list.

When you configure authentication-method lists for RADIUS, you must create a separate authentication-method list for Telnet or SSH CLI access and for CLI access to the Privileged EXEC level and CONFIG levels of the CLI.

To create an authentication-method list that specifies RADIUS as the primary authentication method for securing Telnet access to the CLI.

```
Brocade(config)#enable telnet authentication
Brocade(config)#aaa authentication login default radius local
```

The commands above cause RADIUS to be the primary authentication method for securing Telnet access to the CLI. If RADIUS authentication fails due to an error with the server, local authentication is used instead.

To create an authentication-method list that specifies RADIUS as the primary authentication method for securing access to Privileged EXEC level and CONFIG levels of the CLI.

```
Brocade(config)#aaa authentication enable default radius local none
```

The command above causes RADIUS to be the primary authentication method for securing access to Privileged EXEC level and CONFIG levels of the CLI. If RADIUS authentication fails due to an error with the server, local authentication is used instead. If local authentication fails, no authentication is used; the device automatically permits access.

Syntax: [no] **aaa authentication enable | login default** <method1> [<method2>] [<method3>] [<method4>] [<method5>] [<method6>] [<method7>]

The **web-server | enable | login** parameter specifies the type of access this authentication-method list controls. You can configure one authentication-method list for each type of access.

NOTE

If you configure authentication for Web management access, authentication is performed each time a page is requested from the server. When frames are enabled on the Web Management Interface, the browser sends an HTTP request for each frame. The Brocade device authenticates each HTTP request from the browser. To limit authentications to one per page, disable frames on the Web Management Interface.

The <method1> parameter specifies the primary authentication method. The remaining optional <method> parameters specify additional methods to try if an error occurs with the primary method. A method can be one of the values listed in the Method Parameter column in the following table.

TABLE 25 Authentication method values

Method parameter	Description
line	Authenticate using the password you configured for Telnet access. The Telnet password is configured using the enable telnet password... command. Refer to “Setting a Telnet password” on page 124.
enable	Authenticate using the password you configured for the Super User privilege level. This password is configured using the enable super-user-password... command. Refer to “Setting passwords for management privilege levels” on page 125.
local	Authenticate using a local user name and password you configured on the device. Local user names and passwords are configured using the username... command. Refer to “Local user account configuration” on page 133.
tacacs	Authenticate using the database on a TACACS server. You also must identify the server to the device using the tacacs-server command.
tacacs+	Authenticate using the database on a TACACS+ server. You also must identify the server to the device using the tacacs-server command.
radius	Authenticate using the database on a RADIUS server. You also must identify the server to the device using the radius-server command.
none	Do not use any authentication method. The device automatically permits access.

NOTE

For examples of how to define authentication-method lists for types of authentication other than RADIUS, refer to [“Authentication-method lists”](#) on page 174.

Entering privileged EXEC mode after a Telnet or SSH login

By default, a user enters User EXEC mode after a successful login through Telnet or SSH. Optionally, you can configure the device so that a user enters Privileged EXEC mode after a Telnet or SSH login. To do this, use the following command.

```
Brocade(config)#aaa authentication login privilege-mode
```

Syntax: `aaa authentication login privilege-mode`

The user privilege level is based on the privilege level granted during login.

Configuring enable authentication to prompt for password only

If Enable authentication is configured on the device, when a user attempts to gain Super User access to the Privileged EXEC and CONFIG levels of the CLI, by default he or she is prompted for a username and password. You can configure the Brocade device to prompt only for a password. The device uses the username entered at login, if one is available. If no username was entered at login, the device prompts for both username and password.

To configure the Brocade device to prompt only for a password when a user attempts to gain Super User access to the Privileged EXEC and CONFIG levels of the CLI.

```
Brocade(config)#aaa authentication enable implicit-user
```

Syntax: `[no] aaa authentication enable implicit-user`

RADIUS authorization

Brocade devices support RADIUS authorization for controlling access to management functions in the CLI. Two kinds of RADIUS authorization are supported:

- Exec authorization determines a user privilege level when they are authenticated
- Command authorization consults a RADIUS server to get authorization for commands entered by the user

Configuring exec authorization

When RADIUS exec authorization is performed, the Brocade device consults a RADIUS server to determine the privilege level of the authenticated user. To configure RADIUS exec authorization on the Brocade device, enter the following command.

```
Brocade(config)#aaa authorization exec default radius
```

Syntax: `aaa authorization exec default radius | none`

If you specify **none**, or omit the **aaa authorization exec** command from the device configuration, no exec authorization is performed.

NOTE

If the **aaa authorization exec default radius** command exists in the configuration, following successful authentication the device assigns the user the privilege level specified by the foundry-privilege-level attribute received from the RADIUS server. If the **aaa authorization exec default radius** command does not exist in the configuration, then the value in the foundry-privilege-level attribute is ignored, and the user is granted Super User access.

Also note that in order for the **aaa authorization exec default radius** command to work, either the **aaa authentication enable default radius** command, or the **aaa authentication login privilege-mode** command must also exist in the configuration.

Configuring command authorization

When RADIUS command authorization is enabled, the Brocade device consults the list of commands supplied by the RADIUS server during authentication to determine whether a user can execute a command he or she has entered.

You enable RADIUS command authorization by specifying a privilege level whose commands require authorization. For example, to configure the Brocade device to perform authorization for the commands available at the Super User privilege level (that is; all commands on the device), enter the following command.

```
Brocade(config)#aaa authorization commands 0 default radius
```

Syntax: **aaa authorization commands** <privilege-level> **default radius** | **tacacs+** | **none**

The <privilege-level> parameter can be one of the following:

- **0** – Authorization is performed (that is, the Brocade device looks at the command list) for commands available at the Super User level (all commands)
- **4** – Authorization is performed for commands available at the Port Configuration level (port-config and read-only commands)
- **5** – Authorization is performed for commands available at the Read Only level (read-only commands)

NOTE

RADIUS command authorization can be performed only for commands entered from Telnet or SSH sessions, or from the console. No authorization is performed for commands entered at the Web Management Interface.

NOTE

Since RADIUS command authorization relies on the command list supplied by the RADIUS server during authentication, you cannot perform RADIUS authorization without RADIUS authentication.

Command authorization and accounting for console commands

The Brocade device supports command authorization and command accounting for CLI commands entered at the console. To configure the device to perform command authorization and command accounting for console commands, enter the following.

```
Brocade(config)#enable aaa console
```

Syntax: **enable aaa console**

CAUTION

If you have previously configured the device to perform command authorization using a RADIUS server, entering the **enable aaa console** command may prevent the execution of any subsequent commands entered on the console.

This happens because RADIUS command authorization requires a list of allowable commands from the RADIUS server. This list is obtained during RADIUS authentication. For console sessions, RADIUS authentication is performed only if you have configured Enable authentication and specified RADIUS as the authentication method (for example, with the `aaa authentication enable default radius` command). If RADIUS authentication is never performed, the list of allowable commands is never obtained from the RADIUS server. Consequently, there would be no allowable commands on the console.

RADIUS accounting

Brocade devices support RADIUS accounting for recording information about user activity and system events. When you configure RADIUS accounting on a Brocade device, information is sent to a RADIUS accounting server when specified events occur, such as when a user logs into the device or the system is rebooted.

Configuring RADIUS accounting for Telnet/SSH (Shell) access

To send an Accounting Start packet to the RADIUS accounting server when an authenticated user establishes a Telnet or SSH session on the Brocade device, and an Accounting Stop packet when the user logs out.

```
Brocade(config)#aaa accounting exec default start-stop radius
```

Syntax: `aaa accounting exec default start-stop radius | tacacs+ | none`

Configuring RADIUS accounting for CLI commands

You can configure RADIUS accounting for CLI commands by specifying a privilege level whose commands require accounting. For example, to configure the Brocade device to perform RADIUS accounting for the commands available at the Super User privilege level (that is; all commands on the device), enter the following command.

```
Brocade(config)#aaa accounting commands 0 default start-stop radius
```

An Accounting Start packet is sent to the RADIUS accounting server when a user enters a command, and an Accounting Stop packet is sent when the service provided by the command is completed.

NOTE

If authorization is enabled, and the command requires authorization, then authorization is performed before accounting takes place. If authorization fails for the command, no accounting takes place.

Syntax: `aaa accounting commands <privilege-level> default start-stop radius | tacacs | none`

The `<privilege-level>` parameter can be one of the following:

- **0** – Records commands available at the Super User level (all commands)
- **4** – Records commands available at the Port Configuration level (port-config and read-only commands)
- **5** – Records commands available at the Read Only level (read-only commands)

Configuring RADIUS accounting for system events

You can configure RADIUS accounting to record when system events occur on the Brocade device. System events include rebooting and when changes to the active configuration are made.

The following command causes an Accounting Start packet to be sent to the RADIUS accounting server when a system event occurs, and a Accounting Stop packet to be sent when the system event is completed.

```
Brocade(config)#aaa accounting system default start-stop radius
```

Syntax: `aaa accounting system default start-stop radius | tacacs+ | none`

Configuring an interface as the source for all RADIUS packets

You can designate the lowest-numbered IP address configured an Ethernet port, loopback interface, or virtual interface as the source IP address for all RADIUS packets from the Layer 3 Switch. For configuration details, see [“Specifying a single source interface for specified packet types”](#) on page 977.

Displaying RADIUS configuration information

The **show aaa** command displays information about all TACACS/TACACS+ and RADIUS servers identified on the device.

Example

```
Brocade#show aaa
Tacacs+ key: foundry
Tacacs+ retries: 1
Tacacs+ timeout: 15 seconds
Tacacs+ dead-time: 3 minutes
Tacacs+ Server: 207.95.6.90 Port:49:
                opens=6 closes=3 timeouts=3 errors=0
                packets in=4 packets out=4
no connection
Radius key: networks
Radius retries: 3
Radius timeout: 3 seconds
Radius dead-time: 3 minutes
Radius Server: 207.95.6.90 Auth Port=1645 Acct Port=1646:
                opens=2 closes=1 timeouts=1 errors=0
                packets in=1 packets out=4
no connection
```

The following table describes the RADIUS information displayed by the **show aaa** command.

TABLE 26 Output of the show aaa command for RADIUS

Field	Description
Radius key	The setting configured with the radius-server key command. At the Super User privilege level, the actual text of the key is displayed. At the other privilege levels, a string of periods (....) is displayed instead of the text.
Radius retries	The setting configured with the radius-server retransmit command.
Radius timeout	The setting configured with the radius-server timeout command.
Radius dead-time	The setting configured with the radius-server dead-time command.
Radius Server	For each RADIUS server, the IP address, and the following statistics are displayed: Auth PortRADIUS authentication port number (default 1645) Acct PortRADIUS accounting port number (default 1646) <ul style="list-style-type: none"> • opens - Number of times the port was opened for communication with the server • closes - Number of times the port was closed normally • timeouts - Number of times port was closed due to a timeout • errors - Number of times an error occurred while opening the port • packets in - Number of packets received from the server • packets out - Number of packets sent to the server
connection	The current connection status. This can be “no connection” or “connection active”.

The **show web connection** command displays the privilege level of Web Management Interface users.

Example

```
Brocade#show web-connection
```

```
We management Sessions:
```

User	Privilege	IP address	MAC address	Timeout (secs)	Connection
roy	READ-WRITE	10.1.1.3	0030.488.b84d9	279	HTTPS

Syntax: show web connection

Use the following command to clear web connections:

```
FastIron#clear web-connection
```

Syntax: clear web connection

After issuing the **clear web connection** command, the **show web connection** command displays the following output:

```
Brocade#show web-connection
```

```
No WEB-MANAGEMENT sessions are currently established!
```

Authentication-method lists

To implement one or more authentication methods for securing access to the device, you configure authentication-method lists that set the order in which the authentication methods are consulted.

In an authentication-method list, you specify the access method (Telnet, Web, SNMP, and so on) and the order in which the device tries one or more of the following authentication methods:

- Local Telnet login password
- Local password for the Super User privilege level
- Local user accounts configured on the device
- Database on a TACACS or TACACS+ server
- Database on a RADIUS server
- No authentication

NOTE

The TACACS/TACACS+, RADIUS, and Telnet login password authentication methods are not supported for SNMP access.

NOTE

To authenticate Telnet access to the CLI, you also must enable the authentication by entering the **enable telnet authentication** command at the global CONFIG level of the CLI. You cannot enable Telnet authentication using the Web Management Interface.

NOTE

You do not need an authentication-method list to secure access based on ACLs or a list of IP addresses. Refer to [“ACL usage to restrict remote access”](#) on page 112 or [“Remote access restrictions”](#) on page 115.

In an authentication-method list for a particular access method, you can specify up to seven authentication methods. If the first authentication method is successful, the software grants access and stops the authentication process. If the access is rejected by the first authentication method, the software denies access and stops checking.

However, if an error occurs with an authentication method, the software tries the next method on the list, and so on. For example, if the first authentication method is the RADIUS server, but the link to the server is down, the software will try the next authentication method in the list.

NOTE

If an authentication method is working properly and the password (and user name, if applicable) is not known to that method, this is not an error. The authentication attempt stops, and the user is denied access.

The software will continue this process until either the authentication method is passed or the software reaches the end of the method list. If the Super User level password is not rejected after all the access methods in the list have been tried, access is granted.

Configuration considerations for authentication-method lists

- For CLI access, you must configure authentication-method lists if you want the device to authenticate access using local user accounts or a RADIUS server. Otherwise, the device will authenticate using only the locally based password for the Super User privilege level.
- When no authentication-method list is configured specifically for Web management access, the device performs authentication using the SNMP community strings:
 - For read-only access, you can use the user name “get” and the password “public”. The default read-only community string is “public”.
 - There is no default read-write community string. Thus, by default, you cannot open a read-write management session using the Web Management Interface. You first must configure a read-write community string using the CLI. Then you can log on using “set” as the user name and the read-write community string you configure as the password. Refer to [“TACACS and TACACS+ security”](#) on page 139.
- If you configure an authentication-method list for Web management access and specify “local” as the primary authentication method, users who attempt to access the device using the Web Management Interface must supply a user name and password configured in one of the local user accounts on the device. The user **cannot** access the device by entering “set” or “get” and the corresponding SNMP community string.

Examples of authentication-method lists

The following examples show how to configure authentication-method lists. In these examples, the primary authentication method for each is “local”. The device will authenticate access attempts using the locally configured usernames and passwords.

The command syntax for each of the following examples is provided in [“Command Syntax”](#) on page 176.

Example 1

To configure an authentication-method list for the Web Management Interface, enter a command such as the following.

```
Brocade(config)#aaa authentication web-server default local
```

This command configures the device to use the local user accounts to authenticate access to the device through the Web Management Interface. If the device does not have a user account that matches the user name and password entered by the user, the user is not granted access.

Example 2

To configure an authentication-method list for SNMP, enter a command such as the following.

```
Brocade(config)#aaa authentication snmp-server default local
```

This command allows certain incoming SNMP SET operations to be authenticated using the locally configured usernames and passwords. When this command is enabled, community string validation is not performed for incoming SNMP V1 and V2c packets. This command takes effect as long as the first varbind for SNMP packets is set to one of the following:

- snAgGblPassword=”<username> <password>” (for AAA method local)

- `snAgGblPassword="<password>"` (for AAA method line, enable)

NOTE

Certain SNMP objects need additional validation. These objects include but are not limited to: **snAgReload**, **snAgWriteNVRAM**, **snAgConfigFromNVRAM**, **snAgImgLoad**, **snAgCfgLoad** and **snAgGblTelnetPassword**. For more information, see **snAgGblPassword** in the *IronWare MIB Reference Guide*.

If AAA is set up to check both the username and password, the string contains the username, followed by a space then the password. If AAA is set up to authenticate with the current Enable or Line password, the string contains the password only.

Note that the above configuration can be overridden by the command **no snmp-server pw-check**, which disables password checking for SNMP SET requests.

Example 3

To configure an authentication-method list for the Privileged EXEC and CONFIG levels of the CLI, enter the following command.

```
Brocade(config)#aaa authentication enable default local
```

This command configures the device to use the local user accounts to authenticate attempts to access the Privileged EXEC and CONFIG levels of the CLI.

Example 4

To configure the device to consult a RADIUS server first to authenticate attempts to access the Privileged EXEC and CONFIG levels of the CLI, then consult the local user accounts if the RADIUS server is unavailable, enter the following command.

```
Brocade(config)#aaa authentication enable default radius local
```

Command Syntax

The following is the command syntax for the preceding examples.

Syntax: `[no] aaa authentication snmp-server | web-server | enable | login default <method1> [<method2>] [<method3>] [<method4>] [<method5>] [<method6>] [<method7>]`

The **snmp-server | web-server | enable | login** parameter specifies the type of access this authentication-method list controls. You can configure one authentication-method list for each type of access.

NOTE

TACACS/TACACS+ and RADIUS are supported only with the **enable** and **login** parameters.

The `<method1>` parameter specifies the primary authentication method. The remaining optional `<method>` parameters specify additional methods to try if an error occurs with the primary method. A method can be one of the values listed in the Method Parameter column in the following table.

TABLE 27 Authentication method values

Method parameter	Description
line	Authenticate using the password you configured for Telnet access. The Telnet password is configured using the enable telnet password... command. Refer to “Setting a Telnet password” on page 124.
enable	Authenticate using the password you configured for the Super User privilege level. This password is configured using the enable super-user-password... command. Refer to “Setting passwords for management privilege levels” on page 125.
local	Authenticate using a local user name and password you configured on the device. Local user names and passwords are configured using the username... command. Refer to “Local user account configuration” on page 133.
tacacs	Authenticate using the database on a TACACS server. You also must identify the server to the device using the tacacs-server command.
tacacs+	Authenticate using the database on a TACACS+ server. You also must identify the server to the device using the tacacs-server command.
radius	Authenticate using the database on a RADIUS server. You also must identify the server to the device using the radius-server command. Refer to “RADIUS security” on page 157.
none	Do not use any authentication method. The device automatically permits access.

TCP Flags - edge port security

NOTE

This feature is not supported on FastIron X Series devices.

The edge port security feature works in combination with IP ACL rules, and supports all 6 TCP flags present in the offset 13 of the TCP header:

- +|- urg = Urgent
- +|- ack = Acknowledge
- +|- psh = Push
- +|- rst = Reset
- +|- syn = Synchronize
- +|- fin = Finish

TCP flags can be combined with other ACL functions (such as dscp-marking and traffic policies), giving you greater flexibility when designing ACLs.

The TCP flags feature offers two options, match-all and match-any:

- **Match-any** - Indicates that incoming TCP traffic must be matched against any of the TCP flags configured as part of the match-any ACL rule. In CAM hardware, the number of ACL rules will match the number of configured flags.
- **Match-all** - Indicates that incoming TCP traffic must be matched against all of the TCP flags configured as part of the match-all ACL rule. In CAM hardware, there will be only one ACL rule for all configured flags.

Example

```
Brocade(config-ext-nACL)#permit tcp 1.1.1.1 0.0.0.255 eq 100 2.2.2.2 0.0.0.255  
eq 300 match-all +urg +ack +syn -rst
```

This command configures a single rule in CAM hardware. This rule will contain all of the configured TCP flags (urg, ack, syn, and rst).

Using TCP Flags in combination with other ACL features

The TCP Flags feature has the added capability of being combined with other ACL features.

Example

```
Brocade(config-ext-nACL)#permit tcp any any match-all +urg +ack +syn -rst  
traffic-policy test
```

This command configures the ACL to match incoming traffic with the TCP Flags urg, ack, and syn and also to apply the traffic policy (rate, limit, etc.) to the matched traffic.

```
Brocade(config-ext-nACL)#permit tcp any any match-all +urg +ack +syn -rst tos  
normal
```

This command configures the ACL to match incoming traffic with the flags urg, ack, and syn, and also sets the tos bit to normal when the traffic exits the device.

NOTE

TCP Flags combines the functionality of older features such as TCP Syn Attack and TCP Establish. Avoid configuring these older features on a port where you have configured TCP Flags. TCP Flags can perform all of the functions of TCP Syn Attack and TCP Establish, and more. However, if TCP Syn Attack is configured on a port along with TCP Flags, TCP Syn Attack will take precedence.

NOTE

If an ACL clause with match-any exists, and the system runs out of CAM, if the total number of TCP rules to TCP Flags will not fit within 1021 entries (the maximum rules allowed per device), then none of the TCP Flag rules will be programmed into the CAM hardware.

NOTE

If a range option and match-any TCP-flags are combined in the same ACL, the total number of rules will be calculated as: Total number of rules in CAM hardware = (number of rules for range)* (number of rules for match-any TCP-flags).

SSH2 and SCP

Table 28 lists individual Brocade switches and the SSH2 and Secure Copy features they support.

TABLE 28 Supported SSH2 and Secure Copy features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Secure Shell (SSH) version 2	Yes	Yes	Yes	Yes	Yes
AES encryption for SSH2	Yes	Yes	Yes	Yes	Yes
Optional parameters for SSH2	Yes	Yes	Yes	Yes	Yes
Using secure copy (SCP) with SSH2	Yes	Yes	Yes	Yes	Yes
Filtering SSH access using ACLs	Yes	Yes	Yes	Yes	Yes
Terminating an active SSH connection	Yes	Yes	Yes	Yes	Yes
SSH client	Yes	Yes	Yes	Yes	Yes

SSH version 2 overview

Secure Shell (SSH) is a mechanism for allowing secure remote access to management functions on a Brocade device. SSH provides a function similar to Telnet. Users can log into and configure the device using a publicly or commercially available SSH client program, just as they can with Telnet. However, unlike Telnet, which provides no security, SSH provides a secure, encrypted connection to the device.

The Brocade SSH2 implementation is compatible with all versions of the SSH2 protocol (2.1, 2.2, and so on). At the beginning of an SSH session, the Brocade device negotiates the version of SSH2 to be used. The highest version of SSH2 supported by both the Brocade device and the client is the version that is used for the session. Once the SSH2 version is negotiated, the encryption algorithm with the highest security ranking is selected to be used for the session.

Brocade devices also support Secure Copy (SCP) for securely transferring files between a Brocade device and SCP-enabled remote hosts.

NOTE

The SSH feature includes software that is copyright Allegro Software Development Corporation.

SSH2 is supported in the Layer 2 and Layer 3 codes.

SSH2 is a substantial revision of Secure Shell, comprising the following hybrid protocols and definitions:

- SSH Transport Layer Protocol
- SSH Authentication Protocol
- SSH Connection Protocol

- SECSH Public Key File Format
- SSH Fingerprint Format
- SSH Protocol Assigned Numbers
- SSH Transport Layer Encryption Modes
- SCP/SSH URI Format

Tested SSH2 clients

The following SSH clients have been tested with SSH2:

- SSH Secure Shell 3.2.3
- Van Dyke SecureCRT 5.2.2
- F-Secure SSH Client 5.3 and 6.0
- PuTTY 0.60
- OpenSSH 4.3p2
- Brocade FastIron SSH Client

NOTE

Supported SSH client public key sizes are 1024 bits for DSA keys, and 1024 or 2048 bits for RSA keys.

SSH2 supported features

SSH2 (Secure Shell version 2 protocol) provides an SSH server and an SSH client. The SSH server allows secure remote access management functions on a Brocade device. SSH provides a function that is similar to Telnet, but unlike Telnet, SSH provides a secure, encrypted connection.

Brocade SSH2 support includes the following:

- Key exchange methods are **diffie-hellman-group1-sha1**
- The supported public key algorithms are **ssh-dss** and **ssh-rsa**.
- Encryption is provided with **3des-cbc**, **aes128-cbc**, **aes192-cbc** or **aes256-cbc**. AES encryption has been adopted by the U.S. Government as an encryption standard.
- Data integrity is ensured with **hmac-sha1**.
- Supported authentication methods are **Password** and **publickey**.
- Five inbound SSH connection at one time are supported.
- One outbound SSH is supported.

SSH2 unsupported features

The following are not supported with SSH2:

- Compression
- TCP/IP port forwarding, X11 forwarding, and secure file transfer
- SSH version 1

SSH2 authentication types

The Brocade implementation of SSH2 supports the following types of user authentication:

- **DSA challenge-response authentication**, where a collection of public keys are stored on the device. Only clients with a private key that corresponds to one of the stored public keys can gain access to the device using SSH.
- **RSA challenge-response authentication**, where a collection of public keys are stored on the device. Only clients with a private key that corresponds to one of the stored public keys can gain access to the device using SSH.
- **Password authentication**, where users attempting to gain access to the device using an SSH client are authenticated with passwords stored on the device or on a TACACS or TACACS+ server or a RADIUS server.

Configuring SSH2

You can configure the device to use any combination of these authentication types. The SSH server and client negotiate which type to use.

To configure SSH2, follow these steps:

1. Generate a host Digital Signature Algorithm (DSA) or Really Secure Algorithm (RSA) public and private key pair for the device.

See the section [“Enabling and disabling SSH by generating and deleting host keys”](#) on page 181.

2. Configure DSA or RSA challenge-response authentication.

See the section [“Configuring DSA or RSA challenge-response authentication”](#) on page 183.

3. Set optional parameters.

See the section [“Optional SSH parameters”](#) on page 185.

Enabling and disabling SSH by generating and deleting host keys

To enable SSH, you generate a public and private DSA or RSA host key pair on the device. The SSH server on the Brocade device uses this host DSA or RSA key pair, along with a dynamically generated server DSA or RSA key pair, to negotiate a session key and encryption method with the client trying to connect to it.

While the SSH listener exists at all times, sessions can not be started from clients until a host key is generated. After a host key is generated, clients can start sessions.

To disable SSH, you delete all of the host keys from the device.

When a host key pair is generated, it is saved to the flash memory of all management modules. When a host key pair is deleted, it is deleted from the flash memory of all management modules.

The time to initially generate SSH keys varies depending on the configuration, and can be from a under a minute to several minutes.

NOTE

If you have generated SSH keys on the switch, you should delete and regenerate it when you upgrade or downgrade the software version before ssh session.

Setting the CPU priority for key generation (ICX 6430 and ICX 6450 only)

Generating the key is a resource-intensive operation. You can set the priority for this operation to high so that the device allocates more CPU time for this operation. So you must use this option only when the device is in the maintenance window. This option reduces the time taken for key generation.

To set high priority for the key generation operation, enter the following command:

```
Brocade(config)#crypto-gen priority high
```

Syntax: `crypto key crypto-gen priority default | high`

The **default** keyword sets the priority as default. The key generation task is handled with the regular priority.

The **high** keyword sets the high priority for the key generation task. Use this option only when the device is in the maintenance window.

Generating and deleting a DSA key pair

To generate a DSA key pair, enter the following command.

```
Brocade(config)#crypto key generate dsa
```

To delete the DSA host key pair, enter the following command.

```
Brocade(config)#crypto key zeroize dsa
```

Syntax: `crypto key generate | zeroize dsa`

The **generate** keyword places a host key pair in the flash memory and enables SSH on the device, if it is not already enabled.

The **zeroize** keyword deletes the host key pair from the flash memory. This disables SSH if no other server host keys exist on the device.

The **dsa** keyword specifies a DSA host key pair. This keyword is optional. If you do not enter it, the command **crypto key generate** generates a DSA key pair by default, and the command **crypto key zeroize** works as described in [“Deleting DSA and RSA key pairs”](#) on page 183.

Generating and deleting an RSA key pair

To generate an RSA key pair, enter a command such as the following:

```
Brocade(config)#crypto key generate rsa modulus 2048
```

To delete the RSA host key pair, enter the following command.

```
Brocade(config)#crypto key zeroize rsa
```

Syntax: `crypto key generate | zeroize rsa [modulus modulus-size]`

The **generate** keyword places an RSA host key pair in the flash memory and enables SSH on the device, if it is not already enabled.

The optional [**modulus** *modulus-size*] parameter specifies the modulus size of the RSA key pair, in bits. The valid values for *modulus-size* are 1024 or 2048. The default value is 1024.

The **zeroize** keyword deletes the RSA host key pair from the flash memory. This disables SSH if no other authentication keys exist on the device.

The **rsa** keyword specifies an RSA host key pair.

NOTE

On ICX 6430 and ICX 6450 devices, the **crypto key generate** command can take up to 30 minutes to complete.

Deleting DSA and RSA key pairs

To delete DSA and RSA key pairs from the flash memory, enter the following command:

```
Brocade(config)#crypto key zeroize
```

Syntax: **crypto key zeroize**

The **zeroize** keyword deletes the host key pair from the flash memory. This disables SSH.

Providing the public key to clients

The host DSA or RSA key pair is stored in the system-config file of the Brocade device. Only the public key is readable. Some SSH client programs add the public key to the known hosts file automatically. In other cases, you must manually create a known hosts file and place the public key of the Brocade device in it.

If you are using SSH to connect to a Brocade device from a UNIX system, you may need to add the public key on the Brocade device to a “known hosts” file on the client UNIX system; for example, \$HOME/.ssh/known_hosts. The following is an example of an entry in a known hosts file.

```
AAAAB3NzaC1kc3MAAACBAPY8ZOHY2yF5SJA6XYC9HRwNHxaehvx5wOJ0rzZdzoSOXxbET

```

Configuring DSA or RSA challenge-response authentication

With DSA or RSA challenge-response authentication, a collection of clients' public keys are stored on the Brocade device. Clients are authenticated using these stored public keys. Only clients that have a private key that corresponds to one of the stored public keys can gain access to the device using SSH.

When DSA or RSA challenge-response authentication is enabled, the following events occur when a client attempts to gain access to the device using SSH:

1. The client sends its public key to the Brocade device.
2. The Brocade device compares the client public key to those stored in memory.
3. If there is a match, the Brocade device uses the public key to encrypt a random sequence of bytes.
4. The Brocade device sends these encrypted bytes to the client.
5. The client uses its private key to decrypt the bytes.
6. The client sends the decrypted bytes back to the Brocade device.
7. The Brocade device compares the decrypted bytes to the original bytes it sent to the client. If the two sets of bytes match, it means that the client private key corresponds to an authorized public key, and the client is authenticated.

Setting up DSA or RSA challenge-response authentication consists of the following steps.

1. Import authorized public keys into the Brocade device.
2. Enable DSA or RSA challenge response authentication.

Importing authorized public keys into the Brocade device

SSH clients that support DSA or RSA authentication normally provide a utility to generate a DSA or RSA key pair. The private key is usually stored in a password-protected file on the local host; the public key is stored in another file and is not protected. You must import the client public key for each client into the Brocade device.

Collect one public key of each key type (DSA and/or RSA) from each client to be granted access to the Brocade device and place all of these keys into one file. This public key file may contain up to 32 keys. The following is an example of a public key file containing one public key:

```
----- BEGIN SSH2 PUBLIC KEY -----
Comment: DSA Public Key
AAAAB3NzaC1kc3MAAACBAPY8ZOHY2yFSJA6XYC9HRwNHxahvx5w0J0rzZdzoSOXxbET
W6ToHv8D1UJ/
z+zHo9Fiko5XybZnDiABDhtblQ+Yp7StxyltHnXF1YLfKD1G4T6JYrdH YI14Om

GfJ0/RHd+NjB4eolD+0dix6tXwYGN7PKS5R/FXPNwxHPapcj9uL1Jn2AWQ2dsknf+i/FAA
vioUPkmdMc0zuWoSOEsSNhVDtX3WdvVcGcBq9cetzrtOKW0ocJmJ80qadxTRHtUAAACB
AN7CY+KKv1gHpRzFwdQm7HK9bb1LAo2KwaoXnadFgeptNBQeSXG1vO+JsvphVMBJc9HS
n24VYtYtsMu74qXviYjziVucWKjjKEb11juqnF0GD1B3VvmxHLmxnAz643WK42Z7dLM5
sY29ouezv4Xz2PuMch5VGPP+CDqzCM4loWgV
----- END SSH2 PUBLIC KEY -----
```

NOTE

Each key in the public key file must begin and end with the first and last lines in this example. If your client does not include these lines in the public key, you must manually add them.

Import the authorized public keys into the Brocade device active configuration by loading this public key file from a TFTP server.

To load a public key file called pkeys.txt from a TFTP server, enter a command such as the following:

```
Brocade(config)#ip ssh pub-key-file tftp 192.168.1.234 pkeys.txt
```

Syntax: `ip ssh pub-key-file tftp <tftp-server-ip-addr> <filename> | remove`

The `<tftp-server-ip-addr>` variable is the IP address of the tftp server that contains the public key file that you want to import into the Brocade device.

The `<filename>` variable is the name of the public key file that you want to import into the Brocade device.

The **remove** parameter deletes the public keys from the device.

To display the currently loaded public keys, enter the following command.

```
Brocade#show ip client-pub-key
---- BEGIN SSH2 PUBLIC KEY ----
Comment: DSA Public Key
AAAAB3NzaC1kc3MAAACBAPY8ZOHY2yFSJA6XYC9HRwNHxaehvx5wOJ0rzZdzoSOXxbET

---- END SSH2 PUBLIC KEY ----
```

Syntax: `show ip client-pub-key [begin <expression> | exclude <expression> | include <expression>]`

To clear the public keys from the buffers, enter the following command.

```
Brocade#clear public-key
```

Syntax: `clear public-key`

Enabling DSA or RSA challenge-response authentication

DSA and RSA challenge-response authentication is enabled by default. You can disable or re-enable it manually.

To enable DSA and RSA challenge-response authentication.

```
Brocade(config)#ip ssh key-authentication yes
```

To disable DSA and RSA challenge-response authentication.

```
Brocade(config)#ip ssh key-authentication no
```

Syntax: `ip ssh key-authentication yes | no`

Optional SSH parameters

You can adjust the following SSH settings on the Brocade device:

- The number of SSH authentication retries
- The user authentication method the Brocade device uses for SSH connections
- Whether the Brocade device allows users to log in without supplying a password

- The port number for SSH connections
- The SSH login timeout value
- A specific interface to be used as the source for all SSH traffic from the device
- The maximum idle time for SSH sessions

Setting the number of SSH authentication retries

By default, the Brocade device attempts to negotiate a connection with the connecting host three times. The number of authentication retries can be changed to between 1 – 5.

For example, the following command changes the number of authentication retries to 5.

```
Brocade(config)#ip ssh authentication-retries 5
```

Syntax: `ip ssh authentication-retries <number>`

Deactivating user authentication

After the SSH server on the Brocade device negotiates a session key and encryption method with the connecting client, user authentication takes place. The Brocade implementation of SSH supports DSA or RSA challenge-response authentication and password authentication.

With DSA or RSA challenge-response authentication, a collection of clients' public keys are stored on the Brocade device. Clients are authenticated using these stored public keys. Only clients that have a private key that corresponds to one of the stored public keys can gain access to the device using SSH.

With password authentication, users are prompted for a password when they attempt to log into the device (provided empty password logins are not allowed). If there is no user account that matches the user name and password supplied by the user, the user is not granted access.

You can deactivate one or both user authentication methods for SSH. Note that deactivating both authentication methods essentially disables the SSH server entirely.

To disable DSA or RSA challenge-response authentication, enter the following command.

```
Brocade(config)#ip ssh key-authentication no
```

Syntax: `ip ssh key-authentication yes | no`

The default is **yes**.

To deactivate password authentication, enter the following command.

```
Brocade(config)#ip ssh password-authentication no
```

Syntax: `ip ssh password-authentication no | yes`

The default is **yes**.

Enabling empty password logins

By default, empty password logins are not allowed. This means that users with an SSH client are always prompted for a password when they log into the device. To gain access to the device, each user must have a user name and password. Without a user name and password, a user is not granted access.

If you enable empty password logins, users are **not** prompted for a password when they log in. Any user with an SSH client can log in without being prompted for a password.

To enable empty password logins, enter the following command.

```
Brocade(config)#ip ssh permit-empty-passwd yes
```

Syntax: `ip ssh permit-empty-passwd no | yes`

Setting the SSH port number

By default, SSH traffic occurs on TCP port 22. You can change this port number. For example, the following command changes the SSH port number to 2200.

```
Brocade(config)#ip ssh port 2200
```

Note that if you change the default SSH port number, you must configure SSH clients to connect to the new port. Also, you should be careful not to assign SSH to a port that is used by another service. If you change the SSH port number, Brocade recommends that you change it to a port number greater than 1024.

Syntax: `ip ssh port <number>`

Setting the SSH login timeout value

When the SSH server attempts to negotiate a session key and encryption method with a connecting client, it waits a maximum of 120 seconds for a response from the client. If there is no response from the client after 120 seconds, the SSH server disconnects. You can change this timeout value to between 1 – 120 seconds. For example, to change the timeout value to 60 seconds, enter the following command.

```
Brocade(config)#ip ssh timeout 60
```

Syntax: `ip ssh timeout <seconds>`

Designating an interface as the source for all SSH packets

You can designate a loopback interface, virtual interface, or Ethernet port as the source for all SSH packets from the device. For details, see [“Specifying a single source interface for specified packet types”](#) on page 977.

Configuring the maximum idle time for SSH sessions

By default, SSH sessions do not time out. Optionally, you can set the amount of time an SSH session can be inactive before the Brocade device closes it. For example, to set the maximum idle time for SSH sessions to 30 minutes, enter the following command.

```
Brocade(config)#ip ssh idle-time 30
```

Syntax: `ip ssh idle-time <minutes>`

If an established SSH session has no activity for the specified number of minutes, the Brocade device closes it. An idle time of 0 minutes (the default value) means that SSH sessions never time out. The maximum idle time for SSH sessions is 240 minutes.

Filtering SSH access using ACLs

You can permit or deny SSH access to the Brocade device using ACLs. To use ACLs, first create the ACLs you want to use. You can specify a numbered standard IPv4 ACL, a named standard IPv4 ACL

Enter commands such as the following.

```
Brocade(config)#access-list 10 permit host 192.168.144.241
Brocade(config)#access-list 10 deny host 192.168.144.242 log
Brocade(config)#access-list 10 permit host 192.168.144.243
Brocade(config)#access-list 10 deny any
Brocade(config)#ssh access-group 10
```

Syntax: `ssh access-group <standard-named-acl> | <standard-numbered-acl>`

Terminating an active SSH connection

To terminate one of the active SSH connections, enter the following command

```
Brocade#kill ssh 1
```

Syntax: `kill ssh <connection-id>`

Displaying SSH information

Up to five SSH connections can be active on the Brocade device.

Displaying SSH connection information

To display information about SSH connections, enter the **show ip ssh** command.

```
Brocade#show ip ssh
Connection  Version      Encryption      Username      HMAC          Server Hostkey      IP Address
Inbound:
  1          SSH-2        3des-cbc       Raymond      hmac-sha1     ssh-dss             10.120.54.2
Outbound:
  6          SSH-2        aes256-cbc     Steve        hmac-sha1     ssh-dss             10.37.77.15
```

```
SSH-v2.0 enabled; hostkey: DSA(1024), RSA(2048)
```

Syntax: `show ip ssh [begin <expression> | exclude <expression> | include <expression>]`

This display shows the following information about the active SSH connections.

TABLE 29 SSH connection information

Field	Description
Inbound	Connections listed under this heading are inbound.
Outbound	Connections listed under this heading are outbound.
Connection	The SSH connection ID.
Version	The SSH version number.

TABLE 29 SSH connection information (Continued)

Field	Description
Encryption	The encryption method used for the connection.
Username	The user name for the connection.
HMAC	The HMAC version
Server Hostkey	The type of server hostkey. This can be DSA or RSA.
IP Address	The IP address of the SSH client
SSH-v2.0 enabled	Indicates that SSHv2 is enabled.
hostkey	Indicates that at least one host key is on the device. It is followed by a list of the the host key types and modulus sizes.

Displaying SSH configuration information

To display SSH configuration information, use the **show ip ssh config** command:

```
Brocade# show ip ssh config
SSH server           :Enabled
SSH port             :22
Encryption           :AES-256 AES-192 AES-128 3-DES
Permit empty password :Yes
Authentication methods :Password Public-key Interactive
Authentication retries :10
Login timeout (seconds) :20
Idle timeout (minutes) :10
Strict management VRF :Enabled
SCP                  :Disabled
SSH IPv4 clients      :200.200.200.201. 200.200.200.202. 200.200.200.203
SSH IPv6 clients       :3ffe:1934:4545:3112:2040:f8ff:fe21:6001
SSH IPv4 access-list   :4
SSH IPv6 access-list   :ssh_ipv6_acl
Brocade#
```

Syntax: show ip ssh config

This display shows the following information.

Field	Description
SSH server	SSH server is enabled or disabled
SSH port	SSH port number
Encryption	The encryption used for the SSH connection. The following values are displayed when AES only is enabled: <ul style="list-style-type: none"> AES-256, AES-192, and AES-128 indicate the different AES methods used for encryption. 3-DES indicates 3-DES algorithm is used for encryption.
Permit empty password	Empty password login is allowed or not allowed.

Field	Description
Authentication methods	The authentication methods used for SSH. The authentication can have one or more of the following values: <ul style="list-style-type: none"> • Password - indicates that you are prompted for a password when attempting to log into the device. • Public-key - indicates that DSA or RSA challenge-response authentication is enabled. • Interactive - indicates the interactive authentication si enabled.
Authentication retries	The number of authentication retries. This number can be from 1 to 5.
Login timeout (seconds)	SSH login timeout value in seconds. This can be from 0 to 120.
Idle timeout (minutes)	SSH idle timeout value in minutes. This can be from 0 to 240.
Strict management VRF	Strict management VRF is enabled or disabled.
SCP	SCP is enabled or disabled.
SSH IPv4 clients	The list of IPv4 addresses to which SSH access is allowed. The default is "All".
SSH IPv6 clients	The list of IPv6 addresses to which SSh access is allowed. Default "All".
SSH IPv4 access-list	The IPv4 ACL used to permit or deny access using SSH.
SSH IPv6 access-list	The IPv6 ACL used to permit or deny access to device using SSH.

Displaying additional SSH connection information

The **show who** command also displays information about SSH connections:

```
Brocade#show who
  Console connections:
    Established
    you are connecting to this session
    2 minutes 56 seconds in idle

SSH server status: Enabled
SSH connections (inbound):
1. established, client ip address 2.2.2.1, server hostkey DSA
   1 minutes 15 seconds in idle
2. established, client ip address 2.2.2.2, server hostkey RSA
   2 minutes 25 seconds in idle
SSH connection (outbound):
3. established, server ip address 10.37.77.15, server hostkey RSA
   7 seconds in idle
```

show who [**begin** <expression> | **exclude** <expression> | **include** <expression>]

Secure copy with SSH2

Secure Copy (SCP) uses security built into SSH to transfer image and configuration files to and from the device. SCP automatically uses the authentication methods, encryption algorithm, and data compression level configured for SSH. For example, if password authentication is enabled for SSH, the user is prompted for a user name and password before SCP allows a file to be transferred. No additional configuration is required for SCP on top of SSH.

You can use SCP to copy files on the Brocade device, including the startup configuration and running configuration files, to or from an SCP-enabled remote host.

Enabling and disabling SCP

SCP is enabled by default and can be disabled. To disable SCP, enter the following command.

```
Brocade(config)#ip ssh scp disable
```

Syntax: `ip ssh scp disable | enable`

NOTE

If you disable SSH, SCP is also disabled.

Secure copy configuration notes

- When using SCP, enter the **scp** commands on the SCP-enabled client, rather than the console on the Brocade device.
- Certain SCP client options, including -p and -r, are ignored by the SCP server on the Brocade device. If an option is ignored, the client is notified.
- An SCP AES copy of the running or start configuration file from the Brocade device to Linux WS 4 or 5 may fail if the configuration size is less than 700 bytes. To work around this issue, use PuTTY to copy the file.

Example file transfers using SCP

The following are examples of using SCP to transfer files to and from a Brocade device.

Copying a file to the running config

To copy a configuration file (c:\cfg\brocade.cfg) to the running configuration file on a Brocade device at 192.168.1.50 and log in as user terry, enter the following command on the SCP-enabled client.

```
C:\> scp c:\cfg\brocade.cfg terry@192.168.1.50:runConfig
```

If password authentication is enabled for SSH, the user is prompted for user terry password before the file transfer takes place.

Copying a file to the startup config

To copy the configuration file to the startup configuration file, enter the following command.

```
C:\> scp c:\cfg\brocade.cfg terry@192.168.1.50:startConfig
```

Copying the running config file to an SCP-enabled client

To copy the running configuration file on the Brocade device to a file called c:\cfg\fdryrun.cfg on the SCP-enabled client, enter the following command.

```
C:\> scp terry@192.168.1.50:runConfig c:\cfg\brcdrun.cfg
```

Copying the startup config file to an SCP-enabled client

To copy the startup configuration file on the Brocade device to a file called c:\cfg\brcdstart.cfg on the SCP-enabled client, enter the following command.

```
C:\> scp terry@192.168.1.50:startConfig c:\cfg\brcdstart.cfg
```

To overwrite the running configuration file

```
C:\> scp c:\cfg\brocade.cfg terry@192.168.1.50:runConfig-overwrite
```

Copying a software image file to flash memory

The **scp** command syntax differs between device series. Use the command syntax in the appropriate section.

Brocade FCX Series, ICX 6610, and FastIron X Series Devices

To copy a software image file from an SCP-enabled client to the **primary** flash on these devices, enter one of the following commands.

```
C:\> scp FCXR07000.bin terry@192.168.1.50:flash:primary
```

or

```
C:\> scp terry@192.168.1.50:flash:primary FCXR07000.bin
```

To copy a software image file from an SCP-enabled client to the **secondary** flash on these devices, enter one of the following commands.

```
C:\> scp FCXR07000.bin terry@192.168.1.50:flash:secondary
```

or

```
C:\> scp terry@192.168.1.50:flash:secondary FCXR07000.bin
```

NOTE

On ICX 6430 and ICX 6450 devices, you can use the same syntax as FCX devices. However, after the copy operation is completed at the host, you do not get the command prompt back because the switch is synchronizing the image to flash. To ensure that you have successfully copied the file, issue the **show flash** command. If the copy operation is not complete, the **show flash** command output will show the partition (primary or secondary) as **EMPTY**.

FastIron WS devices

To copy a software image file from an SCP-enabled client to the **primary** flash on these devices, enter the following command.

```
C:\> scp SXL03200.bin terry@192.168.1.50:flash:primary.bin
```

or

```
C:\> scp terry@192.168.1.50:flash:primary.bin SXL03200.bin
```

To copy a software image file from an SCP-enabled client to the **secondary** flash on these devices, enter the following command.

```
C:\> scp SXL03200.bin terry@192.168.1.50:flash:secondary.bin
```

or

```
C:\> scp terry@192.168.1.50:flash:secondary.bin SXL03200.bin
```

NOTE

The Brocade device supports only one SCP copy session at a time.

Copying a Software Image file from flash memory

The **scp** command syntax differs between device series. Use the command syntax in the appropriate section.

Brocade FCX Series, ICX Series, and FastIron X Series Devices

To copy a software image file from the **primary** flash on these devices to an SCP-enabled client, enter a command such as the following.

```
C:\> scp terry@192.168.1.50:flash:primary FCXR07000.bin
```

To copy a software image file from the **secondary** flash on these devices to an SCP-enabled client, enter a command such as the following.

```
C:\> scp terry@192.168.1.50:flash:secondary FCXR07000.bin
```

FastIron WS Series devices

To copy a software image from the **primary** flash on these devices to an SCP-enabled client, enter a command such as the following.

```
C:\> scp terry@192.168.1.50:flash:primary.bin SXL03200.bin
```

To copy a software image from the secondary flash on these devices to an SCP-enabled client, enter a command such as the following.

```
C:\> scp terry@192.168.1.50:flash:secondary.bin SXL03200.bin
```

NOTE

The Brocade device supports only one SCP copy session at a time.

Importing a digital certificate using SCP

To import a digital certificate using SCP, enter a command such as the following one:

```
C:\> scp certfile user@192.168.89.210:sslCert
```

Syntax: `scp <certificate-filename> <user>@<ip-address>:sslCert.`

The `<ip-address>` variable is the IP address of the server from which the digital certificate file is downloaded.

The `<certificate-filename>` variable is the file name of the digital certificate that you are importing to the device.

The **scp** command can be used when TFTP access is unavailable or not permitted and the command has an equivalent functionality to the **ip ssl certificate-data-file tftp**. For more information on the **ip ssl certificate-data-file tftp** command, refer to [“Importing digital certificates and RSA private key files”](#) on page 138.

Importing an RSA private key

To import an RSA private key from a client using SCP, enter a command such as the following one:

```
Brocade(config)# scp keyfile user@192.168.9.210:sslPrivKey
```

Syntax: `scp <key-filename> <user>@<ip-address>: sslPrivKey`

The `<ip-address>` variable is the IP address of the server that contains the private key file.

The `<key-filename>` variable is the file name of the private key that you want to import into the device.

The **scp** command can be used when TFTP access is unavailable or not permitted and the command has an equivalent functionality to the **ip ssl private-key-file tftp** command. For more information on the **ip ssl private-key-file tftp** command, refer to [“Importing digital certificates and RSA private key files”](#) on page 138.

Importing a DSA or RSA public key

To import a DSA or RSA public key from a client using SCP, enter a command such as the following one:

```
Brocade(config)# scp pkeys.txt user@192.168.1.234:sshPubKey
```

Syntax: `scp <key-filename> <user>@<ip-address>:sshPubKey`

The `<ip-address>` variable is the IP address of the server that contains the public key file.

The `<key-filename>` variable is the name of the DSA or RSA public key file that you want to import into the device.

The **scp** command can be used when TFTP access is unavailable or not permitted and the command has an equivalent function to the **ip ssh pub-key-file tftp** command. For more information on the **ip ssh pub-key-file tftp** command, refer to [“Importing authorized public keys into the Brocade device”](#) on page 184.

SSH2 client

SSH2 client allows you to connect from a Brocade device to an SSH2 server, including another Brocade device that is configured as an SSH2 server. You can start an outbound SSH2 client session while you are connected to the device by any connection method (SSH2, Telnet, console). Brocade devices support one outbound SSH2 client session at a time.

The supported SSH2 client features are as follows:

- Encryption algorithms, in the order of preference:
 - aes256-cbc
 - aes192-cbc
 - aes128-cbc
 - 3des-cbc
- SSH2 client session authentication algorithms:
 - Password authentication
 - Public Key authentication
- Message Authentication Code (MAC) algorithm: hmac-sha1
- Key exchange algorithm: diffie-hellman-group1-sha1
- No compression algorithms are supported.
- The client session can be established through either in-band or out-of-band management ports.
- The client session can be established through IPv4 or IPv6 protocol access.
- The client session can be established to a server listening on a non-default SSH port.

Enabling SSH2 client

To use SSH2 client, you must first enable SSH2 server on the device. See [“SSH2 authentication types”](#) on page 181.

When SSH2 server is enabled, you can use SSH client to connect to an SSH server using password authentication.

Configuring SSH2 client public key authentication

To use SSH client for public key authentication, you must generate SSH client authentication keys and export the public key to the SSH servers to which you want to connect.

The following sections describe how to configure SSH client public key authentication:

- [“Generating and deleting a client DSA key pair”](#) on page 196
- [“Generating and deleting a client RSA key pair”](#) on page 196
- [“Exporting client public keys”](#) on page 196

Generating and deleting a client DSA key pair

To generate a client DSA key pair, enter the following command.

```
Brocade(config)#crypto key client generate dsa
```

To delete the DSA host key pair, enter the following command.

```
Brocade(config)#crypto key client zeroize dsa
```

Syntax: `crypto key client generate | zeroize dsa`

The **generate** keyword places a host key pair in the flash memory.

The **zeroize** keyword deletes the host key pair from the flash memory.

The **dsa** keyword specifies a DSA host key pair.

Generating and deleting a client RSA key pair

To generate a client RSA key pair, enter a command such as the following:

```
Brocade(config)#crypto key client generate rsa modulus 2048
```

To delete the RSA host key pair, enter the following command.

```
Brocade(config)#crypto key client zeroize rsa
```

Syntax: `crypto key client generate | zeroize rsa [modulus modulus-size]`

The **generate** keyword places an RSA host key pair in the flash memory.

The **zeroize** keyword deletes the RSA host key pair from the flash memory.

The optional `[modulus modulus-size]` parameter specifies the modulus size of the RSA key pair, in bits. The valid values for *modulus-size* are 1024 or 2048. It is used only with the **generate** parameter. The default value is 1024.

The **rsa** keyword specifies an RSA host key pair.

Exporting client public keys

Client public keys are stored in the following files in flash memory:

- A DSA key is stored in the file **\$\$sshdapub.key**.
- An RSA key is stored in the file **\$\$sshrapub.key**.

To copy key files to a TFTP server, you can use the **copy flash tftp** command.

You must copy the public key to the SSH server. If the SSH server is a Brocade device, see the section [“Importing authorized public keys into the Brocade device”](#) on page 184.

Using SSH2 client

To start an SSH2 client connection to an SSH2 server using password authentication, enter a command such as the following:

```
Brocade# ssh 10.10.10.2
```

To start an SSH2 client connection to an SSH2 server using public key authentication, enter a command such as the following:

```
Brocade# ssh 10.10.10.2 public-key dsa
```

Syntax: `ssh ipv4Addr | ipv6Addr | host-name [public-key [dsa | rsa]] [port portnum]`

The *ipv4Addr* | *ipv6Addr* | *host-name* variable identifies an SSH2 server. You identify the server to connect to by entering its IPv4 or IPv6 address or its hostname.

The optional [**public-key** [**dsa** | **rsa**]] parameter specifies the type of public key authentication to use for the connection, either DSA or RSA. If you do not enter this parameter, the default authentication type is password.

The optional **port** *portnum* parameter specifies that the SSH2 connection will use a non-default SSH2 port, where *portnum* is the port number. The default port number is 22.

Displaying SSH2 client information

For information about displaying SSH2 client information, see the following sections:

- [“Displaying SSH connection information”](#) on page 188
- [“Displaying additional SSH connection information”](#) on page 190

SSH2 client

Software-based Licensing

Table 30 lists the individual Brocade FastIron switches and the software licensing features they support.

TABLE 30 Supported software licensing features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6450
Software-based licensing	Yes	Yes	Yes	Yes	Yes
License generation	(FESX6, FSX 800 and FSX 1600 only)				
License query					
Deleting a license					

Software license terminology

This section defines the key terms used in this chapter.

- **Entitlement certificate** – The proof-of-purchase certificate (paper-pack) issued by Brocade when a license is purchased. The certificate contains a unique transaction key that is used in conjunction with the License ID of the Brocade device to generate and download a software license from the Brocade software portal.
- **License file** – The file produced by the Brocade software portal when the license is generated. The file is uploaded to the Brocade device and controls access to a licensed feature or feature set.
- **License ID (LID)** – This is a number that uniquely identifies the Brocade device. The LID is used in conjunction with a transaction key to generate and download a software license from the Brocade software portal. The software license is tied to the LID of the Brocade device for which the license was ordered and generated.
- **Licensed feature** – Any hardware or software feature or set of features that require a valid software license in order to operate on the device.
- **Transaction key** – A unique key, along with the LID, used to generate a software license from the Brocade software portal. The transaction key is issued by Brocade when a license is purchased. The transaction key is delivered according to the method specified when the order is placed:
 - **Paper-pack** – The transaction key is recorded on an entitlement certificate, which is mailed to the customer.
 - **Electronic** – The transaction key is contained in an e-mail message, which is sent instantly to the customer after the order is placed. The customer receives the e-mail message within a few minutes after the order is placed, though the timing will vary depending on the network, Internet connection, and so on.

If a delivery method is not specified at the time of the order, the key will be delivered by the way of paper-pack.

Software-based licensing overview

Prior to the introduction of software-based licensing, Brocade supported hardware-based licensing, where an EEPROM was used to upgrade a Layer 2 or base Layer 3 switch to a premium or advanced Layer 3 switch. With the introduction of software-based licensing, one or more valid software licenses are required to run such licensed features on the device.

Software-based licensing is designed to work together with hardware-based licensing. The first release of software-based licensing employs a combination of hardware-based and software-based licensing. A Brocade device can use hardware-based licensing, software-based licensing, or both. Future releases that support software-based licensing will use software-based licensing only, eliminating the need for a customer- or factory-installed EEPROM on the management module or switch backplane.

Software-based licensing provides increased scalability and rapid deployment of hardware and software features on the supported Brocade family of switches. For example, for premium upgrades, it is no longer necessary to physically open the chassis and install an EEPROM to upgrade the system. Instead, the Web is used to generate, download, and install a software license that enables premium features on the device.

NOTE

An ICX device only supports software-based licensing. Hardware-based licensing is not supported on ICX devices.

How software-based licensing works

A permanent license can be ordered pre-installed in a Brocade device when first shipped from the factory, or later ordered and installed by the customer. In either case, additional licenses can be ordered as needed.

When a license is ordered separately (not pre-installed), an entitlement certificate or e-mail message, along with a transaction key, are issued to the customer by Brocade as proof of purchase. The transaction key and LID of the Brocade device are used to generate a license key from the Brocade software licensing portal. The license key is contained within a license file, which is downloaded to the customer's PC, where the file can then be transferred to a TFTP or SCP server, and then uploaded to the Brocade device.

Once a license is installed on the Brocade device, it has the following effects:

- For FCX and ICX devices, the license unlocks the licensed feature and it becomes available immediately. There is no need to reload the software.
- For FWS, FESX6, and FSX devices, the license unlocks the ability to upload the software image (for example, edge Layer 3 or full Layer 3) onto the device. Once the software image is installed and the software is reloaded, the license unlocks the licensed feature.

NOTE

You cannot load the edge Layer 3 software image on a FWS device without first purchasing and installing a license on the device. Likewise, you cannot load the full Layer 3 software image on a FESX6 or FSX device without first purchasing and installing a license on the device.

- When a trial license expires, the commands and CLI related to the feature are disabled, but the feature itself cannot be disabled until the system reloads.

Seamless transition for legacy devices

In this chapter, the term *legacy device* refers to a Brocade device that was shipped prior to the introduction of software-based licensing, has an EEPROM installed, and is running pre-release 07.1.00 software.

The transition to software-based licensing is seamless for legacy devices. When upgraded to a release that supports software-based licensing, these devices will continue to operate as previously configured.

NOTE

There are special considerations and instructions for legacy FastIron devices in need of replacement (by way of a Return Merchandise Agreement [RMA]). For details, refer to [“Special replacement instructions for legacy devices”](#) on page 226.

License types

The following license types are supported on FastIron devices:

- **Port-related** – Applies to FWS devices only. A port-related licensed feature enables a maximum number of ports on the device, for example 24 ports or 48 ports.
- **Application-related** – Enables premium or advanced features on the device, for example, edge Layer 3 for the FWS, advanced Layer 3 for the FCX, premium and advanced Layer 3 for ICX 6610, premium Layer 3 for ICX 6450, and full Layer 3 for the FESX6, FSX 800, and FSX 1600.
- **Trial license** – Also called a *temporary license*, this enables a license-controlled feature to run on the device on a temporary basis. A trial license enables demonstration and evaluation of a licensed feature and can be valid for a period of 45 days. For more information about a trial license, refer to [“Using a trial license”](#) on page 223.
- **Normal license** – Also called a *permanent license*, this enables a license-controlled feature to run on the device indefinitely.

Non-licensed features

[Table 31](#) lists the FastIron software images that do not require a license to run on the device.

TABLE 31 Software image files that do not require a license

Product	Image filename
FESX6	SXSxxxxx.bin (Layer 2)
FSX 800	SXLxxxxx.bin (base Layer 3)
FSX 1600	SXRxxxxx.bin
FWS	FWSxxxxx.bin (Layer 2) FWSLxxxxx.bin (base Layer 3)
FCX	FCXSxxxxx.bin (Layer 2)
ICX 6610	FCXRxxxxx.bin (Layer 3)
ICX 6430	ICX64Sxxxxx.bin (Layer 2)
ICX 6450	ICX64Rxxxxx.bin (Layer 3)

For a list of features supported with these images, refer to the release notes.

Licensed features and part numbers

[Table 32](#) lists the supported licensed features, associated image filenames, and related part numbers.

NOTE

There are no changes to the part numbers for products with pre-installed (factory-installed) licenses. These part numbers are listed for reference in the last column of [Table 32](#).

TABLE 32 Licensed features and part numbers

Product	Licensed feature or feature set	Image filename	Part numbers for software license only	Part numbers for hardware with pre-installed software license
FWS	EPREM Layer 3:	FWSRxxxxx.bin (edge Layer 3)	FWS624-L3U-SW	FWS624-EPREM
	• OSPF V2 (IPv4)		FWS624G-L3U-SW	FWS624-POE-EPREM
	• Full RIP V1 and V2			FWS624G-EPREM
	• Route-only support (Global CONFIG level only)			FWS624G-POE-EPREM
	• Route redistribution		FWS648-L3U-SW	FWS648-EPREM
	• 1020 routes in hardware maximum		FWS648G-L3U-SW	FWS648-POE-EPREM
	• VRRP-E			FWS648G-EPREM FWS648G-POE-EPREM
	Number of ports enabled:	N/A ¹	FWS624-EL3U-SW	Same part numbers (for 24-port devices) as listed above
	• 24 ports			
	• 48 ports	N/A ¹	FWS648-EL3U-SW	Same part numbers (for 48-port devices) as listed above

TABLE 32 Licensed features and part numbers (Continued)

Product	Licensed feature or feature set	Image filename	Part numbers for software license only	Part numbers for hardware with pre-installed software license
FCX	Advance Layer 3: <ul style="list-style-type: none"> BGP4 GRE 	N/A ¹	FCX-ADV-LIC-SW	FCX624-E-ADV FCX624-I-ADV FCX624S-ADV FCX624S-HPOE-ADV <hr/> FCX624S-F-ADV <hr/> FCX648-E-ADV FCX648-I-ADV FCX648S-ADV FCX648S-HPOE-ADV
ICX 6610 Software-based licensing is only supported on ICX 6610 devices.	Premium Layer 3: <ul style="list-style-type: none"> OSPF v2 OSPF v3 PIM-DM PIM-SM PIM-SSM PIM passive PBR RIP v1, v2 RIPng VRRP VRRP v3 for IPv6 VRRP-E VRRP-E for IPv6 IPv6 unicast routing 	N/A ¹	ICX 6610-PREM-LIC-SW	ICX 6610-24-PE ICX 6610-24-PI ICX 6610-24P-PE ICX 6610-24P-PI ICX 6610-24F-PE ICX 6610-24F-PI ICX 6610-48-PE ICX 6610-48-PI ICX 6610-48P-PE ICX 6610-48P-PI

FESX6, FSX 800, FSX 1600	BASE_SOFT_PACKAGE	No
	SX_V4_HW_BASE_L3_SOFT_PACKAGE	No
	SX_V4_HW_ROUTER_SOFT_PACKAGE	Yes
	SX_V6_HW_BASE_L3_SOFT_PACKAGE	No
	SX_V6_HW_ROUTER_SOFT_PACKAGE	Yes
	SX_V6_HW_ROUTER_IPV6_SOFT_PACKAGE	Yes

Licensing rules

This section lists the software licensing rules and caveats related to the Brocade devices that support software-based licensing.

General notes about licensing

The following licensing rules apply to all FastIron devices that support software licensing:

- A license is tied to the unique LID of the management module or fixed configuration switch for which the license was ordered. Therefore, a license can be used on one device only. It cannot be used on any other device.
- More than one license can be installed per device. For example, an FSX 800 with IPv6 hardware can have the license SX-FIL3U-6-IPV4 and the license SX-FIL3U-6-IPV6, and both can be in effect.
- Only one normal or trial license at a time can be in effect for a licensed feature.
- More than one trial license can be in effect at the same time, as long as each trial license applies to a unique licensed feature.
- A trial license cannot replace or supersede a normal license.

Licensing rules for FCX and ICX 6610 devices

The following licensing rules apply to FCX and ICX 6610 devices for software-based licensing. To describe the behavior for running software-based licensing in an FCX IronStack, the FCX-ADV-LIC-SW license is used as an example.

NOTE

For FCX and ICX 6610 devices, the behavior for running software-based licensing with different licenses (Premium, Advance, or Upgrade licenses) is the same. One license allows multiple protocols to run in a stack. All units must have a separate license to run the same licensed feature in a stack. If all units do not have the same license, the Active controller cannot enable the licensed feature on the stack. If a member unit without a license joins a stack, the Active controller must make sure that no protocols are enabled in a stack before putting a member unit into full operational state.

- Each stack unit in an FCX IronStack must have a separate software license for the same licensed feature. For example, if there are eight units in an IronStack, eight separate licenses must be purchased to run the licensed features in the stack. If there is any unit in a stack without the FCX-ADV-LIC-SW license, the Active controller cannot run the licensed features on the stack.
- For example, to run BGP on the stack, the **router bgp** command must be enabled through the CLI on the Active controller. If the Active controller does not have the FCX-ADV-LIC-SW license, the user cannot configure the **router bgp** command at the CLI level.
- If the Active controller has the FCX-ADV-LIC-SW license, and the **router bgp** command is enabled at the CLI level, the system checks all operational units to verify that each unit has the FCX-ADV-LIC-SW license. Only if all the operational units have the FCX-ADV-LIC-SW license will the licensed feature run in the stack.
- If any unit does not have the FCX-ADV-LIC-SW license, the **router bgp** command is rejected and the licensed feature cannot run in the stack. For example, the following error message is displayed on the console.

```
Brocade(config)#router bgp
Error! cannot run BGP because unit 2 has no FCX-ADV license
```

- If the Active controller is running BGP (and all other licensed features if enabled), and a unit without the FCX-ADV-LIC-SW license joins the stack, the unit is put into a non-operational state. If a user copies the FCX-ADV-LIC-SW license to a non-operational unit, it takes effect immediately and the unit becomes operational. If the operational unit has a higher priority than the current Standby controller, the unit replaces the existing Standby controller and becomes the new Standby controller. This behavior applies to all cases in which a non-operational unit becomes operational.
- If a user disables BGP from the stack, the Active controller puts all non-operational units in the operational state. The Active controller and the Standby controller must have the same non-operational units. When the Standby controller receives the runtime configuration from the Active controller, the Standby controller must update the state of every unit (operational or non-operational state).
- If a user deletes the FCX-ADV-LIC-SW license in any stack unit, the Active controller does not change the unit to the non-operational state regardless of running BGP or not. Even if a new election algorithm change occurs, an operational unit is not changed to a non-operational unit. The stack continues its BGP running state. The stack cannot run BGP again after the user disables BGP, or after a reload.

- If BGP is not enabled on the Active controller, a stack unit is operational whether or not the Active controller or the stack units have the FCX-ADV-LIC-SW license. This implies that in a stack where all units (Active controller, Standby controller, and member units) have the FCX-ADV-LIC-SW license, a stack can be formed whether or not BGP is enabled. However, if there is a license mismatch between any of the units in a stack, a stack can still be formed provided that the **router bgp** command is not enabled on the Active controller.
- The FCX-ADV-LIC-SW license is not considered when selecting a unit to be the Standby controller.

Licensing rules for FESX6, FSX 800, and FSX 1600 devices

SX 800 and SX 1600 devices with redundant management modules must have two separate licenses to run the same licensed feature on both management modules. The license file in the active management module is never copied to or updated on the standby management module.

Upon bootup, the active management module compares its license with the standby management module. If the license differs, the active management module immediately shuts down the standby management module. To enable the standby management module, you must install a separate license. For example, if the active management module has the license SX-FIL3U-SW, the standby management module must also have this license.

Licensing for Ports on Demand

NOTE

Licensing for Ports on Demand is applicable to ICX 6610 devices and ICX 6450 devices.

You can use the Ports on Demand (PoD) feature to enable 1 Gbps ports to 10 Gbps port speed.

By default, regardless of what SFP+ media optic is used, the ICX 6610 device has eight active 1 Gbps uplink ports. To increase the uplink capacity of four ports from 1 Gbps to 10 Gbps port speed, purchase a single ICX6610-10G-LIC-POD license. To increase the uplink capacity of all eight ports from 1 Gbps to 10 Gbps port speed, purchase a second ICX6610-10G-LIC-POD license.

The ICX 6450 device has four active uplink and stacking ports on slot 2. By default, regardless of what SFP+ media optic is used, ports 1 and 3 are 10 Gbps ports. By default, without a license at bootup, ports 2 and 4 come up in 10 Gbps port speed in an error disabled state. To enable ports 2 and 4 to 10 Gbps port speed, purchase the ICX6450-2X10G-LIC-POD license. For more information about enabling ports 2 and 4 to 10 Gbps port speed, refer to [“Configuration considerations when configuring PoD for ICX 6450 devices only”](#) on page 214.

The PoD feature is not applicable to ICX 6430 devices because there are no 10 Gbps ports on the device.

Configuring PoD on an interface

To upgrade the ICX 6610 and ICX 6450 ports from 1 Gbps to 10 Gbps port speed, perform the following steps.

1. Download the PoD license to the device. For more information about copying the license file on ICX devices, refer to [“Using TFTP to copy a license file on FCX and ICX devices”](#) on page 221.
2. Insert the 10 Gbps optic transceiver.
3. Enter the **speed-duplex 10g-full** command on a single, multiple, or interface range as shown in the example below.

```
Brocade(config)# interface ethernet 1/3/1
Brocade(config-if-e10000-1/3/1)# speed-duplex 10g-full
```

4. Enter the **write memory** command to save the configuration.

Syntax: [no] **speed-duplex [10g-full | 1000-full-master]**

The **10g-full** parameter allows you to enable the port speed to 10 Gbps speed.

The **1000-full-master** parameter allows you to enable the port speed to 1 Gbps speed.

If you enable the port to 10 Gbps port speed, and then issue the **no speed-duplex** command, the port continues to run at 10 Gbps speed. Upon bootup, the port reverts to 1 Gbps speed. In a stacking environment, if you issue the **no speed-duplex 10g-full** command on a 10 Gbps port interface, or a range of interfaces, the 10 Gbps port interface defaults back to 1 Gbps port speed in five to ten seconds.

Configuring the upper PoD ports in a stack for ICX 6610 devices only

By default, when a single ICX6610-10G-LIC-POD license is downloaded onto the device, all four lower PoD ports in the stack (1/3/1 to 1/3/4) are eligible for an upgrade to 10 Gbps port speed. If you have a single ICX6610-10G-LIC-POD license, and you want to enable the upper four PoD ports (1/3/5 to 1/3/8) to 10 Gbps port speed, instead of the lower four PoD ports (1/3/1 to 1/3/4), complete the following steps. If the lower four PoD ports are already configured for 10 Gbps speed, you must first issue the **no speed-duplex 10g-full** command on the lower four PoD ports before configuring the upper four PoD ports to 10 Gbps port speed.

The procedure below assumes that you have already downloaded the license.

NOTE

If you purchased a second ICX6610-10G-LIC-POD license, you do not need to perform the steps outlined below. The **flexible-10g-ports upper** command is used to configure the upper four PoD ports to 10 Gbps port speed using a single ICX6610-10G-LIC-POD license. The command can only be used on the upper four PoD ports.

1. Enter the **flexible-10g-ports upper** command at the stack unit configuration level.

```
Brocade(config)# stack unit 2
Brocade(config-unit-2)#flexible-10g-ports upper
Brocade(config-unit-2)#exit
```

2. Specify the upper four PoD ports in a group with a single ICX6610-10G-LIC-POD license at the interface configuration level.

```
Brocade(config)#interface ethernet 2/3/5 to 2/3/8
```

3. Enable the 10 Gbps port speed for the upper four PoD ports by entering the following command.

```

Brocade(config-mif-2/3/5-2/3/8)#speed-duplex 10g-full
Port 2/3/5 mode changed from 1G to 10G
Port 2/3/6 mode changed from 1G to 10G
Port 2/3/7 mode changed from 1G to 10G
Port 2/3/8 mode changed from 1G to 10G
Brocade(config-mif-2/3/5-2/3/8)#end

```

Syntax: [no] flexible-10g-ports upper

Use the **no** form of the **flexible-10g-ports upper** command when you want to enable the lower four PoD ports, instead of the upper four PoD ports, to 10 Gbps port speed. Before you issue the **no flexible-10g-ports upper** command, you must first issue the **no speed-duplex 10g-full** command on the upper four PoD ports.

To display the configuration for the **flexible-10g-ports upper** command on a stack unit, use the **show stack <stack-unit>** command.

```

Brocade#show stack 1
stack unit 1
  module 1 icx6610-24f-sf-port-management-module
  module 2 icx6610-qsfp-10-port-160g-module
  module 3 icx6610-8-port-10g-dual-mode-module
  stack-trunk 1/2/1 to 1/2/2
  stack-trunk 1/2/6 to 1/2/7
  stack-port 1/2/1 1/2/6
  flexible-10g-ports upper

```

Syntax: show stack <stack-unit>

Displaying license configuration for PoD ports after a license upgrade

NOTE

The **show pod** command cannot be used to display the configuration for 1 Gbps or 40 Gbps ports on ICX 6610 and ICX 6450 devices.

The **show pod** command is used to display a license configuration for PoD ports in a stack after a license upgrade on ICX 6610 and ICX 6450 devices. To display general license information about the PoD license in a stack unit, use the **show license** command. For more information about the **show license** command, refer to [“Viewing the license database”](#) on page 229.

Displaying license configuration for PoD ports for ICX 6610 devices

To display a license configuration for all PoD ports for all units in a stack, enter the following command at the CLI level.

```

Brocade#show pod
Unit-Id: 1
PoD license capacity: 4      (UPPER)
PoD license capacity used: 4

PoD-ports  Lic-state
1/3/1      default
1/3/2      default
1/3/3      default
1/3/4      default
1/3/5      acquired

```

```

1/3/6      acquired
1/3/7      acquired
1/3/8      acquired

Unit-Id: 2
PoD license capacity:  8
PoD license capacity used:  8

PoD-ports  Lic-state
2/3/1      acquired
2/3/2      acquired
2/3/3      acquired
2/3/4      acquired
2/3/5      acquired
2/3/6      acquired
2/3/7      acquired
2/3/8      acquired

Unit-Id: 3
PoD license capacity:  4      (LOWER)
PoD license capacity used:  4

PoD-ports  Lic-state
3/3/1      acquired
3/3/2      acquired
3/3/3      acquired
3/3/4      acquired
3/3/5      default
3/3/6      default
3/3/7      default
3/3/8      default

```

Syntax: `show pod [unit <id>]`

The **unit <id>** parameter specifies the unit ID number of the PoD you want to display.

[Table 34](#) describes the information displayed in the output of the **show pod unit** command.

TABLE 34 Output from the **show pod unit** command

Field	Description
Unit-Id	The unit ID number of the PoD.
PoD license capacity	The port capacity of the PoD license that is purchased. For ICX 6610 devices, the port capacity can be four or eight 10 Gbps ports. UPPER is displayed in parentheses when the upper four PoD ports are selected using the flexible-10g-ports upper command. LOWER is displayed in parentheses when the four lower PoD ports are selected for an upgrade to 10 Gbps port speed.
PoD license capacity used	The number of PoD ports that are upgraded to 10 Gbps port speed.
PoD-ports	The list of PoD ports in the PoD unit.
Lic-state	The license state of the PoD ports in the PoD unit. The Lic-state can be one of the following: <ul style="list-style-type: none"> default - The port is configured to 1 Gbps speed. acquired - The port is configured to 10 Gbps speed.

Displaying license configuration for PoD ports for ICX 6450 devices

By default at bootup, the license state for ports 2 and 4 are in the acquired state. The following output from the **show pod** command displays port 2 and 4 as acquired. Upon installing the ICX6450-2X10G-LIC-POD license, ports 2 and 4 can be enabled to run in 10 Gbps port speed. The license state for ports 2 and 4 remains in the acquired state.

```
Brocade#show pod
Unit-Id: 1
PoD-ports Lic-state
1/2/2 acquired
1/2/4 acquired
```

If ports 2 and 4 are configured to 1 Gbps port speed, the license state changes to default. The following output from the **show pod** command displays port 2 and 4 in the default state.

```
Brocade#show pod
Unit-Id: 1
PoD-ports Lic-state
1/2/2 default
1/2/4 default
```

Syntax: **show pod** [unit <id>]

The **unit** <id> parameter specifies the unit ID number of the PoD you want to display.

For a description of the fields in the **show pod** and **show pod** [unit <id>] command outputs, refer to [Table 34](#) on page 211.

Upgrading or downgrading configuration considerations for PoD

Consider the following when upgrading or downgrading PoD ports for ICX 6610 or ICX 6450 devices:

- When a single ICX6610-10G-LIC-POD license is downloaded onto the device, you can upgrade the first four or the last four PoD ports to 10 Gbps port speed. However, if you upgrade the fifth port to 10 Gbps port speed, the following syslog message and error message displays.

```
SYSLOG: <14>Jul 31 00:33:46 10.20.147.22 PoD: No license present for port
1/3/3".
POD:No license present for port 3.
```

The error message is displayed because the port you are attempting to upgrade to 10 Gbps port speed has exceeded the license capacity that is downloaded onto the device. To upgrade all eight ICX 6610 ports to 10 Gbps port speed, purchase a second ICX6610-10G-LIC-POD license.

- There is no trial license available for the PoD feature for ICX 6610 and ICX 6450 devices.

Configuration considerations for stacking or trunking PoD ports

Consider the following when stacking or trunking PoD ports for ICX 6610 or ICX 6450 devices:

- In an ICX Ironstack, a stack member unit without a PoD license can join a stack even when the active or master stack unit has a PoD license.
- All trunk ports must operate at 1 Gbps or 10 Gbps speed in a stack. You cannot mix and match trunk ports with different port speeds.
- In a trunk formation, if there is no license installed in a stack upon bootup or hot swap of a stack unit, a port is disabled. This does not affect the trunk formation.

Configuration considerations when configuring PoD on an interface

Consider the following when configuring PoD on an interface or a range of interfaces on ICX 6610 or ICX 6450 devices:

- The **speed-duplex 10g-full** command is rejected when there is no license or an insufficient license in the unit. For example, an insufficient license implies that you are attempting to upgrade all eight ports to 10 Gbps port speed, and you have downloaded a single ICX6610-10G-LIC-POD license. The following syslog message and error message is generated.

```
SYSLOG: <14>Jul 31 00:33:46 10.20.147.22 PoD: No license present for port 1/3/3".
POD:No license present for port 2
```

- When the **speed-duplex 10g-full** command is configured for a port or multiple ports on an interface, and there is no license or an insufficient license in the stack upon bootup or hot swap of a stack unit, the port is configured to 10 Gbps port speed. However, the port is in ERROR_DISABLED state until you install the correct license in the stack. A syslog message is generated every 30 seconds stating that the license is not present on the port. The error disable recovery timer checks every 30 seconds to see if the correct license is installed in the stack. Once the correct license is installed, the port is automatically enabled to operate at 10 Gbps port speed on the next cycle of the timer. You can also enable the port manually to operate at 10 Gbps port speed once the correct license is installed.
- In a stack, the **speed-duplex 10g-full** command is rejected on the primary port if all ports in a trunk do not have the correct license installed to upgrade to 10 Gbps port speed. The following error message is displayed.

```
Error:Not enough 10Gig License present for all the ports in trunk
```

- If you delete the license from the stack, the port runs in 10 Gbps mode until the switch is reloaded. If the **speed-duplex 10g-full** command is entered, the following syslog message is displayed.

```
SYSLOG: <14>Jul 31 00:33:46 10.20.147.22 PoD: No license present for port 1/3/3".
```

- The **show interface ethernet <stack-unit>/<slotnum>/<portnum>** command can be used to display the configuration for a disabled 10 Gbps interface port, or a range of port interfaces after bootup for both ICX 6610 and ICX 6450 devices. The **show interface ethernet** command displays the port in the ERROR_DISABLED state. The following example output is from an ICX 6450 device.

```
Brocade#show interface ethernet 3/2/2
10GigabitEthernet3/2/2 is ERR-DISABLED (invalid license), line protocol is
down
  Hardware is 10GigabitEthernet, address is 748e.f883.01fa (bia
748e.f883.01fa)
  Configured speed 10Gbit, actual unknown, configured duplex fdx, actual
unknown
  Stacking Port, port state is DISABLED
  BPDU guard is Disabled, ROOT protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, mac-learning is enabled
  Flow Control is enabled
  Mirror disabled, Monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
```

Once the correct license is installed, the port displays the state as up as shown in the example output below.

```
Brocade#show interface ethernet 3/2/2
10GigabitEthernet6/2/2 is up, line protocol is up
  Hardware is 10GigabitEthernet, address is 748e.f882.f872 (bia 748e.f882.f872)
  Configured speed 10Gbit, actual 10Gbit, configured duplex fdx, actual fdx
  Stacking Port, port state is FORWARDING
  BPDU guard is Disabled, ROOT protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, mac-learning is enabled
  Flow Control is enabled
  Mirror disabled, Monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
```

Configuration considerations when configuring PoD for ICX 6450 devices only

Consider the following when configuring PoD for ICX 6450 devices only:

- By default, without a license at bootup, ports 2 and 4 come up in 10 Gbps port speed in an error disabled state. The **show interface ethernet** command displays the port in the `ERROR_DISABLED` state at bootup. Refer to section, [“Configuration considerations when configuring PoD on an interface”](#) on page 213 for output example from the **show interface ethernet** command.
- From the default state, ports 2 and 4 can be configured to 1 Gbps port speed using the **speed-duplex 1000-full-master** command without a license. You do not need to reboot the switch for the links to come up in 1 Gbps port speed.
- If you download the ICX6450-2X10G-LIC-POD license to the device, insert the correct 10 Gbps optic transceiver, and enter the **speed-duplex 10g-full** command on the interface, you can immediately begin using ports 2 and 4 in 10 Gbps port speed. You do not need to reboot the switch for the links to come up.

- For any of the four uplink ports on slot 2, if you re-configure any port from 1 Gbps to 10 Gbps port speed, you must reload the switch to begin using the ports in 10 Gbps port speed. Until you reload the switch, the ports will remain in an error-disabled state. The following example output displays ethernet port 4 in an error-disabled state.

```
Brocade#show interface ethernet 1/2/4
10GigabitEthernet1/2/4 is ERR-DISABLED (Reload the switch or stack to enable
this port in 10G speed), line protocol is down
  Hardware is 10GigabitEthernet, address is 748e.f882.e39c (bia 748e.f882.e39c)
  Configured speed 10Gbit, actual unknown, configured duplex fdx, actual
unknown
  Member of L2 VLAN ID 1, port is untagged, port state is DISABLED
  BPDU guard is Disabled, ROOT protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, mac-learning is enabled
  Flow Control is enabled
  Mirror disabled, Monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  MTU 1500 bytes
  300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
```

Software licensing configuration tasks

This section describes the configuration tasks for generating and obtaining a software license, and then installing it on the Brocade device. Perform the tasks in the order listed in [Table 35](#).

TABLE 35 Configuration tasks for software licensing

Configuration task	Reference...
1 Order the desired license.	For a list of available licenses and associated part numbers, refer to “Licensed features and part numbers” on page 202.
2 When you receive the transaction key, retrieve the LID of the Brocade device. If you received the transaction key by way of paper-pack, record the LID on the entitlement certificate in the space provided.	“Viewing the License ID” on page 227
3 Log in to the Brocade software portal to generate and obtain the license file.	“Obtaining a license” on page 216
4 Upload the license file to the Brocade device.	“Installing a license file” on page 221
5 Verify that the license is installed.	“Using a trial license” on page 223
6 For FESX6, FSX 800, FSX 1600, FWS, FCX, ICX 6610, and ICX 6450 devices, upload the software image to the device.	Refer to the release notes.

Obtaining a license

The procedures in this section show how to generate and obtain a software license.

1. Order a license for the desired licensed feature. Refer to [“Licensed features and part numbers”](#) on page 202 for a list of valid part numbers and licensed features.

NOTE

To order and obtain a trial license, contact your Brocade representative.

2. When you receive the paper-pack or electronic transaction key, retrieve the LID of your Brocade device by entering the **show version** command on the device. Example command output is shown in [“Viewing the License ID”](#) on page 227.”

If you received a paper-pack transaction key, write the LID in the space provided on the entitlement certificate.

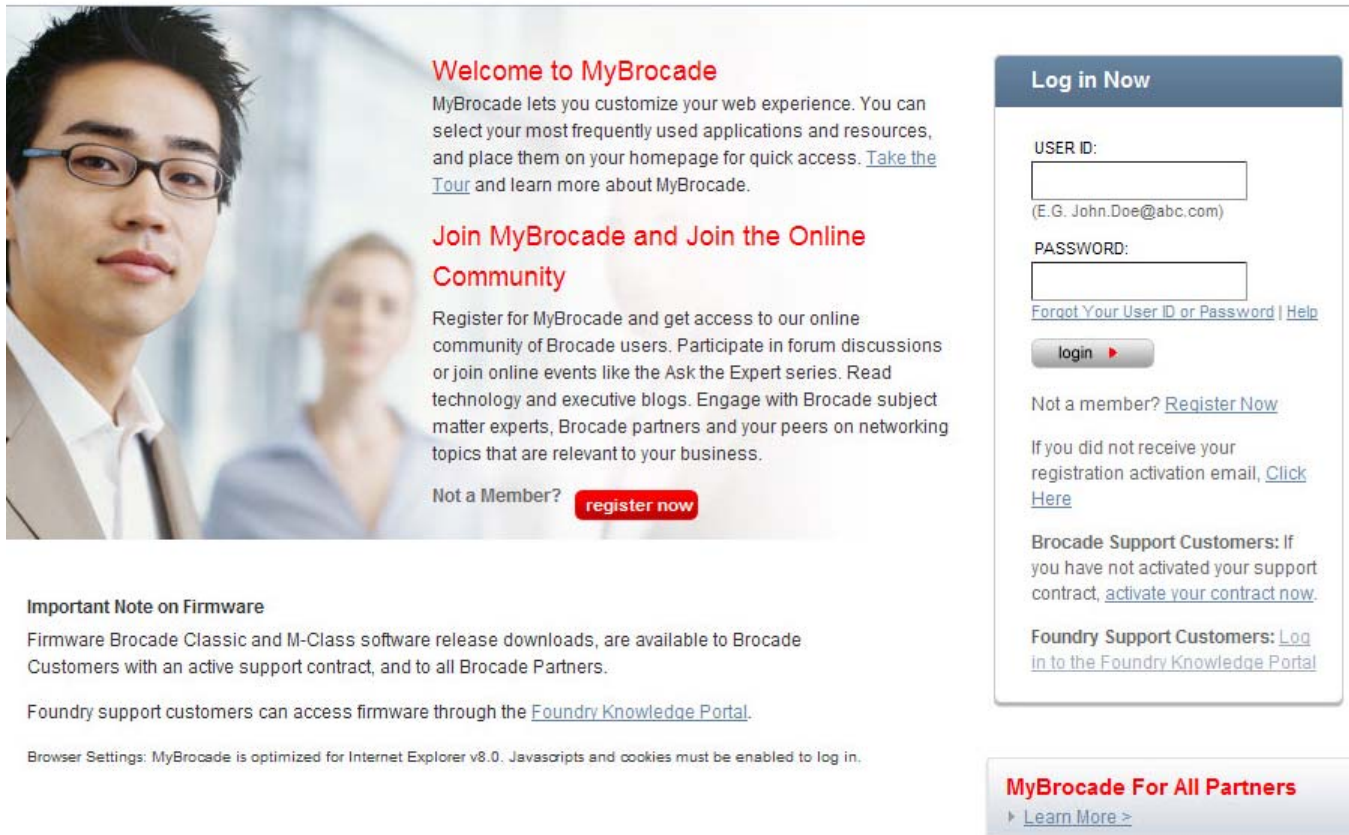

NOTE

Do not discard the entitlement certificate or e-mail with electronic key. Keep it in a safe place in case it is needed for technical support or product replacement (RMAs).

3. Log in to the Brocade software portal at <http://swportal.brocade.com> and complete the software license request. If you do not have a login ID and password, request access by following the instructions on the screen.

Figure 5 shows the **Software Portal Login** window.

FIGURE 5 Brocade Software Portal Login window

Welcome to MyBrocade

MyBrocade lets you customize your web experience. You can select your most frequently used applications and resources, and place them on your homepage for quick access. [Take the Tour](#) and learn more about MyBrocade.

Join MyBrocade and Join the Online Community

Register for MyBrocade and get access to our online community of Brocade users. Participate in forum discussions or join online events like the Ask the Expert series. Read technology and executive blogs. Engage with Brocade subject matter experts, Brocade partners and your peers on networking topics that are relevant to your business.

Customer Information

* Indicates required field

Customer email ID*

Site Name

Technical Contact

Company Name

City

State/Province

Zip/Postal Code

Country

Phone

E-mail Notification Information

Self

☐ Other e-mail address(es)

Unit Information

Unique ID Type*

Unit's Unique ID*

Transaction Key*

☐ I have read and accept the [Brocade End User License Agreement](#)

Enter the required information.

- For a description of the field, move the pointer over the field.
- An asterisk next to a field indicates that the information is required.

NOTE

You can generate more than one license at a time. For each license request, enter the **Unit's Unique ID** and **Transaction Key**, and click **Add**.

When you have finished entering the required information, read the Brocade End User License Agreement, and select the **I have read and accept** check box.

Click the **Generate** button to generate the license. Figure 8 shows the results window, which displays an order summary and the results of the license request.

- If the license request is successful, the **Status** field shows “Success” and the **License File** field contains a hyperlink to the generated license file. The license file is automatically sent by e-mail to the specified customer e-mail address.
- If the license request fails, the **Status** field indicates the reason it failed and the action to be taken.

Generate Another License

4. Download the license file to your PC by either clicking the hyperlink in the **License File** field or saving the license file from the e-mail attachment.
5. Upload the license file to the Brocade device as instructed in [“Installing a license file”](#) on page 221.

Installing a license file

Once you obtain a license file, place it on a TFTP or SCP server to which the Brocade device has access, and then use TFTP or SCP to copy the file to the license database of the Brocade device.

Using TFTP to copy a license file on FESX, SX 800 and SX 1600, and FWS devices

To copy a license file from a TFTP server to the license database of the Brocade device, enter a command such as the following at the Privileged EXEC level of the CLI:

```
Brocade# copy tftp license 10.1.1.1 lic.xml
```

Syntax: `copy tftp license [<IP_address> | <ipv6_address>] <license_filename_on_host>`

The `<IP_address>` variable is the address of the IPv4 TFTP server.

The `<ipv6_address>` variable is the address of the IPv6 TFTP server.

The `<license_filename_on_host>` variable is the filename of the license file.

If you attempt to download the same license twice on the device, the following error message is displayed on the console.

```
Can't add the license string - 93 (DUPLICATE_LICENSE)
```

Using TFTP to copy a license file on FCX and ICX devices

You can copy a license file from the active unit to all other member units without having to physically disable the stack to install a license for each unit. To copy a license file from the active unit to all other member units in the system, enter a command such as the following at the Privileged EXEC level of the CLI:

```
Brocade# copy tftp license 10.120.54.185 FCX_ADV_LIC_PERP.xml unit 2
```

Syntax: `copy tftp license [<IP_address> | <ipv6_address>] <license_filename_on_host> unit <unit_id>`

The `<IP_address>` variable is the address of the IPv4 TFTP server.

The `<ipv6_address>` variable is the address of the IPv6 TFTP server.

The `<license_filename_on_host>` variable is the filename of the license file.

The `unit <unit_id>` parameter specifies a unit for which you want to add a software license file. The `<unit_id>` variable can be from 1 through 8.

If you attempt to download the same license twice on the device, the following error message is displayed on the console.

```
Can't add the license string - 93 (DUPLICATE_LICENSE)
```

Using Secure Copy to install a license

SSH and Secure Copy (SCP) must be enabled on the Brocade device before the procedures in this section can be performed. For details, refer to the chapter [Chapter 5, "SSH2 and SCP"](#).

Deleting a license file

The **scp** *<license_file_on_host>* *<user>@<IP_address>:license* command is supported on FESX, SX 800 and SX 1600, and FWS devices.

To copy a license file from an SCP-enabled client to the license database of the Brocade device, enter a command such as the following on the SCP-enabled client:

```
c:\scp c:\license\license101 terry@10.1.1.1:license
```

Syntax: **scp** *<license_file_on_host>* *<user>@<IP_address>:license*

On FCX and ICX devices, to copy a license file from an SCP-enabled client to the license database of a specific unit, enter a command such as the following on the SCP-enabled client:

```
scp license.xml terry@10.20.91.39:license:3
```

In the example above, the license is copied to unit 3.

Syntax: **scp** *<license_file_on_host>* *<user>@<IP_address>:license:<unit id>*

The **unit** *<unit_id>* parameter specifies a unit for which you want to add a software license file. The *<unit_id>* variable can be from 1 through 8.

Verifying the license file installation

Use the **show license** command to verify that the license is installed on the device. Details about this command are in [“Viewing information about software licenses”](#) on page 227.

Deleting a license file

A license remains in the license database until it is deleted. If you want to delete a license, Brocade recommends that you first disable the licensed feature before deleting the associated license.

NOTE

If a trial license and a normal license for the same licensed feature are added to the system (in either order), the normal license cannot be deleted first. The trial license should be deleted first, and then the normal license can be deleted. If necessary, the same trial license can be reinstalled and used as long as it has not expired.

Deleting a license on FESX, SX 800 and SX 1600, and FWS devices

To delete a license, enter a command such as the following at the Privileged EXEC level of the CLI:

```
Brocade# license delete 7
```

This command immediately removes the license from the license database. The CLI commands related to the licensed feature will no longer be available from the CLI. The licensed feature will continue to run as configured until the software is reloaded, at which time the feature will be disabled and removed from the system. Syslog and trap messages are generated when the license is deleted.

Syntax: **license delete** *<index_number>*

The `<index_number>` variable is a valid license index number. The license index number can be retrieved from the **show license** command output. For more information, refer to [“Viewing information about software licenses”](#) on page 227.

Deleting a license on FCX and ICX devices

To delete all license files for a specific unit, enter the following command at the Privileged EXEC level of the CLI:

```
Brocade# license delete unit 3 all
```

To delete a specific license file from a unit, enter the following command at the Privileged EXEC level of the CLI:

```
Brocade# license delete unit 3 index 3
```

Syntax: `license delete unit <unit_id> [all | index <license_index>]`

The `<unit_id>` variable specifies the unit ID number.

The **all** option allows you to delete all license files for a specific unit.

The **index <license_index>** parameter specifies the software license file, and is generated by the member unit. The license index number is the license file you want to delete from a unit. The license index number is not unique across stack units, and the user must specify both the unit number and the index number to delete a license from a specific unit. For example, the FCX-ADV-LIC-SW license is installed on both stack unit 3, index 1, and stack unit 5, index 1. Because the index numbers are the same, the user must specify both the unit number and the index number to delete a license from a specific unit.

Using a trial license

NOTE

A trial license must be ordered and installed by a Brocade representative only.

A trial license enables demonstration and evaluation of a licensed feature. The trial license is valid for a period of up to 45 days, and is renewable for an additional 45 days on the second time. A licensed feature operating under a trial license has the same functionality (CLI and **show** commands) as does a licensed feature operating under a normal license.

What happens when a trial license expires

A trial license expires when it exceeds the specified expiration time or date. The countdown starts when the trial license is generated. When the license expires, the CLI commands related to the licensed feature will no longer be available from the CLI. The licensed feature will continue to run as configured until the system is reloaded, at which time the feature will be disabled and removed from the system.

NOTE

Trial licenses are not cumulative. The new license replaces the current license. To extend the license, you must contact your Brocade representative.

Console, syslog, and trap messages for trial license expiration

Three days prior to the date that a trial license is set to expire, the following warning message will appear daily on the console. On the day that the license will expire, the warning message will appear every two hours. Syslog and trap messages will also be generated.

```
SYSLOG: <12>Jan  1 00:00:00 624-top License: Package FESX624-L3U-IPV6 with LID  
NFLJMI expires in 3 days
```

When the license has expired, the following message will appear on the console. Syslog and trap messages will also be generated.

```
SYSLOG: <13>Jan  1 00:00:00 624-top License: Package FESX624-L3U-IPV6 with LID  
NFLJMI has expired
```

Renewing or extending a trial license

A trial license can be extended once by another trial license of the same type, or by a normal license of the same type. To avoid any interruptions to the network, obtain and install the second trial license before the first license expires. When extended by another trial license, the duration is not cumulative. The countdown starts when the trial license is generated.

To extend the license, you must contact your Brocade representative.

Viewing software license information from the Brocade software portal

This section describes other software licensing tasks supported from the Brocade software portal. You can use the **License Query** option to view software license information for a particular unit, transaction key, or both. You can export the report to Excel for sharing or archiving purposes.

Depending on the status of the license (for example, whether or not the license was generated), the report will include the following Information:

- Hardware part number, serial number, and description
- Software part number, serial number, and description
- Date the license was installed
- Transaction key
- LID
- Feature name
- Product line

From the **License Management** menu, select **Brocade IP/ADP > License Query**.

The **License Query** window displays. (Refer to Figure 9).

FIGURE 9 License Query window

- To view software license information for a particular unit, enter the LID in the **Unit ID** field and click **Search**.
- To view software license information for a particular transaction key, enter the unique number in the **Transaction key** field and click **Search**.

Figure 10 shows an example of the license query results.

FIGURE 10 License Query Results window

Level	Part Number	Serial Number	Installed Date	License File	Transaction Key	LID	Feature Name	Description	Product Line	C
1	NI-CER-2048C-AC	NICERAC1099				pkagtceGFOO		NI CER 2048C 1 500W AC BASE SW	NICER2048	NI
2	BR-NI-CER-2048-ADV	UA200001757	02-Feb-2010	License File	FD8D0E5B08842E13032C5D	pkagtceGFOO	BR-NI-CER-2048-ADV	BR-NI-CER-2048-ADV	CER 2048C	NI

In this example, the line items for Level 1 display hardware-related information and the line items for Level 2 display software-related information. If the query was performed before the transaction key was generated, the first row (Level 1) would not appear as part of the search results. Similarly, if the query was performed before the license was generated, some of the information in the second row would not be displayed.

Transferring a license

A license can be transferred between Brocade devices if both the following conditions are true:

- The device is under an active support contract.
- The license is being transferred between two similar models (for example, from a 24-port model to another 24-port model or from a 48-port model to another 48-port model).

NOTE

Transferring a license is only available internally for TAC, and externally for designated partners with specific accounts in the Software Portal. Contact your Brocade representative for more information.

Special replacement instructions for legacy devices

A legacy device refers to a Brocade device that was shipped prior to the introduction of software-based licensing, has an EEPROM installed, and is running pre-release 07.1.00 software.

For Brocade legacy devices in need of replacement (by way of a Return Merchandise Agreement [RMA]), the following actions must be taken:

- If the replacement device will be upgraded to a software release that supports software-based licensing, registration of the replacement device is required after the software is upgraded.
- If the replacement device will be using a software release that does *not* support software-based licensing, follow these instructions:

NOTE

This procedure is not supported on FCX and ICX platforms.

1. Prior to shipping the device in need of replacement back to the factory, remove the EEPROM from the device. To remove the EEPROM, follow the instructions in the appropriate hardware installation guide or in the instructions that shipped with the EEPROM.
2. After removing the EEPROM, store it in a safe place.
3. When the replacement device is received from the factory, install the previously removed EEPROM in the device. To do so, follow the instructions that shipped with the EEPROM.

Syslog messages and trap information

Table 36 lists the syslog messages and traps that are supported for software-based licensing.

TABLE 36 Syslog messages

Message level	Message	Explanation
Informational	License: Package <package_name> with LID <LID_number> is added	The license package has been added.
Informational	License: Package <package_name> with LID <LID_number> is removed	The license package has been deleted.
Warning	License: Package <package_name> with LID <LID_number> expires in <number> days	The trial license is about to expire. This message will begin to display three days before the expiration date, and every two hours on the last day that the license will expire.
Notification	License: Package <package_name> with LID <LID_number> has expired	The trial license has expired.

Viewing information about software licenses

This section describes the **show** commands associated with software-based licensing. These commands are issued on the Brocade device, at any level of the CLI.

NOTE

You can also view information about software licenses from the Brocade software portal. Refer to [“Viewing software license information from the Brocade software portal”](#) on page 224.

Viewing the License ID

Brocade devices that ship during and after the release of software-based licensing have the License ID (LID) imprinted on the label affixed to the device. You also can use the **show version** CLI command to view the LID on these devices, and on devices that shipped before the release of software-based licensing.

Use the **show version** command to display the serial number, software and hardware license package name, and LID of all units in the device. The following example is sample output from an FCX unit with the package FCX_ADV_ROUTER_SOFT_PACKAGE installed on units 1, 3, and 5.

```

```

Syntax: show version

In the **show license** command output, only unit 3 and unit 5 are shown with the software license, FCX-ADV-LIC-SW. Unit 1 is not displayed in the **show license** command output because it has a hardware license installed on the device as indicated by the PROM-TYPE: FCX-ADV-U. For more information about the **show license** command, refer to [“Viewing the license database”](#) on page 229.

```

Brocade#show license
Index      License Name      Lid      License Type      Status      License Period      License
Capacity
Stack unit 3:
1          FCX-ADV-LIC-SW      deaHHKigFrN Normal          Active      Unlimited          1
Stack unit 4:
1          FCX-ADV-LIC-SW      dexHHIlgFFd Normal          Active      Unlimited          1
Stack unit 5:
1          FCX-ADV-LIC-SW      writcfgMFMH Normal          Active      Unlimited          1

```

Syntax: show license

Viewing the license database

NOTE

The **show license** command can be used to display software license information for the FESX, SX 800 and SX 1600, FCX, ICX 6610, FWS, and ICX 6450 devices.

To display general information about all software licenses for all units in a device, use the **show license** command. The **show license** command only displays software license information for a unit, not hardware license information, as shown in the following example.

```

Brocade#show license
Index      License Name Lid      License Type      Status License Period      License Capacity
Stack unit 3:
1 FCX-ADV-LIC-SW deaHHKigFrN Normal          Active      Unlimited          1
Stack unit 5:
1 FCX-ADV-LIC-SW writcfgMFMH Normal          Active      Unlimited          1

```

To display software license information on an ICX 6610 device (for example, the ICX 6610 premium and advance licenses) enter the following command.

```

Brocade#show license
Index      License Name      Lid      License Type      Status      License Period      License Capacity
Stack unit 1:
1          ICX6610-PREM-LIC-SW      FJdnjFJFGiF Normal          Active      Unlimited          1
2          ICX6610-10G-LIC-POD      FJdnjFJFGiF Normal          Active      Unlimited          8
Stack unit 2:
1          ICX6610-ADV-LIC-SW      FJdnmFJFGiF Normal          Active      Unlimited          1
2          ICX6610-10G-LIC-POD      FJdnjFJFGiF Normal          Invalid     Unlimited          8
Stack unit 3:
1          ICX6610-ADV-LIC-SW      FJdnlFJFGiF Normal          Active      Unlimited          1
4          ICX6610-10G-LIC-POD      FJdnlFJFGiF Normal          Active      Unlimited          8

```

Syntax: show license

Viewing information about software licenses

To display software license information on an ICX 6430 device, enter the following command. In the example below, the premium and PoD licenses are installed on stack unit 1, and on stack unit 2 only the premium license is installed.

```
Brocade#show license
Index      License Name      Lid      License Type  Status  License Period  License Capacity
Stack unit 1:
1          ICX6450-PREM-LIC-SW  dbtFJIKiFFI Normal      Active  Unlimited      2
2          ICX6450-10G-LIC-POD  dbtFJIKiFFI Normal      Active  Unlimited      2
Stack unit 2:
1          ICX6450-PREM-LIC-SW  dbtFJIKiFFI Normal      Active  Unlimited      2
```

Syntax: show license

To display software license information on an FWS device, enter the following command.

NOTE

The output from the **show license** command is the same for an SX 800, SX 1600, FWS, and a FESX device.

```
Brocade#show license
Index      Package Name      Lid      License Type  Status  License
Period
1          FWS624-EL3U        cpFNJHFFGO normal      active  unlimited
```

Syntax: show license

To display specific software license information installed on a SX 800, SX 1600, FWS, or a FESX device, enter the following command.

```
Brocade#show license 1
License information for license <1>:
+package name:      FWS624-EL3U
+lid:               cpFNJHFFGO
+license type:      normal
+status:            active
+license period:    unlimited
```

Syntax: show license <index_number>

The <index_number> variable specifies the specific license file installed on the device. The **unit** <unit_id> parameter is not applicable on a SX 800, SX 1600, FWS, or a FESX device.

To display software license information for a specific stack unit on an ICX 6610, ICX 6450, or a FCX device, enter the following command. In the output below, the ICX 6610 premium license, and the POD license are installed on unit 3.

```
Brocade#show license unit 3
Index      License Name      Lid      License Type  Status  License Period  License Capacity
Stack unit 3:
1          ICX6610-PREM-LIC-SW  FJdnjFJFGiF Normal      Active  Unlimited      1
2          ICX6610-10G-LIC-POD  FJdnjFJFGiF Normal      Active  Unlimited      8
```

Syntax: `show license [unit <unit_id>]`

The **unit** <unit_id> parameter specifies the unit ID number. The unit ID number is available only on FCX, ICX 6610, and ICX 6450 devices.

[Table 37](#) describes the information displayed by the **show license unit** <unit_id> command

TABLE 37 Output from the **show license unit** command

Field	Description
Index	The index number specifies the software license file for a specific stack. The index number is generated by the member unit.
License Name	The name of license installed for the license index number on the stack unit.
Lid	The license ID. This number is embedded in the Brocade device.
License Type	Indicates whether the license is normal (permanent) or trial (temporary).
Status	Indicates the status of the license: <ul style="list-style-type: none"> • Valid – A license is valid if the LID matches the serial number of the device for which the license was purchased, and the package name is recognized by the system. • Invalid – The LID does not match the serial number of the device for which the license was purchased. • Active – The license is valid and in effect on the device. • Not used – The license is not in effect on the device. • Expired – For trial licenses only, this indicates that the trial license has expired.
License Period	If the license type is trial (temporary), this field displays the number of days the license is valid. If the license type is normal (permanent), this field displays Unlimited.
License capacity	The port capacity of the PoD license. For ICX 6610 devices, the PoD license can be a 4 port capacity license, or a 8 port capacity license depending on the number of licenses purchased. For ICX 6450 devices, the field displays license capacity 2 when the PoD license is purchased for two ports (ports two and four). The license capacity field is displayed in the show license command outputs for ICX 6610, ICX 6450, and FCX devices only.

To display detailed information about a license for a specific unit, use the **show license unit** <unit_id> [**index** <index_number>] command. The following example shows a sample output.

```
Brocade#show license unit 3 index 1
License information for unit 3 license <1>:
+license name:      FCX-ADV-LIC-SW
+lid:               deaHHKIGFrN
+license type:      Normal
+status:            Active
+license period:    Unlimited
Trial license information:
+days used:        10
+hours used:        21
+days left:        30
+hours left:        18
```

Syntax: `show license unit <unit_id> [index <index_number>]`

The **index** *<license_index>* parameter specifies the software license file that you want to display information for. The **index** *<index_number>* option is available only on FCX, ICX 6610, and ICX 6450 devices.

[Table 38](#) describes the information displayed by the **show license unit** *<unit_id>* [**index** *<index_number>*] command.

TABLE 38 Output from the **show license** command

Field	Description
+license name	The name of the license installed on the unit.
+lid	The license ID. This number is embedded in the Brocade device.
+license type	Indicates whether the license is normal (permanent) or trial (temporary).
+status	Indicates the status of the license: <ul style="list-style-type: none"> • Valid – A license is valid if the LID matches the serial number of the device for which the license was purchased, and the package name is recognized by the system. • Invalid – The LID does not match the serial number of the device for which the license was purchased. • Active – The license is valid and in effect on the device. • Not used – The license is not in effect on the device. • Expired – For trial licenses only, this indicates that the trial license has expired.
+license period	If the license type is trial (temporary), this field displays the number of days the license is valid. If the license type is normal (permanent), this field displays Unlimited.
+ days used	The number of days the trial license has been in effect.
+ hours used	The number of hours the trial license has been in effect.
+ days left	The number of days left before the trial license expires.
+ hours left	The number of hours left before the trial license expires.

Viewing software packages installed in the device

Use the **show version** command to view the software packages that are currently running in the device. The following example is sample output from an FCX unit with the package FCX_ADV_ROUTER_SOFT_PACKAGE installed on units 1, 3, and 5.

NOTE

The software package name is not the same as the license name.

Syntax: show version

For a list of supported software packages installed on the device, refer to [Table 33](#) on page 206.

Viewing information about software licenses

Brocade Stackable Devices

Table 39 lists the individual Brocade FastIron switches and the IronStack features they support. These features are supported only on FastIron stackable devices, and are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 39 Supported IronStack features

Feature	FESX FSX 800 FSX 1600	FWS	FCX ¹	ICX 6610 ²	ICX 6430 ICX 6450
Building an IronStack	No	No	Yes	Yes	Yes
<ul style="list-style-type: none"> Secure-setup Automatic configuration Manual configuration 					
IronStack management	No	No	Yes	Yes	Yes
IronStack management MAC address	No	No	Yes	Yes	Yes
IronStack partitioning	No	No	Yes	Yes	Yes
Persistent MAC address	No	No	Yes	Yes	Yes
IronStack software upgrade	No	No	Yes	Yes	Yes
IronStack and stack mismatch troubleshooting	No	No	Yes	Yes	Yes
Hitless stacking:	No	No	Yes	Yes	Yes
<ul style="list-style-type: none"> Hitless failover Hitless switchover 					
Trunking of stacked ports	No	No	No	Yes	Yes
Auto Image Copy for stack units	No	No	Yes	Yes	Yes

1. All FCX models can be ordered from the factory as -ADV models. ADV models include support for Layer 3 BGP. FCX-E and FCX-I models require an optional 10 Gbps SFP+ module to support stacking.

2. All ICX 6610 models can be ordered from the factory as -ADV models. ADV models include support for Layer 3 BGP.

Brocade IronStack overview

This section gives a brief overview of IronStack technology, including IronStack terminology. This section also lists the FastIron models that support stacking.

Brocade IronStack features

A stack is a group of devices that are connected so that they operate as a single chassis. Brocade IronStack technology features include:

- Management by a single IP address
- Support for up to eight units per stack. ICX 6430 supports only up to four units in the stack
- Flexible stacking ports
- Linear and ring stack topology support
- Secure-setup utility to make stack setup easy and secure
- Active Controller, Standby Controller, and member units in a stack
- Active Controller management of entire stack
- Active Controller download of software images to all stack units
- Standby Controller for stack redundancy
- Active Controller maintenance of information database for all stack units
- Packet switching in hardware between ports on stack units
- All protocols operate on an IronStack in the same way as on a chassis system

Brocade stackable models

FCX devices

All FCX devices can be active members of a Brocade IronStack. FCX-E and FCX-I models require an optional 10 Gbps SFP+ module to support stacking. For information about how to install FCX devices, refer to the *Brocade FastIron CX Hardware Installation Guide*.

All FCX devices can be ordered from the factory as -ADV models with support for Layer 3 BGP.

ICX devices

All ICX 6610, ICX 6430, and ICX 6450 devices can be active members of a Brocade IronStack. For information about how to install ICX 6610 devices, refer to the *Brocade ICX 6610 Series Hardware Installation Guide*. For information about how to install ICX 6430 and ICX 6450 devices, refer to the *Brocade ICX 6450 and ICX 6430 Hardware Installation Guide*.

ICX devices also support trunked ports. For ICX 6610 devices, refer to [“ICX 6610 stack topologies”](#) on page 242 for details. For ICX 6450 and ICX 6430 devices, refer to [“Connecting ICX 6450 and ICX 6430 devices in a stack”](#) on page 244.

All ICX 6610 devices can be ordered from the factory as -ADV models with support for Layer 3 BGP.

Brocade IronStack terminology

Stack unit roles

- **Active Controller** - Handles stack management and configures all system- and interface-level features.
 - **Future Active Controller** - The unit that will take over as Active Controller after the next reload, if its priority has been changed to the highest priority. When a priority for a stack unit is changed to be higher than the existing Active Controller, the takeover does not happen immediately to prevent disruptions in the stack operation.
- **Standby Controller** - The stack member with the highest priority after the Active Controller. The Standby Controller takes over if the current Active Controller fails.
- **Stack Member** - A unit functioning in the stack in a capacity other than Active or Standby Controller.
- **Stack Unit** - Any device functioning within the stack, including the Active Controller and Standby Controller.
 - **Upstream Stack Unit** - An upstream unit is connected to the first stacking port on the Active Controller. (The left-hand port as you face the stacking ports.) Refer to [Figure 14](#) and [Figure 15](#).
 - **Downstream Stack Unit** - A downstream unit is connected to the second stacking port on the Active Controller. (The right-hand port as you face the stacking ports.) Refer to [Figure 14](#) and [Figure 15](#).

General IronStack terminology

- **Bootup Role** - the role a unit takes during the boot sequence. This role can be standalone, Active Controller, Standby Controller, or stack member. The Active Controller or a standalone unit can access the full range of the CLI. Until a stack is formed, the local consoles on the Standby Controller and stack members provide access to a limited form of the CLI, such as the show, stack, and a few debug commands. When the stack is formed, all local consoles are directed to the Active Controller, which can access the entire CLI. The last line of output from the **show version** command indicates the role of a unit, unless it is a standalone unit, in which case it is not shown. For example:

```
My stack unit ID = 1, bootup role = active
```

- **Clean Unit** - A unit that contains no startup flash configuration or run time configuration. To erase old configuration information, enter the **erase startup-config** command and reset the unit. For FCX devices, the run-time configuration on a clean unit may also contain default-port information,
- **Control Path** - A path across stacking links dedicated to carrying control traffic such as commands to program hardware or software image data for upgrades. A stack unit must join the control path to operate fully in the stack.
- **Default Port** - FCX devices use the **default-port** command to define stacking port candidates.
- **Interprocessor Communications (IPC)** - The process by which proprietary packets are exchanged between stack unit CPUs.

- **IronStack** - A set of Brocade stackable units (maximum of eight) and their connected stacking links so that: all units can be accessed through their common connections, a single unit can manage the entire stack, and configurable entities, such as VLANs and trunk groups, can have members on multiple stack units.
- **Non-Functioning Stack Unit** - A stack unit that is recognized as a stack member, and is communicating with the Active Controller over the Control Path, but is in a non-functioning state. Because of this state, traffic from the non-stack ports will not be forwarded into the stack - they will be dropped or discarded. This may be caused by an image or configuration mismatch.
- **Sequential Connection** - Stack unit IDs, beginning with the Active Controller, are sequential. For example, 1, 3, 4, 6, 7 is sequential if Active Controller is 1. 1, 7, 6, 4, 3 are non-sequential in a linear topology, but become sequential in a ring topology when counted from the other direction as: 1, 3, 4, 6, 7. Gaps in numbering are allowed.
- **Standalone Unit** - A unit that is not enabled for stacking, or an Active Controller without any Standby Controller or stack members.
- **Stacking Link** - A cable that connects a stacking port on one unit to a stacking port on another unit.
- **Secure Setup** - A software utility that establishes a secure stack.
- **Unit Replacement** - The process of swapping out a unit with a Clean Unit. No configuration change is required. Refer to [“Adding, removing, or replacing units in an IronStack”](#) on page 311.
- **Reserved / Provisional Unit** - A unit configuration number that has no physical unit associated with it.
- **Trunked Stacking Port (Trunk)** - A trunk consists of multiple stacking ports and is treated as one logical link. It provides more bandwidth and better resilience.
- **Stack Path** - A data path formed across the stacking links to determine the set of stack members that are present in the stack topology, and their locations in the stack.
- **Stacking Port** - A physical interface on a stack unit that connects a stacking link. Stacking ports are point-to-point links that exchange proprietary packets. Stacking ports must be 10 Gbps Ethernet ports, and cannot be configured for any other purpose while operating as stacking ports. Brocade stacking units contain two ports that can be stacking ports. However, the flexible stacking port feature also allows you to use one port as a stacking port and the other port as a regular data port. Refer to [“Controlling stack topology”](#) on page 283.
- **Stack Slot** - A slot in a stack is synonymous with *line model* in a chassis. [Table 40](#) shows the port and slot designations for FastIron stackable devices.
- **Stack Topology** - A contiguously-connected set of stack units in an IronStack that are currently communicating with each other. All units that are present in the stack topology appear in output from the **show stack** command.
- **Static Configuration** - A configuration that remains in the database of the Active Controller even if the unit it refers to is removed from the stack. Static configurations are derived from the startup configuration file during the boot sequence, are manually entered, or are converted from dynamic configurations after a **write memory** command is issued.
- **Dynamic Configuration** - A unit configuration that is dynamically learned by a new stack unit from the Active Controller. A dynamic configuration disappears when the unit leaves the stack.

Supported IronStack topologies

This section describes how to build an IronStack. Before you begin, you should be familiar with the supported stack topologies and the software requirements. When you are ready to build your stack, you can go directly to the instructions.

Brocade IronStack topologies

Brocade IronStack technology supports linear and ring stack topologies. Although Brocade stackable units may be connected in a simple linear topology, Brocade recommends a ring topology because it offers the best redundancy and the most resilient operation.

Mixed unit topologies

FCX, ICX 6610, ICX 6450 and ICX 6430 devices cannot be combined in a stack with other devices. Stacks must contain devices of the same type. For more information about FCX stack topologies, refer to [“FCX stack topologies”](#) on page 239. For more information about stack topologies for ICX 6430 and ICX 6450 devices, see [“Configuring an ICX 6430 and ICX 6450 IronStack”](#) on page 266.

FCX stack topologies

A Brocade IronStack can contain all one model, or any combination of the FCX models. You can mix 24-port and 48-port FCX devices in a single stack, to a maximum of eight units per stack.

NOTE

FCX devices cannot be combined in a stack with non-FCX devices.

The procedure for cabling a stack of FCX devices differs depending on whether your stack contains FCX-E and FCX-I devices. [Figure 11](#) shows FCX-S and FCXS-F devices cabled in linear and ring stack topologies. Note that these devices are cabled from the rear panel. [Figure 12](#) shows FCX-E devices in a ring topology stack. [Figure 13](#) shows FCX-E devices in a linear topology stack.

Figure 14 shows a mixed linear topology stack of FCX-S, FCXS-F, and FCX-E or FCX-I devices. Because the FCX-E and FCX-I devices are cabled from the front panel, and FCX-S and FCXS-F devices are cabled from the rear panel by default, you need to reconfigure the default stacking ports on FCX-S or FCXS-F devices to the ports on the front panel. For more information about reconfiguring default stacking ports, refer to [“Configuring default ports on FCX devices”](#) on page 261.

FIGURE 11 FCX linear and ring stack topologies

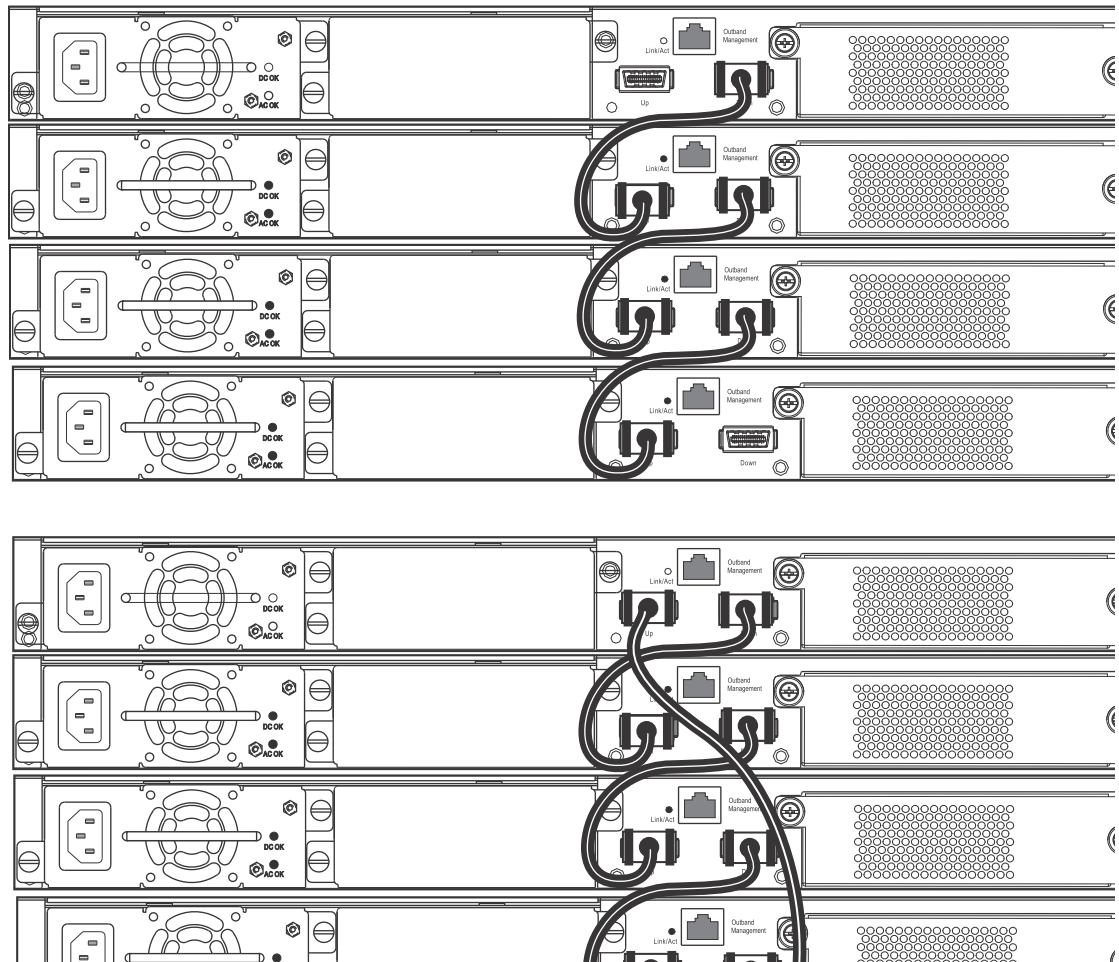

FIGURE 12 FCX-E ring topology stack using SFP+ module ports**FIGURE 13** FCX-E linear topology stack using SFP+ module ports**FIGURE 14** Mixed linear stack of FCX-E devices and FCX-S devices

ICX 6610 stack topologies

In contrast to earlier generations of switches, ICX 6610 devices have four ports on their back panels that are exclusively dedicated to stacking. These cannot be used as data ports, even when stacking is not enabled.

These are the two 40-Gbps ports and two 4 x 10-Gbps ports arranged in two rows. The top row consists of port 1/2/1 and 1/2/2, and the bottom row has 1/2/6 and 1/2/7. Here ports 1/2/1 and 1/2/6 are 40G ports. Ports 1/2/2 and 1/2/7 are 4*10G ports. Refer to [Figure 15](#).

You can create a stacking trunk by connecting one port of each type to ports of the same type on another switch in the stack.

When creating a trunk, the two ports in the same row are always trunked, one 40G and one 4*10G and they must connect to ports in the same row of another device. For example, one device has a trunk consisting of 40-Gbps port 1/2/1 and a 4 x 10-Gbps port 1/2/2 on the top row, and one trunk with the same pair type, 1/2/6 and 1/2/7, on the bottom row. If this device is being connected to the next one in sequence, one of these rows must connect to 2/2/1 and 2/2/2, OR to 2/2/6 and 2/2/7.

FIGURE 15 Trunked stack port configuration on Brocade ICX 6610 devices

- (1) Stack port n/2/1 (40G)
- (2) Trunk 0
- (3) Stack port n/2/2 (4*10G)
- (4) Stack port n/2/6 (40G)
- (5) Trunk 1
- (6) Stack port n/2/7 (4*10G)

The two stacking trunks can form either linear or ring topologies. [Figure 16](#) and [Figure 17](#) show fully connected linear and ring topologies. Both cables of each trunk are connected.

FIGURE 16 ICX 6610 linear stack topology**FIGURE 17** ICX 6610 ring stack topology

Figure 18 shows a linear and ring topology with missing partial trunk cables. They both still work.

FIGURE 18 ICX 6610 linear and ring stack topologies with partially missing cables

Connecting ICX 6450 and ICX 6430 devices in a stack

ICX 6430 and ICX 6450 support linear and ring stack topologies, and can also operate as standalone devices. ICX 6430 and ICX 6450 devices have four ports on the front panel for a stacking configuration. ICX 6430 and ICX 6450 devices ship with two default stacking ports configured. When stacking is enabled, ports 1 and 3 are dedicated to stacking and cannot be used for data ports. Use the **stack-port** command to select only one of these default ports as the stacking port. If you do not select a default port as the stacking port, both default ports will operate as stacking ports. For more information about using the **stack-port** command on ICX 6430 and ICX 6450 devices, refer to [“Error messages encountered during the configuration of an ICX 6430 or ICX 6450 IronStack”](#) on page 269. If stacking is not enabled on the ports, then all four stacking ports

can be used for data or uplink ports. By default, ICX 6430 and ICX 6450 devices are not configured for trunked stacking. You can dynamically configure or remove a stacking trunk port configuration using the **stack-trunk** command or the **multi-trunk** command. For more information about these commands, refer to [“Configuring an ICX 6430 and ICX 6450 IronStack”](#) on page 266.

ICX 6450 and ICX 6430 devices support hitless stacking switchover and failover. The Secure Setup utility is supported for ICX 6450 and ICX 6430 devices.

ICX 6430 device supports up to four units in a stack. ICX 6450 device supports up to eight units in a stack. You cannot mix and match stacking units between ICX 6430 and ICX 6450 devices.

Connecting ICX 6450 devices in a stack

ICX 6450 devices have 24 or 48 10/100/100 Mbps data ports and 4 ports with 1-Gbps or 10-Gbps SFP+ fiber uplink and stacking ports. The top row consists of ports 1 and 3, and the bottom row consists of ports 2 and 4. By default, ports 1 and 3 are 10-Gbps stacking ports. By default, without a license at bootup, ports 2 and 4 come up in 10-Gbps port speed in an error disabled state. To enable ports 2 and 4 to 10-Gbps port speed, purchase the ICX6450-2X10G-LIC-POD license. For more information about enabling ports 2 and 4 to 10-Gbps port speed, refer to [“Licensing for Ports on Demand”](#) on page 208.

Connecting ICX 6430 devices in a stack

ICX 6430 devices have 24 or 48 10/100/100 Mbps data ports and 4 1-Gbps SFP fiber uplink and stacking ports. The default stacking ports are 1 and 3. The 4 1-Gbps ports are not eligible for an upgrade to 10-Gbps port speed. Trunk stacking configuration is supported for ICX 6430 devices. LAG configuration is supported for stacking or uplink ports when a pair of 1-Gbps ports are aggregated.

Trunking configuration considerations for ICX 6430 and ICX 6450 devices

The ICX 6430 and ICX 6450 stacking ports are grouped into two trunks. Follow these guidelines for connecting and configuring the stacking ports:

NOTE

After enabling the ICX 6430 and ICX 6450 trunked stacking ports, it is recommended that you enter the **write memory** command to save your configuration.

- You can connect one or both ports in a trunk. Connecting both ports in a trunk increases stacking bandwidth and provides resiliency.
- You must enable stacking and connect cables properly for the stack to work. The active copper cable lengths for 1-Gbps ports are 1 m (3.2 ft) and 5 m (16.4 ft). The copper cable lengths for 10-Gbps ports are 1 m (3.2 ft), 3 m (9.8 ft), and 5 m (16.4 ft).
- The default stacking ports are always ports 1 and 3. You can trunk (or un-trunk) ports 1 to 2 and or ports 3 to 4. One or both of the two sets of stacking ports can be trunked (or un-trunked).
- When creating a trunk, the ports in the same column are always trunked. For ICX 6450 devices, all stack ports must be configured to 10-Gbps port speed to enable trunking. For ICX 6430 devices, all stack ports must be at 1-Gbps port speed to enable trunking.

For example, you can connect ports 1/2/3 to 1/2/4 to form one trunk on one device, and ports 2/2/1 to 2/2/2 to form a second trunk on another device.

- If you connect both ports in a trunk, both ports must connect to both ports of one trunk on another device.

ICX 6430 and ICX 6450 stack topologies

In a linear stack topology, there is a single stack cable connection between each switch that carries two-way communications across the stack. In a ring stack topology, an extra cable is connected between the top and bottom switches forming a “ring” or “closed-loop.” The closed-loop cable provides a redundant path for the stack link, so if one link fails, stack communications can be maintained.

The following figures show stacking cabling configurations.

[Figure 19](#) shows an example of how the stack cables can be connected between switches if you only connect one port per trunk. The figure shows both linear and ring stacking configurations. The one port per trunk topology is the most commonly configured stacking configuration and is applicable to both ICX 6430 and ICX 6450 switches.

[Figure 20](#) shows how the stack cables are connected between switches in a linear stacking configuration for dual linking. The linear stacking configuration is applicable to both ICX 6430 and ICX 6450 devices.

[Figure 21](#) shows how the stack cables are connected between switches in a ring stacking configuration. The ring stacking configuration is applicable to both ICX 6430 and ICX 6450 devices.

FIGURE 19 ICX 6430 and ICX 6450 stacking with one port per trunk

FIGURE 20 ICX 6430 and ICX 6450 linear stacking configuration

FIGURE 21 ICX 6430 and ICX 6450 ring stacking configuration

Software requirements

All units in an IronStack must be running the same software version. Refer to [“IronStack troubleshooting”](#) on page 315 for more information.

IronStack construction methods

There are three ways to build an IronStack.

1. Use the **secure-setup** utility to form your stack. Secure-setup gives you control over the design of your stack topology and provides security through password verification. For the secure-setup procedure, refer to [“Scenario 1 - Three-member IronStack in a ring topology using secure-setup”](#) on page 250.
2. Automatic stack configuration. With this method, you enter all configuration information, including the module type and the priorities of all members into the unit you decide will be the Active Controller and set its priority to be the highest. When you enable stacking on the Active Controller the stack then forms automatically. This method requires that you start with clean units (except for the Active Controller) that do not contain startup or run time configurations. Refer to [“Scenario 2 - Three-member IronStack in a ring topology using the automatic setup process”](#) on page 254.
3. Manual stack configuration. With this method, you configure every unit individually, and enable stacking on each unit. Once the units are connected together, they will automatically operate as an IronStack. With this method the unit with the highest priority becomes the Active Controller, and ID assignment is determined by the sequence in which you physically connect the units. Refer to [“Scenario 3 - Three member IronStack in a ring topology using the manual configuration process”](#) on page 257.

IronStack configuration notes

Before you configure your IronStack, consider the following guidelines:

- Consider the number of units and how the stacking ports on the units will be connected. For more information, refer to the *Brocade FCX Hardware Installation Guide*.
- The stack should be physically cabled in a linear or ring topology. Connect only those units that will be active in the stack.
- Make sure all units intended for the stack are running the same software version. Refer to [“Confirming IronStack software versions”](#) on page 282.
- When you have a full stack of 8 units, you may need to increase the trap hold time from the default, which is 60 seconds, to five minutes (300 seconds). This will prevent the loss of initial boot traps. To increase the trap hold time, use the following command.

```
Brocade(config)#snmp-server enable traps holddown-time 300
```

Syntax: [no] snmp-server enable traps holddown-time <seconds>

NOTE

The router image requires more time to boot than the switch image.

Scenario 1 - Three-member IronStack in a ring topology using secure-setup

NOTE

For more detailed information about configuring an FCX IronStack, refer to [“FCX IronStack configuration”](#) on page 258.

This scenario describes how to build an IronStack using the secure-setup utility. Secure-setup lets you easily configure your entire stack through the Active Controller, which propagates the configuration to all stack members. Secure-setup is the most secure way to build an IronStack, and gives you the most control over how your stack is built. For example, secure-setup offers three security features that prevent unauthorized devices from accessing or joining an IronStack:

- Authentication of secure-setup packets provides verification that these packets are from genuine Brocade stack unit. MD5-based port verification confirms stacking ports.
- Superuser password is required to allow password-protected devices to become members of an IronStack.
- The **stack disable** command. When this command is issued, a unit does not listen for or send stacking packets, which means that no other device in the network can force the stacking-disabled unit to join an IronStack.

Secure-setup can also be used to add units to an existing IronStack (refer to [“Adding, removing, or replacing units in an IronStack”](#) on page 311) and to change the stack IDs of stack members (refer to [“IronStack unit identification”](#) on page 277).

When secure-setup is issued on a unit that is not already the Active Controller, this unit becomes the Active Controller, and, if it does not have an assigned priority, secure-setup assigns it a priority of 128. Any unit that then tries to join the stack must have an assigned priority less than 128. If secure-setup discovers a unit with a priority of 128 or higher, it changes the priority to 118.

When secure-setup is issued on a unit that is not already the Active Controller, this unit becomes the Active Controller. If this unit does not already have an assigned priority, secure-setup will assign this unit a priority of 128 by default, if no other units in the stack have a priority higher than 128. If another unit in the stack has a priority of 128 or higher, secure-setup will give the Active Controller a priority equal to the highest priority unit in the stack (which is by default the Standby Controller). When the Active Controller and the Standby Controller have identical priorities, during a reset, the old Active Controller cannot reassume its role from the Standby Controller (which has become the Active Controller at the reset).

If the previous Active Controller again becomes active, and you want it to resume the role of Active Controller, you should set the priority for the Standby Controller to a priority lower than 128. If you do not want the previous Active Controller to remain Active Controller, you can set the same priority for both Active and Standby Controllers (higher than, or equal to 128). For details, refer to [“IronStack unit priority”](#) on page 277.

NOTE

Secure-setup works for units within a single stack. It does not work across stacks.

[Figure 12](#) on page 241 shows an IronStack with three units in a ring topology. Refer to this figure as you follow the procedure steps for this scenario.

Configuring a three-member IronStack in a ring topology using secure-setup

1. Connect the devices using the stacking ports and stack cabling. For more information refer to the appropriate hardware installation guides.
2. Power on the units.
3. Connect your console to the intended Active Controller. The unit through which you run secure-setup becomes the Active Controller by default.
4. Issue the **stack enable** command on the intended Active Controller.

```
Brocade# config terminal
Brocade(config)# stack enable
Brocade(config)# exit
```

5. Enter the **stack secure-setup** command. As shown in the following example, this command triggers a Brocade proprietary discovery protocol that begins the discovery process in both upstream and downstream directions. The discovery process produces a list of upstream and downstream devices that are available to join the stack. Secure-setup can detect up to 7 units in each direction (14 total), but since the maximum number of units in a stack is 8, you must select a maximum of 7 units from both directions.

NOTE

To exit the secure-setup, enter **^C** at any time.

You should see output similar to the following.

```
Brocade# stack secure-setup
Brocade# Discovering the stack topology...
```

Current Discovered Topology - RING

Available UPSTREAM units

Hop(s)	Type	Mac Address
1	FCX624	0012.f239.2d40
2	FCX624	0012.f2d5.2100

Available DOWNSTREAM units

Hop(s)	Type	Mac Address
1	FCX624	0012.f2d5.2100
2	FCX624	0012.f239.2d40

Do you accept the topology (RING) (y/n)? : y

If you accept the topology, you will see output similar to the following.

Selected Topology:

Active	Id	Type	Mac Address
	1	FCX648	00e0.52ab.cd00

Selected UPSTREAM units

Hop(s)	Id	Type	Mac Address
1	3	FCX624	0012.f239.2d40
2	2	FCX624	0012.f2d5.2100

Connecting ICX 6450 and ICX 6430 devices in a stack

Selected DOWNSTREAM units

Hop(s)	Id	Type	Mac Address
1	2	FCX624	0012.f2d5.2100
2	3	FCX624	0012.f239.2d40

Do you accept the unit ids (y/n)? : y

To accept the unit ID assignments, type **y**. If you do not want to accept the ID assignments, type **n**. You can use secure-setup to renumber the units in your stack. Refer to [“Renumbering stack units”](#) on page 313.

If you accept the unit IDs, the stack is formed, and you can see the stack topology using the **show stack** command.

```
Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type   Role   Mac Address   Pri State   Comment
1   S FCX648 active  00e0.52ab.cd00 128 local   Ready
2   D FCX624 standby 0012.f2d5.2100 60 remote  Ready
3   D FCX624 member 0012.f239.2d40 0 remote  Ready
```

```

      active      standby
    +---+      +---+      +---+
-2/1| 1 |3/1--2/1| 2 |3/1--2/2| 3 |2/1-
    +---+      +---+      +---+
```

Current stack management MAC is 00e0.52ab.cd00

For ICX devices, it displays an equals sign (=) to show connections between trunk ports, for example:

```
ICX6610-24P POE Router#show stack stack-port
      active      standby
    +---+      +---+      +---+
=2/1| 1 |2/6==2/6| 5 |2/1==2/1| 4 |2/6=
|      +---+      +---+      +---+ |
|                                     |
|-----|
```

NOTE

For field descriptions for the **show stack** command, refer to [“Displaying stack information”](#) on page 293.

NOTE

In this output, D indicates a dynamic configuration. After you perform a **write memory**, this display will change to S, for static configuration.

- The Active Controller automatically checks all prospective stack members to see if they are password protected. If a unit is password protected, you will be asked to enter the password before you can add the unit. If you do not know the password, take one of the following actions:
 - Discontinue secure-setup by entering **^C**.
 - Obtain the device password from the administrator.
 - Continue secure-setup for your stack. The password-protected device and all devices connected behind it will not be included in the setup process.

In the following example, the second unit is password protected, so you are asked for the password.

Connecting ICX 6450 and ICX 6430 devices in a stack

```

Brocade# stack secure-setup
Brocade# Discovering the stack topology...

Verifying password for the password protected units...

Found UPSTREAM units
Hop(s)  Type      Mac Address
1       2       FCX648  001b.ed5e.c480
2       3       FCX648  00e0.5205.0000

Enter password for FCX648 located at 2 hop(s): ****

Enter the number of the desired UPSTREAM units (1-2)[1]: 2

Selected Topology:
Active  Id  Type      Mac Address
      1   FCX624  00e0.5201.4000

Selected UPSTREAM units
Hop(s)  Id  Type      Mac Address
1       2   FCX648  001b.ed5e.c480
2       3   FCX648  00e0.5205.0000

Do you accept the unit id's (y/n)??: y

```

- When the Active Controller has finished the authentication process, you will see output that shows the suggested assigned stack IDs for each member. You can accept these recommendations, or you can manually configure stack IDs. Enter the **show stack** command to verify that all units are in the ready state.

```

Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID  Type  Role      Mac Address      Pri State      Comment
1  S FCX624 active    00e0.5201.4000  128 local      Ready
2  S FCX648 standby  001b.ed5e.c480   0 remote    Ready
3  S FCX648 member  00e0.5205.0000   0 remote    Ready

      active      standby
      +---+      +---+      +---+
-2/1| 1 |3/1--2/1| 2 |3/1--2/2| 3 |2/1-
|      +---+      +---+      +---+
|      |      |      |
|-----|

Current stack management MAC is 00e0.5201.4000
Brocade#

```

For ICX devices, it displays the port up state of all ports of the trunk, for example:

```

ICX6610-24P POE Router#show stack stack-port

      active      standby
      +---+      +---+      +---+
=2/1| 1 |2/6==2/6| 5 |2/1==2/1| 4 |2/6=
|      +---+      +---+      +---+
|      |      |
|-----|

U#  Stack-port1      Stack-port2
1  up (1/2/1-1/2/5)  up (1/2/6-1/2/10)

```

```
up ports: 1/2/1, 1/2/2, 1/2/3, 1/2/4, 1/2/5
up ports: 1/2/6, 1/2/7, 1/2/8, 1/2/9, 1/2/10

4  up (4/2/1-4/2/5)                                up (4/2/6-4/2/10)
   up ports: 4/2/1, 4/2/2, 4/2/3, 4/2/4, 4/2/5
   up ports: 4/2/6, 4/2/7, 4/2/8, 4/2/9, 4/2/10

5  up (5/2/1-5/2/5)                                up (5/2/6-5/2/10)
   up ports: 5/2/1, 5/2/2, 5/2/3, 5/2/4, 5/2/5
   up ports: 5/2/6, 5/2/7, 5/2/8, 5/2/9, 5/2/10
```

NOTE

A 4x10G port consists of four sub-ports and the **show stack-port** command displays all sub-ports. So ports 1/2/2-1/2/5 in the previous code example are sub-ports of port 1/2/2 and 1/2/7-1/2/10 are sub-ports of 1/2/7.

NOTE

For field descriptions for the **show stack** command, refer to [“Displaying stack information”](#) on page 293.

8. Enter the **write memory** command on the Active Controller once all of the stack units are active. This command initiates configuration synchronization, which copies the configuration file of the Active Controller to the rest of the stack units.

NOTE

The secure-setup process may modify your configuration with information about new units, stacking ports, and so on. For this reason, it is very important to save this information by issuing the **write memory** command. If you do not do this, you may lose your configuration information the next time the stack reboots.

The secure-setup process for your stack is now complete.

NOTE

During the secure-setup process, after one minute of inactivity, authentication for stack members will expire and you will need to restart the process.

Scenario 2 - Three-member IronStack in a ring topology using the automatic setup process

FCX devices determine stacking port candidates through the default-port setting. An FCX stackable device with the default port configuration is still considered a clean unit. To ensure that the device remains a clean unit, do not do a write memory on the device.

For more detailed information about configuring an FCX IronStack, refer to [“FCX IronStack configuration”](#) on page 258.

Configuring a three-member IronStack in a ring topology using the automatic setup process

Complete the following steps to configure a three-member IronStack in a ring topology using automatic setup process.

1. Power on the devices.
2. This process requires clean devices (except for the Active Controller) that do not contain any configuration information. To change a device to a clean device, enter the **erase startup-config** command and reset the device. When all of the devices are clean, continue with the next step.

NOTE

The physical connections must be sequential, and must match the stack configuration.

3. Log in to the device that you want to be the Active Controller.
4. Configure the rest of the units by assigning ID numbers and module information on each unit. The stack ID can be any number from 1 through 8.

```
Brocade# config t
Brocade(config)# stack unit 2
Brocade(config-unit-2)# module 1 fcx-24-port-copper-base-module
Brocade(config-unit-2)# module 2 fcx-xfp-1-port-10g-module
Brocade(config-unit-2)# module 3 fcx-xfp-1-port-10g-module
Brocade(config-unit-2)# stack unit 3
Brocade(config-unit-3)# module 1 fcx-24-port-copper-base-module
Brocade(config-unit-3)# module 2 fcx-xfp-1-port-10g-module
Brocade(config-unit-3)# module 3 fcx-xfp-1-port-10g-module
```

NOTE

Each stack unit must have a unique ID number.

5. Assign a priority to the Active Controller using the **priority** command, as shown.

```
Brocade(config)# stack unit 1
Brocade(config-stack-1)# priority 255
```

Syntax: **priority** <num>

- The <num> variable is a value from 0 through 255. 255 is the highest priority.

6. Assign a priority to the unit that will act as Standby Controller.

```
Brocade# config t
Brocade(config)# stack unit 2
Brocade(config-unit-2)# priority 240
```

7. Enter the **write memory** command to save your settings.
8. Enter the **stack enable** command.
9. Physically connect the devices in a stack topology, which triggers an election during which the stack is automatically configured. For more information about cabling the devices, refer to the appropriate hardware installation guides.

NOTE

When you are configuring individual stack units, you can skip ID numbers. However, the sequence in which the units are connected must match the order in which you configure them. For example, you could configure unit 1 as FCX624, unit 3 as FCX648, unit 4 as FCX624, unit 6 as FCX624 and unit 7 as FCX648. The physical connection order must be: Active (FCX624), FCX648 (3), FCX624 (4), FCX624 (6) and FCX648 (7). The Active Controller is stack unit 1.

10. Verify your stack configuration by entering the **show running config** command.

```
Brocade# show running config
Current configuration:
!
ver 05.0.02
!
stack unit 1
  module 1 fcx-24-port-copper-base-module
  module 2 fcx-xfp-1-port-10g-module
  module 3 fcx-xfp-1-port-10g-module
  priority 255
stack unit 2
  module 1 fcx-24-port-copper-base-module
  module 2 fcx-xfp-1-port-10g-module
  module 3 fcx-xfp-1-port-10g-module
  priority 240
stack unit 3
  module 1 fcx-24-port-copper-base-module
  module 2 fcx-xfp-1-port-10g-module
  module 3 fcx-xfp-1-port-10g-module
stack enable
!
```

NOTE

For field descriptions for the **show running config** command, refer to [“Displaying running configuration information”](#) on page 305.

11. To see information about your stack, enter the **show stack** command.

```
Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type   Role   Mac Address   Pri State   Comment
1   S FCX624 active  00e0.5200.0100 255 local   Ready
2   S FCX624 standby 0012.f2eb.afc0 240 remote  Ready
3   S FCX624 member 001b.ed5d.alc0 0 remote   Ready

      active      standby
      +---+      +---+      +---+
-2/1| 1 |3/1--2/1| 2 |3/1--2/2| 3 |2/1-
|   +---+      +---+      +---+ |
|   |-----|-----|-----| |
|   |-----|-----|-----| |

Current stack management MAC is 00e0.5200.0100
Brocade#
```

Results for ICX devices are similar, with an equals signe (=) to show connections between trunk ports, rather than the hyphen symbol (-) symbol showing connection.

NOTE

For field descriptions for the **show stack** command, refer to [“Displaying stack information”](#) on page 293.

Configuration notes for building a stack using the automatic setup process

- If a new unit configuration matches other unit configurations, the Active Controller gives this unit the lowest *sequential* ID. For example, in a stack configuration that contains eight FCX624 configurations, but only units 1, 4 and 8 are currently active, if you place a new FCX624 unit between units 4 and 8, the new unit will be assigned ID 5, even though it might match unused IDs 2, 3, 5, 6, and 7, because 5 is the lowest *sequential* ID.
- In a ring topology, the same new unit might assume either ID if either direction produces sequential IDs. For example, in a four-member stack where IDs 2 and 4 are reserved, a new unit could assume either ID 2 or ID 4 because either ID 1,2,3 or 1, 3, 4 is sequential.

Scenario 3 - Three member IronStack in a ring topology using the manual configuration process

NOTE

For more detailed information about configuring an FCX IronStack, refer to [“FCX IronStack configuration”](#) on page 258

Complete the following steps to configure a three-member IronStack in a ring topology using the manual configuration process.

1. Power on the devices. Do not connect the stacking cables at this point.
2. Assign a priority of 255 to unit 1, and a priority of 240 to unit 3 using the **priority** command. You do not have to assign a priority to the third device. Enter the **stack enable** command on each device. In this example, device 1 will be the Active Controller and device 2 will be the Standby Controller.

Unit 1

```
Brocade# config t
Brocade(config)# stack unit 1
Brocade(config-unit-1)# priority 255
Brocade(config-unit-1)# stack enable
Enable stacking. This unit actively participates in stacking
Brocade(config-unit-1)# write memory
Write startup-config done.
Flash Memory Write (8192 bytes per dot) .Flash to Flash Done.
Brocade(config-unit-1)# end
```

Unit 2

```
Brocade# config t
Brocade(config)# stack enable
Enable stacking. This unit actively participates in stacking
Brocade(config)# Handle election, was standalone --> member, assigned-ID=2,
T=261285 ms.
```

```
Write startup-config done.
```

```
Flash Memory Write (8192 bytes per dot) .Flash to Flash Done.
Brocade(config-unit-1)# end
Brocade# config t
```

Unit 3

```
Brocade# config t
Brocade(config)# stack unit 1
Brocade(config-unit-1)# priority 240
Brocade(config-unit-1)# stack enable
```

```
Enable stacking. This unit actively participates in stacking
Brocade(config-unit-1)# end
```

3. Connect the devices in a stack topology. The Active Controller will retain its ID. The rest of the units are assigned unique ID numbers depending on the sequence in which you connected them.

For more information about cabling the devices, refer to the appropriate hardware installation guides.

NOTE

This method does not guarantee sequential stack IDs. If you want to change stack IDs to make them sequential, you can use secure-setup. Refer to [“Renumbering stack units”](#) on page 313.

FCX IronStack configuration

FCX devices cannot be intermixed with non-FCX devices, and FCX devices have more possible stacking ports.

Every FCX-S and FCXS-F device contains two default 16 Gbps stacking ports on the rear panel and two 10 Gbps ports on the front panel that can also be used as stacking ports.

NOTE

FCX-I and FCX-E devices can only be used for stacking if they have an optional 10 Gbps SFP+ module installed in the front panel. These devices do not have stacking ports on the rear panels.

An FCX IronStack may contain up to eight 24-port and 48-port devices, using any combination of the rear panel stacking ports and the front panel optional stacking ports. For FCX-S and FCXS-F devices, to use ports other than the factory-default 16 Gbps ports, you must define the ports for each device in the run time configuration. You can also configure the 16 Gbps ports to operate as 10 Gbps ports. Refer to [“Configuring FCX stacking ports”](#) on page 259.

An FCX “clean unit” may contain a default port configuration, but it is still considered a clean unit. To preserve this state, do not do a write memory on the unit before you build the stack. An FCX device with the default port configuration is still considered a clean unit. To ensure that the device remains a clean unit, do not do a write memory on the device. (Write memory adds a startup-config, and the device is no longer a clean unit.)

NOTE

The automatic setup process will not work for FCX devices that do not contain the default port information in their clean unit configurations.

Configuring FCX stacking ports

Brocade FCX-S and FCXS-F devices have two 10 Gbps ports on the front panel and two 16 Gbps ports on the rear panel. All of these ports may be used as stacking ports, however the non-default ports must be configured as stacking ports when setting up your FCX-S or FCXS-F IronStack.

FCX-I and FCX-E devices do not have 16 Gbps ports on the rear panel. These devices may be used in an IronStack by installing the 10 Gbps 4-port SFP+ module in the module slot on the front panel. Once you have installed one of these modules, ports 1 and 2 act as the default stacking ports. However, you can also use these ports to pass regular traffic, after disabling the stacking default. Refer to [“Changing default stacking port configurations”](#) on page 261.

NOTE

If you are adding FCX-E or FCX-I devices to a stack containing FCX-S or FCXS-F devices, you must reconfigure the stacking ports on the FCX-S or FCXS-F devices to be the 10 Gbps ports on the front panel. You can then connect all of the devices in a stack using front panel ports.

Changing FCX-S and FCXS-F CX4 ports from 16 Gbps to 10 Gbps

You can configure the 16 Gbps CX4 ports to operate as 10 Gbps ports using the **speed-duplex** command, as shown in the following example.

Syntax: **speed-duplex** [10-full | 10-half | 100-full | 100-half | 1000-full-master | 1000-full-slave | 10g-full | auto]

- **10-full** - 10M, full duplex
- **10-half** - 10M, half duplex
- **100-full** - 100M, full duplex
- **100-half** - 100M, half duplex
- **1000-full-master** - 1G, full duplex, master
- **1000-full-slave** - 1G, full duplex, slave
- **10g-full** - 10G, full duplex
- **auto** - Autonegotiation

NOTE

Both ends of a link must be configured for 10 Gbps for the link to operate as 10 Gbps. If you want the link to operate as a 16 Gbps link, both ends of the link must be configured for 16 Gbps.

```
Brocade(config-if-e10000-cx4-1/2/1)# speed-duplex 10g-full
Brocade(config-if-e10000-cx4-1/2/1)# end
Brocade# show int br | in Up
1/1/4   Up      Forward    Full 1G    None No 1    0    001b.f288.0003
1/2/1   Up      Forward    Full 10G    None No 1    0    001b.f288.0019
1/3/1   Up      Forward    Full 10G    None No N/A  0    001b.f288.001b
3/3/1   Up      Forward    Full 10G    None No N/A  0    0024.3814.9df3
mgmt1   Up      None       Full 1G    None No 1    0    001b.f288.0018
Brocade# show interface e 1/2/1

Brocade(config-if-e10000-cx4-1/2/1)#

```

Configuring default ports on FCX devices

On FCX devices, the **default-port** command is used to define stacking port candidates. A stacking port is always a default port, but a default port may not necessarily be a stacking port. Default ports can become stacking ports using the secure-setup utility, or through automatic stack building.

Secure-setup probe packets can be received by a default port whether or not it is acting as a stacking port. Stacking packets can be only received by a stacking port (which is also always a default port). In order to use stacking ports that are not defined in the default configuration, you must define the port settings for each unit using the **default-port** command, so that secure-setup can discover the topology of the stack.

The 4-byte Ethernet preamble for the Ethernet frame is used when a port is configured as a default stacking port. For non-default ports, the standard 8-byte Ethernet preamble is used. For a default port that is used as a regular data port, the standard 8-byte Ethernet preamble must be explicitly enabled on the port using the **long-preamble** command. For details, refer to [“Configuring a default stacking port to function as a data port”](#) on page 264.

Stackable devices ship with two default stacking ports configured. Use the **stack-port** command to select only one of these factory default ports as the stacking port. If you do not configure **stack-port**, both default ports will operate as stacking ports.

Use the **default-port** command to use ports other than the factory default ports as stacking ports. You must configure **default-port** on each unit before building a stack. Once you have configured **default-port** on all units, you can then use any of the three stack construction methods to build a stack. The Active Controller then learns the port configuration for each unit.

NOTE

You cannot change the setting for a default port if the port is in use.

Changing default stacking port configurations

For FCX-E and FCX-I devices, ports 1 and 2 of the optional 10 Gbps SFP+ module (slot 2) act as the default stacking ports. You can change the default stacking ports to 3 and 4 on this module, or disable stacking, on all of the module ports. The following example changes the default ports on a 10 Gbps module from 1 and 2 to 3 and 4.

```
Brocade 10g-1(config)# stack unit 1
10g-1(config-unit-1)#
10g-1(config-unit-1)# default-ports 1/2/3 1/2/4
```

[Table 40](#) identifies the slot and port designations for each model.

NOTE

FCX-I and FCX-E models cannot be used in an IronStack without the addition of an optional 10 Gbps SFP+ module.

TABLE 40 Slot and port designations for FastIron stackable devices

Device	Slot 1	Slot 2	Slot 3	Slot 4
FCX624S-F	24 10/100/1000 ports on front panel	Two 16 Gbps ports on rear panel	Two 10 Gbps ports on front panel	N/A
FCX648S-F	48 10/100/1000 ports on front panel	Two 16 Gbps ports on rear panel	Two 10 Gbps ports on front panel	N/A
FCX-E devices with four-port 1 Gbps SFP module	Four-port 1 Gbps SFP module plus the first four copper ports act as a combo port. Slot 1 also contains the remaining 20 10/100/1000 ports.	N/A	N/A	N/A
FCX-I devices with four-port 1 Gbps SFP module	Four-port 1 Gbps SFP module plus the first four copper ports act as a combo port. Slot 1 also contains the remaining 20 10/100/1000 ports.	N/A	N/A	N/A
FCX-E devices with four-port 10 Gbps SFP+ module	48 10/100/1000 ports on front panel	Four-port 10 Gbps SFP+ module (supports stacking)	N/A	N/A
FCX-I devices with four-port 10 Gbps SFP+ module	48 10/100/1000 ports on front panel	Four-port 10 Gbps SFP+ module (supports stacking)	N/A	N/A

NOTE

Do not connect stacking ports to non-stacking ports. Stacking ports have a proprietary packet format that renders them incompatible with regular ports even when they are forwarding regular packets. In linear topologies, make sure that end units have only one stacking port configured (secure-setup automatically configures only one stacking port for an end unit).

Configuring a single stack port

To configure a single stack port, enter a command similar to the following.

```
Brocade(config)# stack unit 3
Brocade(config-unit-3)# stack-port 3/2/1
```

Syntax: [no] **stack-port** <stack-unit/slotnum/portnum>

If you enter an incorrect stack port number, you will get an error similar to the following.

```
Brocade(config-unit-3)# stack-port 3/4/1
Error! port 3/4/1 is invalid
Brocade(config-unit-3)# stack-port 3/2/1
```

To return both ports to stacking status, enter the **no stack-port** command on the single stacking port. This converts both ports to stacking ports. By default, if both ports are stacking ports, they are displayed by the system only when stacking is enabled. If only one port is configured as a stacking port, the system always displays this port.

Using secure-setup to build an FCX IronStack

You can use the secure-setup utility to build an FCX IronStack by performing the following step.

Enter **stack enable** and **stack secure-setup** commands when you have designated the desired stacking ports and connected your FCX units together, on stack unit 1, as shown in the following output.

```

Brocade# stack enable
Brocade# stack secure-setup
Brocade# Discovering the stack topology...

Configuring a default stacking port to function as a data port

You can configure one of the two default stacking ports as a stacking port and the other port as a regular data port. By default, the 4-byte Ethernet preamble for the Ethernet frame is used when a port is configured as a default stacking port. This is done to compensate for extra overhead caused by stacking protocol. To use a default stacking port as a regular data port, the Ethernet preamble must be set to 8 bytes.

To configure a default port to use the long preamble, enter the **long-preamble** command at the Interface level of the CLI.

```

Brocade(config)#interface ethernet 1/2/1
Brocade(config-if-e10000-1/2/1)#long-preamble

```

Syntax: [no] long-preamble

Use the **no** form of the command to revert to the 4-byte Ethernet preamble.

Configuring an ICX 6610 IronStack

ICX 6610 devices can be stacked using the methods and topologies described in [“Supported IronStack topologies”](#) on page 239. This section describes how stacking ports on the ICX 6610 devices can be trunked.

ICX 6610 trunked stacking ports configuration

A trunk doubles the stacking port bandwidth, and provides better resilience. As long as at least one port of the trunk is connected properly, the communication between the neighboring units will work. Traffic is load balanced to the trunk ports. With large number of sessions, traffic should be well load balanced between 40G and 4*10G ports. Traffic should also be well distributed among the four sub-ports of a 4*10G port. If a 4*10G sub-port fails due to hardware failure, traffic is re-distributed to other ports. So, the stack system should still work. Periodical background diagnosis will print out warning messages that any 4*10G sub-port is down.

When a stacking port goes down, it should not cause stack election or topology change as long as the other port of the same trunk is up. The traffic interruption time should be sub-second for the system to detect the port down event and reprogram HW.

Stacking ports are trunked by default in Brocade ICX 6610 Series. You do not need to configure anything. The system automatically generate trunk configuration. You must enable stacking and connect cables properly for the stack to work.

The **show trunk** command shows user-configured or LACP trunks, and does not show stacking trunks.

At least one port of a trunk must be connected. If multiple ports of a trunk are connected, they must be connected to the same trunk of other unit. For example, it is invalid that the two ports of a trunk connect to two different units, or to different trunks of the same unit. Wrong connection might result in stacking formation failure or other problems. Some invalid connections still form a stack but with forwarding problems. Stack probe packets use the first connected port of a stacking trunk. So, as long as the first connected port of a trunk is connected properly, a stack can form. However, packet forwarding may not work for some streams that are hashed into the wrongly connected trunk port. In such case, periodical background diagnosis task could detect wrong connections in about 20 minutes, and it prints error messages.

Configuration notes for ICX stack topologies

- ICX devices do not allow users to change "stack-ports" configuration. Secure-setup sets the endpoints of a linear FCX stack to data ports, but it does not do so for ICX.
- ICX devices support up to 124 user-configured or LACP trunks. HW trunk ID of 0 is reserved, IDs 125-127 are used in trunk stacking ports and the internal cascade trunk in the 48-port unit.

NOTE

ICX 40G and 4x10G ports cannot be used as data ports, even when stacking is not enabled. In standalone mode, they drop all packets, except stacking probe packets. Secure Setup and unit replacement can therefore still discover a standalone unit.

Periodic background stack diagnosis for ICX 6610 devices

After a stack forms, the system periodically probes the topology to check the connections between units of this stack. It can detect the following errors. The purposes are to detect user's connection problem and hardware failures. Error messages are printed about every 10 minutes. If there is no printout, there is no problem. This diagnosis runs in the background.

Manually triggering stack diagnosis

You can manually trigger the diagnosis using the **show stack connection** command.

1. Ports of the same trunk connect to different units.
2. Ports of the same trunk connect to different trunks of the same unit.
3. Sub-ports of the 4*10G are down.
4. One end of a 10G port is up and the other end is down.
5. Communication problems between units of the stack

The most common connection error is connecting a 40G port to a 4*10G port. They use the same type of cable. In such case, the system might show one end is up, and one end is down. The stack cannot form, and the periodical background diagnosis task won't run at all.

Another connection error is that the two cables of a trunk go to different units, or to different trunks of the same unit as in case 1 and 2. Stack might still form in these cases. But it may cause internal forwarding loop, or have forwarding problem.

Cases 3 to 5 are due to hardware failures or software problems.

For example, the active unit console pops up the following messages if sub-ports of 4*10G are down. The stack should still work because of trunks. If all sub-ports of 4*10G are down, the diagnosis prints nothing because it cannot distinguish hardware failure or the cable is not connected.

```
*** Warning! miss 4*10G link 5/2/8(down)to 1/2/8(down). Stack can still work.
*** Warning! U1, dir=1, 4*10G ports: 1/2/8 are down.
*** Warning! U5, dir=1, 4*10G ports: 5/2/8 are down.
Please use "show stack conn" to view detailed connections
You can suppress the error messages by configuring "stack suppress-warning"
```

Configuring an ICX 6430 and ICX 6450 IronStack

ICX 6430 and ICX 6450 devices can be stacked using the methods and topologies described in [“Connecting ICX 6450 and ICX 6430 devices in a stack”](#) on page 244. The [“Configuring ICX 6430 or ICX 6450 trunked stacking ports”](#) section describes how stacking ports on the ICX 6430 and ICX 6450 devices can be trunked to form a single trunk-to-port connection on two directly connected stack units. The [“Configuring ICX 6430 or ICX 6450 multi-trunked stacking ports”](#) section describes how to configure a double port trunk configuration on the ICX 6430 and ICX 6450 devices. The [“Error messages encountered during the configuration of an ICX 6430 or ICX 6450 IronStack”](#) section describes the error messages that may occur when configuring an ICX 6430 or ICX 6450 IronStack.

Configuring ICX 6430 or ICX 6450 trunked stacking ports

NOTE

Brocade advises using the **stack-trunk** command in a new environment on first deployment. Brocade recommends using the **multi-trunk** command in a production environment. For more information about the **multi-trunk** command refer to [“Configuring ICX 6430 or ICX 6450 multi-trunked stacking ports”](#) on page 267.

The **stack-trunk** command forms a single trunk-to-port connection on two connected stack units. A trunk-to-port connection is formed when one side of the ports forms a trunk, and the other side of the ports does not. You can use the **stack-trunk** command to configure a stack trunk if one or both of the units are provisional units. You must enable stacking and connect cables properly for the stack to work. To enable the **stack-trunk** command, the primary port in the trunk must be configured under the **stack-port** command configuration.

For ICX 6450 devices, the data ports on both units must be configured to 10 Gbps port speed to enable trunking. To upgrade to 10 Gbps port speed on ports 2 and 4, use the ICX6450-2X10G-LIC-POD license. If the data port is not enabled for 10 Gbps port speed, the port status is down. For more information about configuring ports to 10 Gbps port speed, refer to [“Licensing for Ports on Demand”](#) on page 208.

Configure a stack truck by entering the following command under the stack unit configuration level.

```
Brocade (config)#stack unit 1
Brocade (config-unit-1)#stack-trunk 1/2/3 to 1/2/4
```

The following warning is displayed on the CLI if the **stack-trunk** command results in a trunk-to-port connection.

```
Error- this command will result in a port-to-trunk connection between stack 1 and
2. Please use "multi-trunk" command instead.
```

Use the **multi-trunk** command to configure a stack trunk on two directly connected stack units to ensure that a trunk-to-trunk connection is formed on both units at the same time.

Syntax: [no] **stack-trunk**

Use the **no** form of the command to disable the stack trunk configuration.

To save the configuration, enter the **write memory** command.

Configuring ICX 6430 or ICX 6450 multi-trunked stacking ports

To upgrade from a single to a double port trunk configuration, use the **multi-trunk** command. The **multi-trunk** command is used to ensure that a stack trunk is formed on two directly connected stack units at the same time. The **multi-trunk** command can only be enabled on the active controller unit. By configuring a multi-trunk on two sets of connected stack ports, a trunk-to-port connection is avoided. A trunk-to-port connection is formed when one side of the ports forms a trunk, and other side of the ports does not. A trunk-to-port connection can result in packet drops and can potentially break a stacking link.

The primary ports of the stack trunk must be connected and in an up status to enable the **multi-trunk** command. If the primary stack trunk ports are not connected and not in an up status, the command is rejected and the following error message is displayed on the CLI.

Error- Primary trunk port 1/2/3 is not UP; removing the trunk might break the stack

To upgrade to a double port trunk configuration, enter the **multi-trunk** command under the stack unit configuration level. Enter the following command.

```
Brocade(config)#stack unit 1
Brocade(config-unit-1)# multi-trunk 1/2/3 to 1/2/4 and 2/2/1 to 2/2/2
Brocade(config-unit-1)#stack unit 2
Brocade(config-unit-2)# multi-trunk 2/2/3 to 2/2/4 and 3/2/1 to 3/2/2
```

Syntax: [no] multi-trunk

Use the **no** form of the command to disable the configuration of the two connected stack trunk ports, and convert the secondary stack ports to data ports.

Displaying multi-trunked stacking configuration

When upgrading to a double port trunk configuration using the **multi-trunk** command, the configuration is not saved in the running or start-up configuration. Instead, the configuration for the **multi-trunk** command is saved as stack-trunk ports. Use the **show stack** command to display the configuration for multi-trunked stacking ports. For example, the following command is entered.

```
Brocade (config-unit-1)# multi-trunk 1/2/3 to 1/2/4 and 2/2/1 to 2/2/2
```

The running or start-up configuration displays the following configuration for the **show stack** command.

```
Brocade#show stack
stack unit 1
module 1 icx6450-48p-poe-port-management-module
  module 2 icx6450-sfp-plus-4port-40g-module
    stack-trunk 1/2/3 to 1/2/4
    stack-port 1/2/1 1/2/3
stack unit 2
module 1 icx6450-24-port-management-module
module 2 icx6450-sfp-plus-4port-40g-module
default-ports 2/2/1 2/2/3
stack-trunk 2/2/1 to 2/2/2
stack-port 2/2/1 2/2/3
```

Syntax: show stack

Periodic background stack diagnosis for ICX 6430 and ICX 6450 devices

After a stack forms, the system periodically probes the topology to check the connections between units of this stack. It can detect the following errors. The purposes are to detect user's connection problem and hardware failures. Error messages are printed about every 10 minutes. If there is no printout, there is no problem. This diagnosis runs in the background.

Manually triggering stack diagnosis

You can manually trigger the diagnosis using the **show stack connection** command.

1. Ports of the same trunk connect to different units.
2. Ports of the same trunk connect to different trunks of the same unit.
3. One end of a 10G port is up and the other end is down.
4. Communication problems between units of the stack

Another connection error is that the two cables of a trunk go to different units, or to different trunks of the same unit as in case 1 and 2. Stack might still form in these cases. But it may cause internal forwarding loop, or have forwarding problem.

Cases 3 to 5 are due to hardware failures or software problems.

Error messages encountered during the configuration of an ICX 6430 or ICX 6450 IronStack

The following error messages may occur when configuring an ICX 6430 or ICX 6450 IronStack:

- In you form a multi-trunk connection on two sets of stack ports that are not directly connected on neighboring units, the **multi-trunk** command is rejected and an error message is displayed. The following is an example of an error message.

```
Error- 1/2/3 and 1/2/4 are not connected; please use directly connected
stack-ports to form stack-trunks.
```

- When an unit joins or leaves a stack, or a stack trunk is configured using the **stack-trunk** command, a stack election is triggered. The **multi-trunk** command triggers a stack election among the stack units and reprograms (or removes) the stack trunk port in the hardware. A timer is set on all units to coordinate a stack election. The traffic interruption time generally takes less than 5 seconds for the system to detect the port down event and reprogram HW. You must wait for the stack election to be completed before entering another command. If you do not wait for the stack election to finish, the following warning message is displayed.

```
Stack port or trunk change is in progress, please try later.
```

You cannot enter the **stack-switchover** command until the stack election is completed. You can enter the **stack-switchover** command following the **multi-trunk** command configuration. If you enter the **stack-switchover** command before the stack election is completed, the following warning message is displayed.

```
Please try later, reason: during stack port or trunk deployment.
```

- If ports 2 and 4 of the ICX 6450-24 device are not configured to 10 Gbps port speed, then the **multi-trunk** command and the **stack-trunk** command are rejected with the following error message.

```
Error! port 1/2/2 is not configured as 10G
```

You must first enable the port to 10 Gbps port speed using the **speed-duplex 10g-full** command. For more information about configuring ports to 10 Gbps port speed, refer to [“Licensing for Ports on Demand”](#) on page 208.

- You cannot use the **stack-port** command to remove a stacking port if the port is part of a stack trunk. You must first remove the stack trunk and then remove the stack port. Use the **stack-trunk** command or the **multi-trunk** command to remove the stack trunk. If you attempt to remove the stack port before removing the stack trunk, an error message is displayed. The following is an example of an error message.

Please remove stack-trunk 1/2/3 - 1/2/4 using "stack-trunk" or "multi-trunk" command before removing stack port 1/2/3.

Verifying an IronStack configuration

Complete the following step to verify your IronStack configuration.

Log in to the Active Controller and verify the stack information by entering the **show running-config** and **show stack** or **show stack detail** commands. If your stack is configured properly, you should see the following:

- One Active Controller, one Standby Controller, and stack members.
- All stack members show a status of Ready

The following output shows an example configuration of an FCX IronStack.

```
Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type      Role      Mac Address      Pri State      Comment
2   S FCX648POE standby 00e0.5202.0000    0 remote Ready
3   S FCX624POE member 00e0.5203.0000    0 remote Ready
4   S FCX648   member 00e0.5204.0000    0 remote Ready
5   S FCX648POE member 0000.0000.0000    0 remoteReady
6   S FCX648POE active 00e0.5201.0000  128 local  Ready

active                                     standby
+---+ +---+ +---+ +---+
-2/1| 8 |2/2--2/1| 4 |2/2--2/1| 3 |2/2--2/1| 2 |2/2-
| +---+ +---+ +---+ +---+ |
|-----|
Current stack management MAC is 00e0.5201.0000
```

Results for ICX devices are similar, with an equals sign (=) to show connections between trunk ports, rather than the hyphen symbol (-) showing connections.

The next example shows output from the **show version** command for the same FCX stack.

```
Brocade# show version

```

NOTE

For field descriptions for the **show running config** command, refer to [“Displaying running configuration information”](#) on page 305.

NOTE

For field descriptions for the **show stack** and **show stack detail** commands, refer to [“Displaying stack information”](#) on page 293.

The output from the **show stack** command contains a visual diagram of the stack. The dashed line between ports 1/2/1 and 3/2/1 indicates that this stack is configured in a ring topology. If the link between ports 1/2/1 and 3/2/1 is lost, the stack topology changes to linear, and the diagram changes to resemble the following.

```

      active      standby
      +---+      +---+      +---+
-2/1| 1 |3/1--2/1| 2 |3/1--2/2| 3 |2/1-
      +---+      +---+      +---+

```

The interfaces at either of a stack member are stacking ports. If no interface is displayed, it indicates that there is no stacking port configured. For example, the following diagram shows that stack units 1 and 3 each have only one stacking port configured.

Verifying an IronStack configuration

```
active      standby
+---+      +---+      +---+
| 1 |3/1--2/1| 2 |3/1--2/2| 3 |
+---+      +---+      +---+
```

For more detailed information, you can enter the **show stack detail** command.

Brocade IronStack management

Your Brocade IronStack can be managed through a single IP address. You can manage the stack using this IP address even if you remove the Active Controller or any member from the stack. You can also connect to the Active Controller through Telnet or SSH using this address. All management functions, such as SNMP, use this IP address to acquire MIB information and other management data.

A Brocade IronStack can be configured and managed using the command line interface (CLI) over a serial connection to a console port.

Logging in through the CLI

You can access the IronStack and the CLI in two ways:

- Through a direct serial connection to the console port
- Through a local or remote Telnet session using the stack IP address

You can initiate a local Telnet or SNMP connection by attaching a cable to a port and specifying the assigned management station IP address.

The stacking commands in the CLI are organized into the following levels:

- **Global** – Commands issued in the global mode are applied to the entire stack.
- **Stack Member Configuration Mode** – Commands issued in this mode apply to the specified stack member. Configuration information resides in the Active Controller.
- **Configuration Mode** – This is where you make configuration changes to the unit. To save changes across reloads, you need to save them to the Active Controller startup-config file. The configuration mode contains sub-levels for individual ports, for VLANs, for routing protocols, and other configuration areas.

NOTE

By default, any user who can open a serial or Telnet connection to the IronStack can access all of these CLI levels. To secure access, you can configure Enable passwords or local user accounts, or you can configure the Active Controller to use a RADIUS or TACACS/TACACS+ server for authentication. Refer to [Chapter 4, “Security Access”](#).

Logging in through the console port

When a device becomes a stack member in the IronStack, it establishes a remote connection to a virtual console port on the Active Controller. Input and output are relayed between the physical console port on the stack member and the virtual console port on the Active Controller. Since each stack member connects to an independent virtual console port on the Active Controller, the console ports on multiple stack units may be used simultaneously. However, messages displayed on the Active Controller physical console port during a reload will not be visible on the console ports of the stack members because the remote connections are not established until the software loading process is complete. It is preferable to connect a cable to the console port on the stack unit that will normally be the Active Controller, rather than to the console port of one of the other stack units.

When a stack unit establishes communication with the Active Controller, it also establishes a remote console session to the Active Controller. In a normally functioning IronStack, a console cable may be connected to any of the stack units and provide access to the same commands on the Active Controller.

You can terminate a session by entering **Ctrl+O** followed by **x** or **X**, or by entering the **exit** command from the User EXEC level, or by entering the **logout** command at any level.

NOTE

For the rconsole connections from the stack units to the Active Controller, the escape sequence and other methods of terminating the session are not available.

NOTE

Error messages that are generated during a reload of the Active Controller will not appear on rconsole connections from the stack units to the Active Controller. To see these error messages, you must connect a console cable to the Active Controller itself.

To establish an rconsole session, enter the **rconsole** command as shown:

```
Brocade# rconsole 1
```

Syntax: **rconsole** <stack-unit>

The following example shows how to establish rconsole sessions to stack members. Notice that the **show stack** command on the stack members displays different information than what is shown when the **show stack** command is entered on the Active Controller.

To see the status of your stack units, enter the **show stack** command on the Active Controller.

```
Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID  Type    Role      Mac Address      Pri  State   Comment
1  S FCX648P active    0012.f2de.8100   128  local   Ready
2  S FCX624P standby   0012.f2e2.ba40   0     remote  Ready
3  S FCX624P member    001b.ed7a.22c0   0     remote  Ready
```

```

      active      standby
      +---+      +---+      +---+
-2/1| 1 |3/1--2/1| 2 |3/1--2/2| 3 |2/1-
|   +---+      +---+      +---+ |
|   |           |           |   |
|   |-----|           |   |

```

```
Current stack management MAC is 0012.f2de.8100
Brocade#
```

NOTE

For field descriptions for the **show stack** command, refer to [“Displaying stack information”](#) on page 293.

Establish a remote console session with stack unit 2.

```
Brocade# rconsole 2
Connecting to unit 2... (Press Ctrl-O X to exit)
rconsole-2@Brocade#show stack
ID  Type    Role      Mac Address      Prio State   Comment
2  S FCX624P standby   0012.f2e2.ba40   0     local   Ready
```

```
rconsole-2@Brocade# exit
rconsole-2@Brocade> exit
Disconnected. Returning to local session...
```

Establish a remote console session with stack unit 3.

```
Brocade# rconsole 3
Connecting to unit 3... (Press Ctrl-O X to exit)
rconsole-3@Brocade# show stack
ID  Type   Role      Mac Address      Prio State   Comment
3  S  FCX624P  member          001b.ed7a.22c0    0   local   Ready

rconsole-3@Brocade# logout
Disconnected. Returning to local session...
Brocade#
```

IronStack management MAC address

The IronStack is identified in the network by a single MAC address, usually the MAC address of the Active Controller (the default). If a new Active Controller is elected, the MAC address of the new Active Controller (by default) becomes the MAC address for the entire stack. However, you can manually configure your stack to use a specified MAC address. Refer to [“Manually allocating the IronStack MAC address”](#) on page 275.

In an IronStack, the management MAC address is generated by the software, and is always the MAC address of the first port of the Active Controller. This ensures that the management MAC address remains consistent across stack reboots, and helps prevent frequent topology changes as a result of protocol enable, disable, and configuration changes.

When you are configuring Layer 2 protocols on stack units, such as STP, RSTP, and MSTP, the management MAC address of the Active Controller acts as the Bridge ID.

You can also configure the IronStack to retain its original MAC address, or wait for a specified amount of time before assuming the address of a new Active Controller, using the Persistent MAC Address feature (refer to [“Persistent MAC address for the IronStack”](#) on page 286).

Manually allocating the IronStack MAC address

You can manually configure your IronStack to use a specific MAC address. This overrides the default condition where the stack uses the MAC address of whatever unit is currently serving as Active Controller.

NOTE

The **stack mac** command is useful for administration purposes, however it should be used with caution to prevent duplication of MAC addresses.

NOTE

For hitless stacking failover, Brocade recommends that you configure the IronStack MAC address using the **stack mac** command. Without this configuration, the MAC address of the stack will change to the new base MAC address of the Active Controller. This could cause a spanning tree root change. Even without a spanning tree change, a client (for example, a personal computer) pinging the stack might encounter a long delay depending on the client MAC aging time. The client won't work until it ages out the old MAC address and sends ARP requests to relearn the new stack MAC address.

To configure a stack MAC address manually, enter the following command.

```
Brocade(config)# stack mac 0000.0000.0011
```

Syntax: [no] **stack mac** <mac-address>

The <mac-address> variable is a hexadecimal MAC address in the xxxx.xxxx.xxxx format.

Enter the **no** form of this command to return the MAC address to that of the Active Controller.

Output for this command resembles the following.

```
Brocade(config)# stack mac 0000.0000.0011
Brocade(config)# show running-config
Current configuration:
!
ver 05.0.01 100T7e1
!
stack 1
  module 1 fcx-48-port-copper-base-module
  module 2 fcx-cx4-1-port-10g-module
  priority 80
stack 2
  module 1 fcx-24-port-copper-base-module
  module 2 fcx-cx4-1-port-10g-module
  module 3 fcx-cx4-1-port-10g-module
stack enable
stack mac 0000.0000.0011
```

To display the stack MAC address, enter the **show chassis** command.

```
Brocade# show chassis
The stack unit 1 chassis info:

Power supply 1 (NA - AC - Regular) present, status ok
Power supply 2 not present

Fan 1 ok
Fan 2 ok
Exhaust Side Temperature Readings:
  Current temperature : 35.5 deg-C
  Warning level.....: 80.0 deg-C
  Shutdown level.....: 90.0 deg-C
Intake Side Temperature Readings:
  Current temperature : 33.5 deg-C
Boot Prom MAC: 0012.f2de.9440
Management MAC: 0000.0000.0011

The stack unit 2 chassis info:

Power supply 1 (NA - AC - Regular) present, status ok
Power supply 2 not present

Fan 1 ok
Fan 2 ok
--More--, next page: Space, next line: Return key, quit: Control-c
```

NOTE

For field descriptions for the **show chassis** command, refer to [“Displaying IronStack chassis information”](#) on page 291.

Removing MAC address entries

You can remove the following types of learned MAC address entries from the Brocade system MAC address table:

- All MAC address entries
- All MAC address entries for a specified Ethernet port
- All MAC address entries for a specified VLAN
- A specified MAC address entry in all VLANs

For example, to remove entries for the MAC address 000d.cb80.00d in all VLANs, enter the following command at the Privileged EXEC level of the CLI.

```
Brocade# clear mac-address 000d.cb80.00d0
```

Syntax: **clear mac-address** <mac-address> | **ethernet** <port> | **vlan** <number>

- If you enter the **clear mac-address** command without any parameters, the software removes all MAC entries.
- Use the <mac-address> variable to remove a specified MAC address from all VLANs. Specify the MAC address in the following format: HHHH.HHHH.HHHH.
- Use the **ethernet** <port> parameter to remove all MAC addresses for a specified Ethernet port. Specify the <port> variable in the format <stack-unit/slotnum/portnum>.
- Use the **vlan** <number> parameter to remove all MAC addresses for a specified VLAN.

IronStack unit identification

Stack units are identified by numbers 1 through 8. You can display stack unit IDs by entering the **show stack** command (refer to [“Displaying IronStack information”](#) on page 289).

A new device (one that has not been connected in an IronStack or has not been manually assigned a stack unit number) ships with a default number of 1. Once you enable stacking and the unit becomes part of an IronStack, its default stack unit number changes to the lowest available number in the stack.

Stack units must each have a unique identification number. Every stack member, including any standalone units, retains its stack unit number unless that number is already being used in the stack, or until you manually renumber the unit using secure-setup. For more information about how to renumber stack IDs using secure-setup, refer to [“Renumbering stack units”](#) on page 313.

IronStack unit priority

A unit with a higher priority is more likely to be elected Active Controller. The priority value can be 0 to 255 with a priority of 255 being the highest. The default priority value assigned to the Active Controller and Standby is 128.

You can assign the highest priority value to the stack unit you want to function as the Active Controller. When you enter a new priority value for a stack unit, that value takes effect immediately, but does not affect the current Active Controller until the next reset. However, if you enable hitless stacking failover, the stack unit with the highest priority will become the active controller in about five minutes (2 minutes in the case of ICX 6430 devices). For details, refer to [“Changing the priority of a stack unit”](#) on page 278.

You can give your Active and Standby Controllers the same priority, or different priorities (Active highest, Standby second-highest). When Active and Standby Controllers have the same priority, if the Active fails and the Standby takes over, then the original Active becomes operational again, it will not be able to resume its original role if the new Active Controller has more members.

In the same situation, when the priorities of the Active and Standby Controllers are different, the old Active Controller will regain its role and will reset the other units.

For example, suppose both Active and Standby Controllers have the same priority. If there are more than two units in a stack and the Active Controller leaves and comes back, it cannot win back the Active role because the new Active Controller has more members than the old Active Controller, which has no members. In this case, both the old Active Controller and new Active Controller have no members, so the unit with the longer up time wins the Active role. If the old Active Controller is reset, it cannot win. If the old Active Controller is not reset, it could win due to longer up time on up time or lower unit ID.

If you want to assign the same priority to the Active and Standby Controllers, you must do so after the stack is formed. This prevents the intended Standby Controller from becoming the Active Controller during stack construction.

Changing the priority of a stack member will trigger an election that takes effect immediately unless the Active Controller role changes. If this is the case, the changes will not take effect until after the next stack reload. However, if you enable hitless stacking failover, the stack unit with the highest priority will become the active controller without reload.

To display stack member priority values, enter the **show stack** command.

```
Brocade(config-unit-3)# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type  Role   Mac Address   Pri State   Comment
1 S   FCX624 active  0012.f2eb.a900 128 local    Ready
2 S   FCX624 standby 00f0.424f.4243 0  remote   Ready, member after reload
3 S   FCX624 member  001b.ed5d.a100 200 remote   Ready, active after reload
Brocade(config-unit-3)#
```

Changing the priority of a stack unit

To change the priority value for a stack unit, enter the **priority** command.

```
Brocade(Config)# stack unit 1
Brocade(Config-unit-1)# priority 128
```

Once a change in priority value has taken effect, if you have enabled hitless stacking failover, the stack unit with the highest priority will become the active controller without reload.

Syntax: **priority** <num>

The <num> variable is a value from 0 through 255. 255 is the highest priority.

CLI command syntax for stack units

CLI syntax that refers to stack units must contain all of the following parameters:

`<stack-unit>/<slotnum>/<portnum>`

- `<stack-unit>` - If the device is operating as a standalone, the stack-unit will be 1. Stack IDs can be any number from 1 through 8.
- `<slotnum>` - Refers to a specific group of ports on each device.
- `<portnum>` - A valid port number.

IronStack CLI commands

CLI commands specific to stacking are listed in [Table 41](#), with a link to the description for each command. For more information about CLI commands and syntax conventions, refer to [1](#), “Management Applications”.

TABLE 41 Stacking CLI commands

Command	Description location
copy flash flash	“Copying the flash image to a stack unit from the Active Controller” on page 283
clear stack ipc	“Troubleshooting an unsuccessful stack build” on page 315
cx4-10g	“Changing FCX-S and FCXS-F CX4 ports from 16 Gbps to 10 Gbps” on page 259
kill console	“Configuring TACACS/TACACS+ for devices in a Brocade IronStack” on page 140
priority	“Changing the priority of a stack unit” on page 278
rconsole	“Logging in through the console port” on page 273
reload stack unit	“Reloading a stack unit” on page 283
show chassis	“Displaying IronStack chassis information” on page 291
show flash	“Displaying IronStack flash information” on page 289
show memory	“Displaying IronStack memory information” on page 290
show module	“Displaying stack module information” on page 292
show running-config	“Displaying running configuration information” on page 305
show stack	“Displaying stack information” on page 293
show stack detail	“Displaying stack information” on page 293
show stack flash	“Displaying stack flash information” on page 296
show stack ipc	“Troubleshooting an unsuccessful stack build” on page 315
show stack neighbors	“Displaying stack neighbors information” on page 303
show stack resource	“Displaying stack information” on page 293
show stack rel-ipc stats	“Displaying stack rel-IPC statistics” on page 297
show stack rel-ipc stats unit #	“Displaying stack rel-IPC statistics for a specific stack unit” on page 301
show stack stack-port	“Displaying stack port information” on page 304
show statistics stack-port	“Displaying stacking port statistics” on page 309
show interfaces stack-ports	“Displaying stacking port interface information” on page 308

TABLE 41 Stacking CLI commands (Continued)

Command	Description location
show version	"Displaying software version information" on page 307
stack enable	"Enabling the stacking mode" on page 280
stack disable	"Enabling the stacking mode" on page 280
stack mac [mac-address]	"IronStack management MAC address" on page 275
stack persistent-mac-timer	"Persistent MAC address for the IronStack" on page 286
stack-port	"Changing default stacking port configurations" on page 261
default-ports	"Changing default stacking port configurations" on page 261
stack secure-setup	"Scenario 1 - Three-member IronStack in a ring topology using secure-setup" on page 250
stack unconfigure	"Unconfiguring an IronStack" on page 287
stack unconfigure rollback	"Unconfiguring an IronStack" on page 287
hitless-failover enable	"Enabling hitless stacking" on page 341
stack switch-over	"Executing a hitless stacking switchover" on page 344
debug stacking sync_rel_msg	"Displaying information about hitless stacking" on page 350
show stack failover	"Displaying information about stack failover" on page 350
show stack link-sync	"Displaying information about link synchronization status" on page 350

Enabling the stacking mode

When a unit is stack-enabled or joins a stack either actively or passively, it reserves priority queue 7 for stacking traffic control, assigns buffers for the stacking ports, and configures the first two 10 Gbps ports as stacking ports.

NOTE

Designated stacking ports cannot contain any configuration information, such as VLAN membership, etc. If configuration information exists, **stack enable** will fail. You must remove all configuration information from the port and re-issue the **stack enable** command.

To enable stacking mode on a new unit before you add it to the stack, enter the following command.

```
Brocade(config)# stack enable
Enable stacking. This unit actively participates in stacking
```

Syntax: [no] stack enable

To see the configuration of the stack at any time, enter the **show stacking configuration** command.

To remove stacking capability, enter the **no stack enable** command. This prevents the unit from actively sending out probe messages, however the unit could still be called to join a stack by an Active Controller. To prevent this, enter the **stack disable** command.

The **stack disable** command prevents a unit from sending or listening for any stacking probe messages. In this mode, the unit cannot be forced to join a stack.

```
Brocade(config)# stack disable
```

Syntax: [no] stack disable

To remove this restriction, enter the **no stack disable** command.

Important notes about stacking images

Consider the notes in this section when upgrading from a pre-stacking release to a stacking release, or when reverting from a stacking release to a pre-stacking release.

Refer to the release notes for instructions about upgrading the software.

Converting from a pre-stacking image to a stacking image

When you boot a stacking image (release 05.X or later) on a device with a pre-stacking (pre-release 05.X) startup-config.txt file, the system automatically converts the interface format from 0/X/X to 1/X/X. In addition, when a **write memory** command is issued, the pre-stacking startup-config.txt file is renamed to start-config.v4 and saved as a backup file.

NOTE

If you enter the **erase startup-config** command or **stack unconfigure clean** command, all startup-config.txt-related files, such as startup-config.v4 and startup-config.old are erased. You will no longer be able to recover pre-stacking startup-config.txt files.

Reverting from a stacking image to a pre-stacking image

To convert a device running a stacking image (release 05.X or later) to a pre-stacking (pre-release 05.X) image, use the **stack unconfigure rollback** command, which recovers the startup-config.v4 file that was saved when the **write memory** command was issued at the time the device was upgraded to a stacking image. For more information, refer to [“Recovering an earlier version of a stack configuration”](#) on page 288.

Encountering a problem after upgrading and reloading the software

If you encounter a problem after upgrading and reloading the software, make sure the device has the correct boot code version and the following (if applicable) are installed correctly:

- EEPROM
- Memory DIMM

NOTE

If you do not have the correct EEPROM for the upgrade, you will need to recover your pre-stacking image. For information about how to do this, refer to [“Recovering an earlier version of a stack configuration”](#) on page 288.

If the stacking EEPROM is missing or is not installed correctly, or if you have installed the wrong EEPROM, you will see output similar to the following.

```
FCX MEM size: 0x10000000
FCX Flash config....
FCX Boot Code Version 05.0.01
Enter 'b' to stop at boot....
BOOT INFO: load monitor from primary, size=103408
BOOT INFO: load image from primary.....
BOOT INFO: bootparam at 000543e8, mp_flash_size=002ee6c5
BOOT INFO: code decompression completed
```

```

BOOT INFO: branch to 00400100
Starting Main Task.....
*****
ERR: This software needs License PROM to be installed in the system
*****
System Reset!

```

If your memory DIMM is not installed correctly, you will see output similar to the following.

```

FCX Mem size: 0x8000000
Flash Config...
FCX Boot Code Version 05.0.01
Enter 'b' to stop at boot....
BOOT INFO: load monitor from primary, size = 103380
BOOT INFO: debug enabled!!
BOOT INFO: load image from primary...
BOOT INFO: bootparam at 00054338 mp_flash_size = 002flaeb
BOOT INFO: code decompression completed
BOOT INFO: branch to 00400100
Starting Main Task...

*****
ERR: This software requires 256M memory to be installed in the system.
*****
System Reset!

```

When you have confirmed that your hardware upgrade is installed correctly, restart the system and check the software version using the **show version** command. Refer to [“Confirming IronStack software versions”](#) in the next section.

Confirming IronStack software versions

All units in an IronStack must be running the same software image. To confirm this, check the software version on all devices that you want to add to your IronStack. Upgrade any units that are running older versions of the software before you build your stack.

1. Telnet, SSH, or connect to any of the console ports in the stack.
2. Enter the **show version** command. Output similar to the following is displayed.

```

Brocade# show version
Copyright (c) 1996-2010 Brocade Communications Systems, Inc.
  UNIT 1: compiled on Jan 26 2010 at 22:16:08 labeled as FCX07001
          (2441570 bytes) from Primary fcx07001.bin
          SW: Version 07.0.0151T7e1
  UNIT 2: compiled on Jan 26 2010 at 22:16:08 labeled as FCX07001
          (2441570 bytes) from Primary fcx07001.bin
          SW: Version 07.0.0151T7e1
  UNIT 3: compiled on Jan 26 2010 at 22:16:08 labeled as FCX07001
          (2441570 bytes) from Primary fcx07001.bin
          SW: Version 07.0.0151T7e1
  UNIT 4: compiled on Jan 26 2010 at 22:16:08 labeled as FCX07001
          (2441570 bytes) from Primary fcx07001.bin
          SW: Version 07.0.0151T7e1

```

NOTE

If any unit in the IronStack is running an incorrect version of the software, it will appear as non-operational. You must install the correct software version on that unit for it to operate properly in the stack. For more information, refer to [“Copying the flash image to a stack unit from the Active Controller”](#) in the next section.

Copying the flash image to a stack unit from the Active Controller

To copy the flash image to a stack unit from the Active Controller primary or secondary flash, enter the following command.

```
Brocade# copy flash flash unit-id-pri 2
```

Syntax: `copy flash flash [primary | secondary | unit-id-pri <unit-num> | unit-id-sec <unit-num>]`

- **primary** - Copy secondary to primary
- **secondary** - Copy primary to secondary
- **unit-id-pri** - Copy active primary image to unit ID
- **unit-id-sec** - Copy active secondary image to unit ID

The **unit-id-pri** and **unit-id-sec** keywords are used to copy images to a stack member from the Active Controller primary and secondary flash, respectively. For **<unit-num>**, enter a value from 1 through 8.

NOTE

You do not have to manually copy the flash image to a mismatched stack unit. For more information, refer to [“Auto Image Copy for stack units”](#) on page 321.

Reloading a stack unit

To reload a stack unit, enter the following command.

```
Brocade# reload
```

Syntax: `reload [after | at | cancel | unit-id <unit-list>]`

- **after** - Schedule reloading after certain time period
- **at** - Schedule reloading at an exact later time
- **cancel** - Cancel scheduled reload
- **unit-id** - Stack members to reload. The **<unit-list>** variable can be a combination, such as 2,4-6,8. Tokens must be separated by a comma and there is no space.

Controlling stack topology

Because Stackable devices allow you to use one of the two ports intended for stacking as a regular data port, you can control the size of your stack. The following example shows a stack where the existing ring topology is changed so that only one unit in the upstream direction is connected through a stacking port, which limits the size of the stack to two units.

```

Brocade# stack secure-setup
Brocade# Discovering the stack topology...

Current Discovered Topology - RING

```

Managing IronStack partitioning

When a unit in an IronStack with a linear topology fails, the IronStack divides (partitions) into two or more separate stacks that all have the same configuration. This may cause an IP address conflict in the network. If you want to keep the stacks separate, you will need to change the IP address of each new stack.

When a stack breaks into partitions, the partition with the Active Controller remains operational. If a partition contains the Standby Controller, this partition will become operational because the Standby Controller will assume the Active role and will reload the partition units. A partition without an Active or Standby Controller will not function. To reconfigure these units to act in standalone mode, you must first do a **stack unconfigure me** command on each unit. Refer to [“Unconfiguring an IronStack”](#) on page 287.

To reverse the partitioning, reconnect all of the units into the original stack topology using the stacking ports. This is the same as merging stacks. If the original Active Controller again has the highest priority, it will regain its role. If two partition Active Controllers have the same priority, the Active Controller with the most stack members will win the election. This process helps minimize traffic interruption.

Ring topology stacks do not partition in the event of a member failure. Operation is interrupted briefly while the stack recalculates a new path. Ring topologies are more stable than linear topologies because they provide redundant pathways in case of accidental failure.

Merging IronStacks

IronStacks may be merged, but the total number of stack units must not exceed eight. For example, you could combine two stacks with four units each into a single stack of eight units.

You can merge stacks by connecting them together using the stacking ports. Before doing this, make sure that none of the stacking ports have been reconfigured as data ports (for example, ports on an end unit in a linear stack topology). You cannot use secure-setup to merge stacks because secure-setup does not work across stack boundaries.

When stacks are merged, an election is held among the Active Controllers. The winner retains its configuration and the IDs of all of its original stack members. The remaining stack units lose their configuration and are reset. If the IDs of the losing stack units conflict with the IDs of the winning units they may change, and the IDs will no longer be sequential. You can use secure-setup to renumber the members in the newly merged stack. The following examples show how stack merging works:

- If a stack partitions into multiple stacks because of a connection failure, and you fix the connection, the stack partitions will merge back into the original stack with no change to stack IDs, because in this case all stack IDs are distinct.
- In a linear stack topology, the end units of the stack will have only one stacking port configured. Before you can merge two linear stacks, you must reconfigure the end units so that both ports are stacking ports.

MIB support for the IronStack

All statistics about packets received and sent, RMON, jumbo frames, runts, giants, and other instances are gathered through the stack interfaces and are accessible through SNMP. The functionality for an IronStack is the same as that for a standard 10 Gbps interface. Information includes types of modules, including optics modules.

NOTE

A type counter has been added to count the number of packets greater than 1518 bytes (jumbo frames).

For detailed information about stacking MIBs, refer to the *MIB Reference Guide*.

Persistent MAC address for the IronStack

The MAC address for the entire IronStack is determined by the MAC address of the Active Controller. When an Active Controller is removed from the stack, and a new Active Controller is elected, by default the MAC address of the new Active Controller becomes the MAC address for the IronStack. When you enable the Persistent MAC Address feature, you configure a time delay before the stack MAC address changes. During this configured interval, if the previous Active Controller is reinstalled in the stack, the stack continues to use the MAC address of this unit, even though it may no longer be the Active Controller. If the previous Active Controller does not rejoin the stack during the specified time interval, the stack assumes the address of the new Active Controller as the stack MAC address.

The Persistent MAC Address feature allows you to configure a period of time during which the original base MAC address will not change if the Active Controller fails, or is removed for maintenance. This timer is triggered when the Standby Controller becomes the Active Controller. When the timer expires, the new Active Controller will change the previous MAC address to its base MAC address and advertise this MAC address to management VLANs to update the ARP peer table. If you want to use the new address, you will have to re-enter the **stack-persistent-mac-timer** command again to reactivate the persistent MAC address,

To enable Persistent MAC Address, enter the following command.

```
Brocade(config)# stack persistent-mac-timer 120
```

Syntax: [no] **stack persistent-mac-timer** <number>

The <number> variable is the number of minutes during which the IronStack will retain the original MAC Address if the Active Controller fails or is removed for service. The valid value range is from 5 through 6000 minutes. If you enter a 0, it means “keep this address forever”. The default is 60 minutes.

To disable Persistent MAC Address, enter the following command.

```
Brocade(config)# no stack persistent-mac-timer
```

NOTE

If you enter the **no** form of this command while the persistent MAC address timer is active, the stack will disregard the persistent MAC address and will assume the MAC address of the new Active Controller.

NOTE

Persistent MAC and stack MAC cannot be used together.

In the following example, the persistent MAC timer has been set to the default of 60 minutes.

```
Brocade(config)# stack persistent-mac 60

Brocade(config)# show running-config
Current configuration:
!
ver 05.0.011T7e1
!
stack 1
  module 1 fcx-48-port-copper-base-module
  module 2 fcx-cx4-1-port-10g-module
  priority 80
stack 2
```

```

module 1 fcx-24-port-copper-base-module
module 2 fcx-cx4-1-port-10g-module
module 3 fcx-cx4-1-port-10g-module
stack 3
  module 1 fcx-48-port-management-module
  module 2 fcx-cx4-2-port-10g-module
  priority 40
stack enable
stack persistent-mac 60

```

To display the stack MAC addresses, enter the **show stack** command.

```

Brocade(config)# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type   Role      Mac Address      Prio State   Comment
1   S   FCX648p  active          0012.f2d5.9380   80   local   Ready
2   S   FCX648   member          00e0.6666.8880   0    remote  Ready
3   S   FCX624   standby         0012.f2dc.0ec0   40   remote  Ready
Current persistent MAC is 0012.f2d5.9380
Brocade(config)# stack mac 111.111.111
Error: persistent stacking MAC address timer is configured
Brocade(config)#

```

The following example shows what the Persistent MAC information looks like in the output of the **show stack** command when the Standby Controller becomes the Active Controller.

```

Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type   Role      Mac Address      Prio State   Comment
1   S   FCX648P  active          0000.0000.0000   80   reserved
2   S   FCX648   standby         00e0.6666.8880   0    remote  Ready
3   S   FCX624   master         0012.f2dc.0ec0   40   local   Ready
Brocade#Persistent MAC timer expires in 59 minutes 52 seconds.

Current persistent MAC is 0012.f2d5.9380

```

Unconfiguring an IronStack

The **stack unconfigure** command is a run time command that returns stack units to their pre-stacking state. When a stack unit is unconfigured, its stacking flash is removed, and its startup-config.txt flash file is recovered. These actions apply to all units to which this command is applied, regardless of the role of the unit in the stack.

When the **stack unconfigure** command is applied to the Active Controller, it removes **stack enable** from the run time configuration but not from the startup configuration. If you want to remove **stack enable** from the Active Controller permanently, you must enter the **write memory** command.

When the **stack unconfigure** command is applied to the Standby Controller or a stack member (besides the Active Controller) it removes **stack enable** from the recovered startup-config.txt and resets the unit.

When a stack unit that did not have an original startup-config file is unconfigured, it becomes a clean unit. It is possible that this unit could automatically rejoin the stack if its module configuration matches that of the Active Controller. To prevent this from happening accidentally, it is best to first disconnect the unit which has to be unconfigured, and then issue the **stack unconfigure me** command on it.

To remove the configuration from a specific IronStack unit, or from the entire stack, enter a command similar to the following.

```
Brocade# stack unconfigure me
```

Syntax: `stack unconfigure [<stack-unit> | all | me | clean | rollback]`

- `<stack-unit>` - Unconfigure the stack member with this ID
- `all` - Unconfigure every unit including this unit
- `me` - Unconfigure this unit only
- `clean` - Removes all startup configuration files including v4 and v5 and makes this a clean unit
- `rollback` - Recovers the earlier version (4 or 3) of a startup configuration (refer to [“Recovering an earlier version of a stack configuration”](#) on page 288)

NOTE

The `stack unconfigure me` command is available to all units, while `stack unconfigure all` and `stack unconfigure <stack-unit>` are available on the Active Controller only.

The following example shows a session where stack unit 2 is unconfigured.

```
Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type   Role   Mac Address   Pri State   Comment
1 S   FCX624 active  0012.f2eb.a900 128 local   Ready
2 S   FCX648 standby 00f0.424f.4243  0 remote Ready
3 S   FCX624 member 00e0.5201.0100  0 remote Ready

Brocade# stack unconfigure 2
Will recover pre-stacking startup config of this unit, and reset it. Are you sure?
(enter 'y' or 'n'): y
Stack 2 deletes stack bootup flash and recover startup-config.txt from .old

Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID   Type   Role   Mac Address   Pri State   Comment
1 S   FCX624 active  0012.f2eb.a900 128 local   Ready
2 S   FCX648 member 0000.0000.0000  0 reserved
3 S   FCX624 standby 00e0.5201.0100  0 remote   Ready
```

When the `stack unconfigure 2` command is issued, stack unit 2 recovers the `startup-config.txt` from the `startup-config.old` configuration file that was saved when this unit downloaded its configuration from the Active Controller. As the output shows, stack member 2 has been removed from the stack, and ID 2 is now reserved for a replacement unit. Stack member 3 is now the Standby Controller.

Recovering an earlier version of a stack configuration

The `stack unconfigure rollback` command recovers the earlier, non-stacking version (4.X or 3X) of a startup configuration. When a system that is running stacking (05.X and later) discovers that its startup configuration is an earlier version, it saves this configuration to a `startup-config.v4` file when a `write memory` command is issued, or when the Active Controller tries to synchronize all startup configurations. The `stack unconfigure rollback` command is similar to the `stack unconfigure` command except that it does not remove “stack enable” from the run time or startup configuration.

The **stack unconfigure** and **stack unconfigure rollback** commands are unrelated and recover different startup-config.txt files. Both commands permanently delete the current startup-config.txt and replace it with a pre-stacking (pre-05.X) startup-config.txt file.

NOTE

When you issue the **stack unconfigure rollback** command to recover the previous startup-config.v4 file, DO NOT issue a **write memory** command, as **write memory** will overwrite the recovered file. You should reboot from a pre-5.X image without doing a **write memory**.

If you enter the **erase startup-config** or **stack unconfigure clean** commands, all startup-config text-related files, such as startup-config.v4 and startup-config.old are erased. You will no longer be able to recover pre 5.X startup-config.txt files.

Syntax: **stack unconfigure rollback** [<stack-unit> | **all** | **me**]

- <stack-unit>- Recover the version 4 startup-config file for the stack member with this ID
- **all** - Recover the version 4 startup-config file for every unit including this unit
- **me** - Recover the version 4 startup-config file for this unit only

Displaying IronStack information

This section describes the **show** commands for an IronStack, including output examples and field descriptions.

Displaying IronStack flash information

Use the **show flash** command to display flash memory information for all members of a stack, or for a specified stack member.

Syntax: **show flash** <stack-unit>

Output from the **show flash** command for a stack resembles the following (for a stack with three members).

From the Active Controller for the entire stack:

```
Brocade# show flash
Stack unit 1:
Compressed Pri Code size = 3034232, Version 05.0.00T7e1 (fcx05000.bin)
Compressed Sec Code size = 2873568, Version 04.2.00T7e1 (fcx04200.bin)
Compressed BootROM Code size = 405217, Version 04.0.00T7e5
Code Flash Free Space = 2146304
Stack unit 2:
Compressed Pri Code size = 3034232, Version 05.0.00T7e1 (fcx05000.bin)
Compressed Sec Code size = 2873523, Version 04.2.00aT7e1 (fcx04200a.bin)
Compressed BootROM Code size = 403073, Version 03.0.00T7e5
Code Flash Free Space = 24117248
Stack unit 3:
Compressed Pri Code size = 3034232, Version 05.0.00T7e1 (fcx05000.bin)
Compressed Sec Code size = 2873568, Version 04.2.00T7e1 (fcx04200.bin)
Compressed BootROM Code size = 405217, Version 04.0.00T7e5
Code Flash Free Space = 2252800
Brocade#
```

For stack member 3 only:

```
Brocade# show flash unit 3
Stack unit 3:
Compressed Pri Code size = 3034232, Version 05.0.00T7e1 (fcx05000.bin)
Compressed Sec Code size = 2873568, Version 04.2.00T7e1 (fcx04200.bin)
Compressed BootROM Code size = 405217, Version 04.0.00T7e5
Code Flash Free Space = 2252800
Brocade#
```

Table 42 describes the fields displayed in this example.

TABLE 42 Field definitions for the **show flash** command

Field	Description
Compressed Pri Code size	The compressed size, version, and image name for the Primary Code
Compressed Sec Code size	The compressed size, version, and image name for the Secondary Code
Compressed BootROM Code size	The compressed size and version for the BootROM Code
Code Flash Free Space	The amount of available free space on the Flash memory

Displaying IronStack memory information

The **show memory** command displays information about stack units. The following example shows output from this command for a stack with eight units.

```
Brocade# show memory
Stack unit 1:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 182820476 bytes free, 23% used
Stack unit 2:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 172751776 bytes free, 27% used
Stack unit 3:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 172751776 bytes free, 27% used
Stack unit 4:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 172751776 bytes free, 27% used
Stack unit 5:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 107140664 bytes free, 54% used
Stack unit 6:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 172751740 bytes free, 27% used
Stack unit 7:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 182820504 bytes free, 23% used
Stack unit 8:
  Total DRAM: 268435456 bytes
  Dynamic memory: 238026752 bytes total, 182811440 bytes free, 23% used
Brocade#
```

Syntax: **show memory**

Table 43 describes the fields displayed in this output example.

TABLE 43 Field definitions for the show memory command

Field	Description
Total DRAM	The size (in bytes) of DRAM
Dynamic memory	The total number of bytes in dynamic memory, including the number of bytes that are available (free, or unused), and the percentage of memory used.

Displaying IronStack chassis information

The **show chassis** command displays chassis information for each stack unit. Output resembles the following (in this example, a three member stack).

```

Brocade# show chassis
The stack unit 1 chassis info:

Power supply 1 (NA - AC - Regular) present, status ok
Power supply 2 not present

Fan 1 ok
Fan 2 ok
Exhaust Side Temperature Readings:
    Current temperature : 33.0 deg-C
    Warning level.....: 85.0 deg-C
    Shutdown level.....: 90.0 deg-C
Intake Side Temperature Readings:
    Current temperature : 31.0 deg-C
Boot Prom MAC: 0012.f2e4.6e00
Management MAC: 0012.f2e4.6e00

The stack unit 2 chassis info:

Power supply 1 (NA - AC - Regular) present, status ok
Power supply 2 not present

Fan 1 ok
Fan 2 ok
Exhaust Side Temperature Readings:
    Current temperature : 32.5 deg-C
    Warning level.....: 85.0 deg-C
    Shutdown level.....: 90.0 deg-C
Intake Side Temperature Readings:
    Current temperature : 31.0 deg-C
Boot Prom MAC: 0012.f2e3.11c0

The stack unit 3 chassis info:

Power supply 1 (NA - AC - Regular) present, status ok
Power supply 2 not present

Fan 1 ok
Fan 2 ok
Exhaust Side Temperature Readings:
    Current temperature : 31.5 deg-C
    Warning level.....: 85.0 deg-C
    Shutdown level.....: 90.0 deg-C

```

```
Intake Side Temperature Readings:
    Current temperature : 32.0 deg-C
Boot Prom MAC: 0012.f2db.e500
```

Syntax: show chassis

Table 44 describes the fields displayed in this output example.

TABLE 44 Field definitions for the show chassis command

Field	Description
Power Supply 1	The status of the primary power supply.
Power Supply 2	The status of the secondary power supply, if present.
Fan 1 and Fan 2	The status of the cooling fans
Exhaust Side Temperature Readings	From the air exhaust side of the chassis, the current temperature reading, the warning level temperature setting, and the shutdown level temperature setting.
Intake Side Temperature Reading	The current temperature reading from the air intake side of the chassis.
Boot Prom MAC	The MAC address of the boot prom
Management MAC	For the Active Controller only, the management MAC address

Displaying stack module information

The **show module** command displays information about the stack unit modules. Output resembles the following.

```
Brocade(config)# show module
Module                                     Status Ports Starting MAC
S1:M1 FCX-24G 24-port Management Module + PoE      OK      24      00e0.5201.4000
S1:M2 FCX-2XGC 2-port 10G Module (2-CX4)           OK       2      00e0.5201.4018
S1:M3 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      00e0.5201.401a
S3:M1 FCX-48G 48-port Management Module            OK      48      001b.ed5e.c480
S3:M2 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      001b.ed5e.c4b0
S3:M3 FCX-1XGC 1-port 10G Module (1-CX4)           OK       1      001b.ed5e.c4b1
S4:M1 FCX-48G 48-port Management Module            OK      48      001b.ed5e.ac00
S4:M2 FCX-1XGC 1-port 10G Module (1-CX4)           OK       1      001b.ed5e.ac30
S4:M3 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      001b.ed5e.ac31
S5:M1 FCX-24G 24-port Management Module            OK      24      001b.ed5d.a180
S5:M2 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      001b.ed5d.a198
S5:M3 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      001b.ed5d.a199
S5:M4 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      001b.ed5d.a19a
S6:M1 FCX-24G 24-port Management Module            OK      24      00e0.5200.3000
S6:M2 FCX-1XGC 1-port 10G Module (1-CX4)           OK       1      00e0.5200.3018
S6:M3 FCX-1XGC 1-port 10G Module (1-CX4)           OK       1      00e0.5200.3019
S7:M1 FCX-48G 48-port Management Module            OK      48      00e0.4444.0000
S7:M2 FCX-1XGC 1-port 10G Module (1-CX4)           OK       1      00e0.4444.0030
S7:M3 FCX-1XGC 1-port 10G Module (1-CX4)           OK       1      00e0.4444.0031
S8:M1 FCX-48G 48-port Management Module            OK      48      0012.f2eb.d540
S8:M2 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      0012.f2eb.d570
S8:M3 FCX-1XG 1-port 10G Module (1-XFP)            OK       1      0012.f2eb.d571
Brocade(config)#
```

Syntax: `show module`

Table 45 describes the fields displayed in this output example.

TABLE 45 Field definitions for the **show module** command

Field	Description
Module	Identifies the module, by stack unit ID, module number, module type
Status	The status of this module
Ports	The number of ports in this module
Starting MAC	The starting MAC address for this module

Displaying stack resource information

Use the **show stack resource** command to display stack resource information, as shown in the example output from a Brocade ICX 6610 switch.

```
Brocade# show stack resource
alloc in-use avail get-fail limit get-mem size init
register attribute 4800 2710 2090 0 556800 4810 334 2400
general 12B data 32 10 22 0 7424 12 12 32
RB-tree node 4096 2714 1382 0 237568 3026 18 1024
variable length link 3905 4 3901 0 905960 4 8 3905
AU msg dev0 4092 0 4092 0 16368 0 16 4092
AU msg dev1 4092 0 4092 0 16368 0 16 4092
```

Syntax: `show stack resource`

Table 46 describes the output fields for this command. This command displays the following information for register attributes, general 12B data, and RB-tree node.

TABLE 46 Field definitions for the **show stack resource** command

Field	Description
alloc	Memory allocated
in-use	Memory in use
avail	Available memory
get-fail	The number of get requests that have failed.
limit	The maximum memory allocation
get-mem	The number of get-memory requests
size	The size
init	The number of requests initiated.

Displaying stack information

You can display information about any and all of the members in an IronStack by entering **show** commands from the Active Controller console port. If you enter **show** commands from a unit that is not the Active Controller, the information may not be displayed correctly.

The **show stack** command displays general information about an IronStack, for all members, for a specified member, and with additional detail if required.

The following output covers the entire stack, as shown in this example output from a Brocade ICX 6610 switch.

```
Brocade#show stack
```

alone: standalone, D: dynamic config, S: static config

ID	Type	Role	Mac Address	Pri	State	Comment
1	S ICX6610-24P	member	748e.f834.5238	0	remote	Ready
2	S ICX6610-48P	member	748e.f834.4800	0	remote	Ready

Syntax: `show stack <stack-unit> | detail`

Table 47 describes the fields displayed by the **show stack** command.

TABLE 47 Field descriptions for the **show stack** command

Field	Description
alone: Standalone	This device is operating as a standalone device
S: static configuration	The configuration for this unit is static (has been saved with a write memory command).
D: dynamic configuration	The configuration for this unit is dynamic and may be overwritten by a new stack unit. To change to a static configuration, enter the write memory command.
ID	The stack identification number for this unit.
Type	The model of this unit.
Role	The role of this unit within the stack.
MAC address	The MAC address of this unit.
Priority	The priority assigned to this unit.

TABLE 47 Field descriptions for the **show stack** command (Continued)

Field	Description
State	The operational state of this unit.
Comments	Additional information about this unit (optional).

NOTE

The Active Controller removes the dynamic configuration of a unit when the unit leaves. However, if there is a static trunk configuration associated with the unit, the Active Controller cannot remove the dynamic configuration. In this case, you must remove the static trunk and use the **no stack unit x** to manually remove the configuration.

[Table 48](#) describes the output from the **show stack detail** command (in addition to the **show stack** command fields shown in the previous table).

TABLE 48 Field descriptions for the **show stack detail** command

Field	Description
Stack Port Status	Indicates stacking port status for each stack unit.
Neighbors	Identifies stack neighbors (by unit ID) for each stack unit.
ID	The stack identification number for this unit.
Stack-port 1	Indicates the port state (up or down) and identifies the port by number (stack-ID/slot/port).
Stack-port 2	Indicates the port state (up or down) and identifies the port by number (stack-ID/slot/port).

Displaying stack flash information

Use the **show stack flash** command to display information about flash memory for stack members, as shown in this example output from a Brocade ICX 6610 switch.

```
Brocade# show stack flash
There is no startup-config.old
Stack flash that was read in bootup:
ICX6610-48P, ID =4, role= active, pri=200, config=1, jumbo=X PPVLAN=X S2M=0 FIPS=X
stack p: [0]=4/2/1 [1]=4/2/6 default p: 4/2/1(5) 4/2/6(5), , , hash-chain=X
vlan#=X ve#=X stp#=X
active-chg=0

Current written stack flash:
ICX6610-48P, ID =4, role= active, pri=200, config=1, jumbo=X PPVLAN=X S2M=0 FIPS=X
stack p: [0]=4/2/1 [1]=4/2/6 default p: 4/2/1(5) 4/2/6(5), , , hash-chain=X
vlan#=X ve#=X stp#=X
active-chg=0
```

Syntax: show stack flash

Table 49 describes the output from the **show stack flash** command.

TABLE 49 Field descriptions for the **show stack flash** command

Field	Description
ID	Device ID
role	The role of this device in the stack
priority	The priority of this device in the stack
config	Indicates the port state (up or down) and identifies the port by number (stack-ID/slot/port).
<i>The rest of the fields are used for debug purposes only.</i>	

Displaying stack rel-IPC statistics

Use the **show stack rel-ipc stats** command to display session statistics for stack units. The following output is observed on a Brocade ICX 6610 switch.

```
Brocade# show stack rel-ipc stats
Reliable IPC statistics:

Global statistics:
Pkts rcvd w/no session: 0
Msgs rcvd w/no handler: 0

Unit statistics:

Unit 2 statistics:
Msgs sent: 41384  Msgs received: 14052, Pkt sends failed: 0

Message types sent:

Brocade#

```

Syntax: show stack rel-ipc unit *<num>*

Displaying stack neighbors information

The **show stack neighbors** command displays information about stack member neighbors. The following output is from a Brocade ICX 6610 switch.

```

Brocade# show stack neighbors
U#   Stack-port1                Stack-port2
1    unit7 (7/2/1-7/2/5)       unit2 (2/2/6-2/2/10)
2    unit3 (3/2/1-3/2/5)       unit1 (1/2/6-1/2/10)
3    unit2 (2/2/1-2/2/5)       unit4 (4/2/6-4/2/10)
4    unit5 (5/2/1-5/2/5)       unit3 (3/2/6-3/2/10)
5    unit4 (4/2/1-4/2/5)       unit6 (6/2/1-6/2/5)
6    unit5 (5/2/6-5/2/10)      unit7 (7/2/6-7/2/10)
7    unit1 (1/2/1-1/2/5)       unit6 (6/2/6-6/2/10)

```

Topology: Ring, 7 unit(s), order: 4 3 2 1 7 6 5

[illegible]

```

|                                     +---+ |
-----2/1| 5 |2/6=
                                     +---+

```

Syntax: `show stack neighbors`

[Table 50](#) describes the output from the `show stack neighbors` command.

TABLE 50 Field descriptions for the `show stack neighbors` command

Field	Description
U	The stack identification number for this unit.
Stack-port1	Identifies the neighbor stack unit for stack-port1 for this unit ID.
Stack-port2	Identifies the neighbor stack unit for stack-port2 for this unit ID.

Displaying stack port information

The `show stack stack-ports` command displays information about stack port status.

```

Brocade(config)# show stack stack-ports
ID      Stack-port1      Stack-port2
1       up (1/2/1)       up (1/2/2)
2       up (2/2/1)       up (2/2/2)
3       up (3/2/1)       up (3/3/1)
4       up (4/2/1)       up (4/3/1)
5       up (5/2/1)       up (5/3/1)

```

For ICX devices, it displays an equals sign (=) to show connections between trunk ports and is enhanced to display the port up state of all trunked ports. The following example is observed on a Brocade ICX 6610 switch.

```

Brocade#show stack stack-ports
active
      +---+      +---+      +---+      +---+      +---+      +---+
=2/1| 4 |2/6==2/6| 3 |2/1==2/1| 2 |2/6==2/6| 1 |2/1==2/1| 7 |2/6==2/6| 6 |2/1=
|      +---+      +---+      +---+      +---+      +---+      +---+
|                                     standby
|                                     +---+
-----2/1| 5 |2/6=
                                     +---+

   up ports: 5/2/1, 5/2/2, 5/2/3, 5/2/4, 5/2/5
   up ports: 5/2/6, 5/2/7, 5/2/8, 5/2/9, 5/2/10

6  up (6/2/1-6/2/5)                                up (6/2/6-6/2/10)
   up ports: 6/2/1, 6/2/2, 6/2/3, 6/2/4, 6/2/5
   up ports: 6/2/6, 6/2/7, 6/2/8, 6/2/9, 6/2/10

7  up (7/2/1-7/2/5)                                up (7/2/6-7/2/10)
   up ports: 7/2/1, 7/2/2, 7/2/3, 7/2/4, 7/2/5
   up ports: 7/2/6, 7/2/7, 7/2/8, 7/2/9, 7/2/10

```

Syntax: show stack stack-ports

[Table 51](#) describes the output from the **show stack stack-ports** command.

TABLE 51 Field descriptions for the **show stack stack-ports** command

Field	Description
ID	The stack identification number for this unit
Stack-port1	Indicates port state (up or down) and identifies the port by number (stack-ID/slot/port)
Stack-port 2	Indicates port state (up or down) and identifies the port by number (stack-ID/slot/port)

Displaying running configuration information

The **show running-config** command displays information about the current stack configuration.

```

Brocade(config)# show running-config
Current configuration:
!
ver 05.0.00T7e1
!
stack unit 1
  module 1 fcx-24-port-management-module
  module 2 fcx-cx4-2-port-10g-module
  module 3 fcx-xfp-1-port-10g-module
  stack-port 1/2/1 1/3/1
stack unit 2
  module 1 fcx-48-port-management-module
  module 2 fcx-xfp-2-port-10g-module
stack unit 3
  module 1 fcx-48-port-copper-base-module
  module 2 fcx-xfp-1-port-10g-module
  module 3 fcx-cx4-1-port-10g-module
stack unit 4
  module 1 fcx-48-port-copper-base-module
  module 2 fcx-cx4-1-port-10g-module
  module 3 fcx-xfp-1-port-10g-module
  priority 128
stack enable
!

```

For ICX devices, with stacking enabled, for example:

```

stack unit 1
  module 1 icx6610-24p-poe-port-management-module
  module 2 icx6610-qsfp-10-port-160g-module

```

```

module 3 icx6610-8-port-10g-dual-mode-module
priority 128
stack-trunk 1/2/1 to 1/2/2
stack-trunk 1/2/6 to 1/2/7
stack-port 1/2/1 1/2/6
stack unit 4
module 1 icx6610-48p-poe-port-management-module
module 2 icx6610-qsfp-10-port-160g-module
module 3 icx6610-8-port-10g-dual-mode-module
priority 100
stack-trunk 4/2/1 to 4/2/2
stack-trunk 4/2/6 to 4/2/7
stack-port 4/2/1 4/2/6
stack unit 5
module 1 icx6610-48-port-management-module
module 2 icx6610-qsfp-10-port-160g-module
module 3 icx6610-8-port-10g-dual-mode-module
priority 128
stack-trunk 5/2/1 to 5/2/2
stack-trunk 5/2/6 to 5/2/7
stack-port 5/2/1 5/2/6
stack enable

```

Syntax: `show running-config`

Table 52 describes the output from the **show running-config** command.

TABLE 52 Field descriptions for the `show running-config` command

Field	Description
stack unit <#>	The stack identification number for this unit.
module <#>	Identifies the configuration for modules on this unit.
priority	Indicates that a priority has been assigned to this stack unit
stack-trunk	Indicates the trunk configuration ¹

1. For ICX devices, software version 7.3 always shows two primary ports of two stacking trunks. The user cannot define just one stacking port as for FCX devices.

Displaying configured stacking ports

The stacking ports may display in the output from the **show running-config** command in three different ways.

1. When stacking is enabled, the output shows both stacking ports.

```

stack unit 1
module 1 fcx-24-port-management-module
module 2 fcx-cx4-2-port-10g-module
module 3 fcx-xfp-1-port-10g-module
stack-port 1/2/1 1/3/1

```

2. When stacking is not enabled, neither stacking port is displayed.

```

stack unit 1
module 1 fcx-24-port-management-module
module 2 fcx-cx4-2-port-10g-module
module 3 fcx-xfp-1-port-10g-module

```

3. If one stacking port is configured, that port will be displayed whether or not stacking is enabled.

```
stack unit 1
  module 1 fcx-24-port-management-module
  module 2 fcx-cx4-2-port-10g-module
  module 3 fcx-xfp-1-port-10g-module
stack-port 1/3/1
```

Displaying software version information

The **show version** command shows the software version that the stack is running. Note that the last line of this output shows the bootup ID and role for this unit. Output resembles the following.

```
Brocade(config)# show version

Syntax: `show interfaces stack-ports`

[Table 53](#) describes the fields displayed by the `show interfaces stack-ports` command.

TABLE 53 Field descriptions for the `show interfaces stack-ports` command

Field	Description
Port	The stack identification number for this unit.
Link	Identifies the configuration for modules on this unit.
State	Indicates that a priority has been assigned to this stack unit
Dupl	Indicates whether the port is configured as half or full duplex
Speed	Indicates the port speed
Trunk	Indicates whether the port is part of a trunk
Tag	Indicates whether the port is tagged or untagged
P	Port priority
MAC	The MAC address of the port
Name	An optional name assigned to the port

NOTE

If a unit is provisional (reserved; and does not have a physical unit associated with the unit ID), its interface MAC address shows as 0000.0000.0000

Displaying stacking port statistics

The **show statistics stack-ports** command displays information about all stacking ports in an IronStack topology.

```
Brocade# show statistics stack-ports
```

Port	In Packets	Out Packets	In Errors	Out Errors
1/2/1	22223	4528	0	0
1/2/2	35506	3844	0	0
2/2/1	3161	34173	0	0
2/2/2	24721	3676	0	0
3/2/1	3048	23881	0	0
3/2/2	13540	2857	0	0
4/2/1	2862	13537	0	0
4/2/2	3626	3184	0	0
5/2/1	3183	3621	0	0
5/2/2	3265	13508	0	0
6/2/1	14020	3655	0	0
6/3/1	3652	17705	0	0
7/2/1	17705	3658	0	0
7/3/1	4047	21802	0	0
TOTAL	154559	153629	0	0

Syntax: show statistics stack-ports

[Table 54](#) describes the fields displayed by the **show statistics stack-ports** command.

TABLE 54 Field definitions for the **show statistics stack-ports** command

Field	Description
Port	The stack identification number for this unit.
In Packets	The number of incoming packets on this port
Out Packets	The number of outgoing packets on this port
In Errors	The number of incoming errors on this port
Out Errors	The number of outgoing errors on this port

Displaying stacking topology

The **show stack connection** command displays the topology and prints out a detailed connection report. It also prints connection errors or hardware failures, as shown in the following example output from a Brocade ICX 6610 switch.

```
Brocade#show stack connection
Probing the topology. Please wait ...

```

Table 55 describes the fields displayed by the **show stack connection** command.

TABLE 55 Field definitions for the **show stack connection** command

Field	Description
T0	Identifies Trunk 0
T1	Identifies Trunk 1

Syntax: show stack connection

Adding, removing, or replacing units in an IronStack

The following sections describe how to add, remove, or replace units in an IronStack. The recommended method is to connect units to the stack before you supply power to the units; however, you can also connect powered units.

Installing a new unit in an IronStack using secure-setup

This method can be applied to clean units, or units that have existing configurations.

1. Connect the new unit to the stack by connecting the 10 Gbps stacking ports.
2. Run secure-setup on the Active Controller and assign an ID to the new unit. The Active Controller will reset the new unit.
3. Once the new unit boots and joins the stack, do a **write memory** on the Active Controller.

Installing a new unit using static configuration

If the new unit is a clean unit and the connection is sequential you can add it using the static setup process.

1. Enter the module configuration of the new unit into the Active Controller configuration.
2. Connect the new unit to the stack using the 10Gbps stacking ports. The sequence in which you connect the unit must match that of the Active Controller configuration. The Active Controller automatically resets the unit.
3. Once the new unit boots and joins the stack, do a **write memory** on the Active Controller. You should see the following message.

```
Done hot swap: Set stack unit 3 to Fully-Operational:16
```

Configuration notes

Configuration on a new unit can be accomplished in three ways:

- If the Active Controller has no configuration information for the new unit, it learns the new unit's configuration. This is a dynamic configuration and will disappear if the new unit leaves the stack. In order for the configuration to stay on the Active Controller (to make it a static configuration), you must do a **write memory** on the Active Controller.
- If the Active Controller has configuration information for a new unit, and it matches the base module (module 1) of the new unit, no action is necessary. If configuration information for non-base modules on the new unit does not match the information on the Active Controller, the Active Controller learns the configuration for the new unit module types and merges it with the information it has for the base module. This merged configuration remains static and will stay on the Active Controller even if the new unit leaves the stack.
- If the Active Controller has configuration information for the new unit, but it does not match the base module of the new unit, a configuration mismatch can occur where the configuration related to this unit is removed even after the mismatch is resolved. Refer to [“Recovering from a stack unit mismatch”](#) on page 323 for more information.

Removing a unit from an IronStack

To remove a unit from the stack, disconnect the cables from the stacking ports. This can be done whether the units are powered-on or powered-off. When you remove a unit that is powered-on, it is still in stacking enabled mode. To remove the stacking files, enter the **stack unconfigure me** or **stack unconfigure clean** command. When the unit reboots, it will operate as a standalone unit. Refer to “[Unconfiguring an IronStack](#)” on page 287.

When a unit is removed from a stack, the Active Controller deletes this unit configuration if it is dynamically learned. Refer to “[Brocade IronStack terminology](#)” on page 237 for definitions of static and dynamic configurations.

Replacing an IronStack unit (unit replacement)

Replacing with a clean IronStack unit

If the stack unit ID numbering is sequential, you can easily swap a failed unit with an identical clean unit using this procedure.

1. Remove the old unit from the stack.
2. Make sure that the hardware (module) configuration of the replacement unit is identical to that of the failed unit.
3. Connect the new unit to the stack using the same stacking ports used by the old unit.
4. If the configuration of the replacement unit matches the configuration on the Active Controller, the Active Controller resets the new unit, which automatically becomes active in the stack, and the stack retains its original topology.

Replacing with multiple clean IronStack units

If you are replacing multiple old units with clean units, the Active Controller replaces the unit with the lowest ID first. For example, if you remove units 5 and 6 (which are FCX624P-STK devices), the Active Controller assigns ID 5 to the first new FCX624P-STK device you install. If you wanted this particular unit to replace unit 6, instead of unit 5, you must use secure-setup.

You must use secure-setup if the replacement is not a clean unit, the connection is not sequential, or you do not want the Active Controller to trigger an automatic replacement. Use the following steps.

1. Remove the old stack unit from the stack
2. Connect the new unit to the existing stack using the same stacking ports used by the old unit.
3. Run secure-setup to select the ID of the old unit for the new unit. The Active Controller resets the unit, and it joins the stack.

NOTE

Adding, removing or replacing a stack unit which is not at the end of linear topology may cause the other units in the stack to reset if these units lose their path to the Active Controller during the process. Adding or removing a unit in a ring topology should not cause the other units to reset because each unit can still find a path to the Active Controller.

Moving a unit to another stack

Moving a member from a stack and to another stack can result in non-sequential ID assignment. The Active Controller will honor the new unit original ID if that ID is not being used in the new stack. The Active Controller will assign a new ID if the original ID is already being used. To prevent non-sequential stack ID assignments, configure the unit that is moving as a clean unit before adding it to the new stack.

Removing an Active Controller from a powered stack

To remove an Active Controller from a powered stack, disconnect the Active Controller. The Standby Controller waits for 30 seconds and then assumes the role of Active Controller. A single Active Controller device functions as a standalone unit even it is still stacking-enabled. You do not have to issue a **stack unconfigure me** command for an Active Controller.

Renumbering stack units

You can use secure-setup to renumber stack units in a previously constructed stack. In the following example, three units make up a stack, yet two of the units are numbered 5 and 6 (the Active Controller is numbered 1). Since this stack is only going to contain 3 units, you can renumber the other units so that they are unit 2 and unit 3.

The most effective way to number your stack members is sequentially. You can skip numbers, but they should still be sequential, from 1 to 8. Sequential numbering makes it easy to replace stack units, and easier to troubleshoot issues.

NOTE

In a ring topology, 1, 2, 4, 5, and 1, 5, 4, 2 are both sequential.

Example

```
Brocade# stack secure-setup
Brocade#Discovering the stack topology...

Available UPSTREAM units
Hop(s)  Type      Mac Address
1       FCX624    0012.f2d5.2100
2       FCX624    001b.ed5d.9940

Enter the number of the desired UPSTREAM units (1-2)[1]: 2

Selected topology:
Active id  Type      Mac Address
1         FCX624    0012.f239.2d40

Selected UPSTREAM units
Hop(s)  id  Type      Mac Address
1       5  FCX624    0012.f2d5.2100
2       6  FCX624    001b.ed5d.9940

Do you accept the unit ids? (y/n)? : n

Enter an unused id for the UPSTREAM FCX623 unit a 1 hop(s) (1-8)[5]: 2
Enter an unused id for the UPSTREAM FCX624 unit at 2 hop(s) (1-8) [6]: 3
Brocade# Election, was active, no role change, assigned-ID=1
reset unit 2: diff bootup id=5
```

```
reset unit 3: diff bootup id=6
Election, was active, no role change, assigned-ID=1
```

```
Brocade# show stack
```

ID	Type	Role	Mac Address	Pri	State	Comment	
1	S	FCX624	active	0012.f239.2d40	128	local	Ready
2	S	FCX624	standby	0012.f2d5.2100	0	remote	Ready
3	S	FCX624	member	001b.ed5d.9940	0	remote	Ready

Configuration notes for renumbering stack units

- Renumbering may result in the removal of a unit configuration if the stack unit base module does not match the configuration on the Active Controller. However, secure-setup renumbering never changes the interface configuration. For example, if you switch the IDs of identical units 2 and 3, the Active Controller does not change 2/1/5 to 3/1/5 and vice versa.
- If the configuration for the ID you select for a specific unit does not match the configuration on that unit, secure-setup will change the static configuration into a dynamic configuration so it can be overwritten by the learned configuration.
- When swapping IDs for two or more identical units - for example, if units 2, 3, and 4 are identical, changing 2 to 3, 3 to 4, and 4 to 2 will not affect the configurations of the units except that the units will reset and assume the new IDs.
- If you swap IDs for two units that are not identical - for example, unit 2 is an FCX648 and unit 3 is an FCX624, you may cause a configuration mismatch. If this happens, the Active Controller removes the configurations and resets both units. When both units boot with new IDs, the Active Controller learns their module types and creates new *unit* configurations for both. However, all *interface configuration* information related to units 2 and 3 is gone.
- When you renumber identical units using secure-setup, the configurations are not mapped to the new units (since the configurations match exactly). However, if you switch the IDs of units that are not identical, a configuration mismatch occurs. Refer to [“Recovering from a stack unit mismatch”](#) on page 323
- When you assign an unused ID to a stack unit, the unit is reset with the new ID. All unit and interface configuration information related to the old stack ID is deleted. The Active Controller learns the configuration for the new unit (instead of creating interface configuration for the new unit).
- Release 5.0 does not support user changes to the Active Controller ID.
- Secure-setup does not swap configuration information for units that have had their IDs changed. For example, it does not change the 2/1/3 interface configuration or VLAN membership information into 3/1/3 information if the unit ID changes from 2 to 3.
- If the configuration for a unit being replaced does not match the new unit type, the Active Controller removes the unit configuration and associated interface configuration.
- All learned configurations due to mismatches or the addition of new units are dynamic configurations. To convert them into static configurations, do a **write memory** to preserve the configurations if a unit is removed from the stack.

Syslog, SNMP, and traps for stack units

Syslog messages from stack units are forwarded to, and can be viewed from, the Active Controller.

All stack units support SNMP gets, sets, and traps, which are managed by the Active Controller. An SNMP trap is sent from a stack unit to the stack Active Controller, and forwarded from the Active Controller to an SNMP-configured server. An external network management station can execute SNMP gets and sets for MIBs and collect information about any port on the stack.

SNMP traps can be configured for the insertion or removal of a stack unit or uplink module, and for optic identification.

For more information about Syslog messages, refer to [Appendix A, “Syslog messages”](#).

Configuring SNMP for an IronStack

SNMP server and feature configuration is the same for an IronStack as it is for standalone units. In an IronStack, SNMP gets and sets are processed by the Active Controller for the Standby Controller and all stack members. SNMP traps generated by the Standby Controller and stack members are propagated to the configured SNMP server through the Active Controller. For more information about how to configure an SNMP server for FastIron devices, refer to [Chapter 10, “SNMP Access”](#).

SNMP engine IDs for stackable devices

For Brocade stacking devices, if an engine ID is not manually created or a stack MAC address is not specified and saved, the stack will lose its engine ID if the Active Controller fails and the Standby Controller takes over, because the Standby Controller creates a new engine ID at bootup. To prevent this from happening, you will need to either create a new engine ID or create a new stack MAC address to ensure that the engine ID is saved to the startup configuration. This should be done before the SNMPv3 user is created.

If a new Active Controller is elected (for example, the Standby Controller becomes the Active Controller) you will see the following results:

- If you have configured the engine ID saved it to the startup configuration file, the new stack configuration will use the saved engine ID.
- If you have not configured an engine ID, but a stack MAC address is configured, the new stack configuration will retain the original engine ID since it is based on the stack MAC address.
- If you have not configured an engine ID, and no stack MAC address is configured, the new stack configuration will use the default engine ID, which is based on its own management MAC address of the new Active Controller. Since the engine ID will have changed, any SNMPv3 Clients will need to be reconfigured with the new engine ID.

IronStack troubleshooting

The most common reason for an unsuccessful stack build is either a software configuration mismatch, a hardware configuration mismatch, or a combination of both.

The following sections describe common troubleshooting procedures for an IronStack.

Troubleshooting an unsuccessful stack build

If you are unable to build a stack, (for example, the **show stack** command does not display any stack units), perform the following steps.

1. Enter the **show run** command on each unit to make sure the configuration contains “stack enable”. If it does not, enter the **stack enable** command on the unit. Before a stack is formed, you can still access the console port on each device. Once a stack is successfully formed, you are redirected to the Active Controller.

NOTE

If you are building a stack using secure-setup, you do not have to enter stack enable on each unit.

2. Check that all of your stacking port connections are secure and working properly. Enter the **show interface stack** on each device to confirm that the stacking port links are up and the ports are in the forward state.

```
Brocade# show interfaces stack
Port  Link  State   Dupl Speed  Trunk  Tag  P  MAC      Name
1/2/1 Up    Forward Full 10G    None   No   1 0012.f2eb.a902
1/2/2 Up    Forward Full 10G    None   No   1 0012.f2eb.a904
```

3. Confirm that all of the devices are running the same software image
4. Use the **show log** command to display any IPC version mismatch messages. These messages appear in one minute when receiving mismatched probe packets, and then once every 10 minutes.
5. Use the **show stack ipc** command to see if any traffic has been sent or received. Enter **clear stack ipc** to clear the traffic statistics and then enter **show stack ipc** again so you can easily see differences in traffic flow. The following output is from a Brocade ICX 6610 switch.

```
Brocade# show stack ipc
V15, G1, Recv: SkP0: 3749372, P1: 3756064, MAIL: 184291175, sum: 191796611,

target MAC         15230      15230      0          0
unrel target ID    7615              0
There is 1 current jumbo IPC session

```

Possible errors:

```
*** recv from non-exist unit 2 times: unit 5
```

If the send message types: field is empty, it means that stack enable has not been configured. If the number of Recv IPC packets increases, but there are no Recv message types, then the packets are being dropped for various reasons, including the wrong IPC version, or a checksum error. The Possible errors field will list reasons for packet loss.

NOTE

A small “***state not ready” count is normal, but if it continues to increase a problem is indicated.

6. If the results of a **show stack** command show other stack members, but lists them as non-operational, this could be due to an image mismatch, or a configuration mismatch. In the event of an image mismatch, you can download the correct images to the entire stack from the Active Controller. Refer to [“Configuration mismatch for stack units”](#) on page 320 for more information about configuration mismatches.

NOTE

If your intended stacking ports are connected in a ring topology, they will not all appear to be in the forwarding state because of spanning tree, but secure-setup can still build the stack.

7. If you run out of flash memory while doing a **write memory**, your stack devices may contain very large startup-config.v4 or startup-config.old files, which are preserved for recovery purposes (refer to [“Unconfiguring an IronStack”](#) on page 287 for more information). If you do not need these files, you can delete them using the **flash delete** command. Enter the **show dir** command to see all flash files.
8. Check to be sure you do not have any stacking to non-stacking connections. If you see the following message.

```

Warning! Proc ??? packet in 2m from 0012.f2222.8300, Wrong dev/port: dev=4,
port=18, DSA=4971100 497--E
You might have stacking to non-stacking port connections

```

This indicates that you may have a connection between a stacking port and a non-stacking port. This message will appear every 10 minutes after the first display. If you see this message once only, and your connections are correct, your stack should be operating properly. Only repeat displays of this message indicate a problem.

Troubleshooting a stacking upgrade

After you upgrade your device to support stacking, restart the device with the upgraded software. If you encounter a problem at this step, make sure the memory DIMM and stacking EEPROM are installed correctly. If they are not installed correctly, you may see output similar to the following.

```

FCX MEM size: 0x10000000
FCX Flash config....
FCX Boot Code Version 05.0.00
Enter 'b' to stop at boot....

```

Stack mismatches

```
BOOT INFO: load monitor from primary, size=103408
BOOT INFO: load image from primary.....
BOOT INFO: bootparam at 000543e8, mp_flash_size=002ee6c5
BOOT INFO: code decompression completed
BOOT INFO: branch to 00400100
Starting Main Task.....
*****
ERR: This software needs License PROM to be installed in the system
*****
System Reset!
```

If your memory DIMM is not installed correctly, you will see output similar to the following.

```
FCX Mem size: 0x8000000
Flash Config...
FCX Boot Code Version 05.0.00
Enter 'b' to stop at boot....
BOOT INFO: load monitor from primary, size = 103380
BOOT INFO: debug enabled!!
BOOT INFO: load image from primary...
BOOT INFO: bootparam at 00054338 mp_flash_size = 002flaeb
BOOT INFO: code decompression completed
BOOT INFO: branch to 00400100
Starting Main Task ...

*****
ERR: This software requires 256M memory to be installed in the system.
*****
System Reset!
```

Check your upgraded hardware for the following situations:

- EEPROM is installed incorrectly in the socket. Make sure Pin 1 on the EEPROM matches the Pin 1 hole in the socket.
- Make sure your memory DIMM is securely installed in the memory DIMM socket. Refer to the hardware installation guide or the instructions that came with your upgrade kit for more information.

Troubleshooting image copy issues

The **copy tftp flash** command copies the image to all stack units including the Active Controller. The **copy flash flash** command copies the image from the primary or secondary flash on the Active Controller to the primary or secondary flash image of a stack member, respectively. If you are unable to copy an image to one or more stack units, check the following:

- Make sure the unit is actually part of the stack. Use the **show stack** command.
- If a unit joins a stack after the **image copy** command was issued, you will need to copy the image to this unit separately.

Stack mismatches

When a stack mismatch occurs, the Active Controller can put any stack member into a non-operational state, which disables all of the ports except the stacking ports. Stack mismatches can occur for a variety of reasons, which are discussed in this section.

NOTE

The Active Controller can still download an image to the non-operational unit.

The Active Controller generates a log message whenever it puts a stack unit into a non-operational state. The following examples describe the types of mismatches and the related log message:

- **Advanced feature mismatch** - The Active Controller is enabled for advanced features (such as BGP) and the stack unit is not enabled.

```
Stack: Unit 2 00e0.1020.0100 doesn't have the matching advanced feature
privileges
```

- **Image mismatch** - A stack unit is running a different software image than that of the Active Controller.

```
Stack: Unit 2 00c0.1020.0100 image mismatch
```

- **Configuration mismatch** - The module configuration for a stack unit does not match the reserved configuration on the Active Controller.

```
Stack: Unit 2 00e0.1020.0100 config mismatch
```

- **Memory allocation mismatch** - The Active Controller does not have enough memory to accommodate the stack unit.

```
Stack: Malloc failure for unit 2.00e0.1020.0100
```

These mismatches are described in the following sections.

Image mismatches

Advanced feature privileges (FCX devices only)

Advanced feature privileges must be enabled to run advanced features such as BGP. Both Active and Standby units must be enabled for advanced features for these features to operate across the stack. A unit that is not enabled for these features is put into a non-operational state.

If the Active Controller is *not* enabled for advanced features, these features will not operate on the stack.

IronStack technology requires that all stack units run the same version of the software image. In cases where the software version differs, there are two levels of mismatch, major and minor.

Major mismatch for stack units

A major mismatch indicates an Interprocessor Communications (IPC)-related data structure change, or an election algorithm change, or that a version of the software that does not support stacking is installed on a unit. This can happen when the software undergoes a major change (such as a change from 05.0.00 to 05.1.00). When a major mismatch occurs, the system logs and prints a message similar to the following.

```
Warning! Recv 424 IPC in 1m from 0012.f21b.a900 e1/1/25: wrong version 5 !=6.
Please make sure all units run the same image.
```

In a major mismatch, the stack cannot be built and will not operate. You must download the correct version of the software to the mismatched units individually.

Minor mismatch for stack units

With a minor mismatch, an operating stack can still exist, but traffic is dropped from all ports except for the stacking ports for units with the mismatched software. You can download the correct image to the mismatched devices from the Active Controller. A minor software mismatch means that there is no IPC or election algorithm change, but there is a release version disparity. Minor software mismatches can happen with patch release upgrades. The system logs and prints a message similar to the following.

```
Warning! put stack unit 2 to non-operational reason=image mismatch
```

The **show stack** command displays output similar to the following.

```
Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID  Type   Role   Mac Address      Pri   State   Comment
1  S  FCX624  active  0012.f2eb.a900   128   local   Ready
2  S  FCX648  standby 00f0.424f.4243   0     remote NON-OP: image mismatch
3  S  FCX624  member  00e0.5201.0100   0     remote   Ready
```

If the configuration of a stack unit does not match the configuration of the Active Controller, the stack unit will not function. In this example, unit 2 is non-operational due to an image mismatch. To correct this situation, use the **copy flash flash** command (refer to [“Copying the flash image to a stack unit from the Active Controller”](#) on page 283).

Configuration mismatch for stack units

Generally, when a stack unit is added to or removed from the stack, its static configuration is not overwritten by the Active Controller. On the other hand, the Active Controller deletes the dynamic configuration for a unit if it leaves. (Refer to [Table 48](#) for definitions of static and dynamic configurations.)

A configuration mismatch occurs when the base module configuration for a replacement stack unit does not match the run time configuration on the Active Controller. If the configuration on the Active Controller is static, it cannot be overwritten by the new configuration, and a configuration mismatch occurs.

Configuration mismatches can happen during manual setups, or when moving a unit from one stack to another stack or a unit's ID is changed by Secure Setup.

When you renumber identical units using secure-setup, the configurations are not mapped to the new units (since they match exactly). However, if you switch the IDs of units that are not identical, a configuration mismatch occurs.

When a configuration mismatch occurs, port-related functions on all ports are disabled on the mismatched unit (except for the stacking ports). All other functions are unaffected. For example, the Active Controller can still copy the unit's image or reset the unit. Refer to [“Recovering from a stack unit mismatch”](#) on page 323.

Auto Image Copy for stack units

The Auto Image Copy feature ensures that all units in a stack are running the same flash image after a stack merge. This feature also enables automatic reload of the stack units. It prevents the image mismatch that occurs when one or more member units join the stack with a different running image and signature than that of the master and standby units.

Auto Image Copy is enabled by default on Brocade devices and the user does not have to manually copy the master's running image to the mismatched members.

This feature is available on the following Brocade devices:

- Brocade FCX Series (FCX) Stackable Switch
- Brocade ICX 6610 Series (ICX 6610) Stackable Switch
- Brocade ICX 6430 Series (ICX 6430) Stackable Switch
- Brocade ICX 6450 Series (ICX 6450) Stackable Switch

NOTE

To manually copy the master image to the stack units, refer to [“Copying the flash image to a stack unit from the Active Controller”](#) on page 283 and [“Reloading a stack unit”](#) on page 283 for more information.

Auto Image Copy limitations

The following limitations apply to the Auto Image Copy feature:

- This feature is applicable to those stack units that are in a non-operational image mismatch state only.
- Auto Image Copy does not work if the image version of the IPC is different from the stack unit version in the case of a major image mismatch.
- If a stack unit with a newer image is merged with a stack running an older version of the software, the newly formed stack will still be running the older version of the software.
- Auto Image Copy does not work if the user has copied a different image into the flash, creating a mismatch in versions between the flash and the running image on the active unit of the stack.

Disabling Auto Image Copy

Auto Image Copy is enabled by default. However, if you wish to disable this feature, enter the following command in global configuration mode.

```
Brocade(config)# image-auto-copy disable
```

Syntax: no image-auto-copy disable

Run the **no image-auto-copy disable** command to enable Auto Image Copy. This restarts the Auto Image Copy immediately and ensures that all stack units have the same image.

NOTE

You can run the **show running-config** or the **show stack detail** command to see if Auto Image Copy is disabled.

Verifying Auto Image Copy

Use the **show stack detail** command to verify if there are any units in the mismatch state after the stack is formed. Refer to [“Displaying stack information”](#) on page 293 for more information about the command.

Memory allocation failure

A memory allocation (malloc) failure occurs when the Active Controller does not have enough memory to run a stack unit. This failure may occur if you configure large numbers (for example, 4 K of VLANs, or STP instances (for example, 255).in the router image. This message means that the Active Controller is low on memory after allocating these resources and does not have enough remaining memory to control a stack member. You can correct this by reducing the number of VLANs or STP instances.

NOTE

After you make configuration changes such as number of VLANs or STP instances, you must reset the stack.

Recovering from a stack unit mismatch

When a configuration mismatch occurs, the Active Controller logs and displays a configuration mismatch message, and puts the mismatched unit into a non-operational state. In the following example, the original stack unit 3 has failed, and a replacement unit has been installed that does not match the configuration of the original unit. You should see the following message.

```
Warning! put stack unit 3 to non-operational reason= config mismatch
```

Complete the following steps to recover from a configuration or image mismatch.

1. Enter the **show stack** command to see the status of the stack, and a **show running-config** command to see the configurations of the stack units.

```
Brocade# show stack
alone: standalone, D: dynamic config, S: static config
ID Type    Role    Mac Address    Pri State    Comment
1  FCX624  active  0012.f2eb.a900 128 local    Ready
2  FCX648  member  00f0.424f.4243  0 remote  Ready
3  FCX624  standby 00e0.5201.0100  0 remote  NON-OP: config mismatch
```

```
Brocade# show running config
stack unit 1
  module 1 fcx-24-port-copper-base-module
  module 3 fcx-cx4-1-port-10g-module
  module 4 fcx-xfp-1-port-10g-module
  priority 128

stack unit 2
  module 1 fcx-24-port-management-module
  module 3 fcx-xfp-1-port-10g-module

stack unit 3
  module 1 fcx-48-port-copper-base-module
  module 2 fcx-cx4-1-port-10g-module
  module 3 fcx-cx4-1-port-10g-module
stack enable
```

2. To resolve the mismatch, you must remove the configuration for stack unit 3. Use the following command in configuration mode:

```
Brocade(config)# no stack unit 3
```

This removes all configuration related to Unit 3.

If you are unable to remove the configuration because of a multi-slot trunk configuration, you must first manually remove the multi-slot trunk configuration.

3. When you have successfully deleted the mismatched stack unit, a re-election is triggered, and the Active Controller learns the correct module configuration from the Standby Controller or from other stack members. No reload is required.

Complete the following steps to recover from an image mismatch.

1. Use the **copy flash flash** command to replace a mis-matched image with the correct image. Refer to [“Copying the flash image to a stack unit from the Active Controller”](#) on page 283.
2. Reset the unit. After the reset, the unit will contain the new image and the mis-match condition will not exist. To verify, use the **show stack** command.

Troubleshooting secure-setup

Secure-setup can be used to form linear and ring stack topologies. For information about the procedure, refer to [“Scenario 1 - Three-member IronStack in a ring topology using secure-setup”](#) on page 250. During this procedure, if secure-setup does not detect all the units that should be detected, perform the following checks:

- Make sure that all the cables are properly connected
- Make sure that all the relevant ports are in UP state
- Make sure that all the units are running the same image
- Make sure that you issue the **stack enable** command only on the unit that will serve as the Active Controller
- Make sure that **stack disable** is not configured on any prospective members
- Make sure that the connection is sequential (refer to [“Brocade IronStack terminology”](#) on page 237, Sequential Connection)

If secure-setup times out (this may happen due to inactivity), you will not be able to make any changes in your configuration or stack topology until you restart the session by entering the **stack secure-setup** command.

The unit discovery process is triggered when secure-setup is initiated. However, if the stack unit is placed in a topology where another unit in the stack is already running the discovery process, the current discovery process is terminated. If this is the case, you will see a message similar to the following.

```
"Topology discovery is already in progress originated from <mac-address>. Please try later."
```

This means a discovery process is already active and was initiated from the unit with the `<mac-address>` mentioned in the message. You will need to re-issue secure-setup.

If there is already an active discovery process, secure-setup may not discover all the intended units. If this is the case, you will need to restart the secure-setup process.

Troubleshooting unit replacement issues

If you are unsuccessful in building a stack using the automatic setup process (refer to [“Scenario 2 - Three-member IronStack in a ring topology using the automatic setup process”](#) on page 254), or adding or replacing a unit in a stack, consider the following issues:

- Make sure that the number of units in your stack does not exceed the maximum of 8
- Make sure that the replacement unit is a clean unit (does not contain a startup-config.txt file)
- Make sure that the replacement unit running configuration does not contain “stack enable”
- Make sure the replacement unit running configuration does not contain “stack disable”
- Make sure that the configurations of the stack ports on the Active Controller match the physical connections to the unit

More about IronStack technology

This section discusses stacking technology in greater detail than the information presented in Section 1.

Configuration, startup configuration files, and stacking flash

Stacking system behavior is defined by the run time configuration, which can be displayed using the **show run** command. The **write memory** command stores the run time configuration in a flash file called *startup-config.txt*. During bootup, the system reads and applies the *startup-config.txt* file to the run time configuration. The *startup-config.txt* file can be shown using the **show config** command.

The stacking system installs a *stacking.boot* file on each unit that tells the unit what its role is during the boot process. The *stacking.boot* file is generated whenever there is an election that defines the roles for all units.

When an Active Controller is booted, or a **write memory** command is issued, the Active Controller synchronizes its *startup-config.txt* file to every stack unit. The original *startup-config.txt* files in the Standby Controller and other stack members are renamed to *startup-config.old*. If you issue the **stack unconfigure me** command on the Standby Controller or stack member directly, these units will recover their original *startup-config.txt* files and reboot as standalone devices. If you enter the **stack unconfigure all** command from the Active Controller all devices will recover their old *startup-config.txt* files and become standalone devices. When this happens, the *startup-config.old* file is renamed to *startup-config.txt*, and the *stacking.boot* file is removed. For more information, refer to “[Unconfiguring an IronStack](#)” on page 287.

Whenever a change is made to a stack unit's configuration, such as priority, (which could affect stack elections) an election is held, and the result is written into the *stacking.boot* file. A prompt message appears on the console that suggests you do a **write memory**. For an Active Controller role change to take effect, you will need to reset the entire stack.

If you do **not** do a **write memory**, and reset the stack, the stack units will continue to operate in their roles as defined by the *stacking.boot* file. After the reset, each unit readjusts based on the current run time configuration. However, you may get different results depending on what has not been saved. If you have renumbered the stack unit IDs, you may see a configuration mismatch, because your changes no longer match the Active Controller configuration.

If you change priorities to elect an Active Controller, the new Active Controller will assume its role after a reboot whether you have done a **write memory** or not. If you do not save your priority change before the next reboot, the reboot will trigger an election that may result in a different winner based on the priority in the unsaved configuration. The new winner assumes its role after the next reboot.

If you change the stacking port configuration and do not save your changes, you may encounter connectivity errors. To recover from a configuration error, run Secure Startup to define the correct stacking port.

NOTE

You should always do a **write memory** after making stacking-related configuration changes such as priority and stacking ports. If you do not want to keep the changes, change the configuration back to the previous version, and do a **write memory**. Do not discard configuration changes by using the reset without a **write memory**.

IronStack topologies

Brocade IronStack technology supports both linear and ring stack topologies. Because the unicast switching follows the shortest path in a ring topology, this topology offers the strongest redundancy. When the ring is broken, the stack recalculates the forwarding path and resumes the flow of traffic within a few seconds. In a ring topology, all stack members must have two stacking ports, however, in a linear topology, both end units use only one stacking port, leaving the other port available as a data port. To see an illustrated example of each topology, refer to [“Brocade IronStack topologies”](#) on page 239.

Port down and aging

If a unit is powered down, or the stacking link is removed, the system immediately detects the port down and knows that its neighbor is gone. That unit is immediately removed from the Active Controller. If a unit is gone or no longer stack-enabled, but its stacking link is still on, it will take 20 seconds to age the neighbor out. The following message will be logged and displayed.

```
Warning! my mac=00f0.424f.4243, age out up-stream
```

Brocade IronStack device roles and elections

There are three distinct roles played by units that are part of an IronStack:

- Active Controller
- Standby Controller
- Stack member

Active Controller

The Active Controller contains the saved and running configuration files for each stack member. The configuration files include the system-level settings for the stack, and the interface-level settings for each stack member, as well as MIB counters and port status. The Standby Controller also has a synchronized copy of the Active Controller startup config file for use in the event the Active Controller fails.

When a stack is formed, the console function for each stack member is automatically redirected to the Active Controller console. The Active Controller console port handles all stack management functions, as well as ping, Telnet sessions, and tftp image downloads for every stack member. If you connect to the console port on a stack member that is not the Active Controller, you are automatically directed through the console of the Active Controller.

The Active Controller synchronizes its start-up configuration with the Standby Controller and the rest of the stack members. You can recover the previous flash configuration of the Standby Controller and the stack members by issuing the **stack unconfigure** command. For an example of this command and the output generated, refer to [“Unconfiguring an IronStack”](#) on page 287.

The Active Controller may reset the rest of the stack members, if necessary. However, if the Active Controller itself must be reset because of a role or ID change, you must issue the **reset** command.

If the Active Controller fails, the Standby Controller waits 30 seconds, and then takes over as Active Controller, resetting itself and all other stack members. If the old Active Controller becomes operational, it may or may not resume its role as Active, depending on the configured priorities. If hitless stacking failover is enabled, the standby unit can take over immediately without reloading any unit.

Standby Controller

In addition to the Active Controller, another stack member is elected as the Standby Controller. After a default interval of 30 seconds, the Standby Controller takes over if the Active Controller fails. If hitless stacking failover is enabled, the standby unit can take over immediately without reloading any unit.

NOTE

Because it can take as long as 20 seconds to age out a neighbor, the Standby takeover period may last up to 50 seconds. Refer to [“Port down and aging”](#) on page 326.

The Standby Controller synchronizes its configuration with the Active Controller at each reset.

Bootup role

When a stack unit boots, it boots in a particular role, such as standalone, Active Controller, Standby Controller, or stack member. When the bootup role is Standby Controller or stack member, the CLI available to the unit is limited to **show** and **stack** commands. A unit in the role of Standby or stack member will not act without instructions from the Active Controller. To convert a Standby Controller or stack member into a standalone device, use the **stack unconfigure me** command (refer to [“Unconfiguring an IronStack”](#) on page 287).

The last line of the **show version** output identifies the unit role unless the unit is in standalone mode.

Example

```
My stack unit ID = 1, bootup role = active
My stack unit ID = 3, bootup role = standby
```

Active Controller and Standby Controller elections

Whenever there is a topology change in the stack (a reset, unit failure, or the addition or removal of members), elections are held to determine the status of the Active Controller and Standby Controller. The results of the election take effect after the next stack reset.

The following conditions, in the order shown, determine which units will serve as Active Controller and Standby Controller after an election:

- **Boot as Active Controller** - Indicates that a unit was previously Active Controller before the current boot sequence and will again assume the role of Active Controller when two standalone units are combined into a stack. When a third standalone unit joins the stack, a current Active Controller becomes subject to the other factors in this list. The reason for this hierarchy of factors is to achieve a predictable winner regardless of the boot up sequence for a unit. You can upgrade your current Active Controller to “boot as active controller” status by performing a **write memory**. The system interprets the write memory action as a directive to maintain the current Active Controller role regardless of resets or a new unit joining the stack.
- **Priority** - The unit with the highest priority value.

- **Greater number of members** - The unit that has control over the greater number of stack members.
- **Longer up time** - An up time that is more than 30 seconds longer than the next one in size is considered. Where up times are compared, there is no effect if the difference is less than 30 seconds.
- **Lowest boot stack ID** - The unit that has the lowest boot stack ID (1-8, 1 is the lowest).
- **MAC address** - The member with the lowest MAC address.

Active Controller and Standby Controller resets

If the Active Controller is reset or removed from the stack, the entire stack reloads and Active Controller and Standby Controller elections are initiated. If the unit functioning as the previous Active Controller is no longer part of the stack, the Standby Controller unit becomes the new Active Controller. After a reset, if no stack member qualifies as Active Controller, the existing Standby Controller waits 30 seconds and then assumes the role of Active Controller.

NOTE

The details in the preceding paragraph apply to the default setup, with hitless stacking failover not enabled.

If both Active and Standby Controllers are removed the rest of the stack will continue to function because they are operating on whatever is programmed in the hardware. The stack members will not be able to learn any new addresses. You will see the following message every few minutes.

```
Stack member is non-operational because of no Active or Standby Controller
You can recover to standalone mode by "stack unconfigure me"
```

Use **stack unconfigure me** to restore the units into standalone devices with a pre-stacking configuration.

Selecting a standby stack unit

You can choose a Standby Controller by configuring a stack unit priority to be the second highest, or the same as the Active Controller. If the priorities are configured the same for both, when the original Active Controller fails, the Standby Controller takes over. If the original Active Controller becomes active again, it will not win back its active role, which helps to minimize interruption of the stack. However, if the original Active Controller has the higher priority, it will win back its role and reset all of the stack units.

Standby Controller election criteria

The Standby Controller election is based on the following criteria.

- The highest priority
- Bootup as Active Controller
- Bootup as Standby Controller
- The lowest boot ID
- The lowest MAC address

Since Standby election candidates must have startup configurations that have been synchronized with the Active Controller, if the Active Controller does not have a startup-config.txt file, there will not be a Standby Controller. Once a write memory is performed on the Active Controller, the startup-config.txt file is written and synchronized to all stack members, and a Standby Controller can be elected.

Hitless stacking

Hitless stacking is supported on FCX and ICX units in an IronStack. It is a high-availability feature set that ensures sub-second or no loss of data traffic during the following events:

- Active Controller failure or role change
- Software failure
- Addition or removal of units in a stack
- Removal or disconnection of the stacking cable between the Active and Standby Controllers

During such events, the Standby Controller takes over the active role and the system continues to forward traffic seamlessly, as if no failure or topology change has occurred. In software releases that do not support hitless stacking, events such as these could cause most of the units in a stack to reset, resulting in an impact to data traffic.

The following hitless stacking features are supported:

Hitless stacking switchover – A manually-controlled (CLI-driven) or automatic switchover of the Active and Standby Controllers without reloading the stack and without any packet loss to the services and protocols that are supported by hitless stacking. A switchover is activated by the CLI command **stack switch-over**. A switchover might also be activated by the CLI command **priority**, depending on the configured priority value.

Hitless stacking failover – An automatic, forced switchover of the Active and Standby Controllers because of a failure or abnormal termination of the Active Controller. In the event of a failover, the Active Controller abruptly leaves the stack and the Standby Controller immediately assumes the active role. Like a switchover, a failover occurs without reloading the stack. Unlike a switchover, a failover generally happens without warning and will likely have sub-second packet loss (packets traversing the stacking link may be lost) for a brief period of time.

The services and protocols supported by hitless stacking are listed in [Table 56](#) on page 330.

Hitless stacking is disabled by default. To enable it, refer to [“Enabling hitless stacking”](#) on page 341.

Supported hitless stacking events

The following events are supported by hitless stacking:

- Failover
- Switchover
- Priority change
- Role change

Non-supported hitless stacking events

The following events are not supported by hitless stacking. These events require a software reload, resulting in an impact to data traffic.

- Unit ID change – When a stack is formed or when a unit is renumbered using secure-setup.
- Stack merge – When the old Active Controller comes back up, it reboots. If it has fewer number of members than the Active Controller, it loses the election, regardless of its priority. If it has a higher priority, it becomes the Standby Controller after the reboot and is synchronized with the Active Controller. Next, a switchover occurs and it becomes the new Active Controller.

Supported hitless stacking protocols and services

Table 56 lists the services and protocols that are supported by hitless stacking. Table 56 also highlights the impact of a hitless switchover or failover to the system's major functions.

NOTE

Services and protocols that are not listed in Table 56 will encounter disruptions, but will resume normal operation once the new Active Controller is back up and running.

TABLE 56 Hitless-supported services and protocols

Traffic type	Supported protocols and services	Impact
Layer 2 switched traffic, including unicast and multicast	<ul style="list-style-type: none"> • 802.1p and 802.1Q • 802.3ad – LACP • 802.3af – PoE • 802.3at – PoE+ 	Layer 2 switched traffic is not impacted during a hitless stacking event. All existing switched traffic flows continue uninterrupted.
+		
System-level	<ul style="list-style-type: none"> • DSCP honoring and Diffserv 	New switched flows are not learned by the switch during the switchover process and are flooded to the VLAN members in hardware. After the new Active Controller becomes operational, new switched flows are learned and forwarded accordingly. The Layer 2 control protocol states are not interrupted during the switchover process.
+	<ul style="list-style-type: none"> • Dual-mode VLAN 	
Layer 4	<ul style="list-style-type: none"> • IGMP v1, v2, and v3 snooping • IPv4 ACLs • Layer 2 switching (VLAN and 802.1Q-in-Q) • MAC-based VLANs • MLD v1 and v2 snooping • MRP • Multiple spanning tree (MSTP) • Physical port/link state • PIM SM snooping • Port mirroring and monitoring • Port trunking • Rapid spanning tree (RSTP) • Spanning tree (STP) • ToS-based QoS • Policy Based Routing • Traffic policies • UDLD • VSRP 	

TABLE 56 Hitless-supported services and protocols

Traffic type	Supported protocols and services	Impact
Layer 3 IPv4 routed traffic (unicast)	<ul style="list-style-type: none"> • IPv4 unicast forwarding • Static routes • OSPF v2 • OSPF v2 with ECMP • VRRP • VRRP-E 	<p>Layer 3 routed traffic for supported protocols is not impacted during a hitless stacking event.</p> <p>All existing Layer 3 IPv4 multicast flows and receivers may be interrupted. Traffic will converge to normalcy after the new active module becomes operational.</p> <p>Other Layer 3 protocols that are not supported will be interrupted during the switchover or failover.</p> <p>If BGP4 graceful restart or OSPF graceful restart is enabled, it will be gracefully restarted and traffic will converge to normalcy after the new active module becomes operational. For details about OSPF graceful restart, refer to “OSPF graceful restart” on page 1234. For details about BGP4 graceful restart, refer to “BGP4 graceful restart” on page 1347.</p>
Management traffic	N/A	<p>All existing management sessions (SNMP, TELNET, HTTP, HTTPS, FTP, TFTP, SSH etc.), are interrupted during the switchover process. All such sessions are terminated and can be re-established after the new Active Controller takes over.</p>

TABLE 56 Hitless-supported services and protocols

Traffic type	Supported protocols and services	Impact
Security	<ul style="list-style-type: none"> • 802.1X, including use with VLANs • EAP with RADIUS • IPv4 ACLs • DHCP snooping • Dynamic ARP inspection • IP source guard • Multi-device port authentication (MDPA), including use with dynamic VLANs • MAC port security 	<p>Supported security protocols and services are not impacted during a switchover or failover, with the following exceptions:</p> <ul style="list-style-type: none"> • 802.1X is impacted if re-authentication does not occur in a specific time window. • MDPA is impacted if re-authentication does not occur in a variable-length time window. • In some cases, a few IP source guard packets may be permitted or dropped. • If 802.1X and MDPA are enabled together on the same port, both will be impacted during a switchover or failover. Hitless support for these features applies to ports with 802.1X <i>only</i> or multi-device port authentication <i>only</i>. • For MAC port security, secure MACs are synchronized between the Active and Standby Controllers, so they are hitless. However, denied MACs are lost during a switchover or failover but may be relearned if traffic is present. <p>Configured ACLs will operate in a hitless manner, meaning the system will continue to permit and deny traffic during the switchover or failover process. However, dynamic ACLs are not supported for hitless switchover and failover.</p> <p>After a switchover or failover, the new Active Controller will re-authenticate 802.1X or MDPA sessions that were being forwarded in hardware. The hardware continues to forward them (even with dynamic VLAN) while re-authentication occurs. After trying to re-authenticate for a certain amount of time (depending on the number of sessions to re-authorize), sessions that did not re-authenticate are removed.</p>
Other services to Management	<ul style="list-style-type: none"> • AAA • DHCP • sFlow • SNMP v1, v2, and v3 • SNMP traps • SNTP • Traceroute 	<p>Supported protocols and services are not impacted during a switchover or failover.</p> <p>DNS lookups will continue after a switchover or failover. This information is not synchronized.</p> <p>Ping traffic will be minimally impacted.</p> <p>NOTE: If the FCX stack is rebooted, sFlow is disabled on standby and member units until the configuration is synchronized between the Active and Standby Controllers.</p>

Hitless stacking configuration notes and feature limitations

- For hitless stacking on the FCX, Brocade recommends that you configure the IronStack MAC address using the **stack mac** command. Without this configuration, the MAC address of the stack will change to the new base MAC address of the Active Controller. This could cause a spanning tree root change. Even without a spanning tree change, a client (for example, a personal computer) pinging the stack might encounter a long delay depending on the client MAC aging time. The client won't work until it ages out the old MAC address and sends ARP requests to relearn the new stack MAC address. Refer to [“Manually allocating the IronStack MAC address”](#) on page 275.
- Layer 3 multicast traffic is not supported by hitless stacking.
- After a switchover or failover, the Syslog may contain invalid (non-existent) port numbers in messages such as “Interface<portnum> state up”. This is because some messages from the old Active Controller will remain in the Syslog after a switchover or failover.
- Failover for devices connected to the management port is not supported. For example, if during a failover, an end station is connected to the stack through the management port of the Active Controller, the connection will be shut down. After the failover, the management port on the new Active Controller will work.
- The following describes hitless stacking limitations with software-based licensing for BGP:
 - To enable BGP on a stack unit, you should have an appropriate BGP license installed on all the stack units.
 - If the Active Controller has a BGP license but any other unit in the stack does not have, you cannot enable BGP on the stack unit.
 - If the Active Controller is not running BGP, a stack unit is operational regardless of whether the Active Controller or stack units have a BGP license or not.
 - If the Active Controller is running BGP, and a unit without a BGP license joins the stack, the unit is put into a non-operational state. But, If a user copies the BGP license to a non-operational unit, it must take effect immediately and becomes operational. Or, if the user disable BGP, Active Controller will again put all the non-operational units in operational mode.

What happens during a hitless stacking switchover or failover

This section describes the internal events that enable a controlled or forced switchover to take place in a hitless manner, as well as the events that occur during the switchover.

Real-time synchronization among all FCX units in a stack

Hitless stacking requires that the Active Controller, Standby Controller, and stack members are fully synchronized at any given point in time. This is accomplished by *baseline* and *dynamic synchronization* of all units in a stack.

When an FCX stack is first booted and becomes operational, baseline synchronization occurs across all of the units in the stack. The Active Controller copies the current state of its CPU to all units of the stack, including the Standby Controller. The information received from the Active Controller is programmed locally in hardware on all units. The information includes:

- Start-up and run-time configuration (CLI) – These files are copied to the Standby Controller only.
- Layer 2 protocols – Layer 2 protocols such as STP, RSTP, MRP, and VSRP run concurrently on both the Active and Standby Controller.
- Hardware Abstraction Layer (HAL) – This includes the prefix-based routing table, next hop information for outgoing interfaces, and tunnel information.
- Layer 3 IP forwarding information – This includes the routing table, IP cache table, and ARP table, as well as static and connected routes.
- Layer 3 routing protocols are not copied to any of the units in the stack, but remain in init state on the Standby Controller until a switchover occurs. Peer adjacency will be restored after a switchover. If BGP4 or OSPF graceful restart are enabled during a switchover, the Standby Controller (new Active Controller) will initiate a graceful restart and a new set of routes will be relearned. The new set of routes will be the same as the old routes, except in the case of a network change.

When control protocols are synchronized and protocol synchronization timers have expired, the Standby Controller will be in *hot-standby* mode, meaning the Standby Controller will be ready to take over as the Active Controller. In the event of a switchover, the Standby Controller will pick up where the active module left off, without interrupting data traffic.

After baseline synchronization, any new events that occur on the Active Controller will be dynamically synchronized on the Standby Controller. Examples of such events include:

- CLI/HTTP/SNMP configurations
- CPU receive packets
- Link events
- Interrupts
- Layer 2 and Layer 3 forwarding table updates
- Dynamic user authentication updates such as 802.1X or multi-device port authentication

After a switchover, the new Active Controller receives updates from the stack members and sends verification information to the stack members to ensure that they are synchronized.

NOTE

The events described previously occur internally and do not create or affect the external network topology.

NOTE

If there is no Active Controller after a reload, the bootup standby assumes the active role in approximately 60 seconds without a reload. A bootup standby is the device that was the Standby Controller before the reload. It may not be the current Standby Controller.

How a Hitless switchover or failover impacts system functions

For a description of the feature's impact on major system functions, refer to [Table 56](#) on page 330.

Standby Controller role in hitless stacking

In software releases that do not support hitless stacking, the Standby Controller functions as a *dummy* device, meaning it provides limited access to the CLI, such as **show**, **stack**, and a few **debug** commands. The Active Controller can access the full range of the CLI. The Standby Controller synchronizes its configuration with the Active Controller at each reset.

With the introduction of hitless stacking, the Standby Controller shadows the Active Controller. The role or behavior of the Standby Controller with hitless stacking is as follows:

- The local console on the Standby Controller still accepts only **show**, **stack**, and a few **debug** commands.
- The runtime configuration on the Standby Controller is synchronized with the Active Controller whenever there is a configuration change.
- Protocols are configured in the runtime configuration, but no protocol packets are sent out on the Standby.
- The state of every unit is known, including the state of the Active Controller. The **show** commands will display current information, such as STP or port states.
- When a failover occurs, the Standby Controller will use its current runtime configuration. The configuration could be different from the Active Controller if the last configuration transmission was lost.
- After a failover, the new Active Controller (old standby) programs all other units in hardware, based on its runtime configuration.

Standby Controller election

Candidates for Standby Controller must meet the following criteria:

- The unit is operational and the image and module configuration match that of the Active Controller.
- The runtime configuration matches that of the Active Controller.

If more than one unit in the stack meets this criteria, the Standby Controller is chosen according to the following criteria, in the order shown:

- Priority – The unit with the highest priority value.
- Current standby – The unit that is currently the Standby Controller.
- Bootup master – The unit that was the Active Controller before the stack was reloaded.
- Bootup standby – The unit that was the Standby Controller before the stack was reloaded.

Once the Standby Controller is identified, the following internal events take place.

1. The Standby Controller is assigned by the Active Controller 30 to 60 seconds after election (60 seconds if the Active Controller boots up in less than 120 seconds).
2. The Standby Controller receives and processes the runtime configuration sent by the Active Controller.
3. The Standby Controller learns the protocols within 70 seconds.

When the Standby Controller is fully synchronized, the system will be ready for a switchover or failover.

Runtime configuration mismatch

In some cases, such as a runtime configuration mismatch between the Active Controller and candidate Standby Controller, the Standby Controller cannot be assigned by the Active Controller unless the candidate Standby Controller is reloaded.

As shown in the following example, the **show stack** command output will indicate whether there is a runtime configuration mismatch.

```
Brocade#show stack
alone: standalone, D: dynamic config, S: static config
ID   Type      Role      Mac Address    Pri State   Comment
1   S FCX624S    active    00e0.5201.0000  30 local   Ready
2   d FCX648SPOE member  00e0.5202.0000  20 remote  ready, standby if reload

              active
      +----+      +----+
-2/1| 2 |2/2--2/1| 1 |2/2-
      +----+      +----+
```

Note: There is no standby. Reason: u2: diff run-time config
 Current stack management MAC is 00e0.5201.0000
 Note: no "stack mac" config. My MAC will change after failover.

Support during stack formation, stack merge, and stack split

This section illustrates hitless stacking support during stack formation, stack merge, and stack split.

Figure 22 illustrates hitless stacking support during stack formation. Operational stages 1 and 2 are also shown in this illustration.

FIGURE 22 Hitless stacking support during stack formation

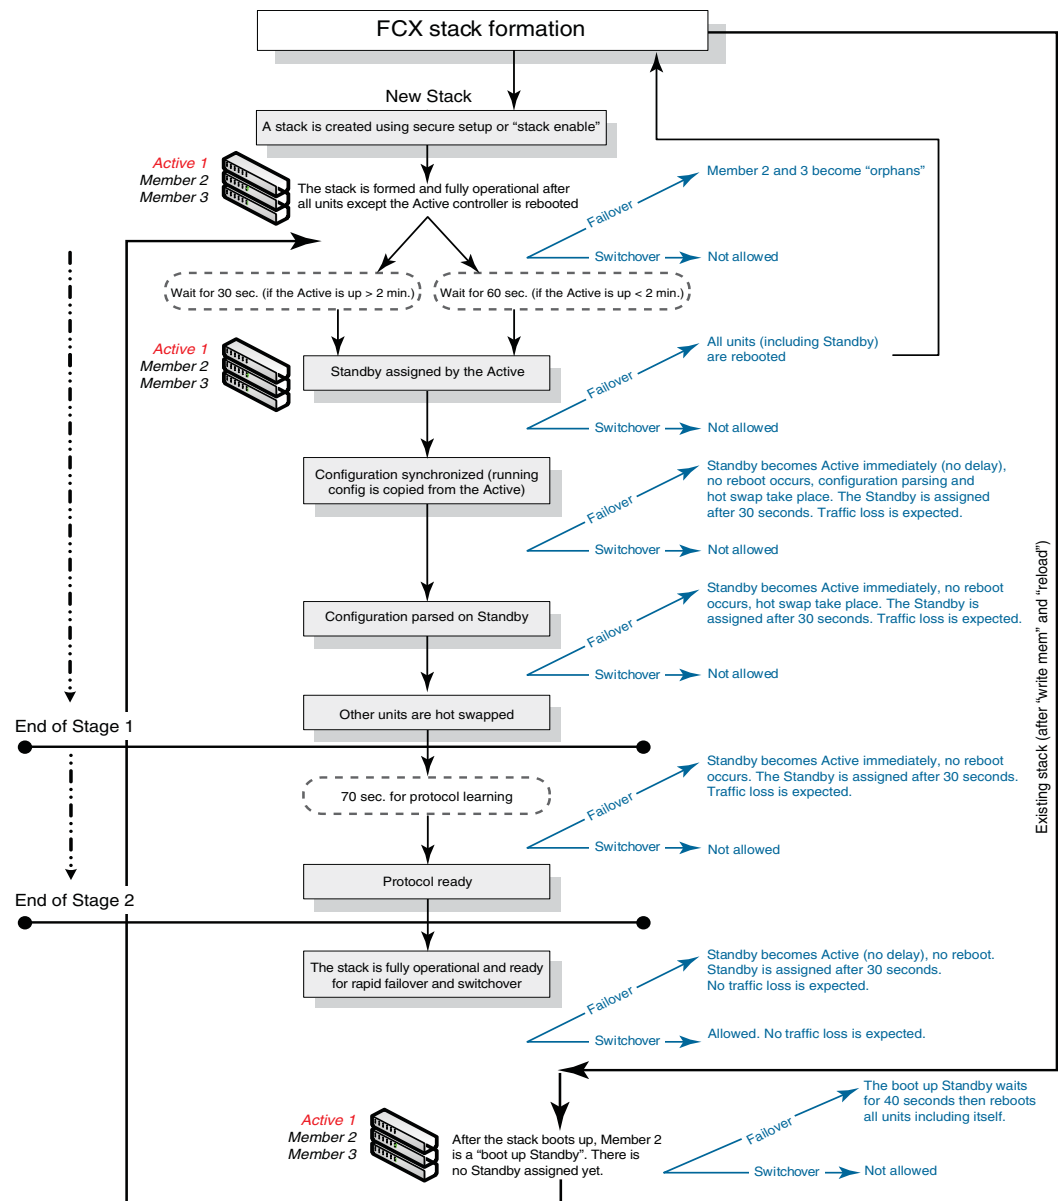

Figure 23 illustrates hitless stacking support during a stack merge.

FIGURE 23 Hitless stacking support during a stack merge

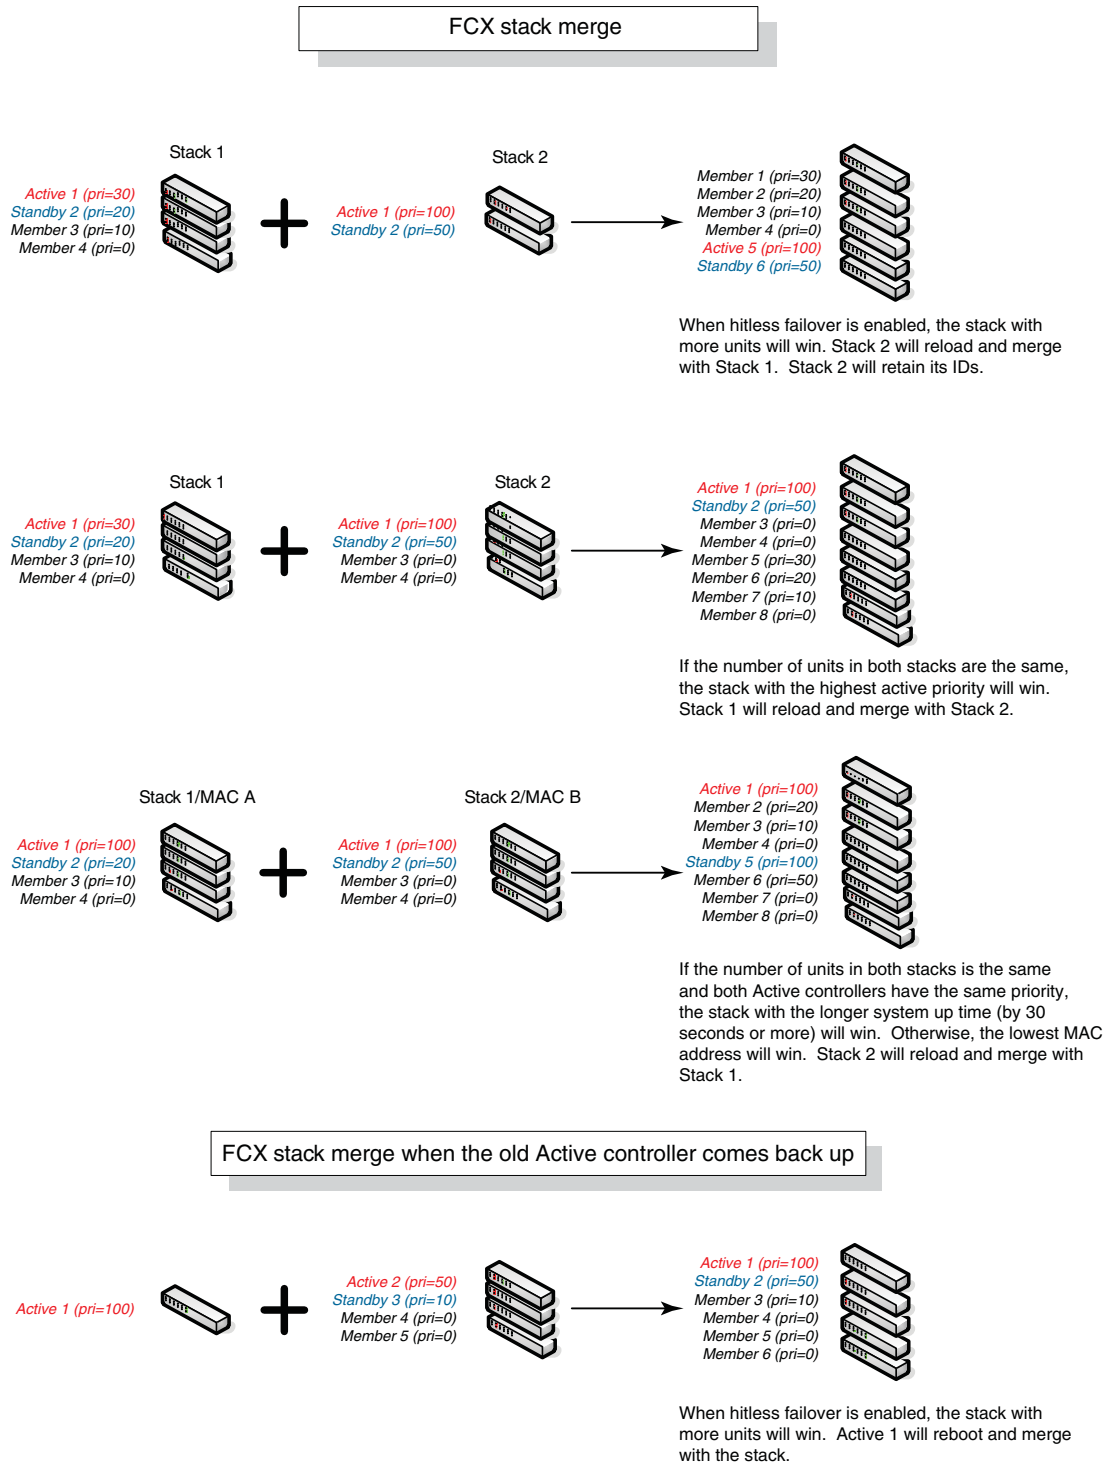

Figure 24 illustrates hitless stacking support in a stack split.

FIGURE 24 Hitless stacking support in a stack split

Hitless stacking default behavior

Hitless stacking is disabled by default. When disabled, the following limitations are in effect:

- If a failover occurs, every unit in the stack will reload
- Manual switchover is not allowed. If the CLI command **stack switch-over** is entered, the following message will appear on the console:
`Switch-over is not allowed. Reason: hitless-failover not configured.`
- Internal switchover resulting from a priority change is blocked until the entire stack is reloaded or hitless stacking is enabled. A priority change will trigger an election, but the newly elected winner will not immediately assume its role. For more information, refer to [“Displaying pending device roles”](#) on page 341.
- If there is no Active Controller after a reload, the bootup standby will assume the active role after reloading every unit in the stack, including itself.
- During a stack merge, the Active Controller with the highest priority will win the election and reload every unit of the losing stack.

NOTE

Synchronization between the Active Controller, Standby Controller, and stack members will occur whether or not hitless stacking is enabled.

When hitless stacking is enabled, the following behavior takes effect immediately:

- If a failover occurs, the stack will not reload.
- Manual switchover (CLI command **stack switch-over**) is allowed.
- If a priority change occurred while hitless stacking was disabled, and the configured priority value requires a switchover, the system will start a 60-second timer before performing a switchover. After the switchover, the highest priority standby will become the Active Controller.
- If there is no Active Controller after a reload, the bootup standby will assume the active role in approximately 90 seconds without a reload.
- During a stack merge, the Active Controller with the larger number of units will win the election and reload every unit of the losing stack. If two stacks have the same number of units, then the priority, system up time, ID, then MAC address is compared. If two stacks have the same number of units and the same priority, then the stack with the longest system up-time (by 30 seconds or more) will win the election. Otherwise, the smallest ID is compared next, followed by MAC address. If the losing Active Controller has the highest priority, it will become a standby after reloading and relearning the protocols. Finally, it will become the Active Controller after an internal switchover.

NOTE

If the Active Controllers of two merging stacks have different hitless stacking settings (i.e., hitless stacking is enabled in one stack and disabled in the other), the default behavior (hitless stacking disabled) will be used in the stack merge. After the merge, the winner will retain its hitless stacking setting and runtime configuration for the merged stack.

You can use the **show stack** command to view whether or not hitless stacking is enabled. Refer to [“Displaying hitless stacking status”](#) on page 341.

Enabling hitless stacking

Hitless stacking is disabled by default. To enable it, enable hitless failover as described in [“Enabling hitless stacking failover”](#) on page 342.

Displaying hitless stacking status

You can use the **show stack** command to view whether or not hitless stacking is enabled. The following example shows that hitless stacking is disabled.

```
Brocade#show stack
alone: standalone, D: dynamic config, S: static config
ID   Type      Role    Mac Address    Pri State  Comment
2   S FCX648S   member  0000.0000.0000    0 reserve
3   S FCX624   member  0024.3876.2640    0 remote  Ready
5   S FCX624   standby 00e0.5200.0400 100 remote  Ready
8   S FCX648   active  0024.3877.7980 128 local   Ready
```

```

      active                      standby
      +---+                      +---+
-2/1| 8 |2/2--2/2| 3 |2/1--2/1| 5 |2/2-
|   +---+                      +---+
|
|-----|

```

Standby u5 - No hitless failover. Reason: hitless-failover not configured

Syntax: show stack

Displaying pending device roles

When hitless stacking is disabled, a priority change will trigger an election, but the newly-elected winner will not assume its role until the entire stack is reloaded or hitless stacking is enabled.

You can use the **show stack** command to view pending device roles. The “Role” column displays the current role for each unit. The “Comment” column displays the role that will take effect after a reload or when hitless stacking is enabled.

Hitless stacking

```
Brocade#show stack
alone: standalone, D: dynamic config, S: static config
ID   Type      Role      Mac Address      Pri State      Comment
2   S FCX648S   member    0000.0000.0000    0  reserve
3   S FCX624    standby   0024.3876.2640    200 remote  Ready, active if reloaded
5   S FCX624    member    00e0.5200.0400    128 remote  Ready, standby if reloaded
8   S FCX648    active    0024.3877.7980    128 local   Ready, member if reloaded
```

```

      active      standby
      +---+      +---+      +---+
-2/1| 8 |2/2--2/2| 3 |2/1--2/1| 5 |2/2-
|      +---+      +---+      +---+
|-----|

```

Standby u3 - No hitless failover. Reason: hitless-failover not configured

Syntax: show stack

Hitless stacking failover

Hitless stacking failover provides automatic failover from the Active Controller to the Standby Controller without resetting any of the units in the stack and with sub-second or no packet loss to hitless stacking-supported services and protocols.

For a description of the events that occur during a hitless failover, refer to [“What happens during a hitless stacking switchover or failover”](#) on page 333.

For a description of this feature’s impact on major system functions, refer to [Table 56](#) on page 330.

For an example of hitless failover operation, refer to [“Hitless stacking failover example”](#) on page 343.

For feature limitations and configuration notes, refer to [“Hitless stacking configuration notes and feature limitations”](#) on page 333.

Enabling hitless stacking failover

To enable hitless stacking failover, enter the following command at the global CONFIG level of the CLI:

```
Brocade(config)#hitless-failover enable
```

The command takes effect immediately. Hitless switchover is allowed, and in the event of a failover, the standby controller will take over the active role without reloading the stack.

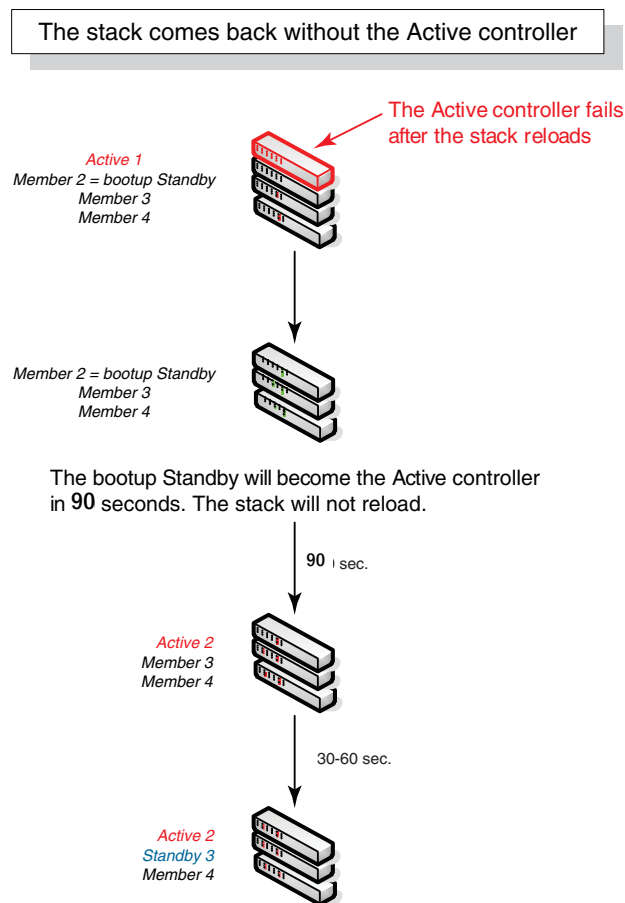

Syntax: [no] hitless-failover enable

Use the **no** form of the command to disable hitless stacking once it has been enabled.

Hitless stacking failover example

Figure 25 illustrates hitless stacking failover operation when the Active Controller fails.

FIGURE 25 Hitless stacking failover when the Active Controller fails

Hitless stacking switchover

Hitless stacking switchover is a manually-controlled (CLI-driven) or automatic switchover of the Active and Standby Controllers without reloading the stack and without any packet loss to the services and protocols that are supported by hitless stacking. A switchover is activated by the CLI command **stack switch-over**. A switchover might also be activated by the CLI command **priority**, depending on the configured priority value.

By default, hitless switchover is not allowed. The default behavior is described in [“Hitless stacking default behavior”](#) on page 340.

Hitless switchover can be used by a system administrator, for example, to perform maintenance on a controller that has been functioning as the Active Controller.

For a description of the events that occur during a hitless stacking switchover, refer to [“What happens during a hitless stacking switchover or failover”](#) on page 333.

For a description of this feature's impact on major system functions, refer to [Table 56](#) on page 330.

For examples of hitless stacking switchover operation, refer to [“Hitless stacking switchover examples”](#) on page 345.

Executing a hitless stacking switchover

The following must be in effect before a hitless switchover (switch over to the Standby Controller) is allowed:

- Hitless stacking is enabled
- The stack has a Standby Controller
- The Standby Controller has learned the protocols
- The Standby Controller has the same priority as the Active Controller
- More than 120 seconds have passed since the previous switchover or failover

You can use the **show stack** command to view whether or not these properties are in effect. For more information, refer to [“Displaying information about hitless stacking”](#) on page 350.

To perform a switchover, enter the following command:

```
Brocade# stack switch-over
Standby unit 8 will become Active Controller, and unit 1 will become standby
Are you sure? (enter 'y' or 'n'): y
Unit 1 is no longer the Active Controller
```

Syntax: **stack switch-over**

Hitless stacking switchover examples

This section illustrates hitless stacking failover and switchover operation during a CLI-driven switchover or priority change.

Figure 26 illustrates a hitless stacking switchover triggered by the **stack switch-over** command.

FIGURE 26 Manual switchover

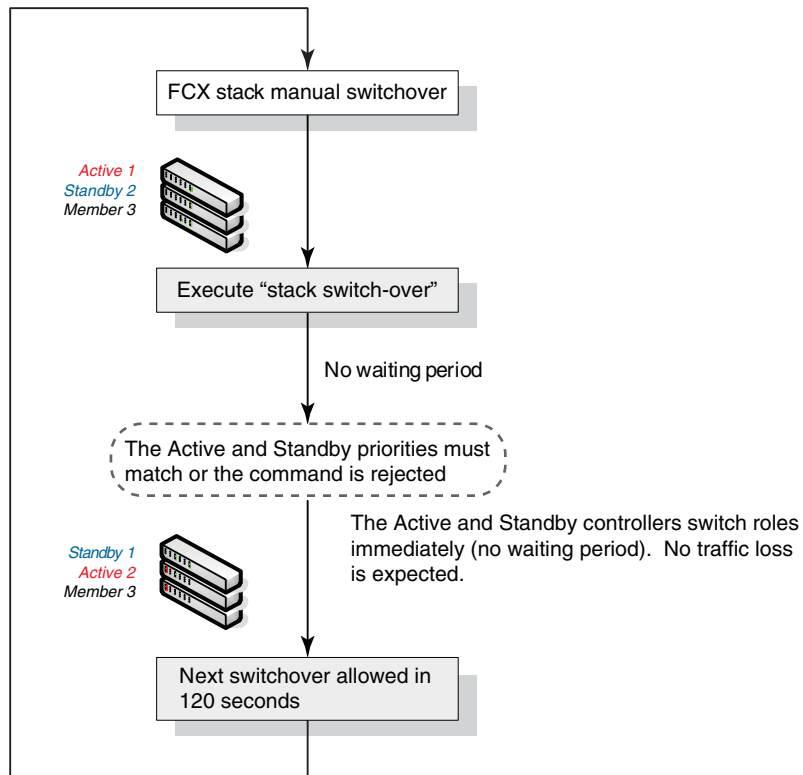

Figure 27 illustrates a hitless stacking switchover when the Active Controller goes down then comes back up. The stack in this example has user-configured priorities.

FIGURE 27 Hitless stacking switchover when the Active Controller comes back up

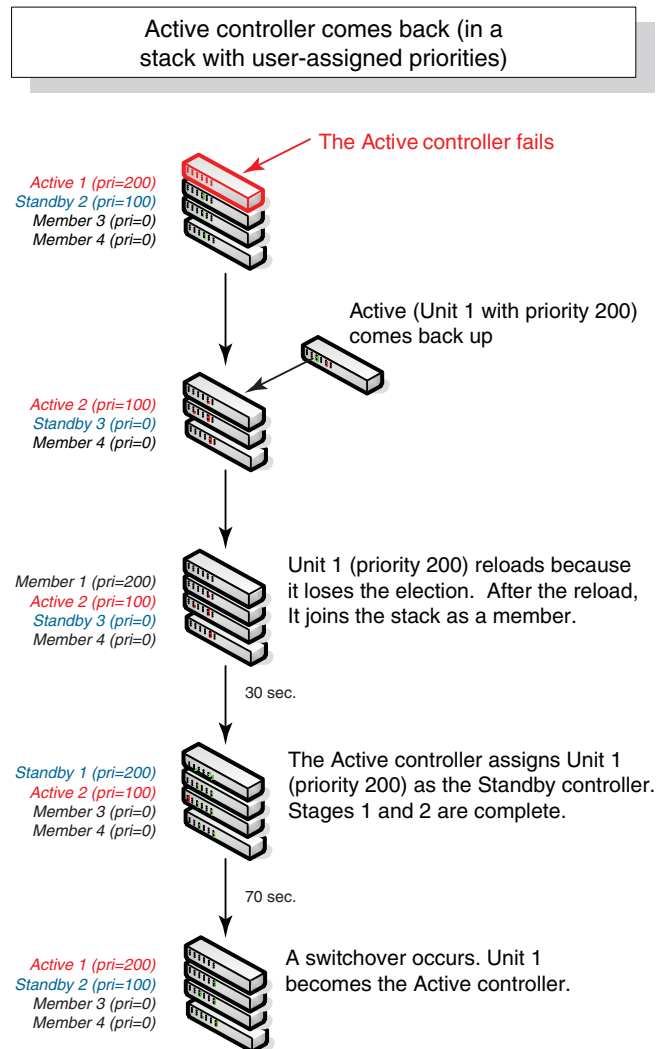

Figure 28 illustrates a hitless stacking switchover after the network administrator increases the priority value of the Standby Controller.

FIGURE 28 Scenario 1 – Hitless stacking switchover after a priority change

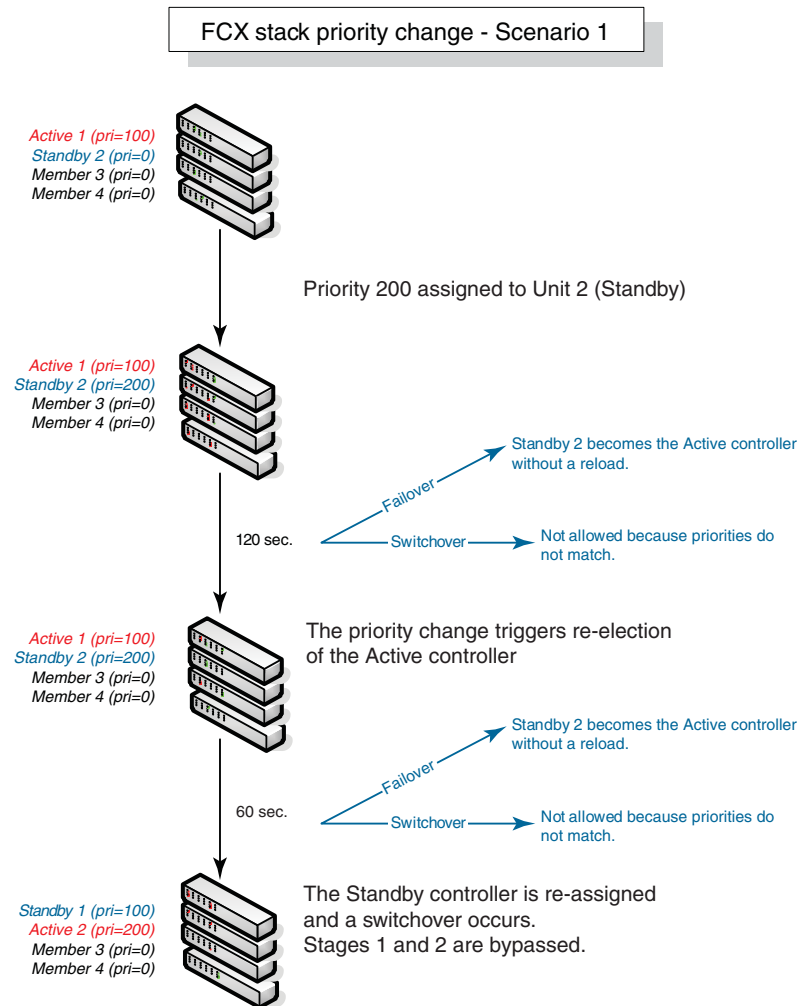

Figure 29 illustrates a hitless stacking switchover after the network administrator increases the priority value of one of the stack members.

FIGURE 29 Scenario 2 – Hitless stacking switchover after a priority change

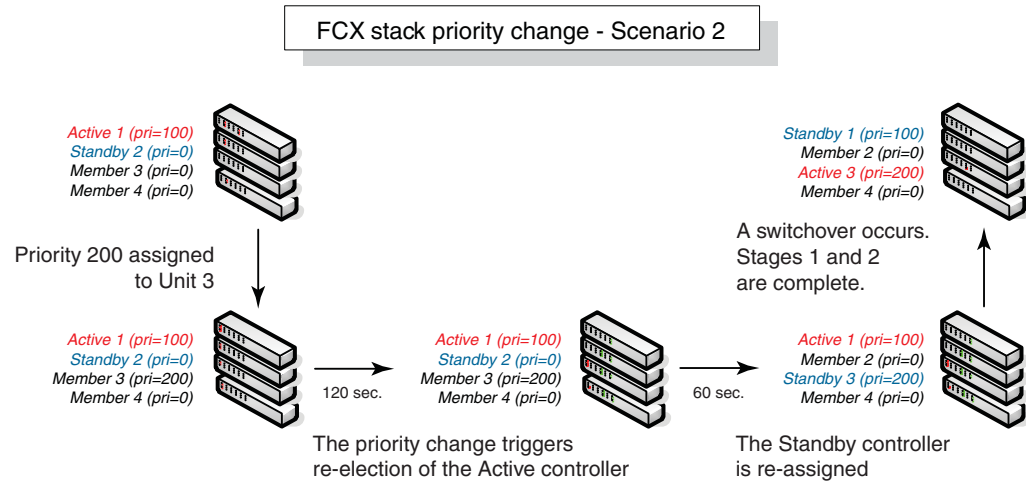

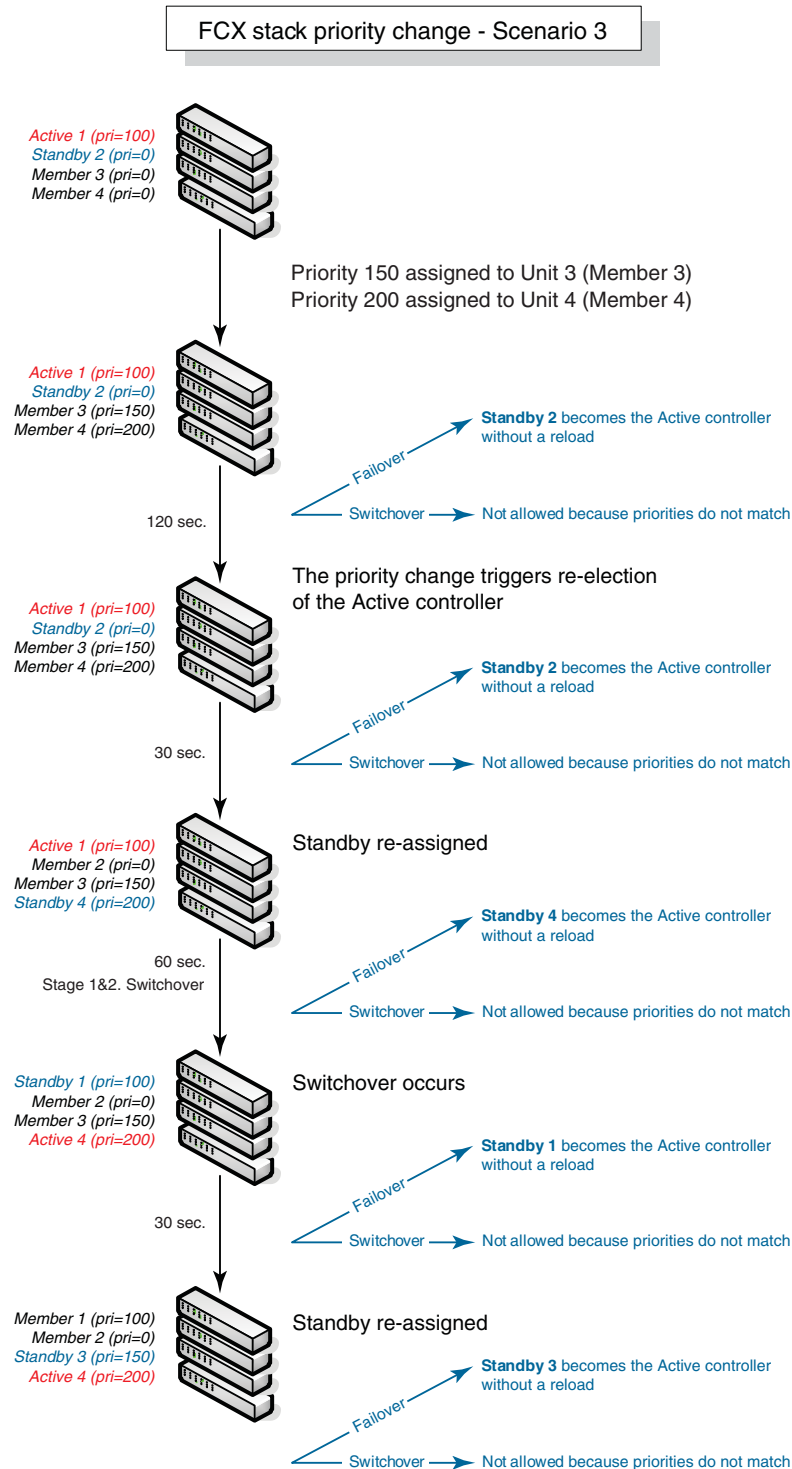

Figure 30 illustrates a hitless stacking switchover after the network administrator increases the priority value for two of the stack members.

FIGURE 30 Scenario 3 – Hitless stacking switchover after a priority change

Displaying information about hitless stacking

Use the **show stack** command to view information pertinent to a hitless stacking switchover or failover. The command output illustrates the Active and Standby Controllers, as well as the readiness of the Standby Controller to take over the role of Active Controller, if needed.

```
Brocade#show stack
alone: standalone, D: dynamic config, S: static config
ID   Type      Role      Mac Address    Pri State  Comment
1   S FCX624S   active    00e0.5200.2900 128 local  Ready
2   S FCX624S   standby   00e0.5200.0100 128 remote Ready
3   S FCX624SPOE member    00e0.5288.8888 50 remote Ready
4   S FCX624S   member    0000.0000.0000 128 reserve
```

```

      active      standby
      +---+      +---+      +---+
-1/3| 1 |1/5--1/5| 2 |1/3--1/5| 3 |1/3-
|   +---+      +---+      +---+ |
|                                   |
|-----|
```

Standby unit 2: protocols ready, can failover or manually switch over
 Current stack management MAC is 0000.5200.1100

NOTE

The text in bold highlights the information added for hitless stacking failover and switchover. For a description of the fields in this output, refer to [“Field descriptions for the show stack command”](#) on page 295.

Displaying information about stack failover

Use the **show stack failover** command to view information about rapid failover. The following command output is from a Brocade ICX 6610 device.

```
Brocade#show stack failover
Current standby is unit 5. state=ready
Standby u5 - protocols ready, can failover or manually switch over
```

Displaying information about link synchronization status

Use the **show stack link-sync status** command to view the status of the link synchronization. The following command output is from a Brocade ICX 6610 device.

```
Brocade#show stack link-sync status
STACKING_LINK_GLOBAL_CTRL messages sent: 0, received: 0
STACKING_LINK_INDIVIDUAL_CTRL messages sent: 359, received: 0
STACKING_LINK_STATUS messages sent: 22300, received: 128883
STACKING_POE_SCTRL messages sent: 0, received: 0
STACKING_POE_STATUS messages sent: 0, received: 0
```

```
global_ctrl_dest: ffffffff
individual_ctrl_dest: ee
status_dest: 30
```

Syslog messages for hitless stacking failover and switchover

Syslog messages are generated for the following events:

- Switchover
- Failover
- Standby Controller assignment

Table 57 lists the supported syslog messages.

TABLE 57 Syslog messages

Message level	Message	Explanation
Informational	Stack: Stack unit <unit_number> has been assigned as STANDBY unit of the stack system	Indicates that the unit has been assigned as the Standby Controller.
Informational	Stack: Stack is operational due to SWITCH-OVER	Indicates that a switchover has occurred.
Informational	Stack: Stack is operational due to FAIL-OVER	Indicates that a failover has occurred.

To view the System log or the traps logged on an SNMP trap receiver, enter the **show log** command at any level of the CLI. The following example output shows what the log might look like after a switchover or assignment of the Standby Controller.

```
Brocade# show log
Syslog logging: enabled (0 messages dropped, 1 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 8 messages logged
  level code: A=alert C=critical D=debugging M=emergency E=error
               I=informational N=notification W=warningDynamic Log Buffer (50 lines):
0d00h05m34s:I:System: Interface ethernet mgmt1, state up
0d00h05m33s:I:Stack: Stack unit 8 has been assigned as STANDBY unit of the stack system
0d00h05m33s:I:Stack: Stack is operational due to SWITCH-OVER
0d00h05m32s:I:Stack: Stack unit 1 has been elected as ACTIVE unit of the stack system
0d00h05m29s:W:System:Stack unit 2 Fan speed changed automatically to 2
0d00h05m25s:W:System:Stack unit 5 Fan speed changed automatically to 2
0d00h05m00s:I:System: Interface ethernet mgmt1, state down
0d00h05m00s:I:Security: Telnet server enabled by from session
```

The following example output shows what the log might look like after a failover of the Active Controller.

NOTE

In FCX devices after failover, the output of the **show log** command displays the status of the previous management port interface.

Hitless stacking

```
Brocade# show log
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 12 messages logged

Clear IPv6 global information	Yes		Yes	Yes	ICX 6450 only
IPv6 source routing security enhancements	No		Yes	Yes	No

¹The following IPv6 features, listed in Table 58, are documented in other chapters of this guide:

- IPv6 access list – [“IPv6 ACLs”](#) on page 1755
- IPv6 copy – [“Using the IPv6 copy command”](#) on page 87
- IPv6 ncopy – [“IPv6 ncopy command”](#) on page 89
- RADIUS – [“Setting RADIUS over IPv6”](#) on page 167
- TFTP – [“Loading and saving configuration files with IPv6”](#) on page 87
- IPV6 routing protocols – Various chapters

Full Layer 3 IPv6 feature support

The following IPv6 Layer 3 features are supported only with the IPv6 Layer 3 PROM, IPv6-series hardware, and the full Layer 3 image:

- IPv6 unicast routing (multicast routing is not supported)
- OSPF V3
- RIPng
- IPv6 ICMP redirect messages
- IPv6 route redistribution
- IPv6 static routes
- IPv6 over IPv4 tunnels in hardware
- IPv6 Layer 3 forwarding

IPv6 addressing overview

IPv6 was designed to replace IPv4, the Internet protocol that is most commonly used currently throughout the world. IPv6 increases the number of network address bits from 32 (IPv4) to 128 bits, which provides more than enough unique IP addresses to support all of the network devices on the planet into the future. IPv6 is expected to quickly become the network standard.

An IPv6 address is composed of 8 fields of 16-bit hexadecimal values separated by colons (:).

[Figure 31](#) shows the IPv6 address format.

FIGURE 31 IPv6 address format

As shown in [Figure 31](#), HHHH is a 16-bit hexadecimal value, while H is a 4-bit hexadecimal value. The following is an example of an IPv6 address.

2001:0000:0000:0200:002D:D0FF:FE48:4672

Note that this IPv6 address includes hexadecimal fields of zeros. To make the address less cumbersome, you can do the following:

- Omit the leading zeros; for example, 2001:0:0:200:2D:D0FF:FE48:4672.
- Compress the successive groups of zeros at the beginning, middle, or end of an IPv6 address to two colons (::) once per address; for example, 2001::200:2D:D0FF:FE48:4672.

When specifying an IPv6 address in a command syntax, keep the following in mind:

- You can use the two colons (::) only once in the address to represent the longest successive hexadecimal fields of zeros
- The hexadecimal letters in IPv6 addresses are not case-sensitive

As shown in [Figure 31](#), the IPv6 network prefix is composed of the left-most bits of the address. As with an IPv4 address, you can specify the IPv6 prefix using the `<prefix>/<prefix-length>` format, where the following applies.

The `<prefix>` parameter is specified as 16-bit hexadecimal values separated by a colon.

The `<prefix-length>` parameter is specified as a decimal value that indicates the left-most bits of the IPv6 address.

The following is an example of an IPv6 prefix.

2001:FF08:49EA:D088::/64

IPv6 address types

As with IPv4 addresses, you can assign multiple IPv6 addresses to a switch interface. [Table 59](#) presents the three major types of IPv6 addresses that you can assign to a switch interface.

A major difference between IPv4 and IPv6 addresses is that IPv6 addresses support **scope**, which describes the topology in which the address may be used as a unique identifier for an interface or set of interfaces.

Unicast and multicast addresses support scoping as follows:

- Unicast addresses support two types of scope: global scope and local scope. In turn, local scope supports site-local addresses and link-local addresses. [Table 59](#) describes global, site-local, and link-local addresses and the topologies in which they are used.
- Multicast addresses support a scope field, which [Table 59](#) describes.

TABLE 59 IPv6 address types

Address type	Description	Address structure
Unicast	An address for a single interface. A packet sent to a unicast address is delivered to the interface identified by the address.	<p>Depends on the type of the unicast address:</p> <ul style="list-style-type: none"> • Aggregatable global address—An address equivalent to a global or public IPv4 address. The address structure is as follows: a fixed prefix of 2000::/3 (001), a 45-bit global routing prefix, a 16-bit subnet ID, and a 64-bit interface ID. • Site-local address—An address used within a site or intranet. (This address is similar to a private IPv4 address.) A site consists of multiple network links. The address structure is as follows: a fixed prefix of FEC0::/10 (1111 1110 11), a 16-bit subnet ID, and a 64-bit interface ID. • Link-local address—An address used between directly connected nodes on a single network link. The address structure is as follows: a fixed prefix of FE80::/10 (1111 1110 10) and a 64-bit interface ID. • IPv4-compatible address—An address used in IPv6 transition mechanisms that tunnel IPv6 packets dynamically over IPv4 infrastructures. The address embeds an IPv4 address in the low-order 32 bits and the high-order 96 bits are zeros. The address structure is as follows: 0:0:0:0:0:A.B.C.D. • Loopback address—An address (0:0:0:0:0:0:1 or ::1) that a switch can use to send an IPv6 packet to itself. You cannot assign a loopback address to a physical interface. • Unspecified address—An address (0:0:0:0:0:0:0 or ::) that a node can use until you configure an IPv6 address for it.
Multicast	An address for a set of interfaces belonging to different nodes. Sending a packet to a multicast address results in the delivery of the packet to all interfaces in the set.	A multicast address has a fixed prefix of FF00::/8 (1111 1111). The next 4 bits define the address as a permanent or temporary address. The next 4 bits define the scope of the address (node, link, site, organization, global).
Anycast	An address for a set of interfaces belonging to different nodes. Sending a packet to an anycast address results in the delivery of the packet to the closest interface identified by the address.	<p>An anycast address looks similar to a unicast address, because it is allocated from the unicast address space. If you assign a unicast address to multiple interfaces, it is an anycast address. An interface assigned an anycast address must be configured to recognize the address as an anycast address.</p> <p>An anycast address can be assigned to a switch only.</p> <p>An anycast address must not be used as the source address of an IPv6 packet.</p>

A switch automatically configures a link-local unicast address for an interface by using the prefix of FE80::/10 (1111 1110 10) and a 64-bit interface ID. The 128-bit IPv6 address is then subjected to duplicate address detection to ensure that the address is unique on the link. If desired, you can override this automatically configured address by explicitly configuring an address.

NOTE

Brocade FastIron devices support RFC 2526, which requires that within each subnet, the highest 128 interface identifier values reserved for assignment as subnet anycast addresses. Thus, if you assign individual IPv6 addresses within a subnet, the second highest IPv6 address in the subnet does not work.

IPv6 stateless auto-configuration

Brocade routers use the IPv6 stateless autoconfiguration feature to enable a host on a local link to automatically configure its interfaces with new and globally unique IPv6 addresses associated with its location. The automatic configuration of a host interface is performed without the use of a server, such as a Dynamic Host Configuration Protocol (DHCP) server, or manual configuration.

The automatic configuration of a host interface works in the following way: a switch on a local link periodically sends switch advertisement messages containing network-type information, such as the 64-bit prefix of the local link and the default route, to all nodes on the link. When a host on the link receives the message, it takes the local link prefix from the message and appends a 64-bit interface ID, thereby automatically configuring its interface. (The 64-bit interface ID is derived from the MAC address of the host's NIC.) The 128-bit IPv6 address is then subjected to duplicate address detection to ensure that the address is unique on the link.

The duplicate address detection feature verifies that a unicast IPv6 address is unique before it is assigned to a host interface by the stateless auto configuration feature. Duplicate address detection uses neighbor solicitation messages to verify that a unicast IPv6 address is unique.

NOTE

For the stateless auto configuration feature to work properly, the advertised prefix length in switch advertisement messages must always be 64 bits.

The IPv6 stateless autoconfiguration feature can also automatically reconfigure a host's interfaces if you change the ISP for the host's network. (The host's interfaces must be renumbered with the IPv6 prefix of the new ISP.)

The renumbering occurs in the following way: a switch on a local link periodically sends advertisements updated with the prefix of the new ISP to all nodes on the link. (The advertisements still contain the prefix of the old ISP.) A host can use the addresses created from the new prefix and the existing addresses created from the old prefix on the link. When you are ready for the host to use the new addresses only, you can configure the lifetime parameters appropriately using the **ipv6 nd prefix-advertisement** command. During this transition, the old prefix is removed from the switch advertisements. At this point, only addresses that contain the new prefix are used on the link.

IPv6 CLI command support

Table 60 lists the IPv6 CLI commands supported.

TABLE 60 IPv6 CLI command support

IPv6 command	Description	Switch code	Router code
clear ipv6 cache	Deletes all entries in the dynamic host cache.		X
clear ipv6 mld-snooping	Deletes MLD-snooping-related counters or cache entries.	X	X
clear ipv6 neighbor	Deletes all dynamic entries in the IPv6 neighbor table.	X	X
clear ipv6 ospf	Clears OSPF-related entries.		X
clear ipv6 rip	Clears RIP-related entries.		X
clear ipv6 route	Deletes all dynamic entries in the IPv6 route table.		X
clear ipv6 traffic	Resets all IPv6 packet counters.	X	X

TABLE 60 IPv6 CLI command support (Continued)

IPv6 command	Description	Switch code	Router code
clear ipv6 tunnel	Clears statistics for IPv6 tunnels		X
copy tftp	Downloads a copy of a Brocade software image from a TFTP server into the system flash using IPv6.	X	X
debug ipv6	Displays IPv6 debug information.	X	X
ipv6 access-class	Configures access control for IPv6 management traffic.	X	X
ipv6 access-list	Configures an IPv6 access control list for IPv6 access control.	X	X
ipv6 address	Configures an IPv6 address on an interface (router) or globally (switch)	X	X
ipv6 debug	Enables IPv6 debugging.	X	X
ipv6 dns domain-name	Configures an IPv6 domain name.	X	X
ipv6 dns server-address	Configures an IPv6 DNS server address.	X	X
ipv6 enable	Enables IPv6 on an interface.	X	X
ipv6 hop-limit	Sets the IPv6 hop limit.		X
ipv6 icmp	Configures IPv6 ICMP parameters		X
ipv6 load-sharing	Enables IPv6 load sharing		X
ipv6 mld-snooping	Configures MLD snooping	X	X
ipv6 mtu	Configures the maximum length of an IPv6 packet that can be transmitted on a particular interface.		X
ipv6 nd	Configures neighbor discovery.		X
ipv6 neighbor	Maps a static IPv6 address to a MAC address in the IPv6 neighbor table.		X
ipv6 ospf	Configures OSPF V3 parameters on an interface.		X
ipv6 prefix-list	Builds an IPv6 prefix list.		X
ipv6 redirects	Enables the sending of ICMP redirect messages on an interface.		X
ipv6 rip	Configures RIPng parameters on an interface		X
ipv6 route	Configures an IPv6 static route.		X
ipv6 router	Enables an IPv6 routing protocol.		X
ipv6 traffic-filter	Applies an IPv6 ACL to an interface.	X	X
ipv6 unicast-routing	Enables IPv6 unicast routing.		X
log host ipv6	Configures the IPv6 Syslog server.	X	X
ping ipv6	Performs an ICMP for IPv6 echo test.	X	X
show ipv6	Displays some global IPv6 parameters, such as IPv6 DNS server address.	X	X
show ipv6 access-list	Displays configured IPv6 access control lists.	X	X
show ipv6 cache	Displays the IPv6 host cache.		X

TABLE 60 IPv6 CLI command support (Continued)

IPv6 command	Description	Switch code	Router code
show ipv6 interface	Displays IPv6 information for an interface.		X
show ipv6 mld-snooping	Displays information about MLD snooping.	X	X
show ipv6 neighbor	Displays the IPv6 neighbor table.	X	X
show ipv6 ospf	Displays information about OSPF V3.		X
show ipv6 prefix-lists	Displays the configured IPv6 prefix lists.		X
show ipv6 rip	Displays information about RIPng.		X
show ipv6 route	Displays IPv6 routes.		X
show ipv6 router	Displays IPv6 local routers.		X
show ipv6 tcp	Displays information about IPv6 TCP sessions.	X	X
show ipv6 traffic	Displays IPv6 packet counters.	X	X
show ipv6 tunnel	Displays information about IPv6 tunnels.	X	X
snmp-client ipv6	Restricts SNMP access to a certain IPv6 node.	X	X
snmp-server host ipv6	Specifies the recipient of SNMP notifications.	X	X
sntp server ipv6	Enables the Brocade device to send SNTP packets over IPv6.	X	X
telnet	Enables a Telnet connection from the Brocade device to a remote IPv6 host using the console.	X	X
traceroute ipv6	Traces a path from the Brocade device to an IPv6 host.	X	X
web access-group ipv6	Restricts Web management access to certain IPv6 hosts as determined by IPv6 ACLs.	X	X
web client ipv6	Restricts Web management access to certain IPv6 hosts.	X	X

IPv6 host address on a Layer 2 switch

In a Layer 3 (router) configuration, each port can be configured separately with an IPv6 address. This is accomplished using the interface configuration process that is described in [“IPv6 configuration on each router interface”](#) on page 362.

In a Layer 2 (switch) configuration, individual ports cannot be configured with an IP address (IPv4 or IPv6). In this situation, the switch has one IP address for the management port and one IP address for the system. This has previously been supported for IPv4 but not for IPv6.

There is support for configuring an IPv6 address on the management port as described in [“Configuring the management port for an IPv6 automatic address configuration”](#) on page 362, and for configuring a system-wide IPv6 address on a Layer 2 switch. Configuration of the system-wide IPv6 address is exactly like configuration of an IPv6 address in router mode, except that the IPv6 configuration is at the Global CONFIG level instead of at the Interface level.

The process for defining the system-wide interface for IPv6 is described in the following sections:

- [“Configuring a global or site-local IPv6 address with a manually configured interface ID”](#) on page 361

- [“Configuring a link-local IPv6 address as a system-wide address for a switch”](#) on page 361

NOTE

When configuring an IPv6 host address on a Layer 2 switch that has multiple VLANs, make sure the configuration includes a designated management VLAN that identifies the VLAN to which the global IP address belongs. Refer to [“Designated VLAN for Telnet management sessions to a Layer 2 Switch”](#) on page 120.

Configuring a global or site-local IPv6 address with a manually configured interface ID

To configure a global or site-local IPv6 address with a manually-configured interface ID, such as a system-wide address for a switch, enter a command similar to the following at the Global CONFIG level.

```
Brocade(config)#ipv6 address 2001:200:12D:1300:240:D0FF:FE48:4000:1/64
```

Syntax: `ipv6 address <ipv6-prefix>/<prefix-length>`

You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

You must specify the `<prefix-length>` parameter in decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

Configuring a link-local IPv6 address as a system-wide address for a switch

To enable IPv6 and automatically configure a global interface enter commands such as the following.

```
Brocade(config)#ipv6 enable
```

This command enables IPv6 on the switch and specifies that the interface is assigned an automatically computed link-local address.

Syntax: `[no] ipv6 enable`

To override a link-local address that is automatically computed for the global interface with a manually configured address, enter a command such as the following.

```
Brocade(config)#ipv6 address FE80::240:D0FF:FE48:4672 link-local
```

This command explicitly configures the link-local address FE80::240:D0FF:FE48:4672 for the global interface.

Syntax: `ipv6 address <ipv6-address> link-local`

You must specify the `<ipv6-address>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The **link-local** keyword indicates that the router interface should use the manually configured link-local address instead of the automatically computed link-local address.

Configuring the management port for an IPv6 automatic address configuration

You can have the management port configured to automatically obtain an IPv6 address. This process is the same for any other port and is described in detail in the section [“Configuring a global IPv6 address with an automatically computed EUI-64 interface ID”](#) on page 364

Configuring basic IPv6 connectivity on a Layer 3 switch

To configure basic IPv6 connectivity on a Brocade Layer 3 Switch, you must do the following:

- Enable IPv6 routing globally on the switch
- Configure an IPv6 address or explicitly enable IPv6 on each router interface over which you plan to forward IPv6 traffic
- Configure IPv4 and IPv6 protocol stacks. (This step is mandatory only if you want a router interface to send and receive both IPv4 and IPv6 traffic.)

All other configuration tasks in this chapter are optional.

Enabling IPv6 routing

By default, IPv6 routing is disabled. To enable the forwarding of IPv6 traffic globally on the Layer 3 switch, enter the following command.

```
Brocade(config)#ipv6 unicast-routing
```

Syntax: [no] ipv6 unicast-routing

To disable the forwarding of IPv6 traffic globally on the Brocade device, enter the **no** form of this command.

IPv6 configuration on each router interface

To forward IPv6 traffic on a router interface, the interface must have an IPv6 address, or IPv6 must be explicitly enabled. By default, an IPv6 address is not configured on a router interface.

If you choose to configure a global or site-local IPv6 address for an interface, IPv6 is also enabled on the interface. Further, when you configure a global or site-local IPv6 address, you must decide on one of the following in the low-order 64 bits:

- A manually configured interface ID.
- An automatically computed EUI-64 interface ID.

If you prefer to assign a link-local IPv6 address to the interface, you must explicitly enable IPv6 on the interface, which causes a link-local address to be automatically computed for the interface. If preferred, you can override the automatically configured link-local address with an address that you manually configure.

This section provides the following information:

- Configuring a global or site-local address with a manually configured or automatically computed interface ID for an interface.
- Automatically or manually configuring a link-local address for an interface.
- Configuring IPv6 anycast addresses

Configuring a global or site-local IPv6 address on an interface

Configuring a global or site-local IPv6 address on an interface does the following:

- Automatically configures an interface ID (a link-local address), if specified.
- Enables IPv6 on that interface.

Additionally, the configured interface automatically joins the following required multicast groups for that link:

- Solicited-node multicast group FF02:0:0:0:0:1:FF00::/104 for each unicast address assigned to the interface.
- Solicited-node for subnet anycast address for each unicast assigned address
- Solicited-node for anycast address FF02:0:0:0:0:1:FF00::0000
- All-nodes link-local multicast group FF02::1
- All-routers link-local multicast group FF02::2

The neighbor discovery feature sends messages to these multicast groups. For more information, refer to [“IPv6 neighbor discovery configuration”](#) on page 384.

Configuring a global or site-local IPv6 address with a manually configured interface ID

To configure a global or site-local IPv6 address, including a manually configured interface ID, for an interface, enter commands such as the following.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 address 2001:200:12D:1300:240:D0FF:
FE48:4672:/64
```

These commands configure the global prefix 2001:200:12d:1300::/64 and the interface ID ::240:D0FF:FE48:4672, and enable IPv6 on Ethernet interface 3/1.

Syntax: `ipv6 address <ipv6-prefix>/<prefix-length>`

You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

You must specify the `<prefix-length>` parameter as a decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

To configure a /122 address on a VE enter commands similar to the following.

```
Brocade(config-vlan-11)#int ve11
Brocade(config-vif-11)#ipv6 add 2020::1/122
Brocade(config-vif-11)#sh ipv6 int
Routing Protocols : R - RIP O - OSPF
Interface      Status      Routing  Global Unicast Address
VE 11          up/up      2020::1/122
Brocade(config-vif-11)#sh ipv6 route
```

Configuring basic IPv6 connectivity on a Layer 3 switch

IPv6 Routing Table - 1 entries:

Type Codes: C - Connected, S - Static, R - RIP, O - OSPF, B - BGP

OSPF Sub Type Codes: O - Intra, Oi - Inter, Ol - Type1 external, O2 - Type2 external

Type	IPv6 Prefix	Next Hop Router	Interface	Dis/Metric
C	2020::/122	::	ve 11	0/0

Configuring a global IPv6 address with an automatically computed EUI-64 interface ID

To configure a global IPv6 address with an automatically computed EUI-64 interface ID in the low-order 64-bits, enter commands such as the following.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 address 2001:200:12D:1300::/64 eui-64
```

These commands configure the global prefix 2001:200:12d:1300::/64 and an interface ID, and enable IPv6 on Ethernet interface 3/1.

Syntax: `ipv6 address <ipv6-prefix>/<prefix-length> eui-64`

You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

You must specify the `<prefix-length>` parameter as a decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

The **eui-64** keyword configures the global address with an EUI-64 interface ID in the low-order 64 bits. The interface ID is automatically constructed in IEEE EUI-64 format using the interface's MAC address.

Configuring a link-local IPv6 address on an interface

To explicitly enable IPv6 on a router interface without configuring a global or site-local address for the interface, enter commands such as the following.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 enable
```

These commands enable IPv6 on Ethernet interface 3/1 and specify that the interface is assigned an automatically computed link-local address.

Syntax: `[no] ipv6 enable`

NOTE

When configuring VLANs that share a common tagged interface with a physical or Virtual Ethernet (VE) interface, Brocade recommends that you override the automatically computed link-local address with a manually configured unique address for the interface. If the interface uses the automatically computed address, which in the case of physical and VE interfaces is derived from a global MAC address, all physical and VE interfaces will have the same MAC address.

To override a link-local address that is automatically computed for an interface with a manually configured address, enter commands such as the following.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 address FE80::240:D0FF:FE48:4672 link-local
```

These commands explicitly configure the link-local address FE80::240:DOFF:FE48:4672 for Ethernet interface 3/1.

Syntax: `ipv6 address <ipv6-address> link-local`

You must specify the `<ipv6-address>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The **link-local** keyword indicates that the router interface should use the manually configured link-local address instead of the automatically computed link-local address.

Configuring an IPv6 anycast address on an interface

In IPv6, an **anycast** address is an address for a set of interfaces belonging to different nodes. Sending a packet to an anycast address results in the delivery of the packet to the closest interface configured with the anycast address.

An anycast address looks similar to a unicast address, because it is allocated from the unicast address space. If you assign an IPv6 unicast address to multiple interfaces, it is an anycast address. On the Brocade device, you configure an interface assigned an anycast address to recognize the address as an anycast address.

For example, the following commands configure an anycast address on interface 2/1.

```
Brocade(config)#int e 2/1
Brocade(config-if-e1000-2/1)#ipv6 address 2002::/64 anycast
```

Syntax: `ipv6 address <ipv6-prefix>/<prefix-length> [anycast]`

IPv6 anycast addresses are described in detail in RFC 1884. See RFC 2461 for a description of how the IPv6 Neighbor Discovery mechanism handles anycast addresses.

Configuring IPv4 and IPv6 protocol stacks

One situation in which you must configure a router to run both IPv4 and IPv6 protocol stacks is if it is deployed as an endpoint for an IPv6 over IPv4 tunnel.

Each router interface that will send and receive both IPv4 and IPv6 traffic must be configured with an IPv4 address and an IPv6 address. (An alternative to configuring a router interface with an IPv6 address is to explicitly enable IPv6 using the **ipv6 enable** command. For more information about using this command, refer to [“Configuring a link-local IPv6 address on an interface”](#) on page 364.)

To configure a router interface to support both the IPv4 and IPv6 protocol stacks, use commands such as the following.

```
Brocade(config)#ipv6 unicast-routing
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ip address 192.168.1.1 255.255.255.0
Brocade(config-if-e1000-3/1)#ipv6 address 2001:200:12d:1300::/64 eui-64
```

These commands globally enable IPv6 routing and configure an IPv4 address and an IPv6 address for Ethernet interface 3/1.

Syntax: `[no] ipv6 unicast-routing`

To disable IPv6 traffic globally on the router, enter the **no** form of this command.

Syntax: `ip address <ip-address> <sub-net-mask> [secondary]`

You must specify the `<ip-address>` parameter using 8-bit values in dotted decimal notation.

You can specify the `<sub-net-mask>` parameter in either dotted decimal notation or as a decimal value preceded by a slash mark (/).

The **secondary** keyword specifies that the configured address is a secondary IPv4 address.

To remove the IPv4 address from the interface, enter the **no** form of this command.

Syntax: `ipv6 address <ipv6-prefix>/<prefix-length> [eui-64]`

This syntax specifies a global or site-local IPv6 address. For information about configuring a link-local IPv6 address, refer to [“Configuring a link-local IPv6 address on an interface”](#) on page 364.

You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

You must specify the `<prefix-length>` parameter as a decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

The **eui-64** keyword configures the global address with an EUI-64 interface ID in the low-order 64 bits. The interface ID is automatically constructed in IEEE EUI-64 format using the interface’s MAC address. If you do not specify the **eui-64** keyword, you must manually configure the 64-bit interface ID as well as the 64-bit network prefix. For more information about manually configuring an interface ID, refer to [“Configuring a global or site-local IPv6 address on an interface”](#) on page 363.

IPv6 management (IPv6 host support)

You can configure a FastIron X Series switch to serve as an IPv6 host in an IPv6 network. An **IPv6 host** has IPv6 addresses on its interfaces, but does not have full IPv6 routing enabled on it.

This section describes the IPv6 host features supported on FastIron X Series devices.

Configuring IPv6 management ACLs

When you enter the **ipv6 access-list** command, the Brocade device enters the IPv6 Access List configuration level, where you can access several commands for configuring IPv6 ACL entries. After configuring the ACL entries, you can apply them to network management access features such as Telnet, SSH, Web, and SNMP.

NOTE

Unlike IPv4, there is no distinction between standard and extended ACLs in IPv6.

Example

```
FastIron(config)#ipv6 access-list netw
FastIron(config-ipv6-access-list-netw)#
```

Syntax: `[no] ipv6 access-list <ACL name>`

The `<ACL name>` variable specifies a name for the IPv6 ACL. An IPv6 ACL name cannot start with a numeral, for example, **1access**. Also, an IPv4 ACL and an IPv6 ACL cannot share the same name.

Restricting SNMP access to an IPv6 node

You can restrict SNMP access to the device to the IPv6 host whose IP address you specify. To do so, enter a command such as the following.

```
Brocade(config)#snmp-client ipv6 2001:efff:89::23
```

Syntax: `snmp-client ipv6 <ipv6-address>`

The `<ipv6-address>` you specify must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

Specifying an IPv6 SNMP trap receiver

You can specify an IPv6 host as a trap receiver to ensure that all SNMP traps sent by the device will go to the same SNMP trap receiver or set of receivers, typically one or more host devices on the network. To do so, enter a command such as the following.

```
Brocade(config)#snmp-server host ipv6 2001:efff:89::13
```

Syntax: `snmp-server host ipv6 <ipv6-address>`

The `<ipv6-address>` you specify must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

Configuring SNMP V3 over IPv6

Brocade FastIron X Series devices support IPv6 for SNMP version 3. For more information about how to configure SNMP, refer to [Chapter 10, “SNMP Access”](#).

Configuring SNTP over IPv6

To enable the Brocade device to send SNTP packets over IPv6, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#sntp server ipv6 3000::400
```

Syntax: `sntp server ipv6 <ipv6-address>`

The `<ipv6-address>` is the IPv6 address of the SNTP server. When you enter the IPv6 address, you do not need to specify the prefix length. A prefix length of 128 is implied.

Secure Shell, SCP, and IPv6

Secure Shell (SSH) is a mechanism that allows secure remote access to management functions on the Brocade device. SSH provides a function similar to Telnet. You can log in to and configure the Brocade device using a publicly or commercially available SSH client program, just as you can with Telnet. However, unlike Telnet, which provides no security, SSH provides a secure, encrypted connection to the Brocade device.

To open an SSH session between an IPv6 host running an SSH client program and the Brocade device, open the SSH client program and specify the IPv6 address of the device. For more information about configuring SSH on the Brocade device, refer to [“SSH2 and SCP”](#) on page 179.

IPv6 Telnet

Telnet sessions can be established between a Brocade device to a remote IPv6 host, and from a remote IPv6 host to the Brocade device using IPv6 addresses.

The **telnet** command establishes a Telnet connection from a Brocade device to a remote IPv6 host using the console. Up to five **read-access** Telnet sessions are supported on the router at one time. **Write-access** through Telnet is limited to one session, and only one outgoing Telnet session is supported on the router at one time. To see the number of open Telnet sessions at any time, enter the **show telnet** command.

Example

To establish a Telnet connection to a remote host with the IPv6 address of 3001:2837:3de2:c37::6, enter the following command.

```
Brocade#telnet 3001:2837:3de2:c37::6
```

Syntax: **telnet** <ipv6-address> [<port-number> | **outgoing-interface ethernet** <port> | **ve** <number>]

The <ipv6-address> parameter specifies the address of a remote host. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The <port-number> parameter specifies the port number on which the Brocade device establishes the Telnet connection. You can specify a value between 1 - 65535. If you do not specify a port number, the Brocade device establishes the Telnet connection on port 23.

If the IPv6 address you specify is a link-local address, you must specify the **outgoing-interface ethernet <port> | ve <number>** parameter. This parameter identifies the interface that must be used to reach the remote host. If you specify an Ethernet interface, you must also specify the port number associated with the interface. If you specify a VE interface, also specify the VE number.

Establishing a Telnet session from an IPv6 host

To establish a Telnet session from an IPv6 host to the Brocade device, open your Telnet application and specify the IPv6 address of the Layer 3 Switch.

IPv6 traceroute

NOTE

This section describes the **IPv6 traceroute** command. For details about **IPv4 traceroute**, refer to [“Tracing an IPv4 route”](#) on page 96.

The **traceroute** command allows you to trace a path from the Brocade device to an IPv6 host.

The CLI displays trace route information for each hop as soon as the information is received. Traceroute requests display all responses to a minimum TTL of 1 second and a maximum TTL of 30 seconds. In addition, if there are multiple equal-cost routes to the destination, the Brocade device displays up to three responses.

For example, to trace the path from the Brocade device to a host with an IPv6 address of 3301:23dd:349e:a384::34, enter the following command:

```
Brocade#traceroute ipv6 3301:23dd:349e:a384::34
```

Syntax: **traceroute ipv6** <ipv6-address>

The <ipv6-address> parameter specifies the address of a host. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

IPv6 Web management using HTTP and HTTPS

When you have an IPv6 management station connected to a switch with an IPv6 address applied to the management port, you can manage the switch from a Web browser by entering one of the following in the browser address field.

http://[<ipv6 address>]

or

https://[<ipv6 address>]

NOTE

You must enclose the IPv6 address with square brackets [] in order for the Web browser to work.

Restricting Web management access

You can restrict Web management access to include only management functions on a Brocade device that is acting as an IPv6 host, or restrict access so that the Brocade host can be reached by a specified IPv6 device.

Restricting Web management access by specifying an IPv6 ACL

You can specify an IPv6 ACL that restricts Web management access to management functions on the device that is acting as the IPv6 host.

Example

```
Brocade(config)#access-list 12 deny host 2000:2383:e0bb::2/128 log
Brocade(config)#access-list 12 deny 30ff:3782::ff89/128 log
Brocade(config)#access-list 12 deny 3000:4828::fe19/128 log
Brocade(config)#access-list 12 permit any
Brocade(config)#web access-group ipv6 12
```

Syntax: `web access-group ipv6 <ipv6 ACL name>`

where <ipv6 ACL name> is a valid IPv6 ACL.

Restricting Web management access to an IPv6 host

You can restrict Web management access to the device to the IPv6 host whose IP address you specify. No other device except the one with the specified IPv6 address can access the Web Management Interface.

Example

```
Brocade(config)#web client ipv6 3000:2383:e0bb::2/128
```

Syntax: `web client ipv6 <ipv6-address>`

The <ipv6-address> you specify must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

Configuring name-to-IPv6 address resolution using IPv6 DNS resolver

The Domain Name Server (DNS) resolver feature lets you use a host name to perform Telnet and ping commands. You can also define a DNS domain on a Brocade device and thereby recognize all hosts within that domain. After you define a domain name, the Brocade device automatically appends the appropriate domain to the host and forwards it to the domain name server.

For example, if the domain “newyork.com” is defined on a Brocade device, and you want to initiate a ping to host “NYC01” on that domain, you need to reference only the host name in the command instead of the host name and its domain name. For example, you could enter either of the following commands to initiate the ping.

```
Brocade#ping ipv6 nyc01
Brocade#ping ipv6 nyc01.newyork.com
```

Defining an IPv6 DNS entry

IPv6 defines new DNS record types to resolve queries for domain names to IPv6 addresses, as well as IPv6 addresses to domain names. Brocade devices running IPv6 software support AAAA DNS records, which are defined in RFC 1886.

AAAA DNS records are analogous to the A DNS records used with IPv4. They store a complete IPv6 address in each record. AAAA records have a type value of 28.

To establish an IPv6 DNS entry for the device, enter the following command.

```
Brocade(config)#ipv6 dns domain-name companynet.com
```

Syntax: [no] **ipv6 dns domain-name** <domain name>

To define an IPv6 DNS server address, enter the following command.

```
Brocade(config)#ipv6 dns server-address 200::1
```

Syntax: [no] **ipv6 dns server-address** <ipv6-addr> [<ipv6-addr>] [<ipv6-addr>] [<ipv6-addr>]

As an example, in a configuration where ftp6.companynet.com is a server with an IPv6 protocol stack, when a user pings ftp6.companynet.com, the Brocade device attempts to resolve the AAAA DNS record. In addition, if the DNS server does not have an IPv6 address, as long as it is able to resolve AAAA records, it can still respond to DNS queries.

Pinging an IPv6 address

NOTE

This section describes the *IPv6 ping* command. For details about *IPv4 ping*, refer to [“Pinging an IPv4 address”](#) on page 95.

The **ping** command allows you to verify the connectivity from a Brocade device to an IPv6 device by performing an ICMP for IPv6 echo test.

For example, to ping a device with the IPv6 address of 2001:3424:847f:a385:34dd::45 from the Brocade device, enter the following command.

```
Brocade#ping ipv6 2001:3424:847f:a385:34dd::45
```

Syntax: `ping ipv6 <ipv6-address> [outgoing-interface [<port> | ve <number>]] [source <ipv6-address>] [count <number>] [timeout <milliseconds>] [ttl <number>] [size <bytes>] [quiet] [numeric] [no-fragment] [verify] [data <1-to-4 byte hex>] [brief]`

- The `<ipv6-address>` parameter specifies the address of the router. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.
- The **outgoing-interface** keyword specifies a physical interface over which you can verify connectivity. If you specify a physical interface, such as an Ethernet interface, you must also specify the port number of the interface. If you specify a virtual interface, such as a VE, you must specify the number associated with the VE.
- The **source** `<ipv6-address>` parameter specifies an IPv6 address to be used as the origin of the ping packets.
- The **count** `<number>` parameter specifies how many ping packets the router sends. You can specify from 1 - 4294967296. The default is 1.
- The **timeout** `<milliseconds>` parameter specifies how many milliseconds the router waits for a reply from the pinged device. You can specify a timeout from 1 - 4294967296 milliseconds. The default is 5000 (5 seconds).
- The **ttl** `<number>` parameter specifies the maximum number of hops. You can specify a TTL from 1 - 255. The default is 64.
- The **size** `<bytes>` parameter specifies the size of the ICMP data portion of the packet. This is the payload and does not include the header. You can specify from 0 - 4000. The default is 16.
- The **no-fragment** keyword turns on the "do not fragment" bit in the IPv6 header of the ping packet. This option is disabled by default.
- The **quiet** keyword hides informational messages such as a summary of the ping parameters sent to the device, and instead only displays messages indicating the success or failure of the ping. This option is disabled by default.
- The **verify** keyword verifies that the data in the echo packet (the reply packet) is the same as the data in the echo request (the ping). By default the device does not verify the data.
- The **data** `<1 - 4 byte hex>` parameter lets you specify a specific data pattern for the payload instead of the default data pattern, "abcd", in the packet's data payload. The pattern repeats itself throughout the ICMP message (payload) portion of the packet.

NOTE

For parameters that require a numeric value, the CLI does not check that the value you enter is within the allowed range. Instead, if you do exceed the range for a numeric value, the software rounds the value to the nearest valid value.

- The **brief** keyword causes ping test characters to be displayed. The following ping test characters are supported.

! Indicates that a reply was received.

. Indicates that the network server timed out while waiting for a reply.

U Indicates that a destination unreachable error PDU was received.

I Indicates that the user interrupted ping.

Configuring an IPv6 Syslog server

To enable IPv6 logging, specify an IPv6 Syslog server. Enter a command such as the following.

```
Brocade(config)#log host ipv6 2000:2383:e0bb::4/128
```

Syntax: `log host ipv6 <ipv6-address> [<udp-port-num>]`

The `<ipv6-address>` must be in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<udp-port-num>` optional parameter specifies the UDP application port used for the Syslog facility.

Viewing IPv6 SNMP server addresses

Some of the **show** commands display IPv6 addresses for IPv6 SNMP servers. The following shows an example output for the **show snmp server** command.

```
Brocade#show snmp server
```

```
    Contact:
    Location:
Community(ro): .....
```

```
Traps
```

```
    Warm/Cold start: Enable
    Link up: Enable
    Link down: Enable
    Authentication: Enable
    Locked address violation: Enable
    Power supply failure: Enable
    Fan failure: Enable
    Temperature warning: Enable
    STP new root: Enable
    STP topology change: Enable
    vsrp: Enable
```

```
Total Trap-Receiver Entries: 4
```

Trap-Receiver	IP-Address	Port-Number	Community
1	192.147.201.100	162
2	4000::200	162
3	192.147.202.100	162
4	3000::200	162

Disabling router advertisement and solicitation messages

Router advertisement and solicitation messages enable a node on a link to discover the routers on the same link. By default, router advertisement and solicitation messages are permitted on the device. To disable these messages, configure an IPv6 access control list that denies them. The following shows an example configuration.

Example

```
Brocade(config)#ipv6 access-list rtradvert
Brocade(config)#deny icmp any any router-advertisement
Brocade(config)#deny icmp any any router-solicitation
Brocade(config)#permit ipv6 any any
```

Disabling IPv6 on a Layer 2 switch

IPv6 is enabled by default in the Layer 2 switch code. If desired, you can disable IPv6 on a global basis on a device running the switch code. To do so, enter the following command at the Global CONFIG level of the CLI.

```
Brocade(config)#no ipv6 enable
```

Syntax: no ipv6 enable

To re-enable IPv6 after it has been disabled, enter **ipv6 enable**.

NOTE

IPv6 is disabled by default in the router code and must be configured on each interface that will support IPv6.

Static IPv6 route configuration

NOTE

Static IPv6 route configuration is supported only with the IPv6 Layer 3 PROM and the full Layer 3 image.

You can configure a static IPv6 route to be redistributed into a routing protocol, but you cannot redistribute routes learned by a routing protocol into the static IPv6 routing table.

NOTE

The maximum IPv6 static routes supported on an ICX 6450 device is 1070.

Before configuring a static IPv6 route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface. For more information on performing these configuration tasks, refer to [“Configuring IPv4 and IPv6 protocol stacks”](#) on page 365.

Configuring a static IPv6 route

To configure a static IPv6 route for a destination network with the prefix 8eff::0/32, a next-hop gateway with the global address 4fee:2343:0:ee44::1, and an administrative distance of 110, enter the following command.

Static IPv6 route configuration

```
Brocade(config)#ipv6 route 8eff::0/32 4fee:2343:0:ee44::1 distance 110
```

Syntax: `ipv6 route <dest-ipv6-prefix>/<prefix-length> <next-hop-ipv6-address> [<metric>] [distance <number>]`

To configure a static IPv6 route for a destination network with the prefix 8eff::0/32 and a next-hop gateway with the link-local address fe80::1 that the Layer 3 switch can access through Ethernet interface 3/1, enter the following command.

```
Brocade(config)#ipv6 route 8eff::0/32 ethernet 1 fe80::1
```

Syntax: `ipv6 route <dest-ipv6-prefix>/<prefix-length> [ethernet <slot/port> | ve <num>] <next-hop-ipv6-address> [<metric>] [distance <number>]`

To configure a static IPv6 route for a destination network with the prefix 8eff::0/32 and a next-hop gateway that the Layer 3 switch can access through tunnel 1, enter the following command.

```
Brocade(config)#ipv6 route 8eff::0/32 tunnel 1
```

Syntax: `ipv6 route <dest-ipv6-prefix>/<prefix-length> <interface> <port> [<metric>] [distance <number>]`

[Table 61](#) describes the parameters associated with this command and indicates the status of each parameter.

TABLE 61 Static IPv6 route parameters

Parameter	Configuration details	Status
The IPv6 prefix and prefix length of the route's destination network.	<p>You must specify the <code><dest-ipv6-prefix></code> parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.</p> <p>You must specify the <code><prefix-length></code> parameter as a decimal value. A slash mark (/) must follow the <code><ipv6-prefix></code> parameter and precede the <code><prefix-length></code> parameter.</p>	Mandatory for all static IPv6 routes.
<p>The route's next-hop gateway, which can be one of the following:</p> <ul style="list-style-type: none"> • The IPv6 address of a next-hop gateway. • A tunnel interface. 	<p>You can specify the next-hop gateway as one of the following types of IPv6 addresses:</p> <ul style="list-style-type: none"> • A global address. • A link-local address. <p>If you specify a global address, you do not need to specify any additional parameters for the next-hop gateway. If you specify a link-local address, you must also specify the interface through which to access the address. You can specify one of the following interfaces:</p> <ul style="list-style-type: none"> • An Ethernet interface. • A tunnel interface. • A virtual interface (VE). <p>If you specify an Ethernet interface, also specify the port number associated with the interface. If you specify a VE or tunnel interface, also specify the VE or tunnel number. You can also specify the next-hop gateway as a tunnel interface. If you specify a tunnel interface, also specify the tunnel number.</p>	Mandatory for all static IPv6 routes.
The route's metric.	You can specify a value from 1 – 16.	Optional for all static IPv6 routes. (The default metric is 1.)
The route's administrative distance.	You must specify the distance keyword and any numerical value.	Optional for all static IPv6 routes. (The default administrative distance is 1.)

A metric is a value that the Layer 3 switch uses when comparing this route to other static routes in the IPv6 static route table that have the same destination. The metric applies only to routes that the Layer 3 switch has already placed in the IPv6 static route table.

The administrative distance is a value that the Layer 3 switch uses to compare this route with routes from other route sources that have the same destination. (The Layer 3 switch performs this comparison before placing a route in the IPv6 route table.) This parameter does not apply to routes that are already in the IPv6 route table. In general, a low administrative distance indicates a preferred route. By default, static routes take precedence over routes learned by routing protocols. If you want a dynamic route to be chosen over a static route, you can configure the static route with a higher administrative distance than the dynamic route.

IPv6 over IPv4 tunnels

NOTE

This feature is supported only with the IPv6 Layer 3 PROM and the full Layer 3 image.

To enable communication between isolated IPv6 domains using the IPv4 infrastructure, you can manually configure IPv6 over IPv4 tunnels that provide static point-point connectivity.

As shown in [Figure 32](#), these tunnels encapsulate an IPv6 packet within an IPv4 packet.

FIGURE 32 IPv6 over an IPv4 tunnel

In general, a manually configured tunnel establishes a permanent link between switches in IPv6 domains. A manually configured tunnel has explicitly configured IPv4 addresses for the tunnel source and destination.

This tunneling mechanism requires that the Layer 3 switch at each end of the tunnel run both IPv4 and IPv6 protocol stacks. The Layer 3 switches running both protocol stacks, or dual-stack routers, can interoperate directly with both IPv4 and IPv6 end systems and routers. Refer to [“Configuring IPv4 and IPv6 protocol stacks”](#) on page 365.

IPv6 over IPv4 tunnel configuration notes

- This feature is not supported in a mixed hardware configuration with 48-port 10/100/1000 Mbps Ethernet POE (SX-FI48GPP) interface modules, together with IPv4 or IPv6 interface modules, or management modules with user ports.

NOTE

If the 48-port 10/100/1000 Mbps Ethernet POE (SX-FI48GPP) interface module is inadvertently inserted in a system that has IPv4 or IPv6 interface modules, or a management module with user ports, existing tunnels will be taken down immediately. To recover, physically remove the module that caused the mix-and-match condition and then disable and re-enable the tunnel interfaces.

- The local tunnel configuration must include both source and destination addresses.
- The remote side of the tunnel must have the opposite source/destination pair.
- A tunnel interface supports static and dynamic IPv6 configuration settings and routing protocols.
- Duplicate Address Detection (DAD) is not currently supported with IPv6 tunnels. Make sure tunnel endpoints do not have duplicate IP addresses.
- Neighbor Discovery (ND) is not supported with IPv6 tunnels.

- If a tunnel source port is a multi-homed IPv4 source, the tunnel will use the first IPv4 address only. For proper tunnel operation, use the **ip address** option.
- Hitless management is not supported with IPv6-over-IPv4 tunnels or GRE tunnels. When either of these tunnel types are enabled on non supported devices, the behavior is as follows:
 - The CLI commands that execute a hitless switchover (**switch-over-active-role** and **hitless reload**) are disabled.
 - In the event of a failover, the following message is displayed on the console and in the Syslog, and the entire system is rebooted:

```
WARNING: All the System will now reload since GRE or IPv6 Tunnel was
configured
```

Configuring a manual IPv6 tunnel

You can use a manually configured tunnel to connect two isolated IPv6 domains. You should deploy this point-to-point tunnelling mechanism if you need a permanent and stable connection.

To configure a manual IPv6 tunnel, enter commands such as the following on a Layer 3 Switch running both IPv4 and IPv6 protocol stacks on each end of the tunnel.

```
Brocade(config)#interface tunnel 1
Brocade(config-tnif-1)#tunnel source ethernet 3/1
Brocade(config-tnif-1)#tunnel destination 198.162.100.1
Brocade(config-tnif-1)#tunnel mode ipv6ip
Brocade(config-tnif-1)#ipv6 enable
```

This example creates tunnel interface 1 and assigns a link local IPv6 address with an automatically computed EUI-64 interface ID to it. The IPv4 address assigned to Ethernet interface 3/1 is used as the tunnel source, while the IPv4 address 192.168.100.1 is configured as the tunnel destination. The tunnel mode is specified as a manual IPv6 tunnel. Finally, the tunnel is enabled. Note that instead of entering **ipv6 enable**, you could specify an IPv6 address, for example, **ipv6 address 2001:b78:384d:34::/64 eui-64**, which would also enable the tunnel.

Syntax: [no] interface tunnel <number>

For the <number> parameter, specify a value between 1 – 8.

Syntax: [no] tunnel source <ipv4-address> | ethernet <port> | loopback <number> | ve <number>

The tunnel source can be an IP address or an interface.

For <ipv4-address>, use 8-bit values in dotted decimal notation.

The **ethernet | loopback | ve** parameter specifies an interface as the tunnel source. If you specify an Ethernet interface, also specify the port number associated with the interface. If you specify a loopback, VE, or interface, also specify the loopback, VE, or number, respectively.

Syntax: [no] tunnel destination <ipv4-address>

Specify the <ipv4-address> parameter using 8-bit values in dotted decimal notation.

Syntax: [no] tunnel mode ipv6ip

ipv6ip indicates that this is an IPv6 manual tunnel.

Syntax: ipv6 enable

The **ipv6 enable** command enables the tunnel. Alternatively, you could specify an IPv6 address, which would also enable the tunnel.

Syntax: **ipv6 address** *<ipv6-prefix>/<prefix-length>* **[eui-64]**

The **ipv6 address** command enables the tunnel. Alternatively, you could enter **ipv6 enable**, which would also enable the tunnel.

Specify the *<ipv6-prefix>* parameter in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

Specify the *<prefix-length>* parameter as a decimal value. A slash mark (/) must follow the *<ipv6-prefix>* parameter and precede the *<prefix-length>* parameter. The **eui-64** keyword configures the global address with an EUI-64 interface ID in the low-order 64 bits. The interface ID is automatically constructed in IEEE EUI-64 format using the interface's MAC address.

Clearing IPv6 tunnel statistics

You can clear statistics (reset all fields to zero) for all IPv6 tunnels or for a specific tunnel interface.

For example, to clear statistics for tunnel 1, enter the following command at the Privileged EXEC level or any of the Config levels of the CLI.

```
Brocade#clear ipv6 tunnel 1
```

To clear statistics for all IPv6 tunnels, enter the following command.

```
Brocade#clear ipv6 tunnel
```

Syntax: **clear ipv6 tunnel** [*<number>*]

The *<number>* parameter specifies the tunnel number.

Displaying IPv6 tunnel information

Use the commands in this section to display the configuration, status, and counters associated with IPv6 tunnels.

Displaying a summary of tunnel information

To display a summary of tunnel information, enter the following command at any level of the CLI.

```
Brocade#show ipv6 tunnel
IP6 Tunnels
  Tunnel  Mode      Packet Received  Packet Sent
  1       configured    0                0
  2       configured    0              22419
```

Syntax: **show ipv6 tunnel**

This display shows the following information.

TABLE 62 IPv6 tunnel summary information

Field	Description
Tunnel	The tunnel interface number.
Mode	The tunnel mode. Possible modes include the following: <ul style="list-style-type: none"> configured – Indicates a manually configured tunnel.
Packet Received	The number of packets received by a tunnel interface. Note that this is the number of packets received by the CPU. It does not include the number of packets processed in hardware.
Packet Sent	The number of packets sent by a tunnel interface. Note that this is the number of packets sent by the CPU. It does not include the number of packets processed in hardware.

Displaying tunnel interface information

To display status and configuration information for tunnel interface 1, enter the following command at any level of the CLI.

```
Brocade#show interfaces tunnel 1
Tunnell is up, line protocol is up
  Hardware is Tunnel
  Tunnel source ve 30
  Tunnel destination is 2.2.2.10
  Tunnel mode ipv6ip
  No port name
  MTU 1480 bytes, encapsulation IPV4
```

Syntax: `show interfaces tunnel <number>`

The `<number>` parameter indicates the tunnel interface number for which you want to display information.

This display shows the following information.

TABLE 63 IPv6 tunnel interface information

Field	Description
Tunnel interface status	The status of the tunnel interface can be one of the following: <ul style="list-style-type: none"> up – The tunnel mode is set and the tunnel interface is enabled. down – The tunnel mode is not set. administratively down – The tunnel interface was disabled with the <code>disable</code> command.
Line protocol status	The status of the line protocol can be one of the following: <ul style="list-style-type: none"> up – IPv4 connectivity is established. down – The line protocol is not functioning and is down.
Hardware is tunnel	The interface is a tunnel interface.
Tunnel source	The tunnel source can be one of the following: <ul style="list-style-type: none"> An IPv4 address The IPv4 address associated with an interface/port.
Tunnel destination	The tunnel destination can be an IPv4 address.
Tunnel mode	The tunnel mode can be the following: <ul style="list-style-type: none"> ipv6ip – indicates a manually configured tunnel

TABLE 63 IPv6 tunnel interface information (Continued)

Field	Description
Port name	The port name configured for the tunnel interface.
MTU	The setting of the IPv6 maximum transmission unit (MTU).

Displaying interface level IPv6 settings

To display Interface level IPv6 settings for tunnel interface 1, enter the following command at any level of the CLI.

```
Brocade#show ipv6 inter tunnel 1
Interface Tunnel 1 is up, line protocol is up
  IPv6 is enabled, link-local address is fe80::3:4:2 [Preferred]
  Global unicast address(es):
    1001::1 [Preferred], subnet is 1001::/64
    1011::1 [Preferred], subnet is 1011::/64
  Joined group address(es):
    ff02::1:ff04:2
    ff02::5
    ff02::1:ff00:1
    ff02::2
    ff02::1
  MTU is 1480 bytes
  ICMP redirects are enabled
  No Inbound Access List Set
  No Outbound Access List Set
  OSPF enabled
```

The display command above reflects the following configuration.

```
Brocade#show running-config interface tunnel 1
!
interface tunnel 1
  port-name ManualTunnell
  tunnel mode ipv6ip
  tunnel source loopback 1
  tunnel destination 2.1.1.1
  ipv6 address 1011::1/64
  ipv6 address 1001::1/64
  ipv6 ospf area 0
```

This display shows the following information.

TABLE 64 Interface level IPv6 tunnel information

Field	Description
Interface Tunnel status	<p>The status of the tunnel interface can be one of the following:</p> <ul style="list-style-type: none"> • up – IPv4 connectivity is established. • down – The tunnel mode is not set. • administratively down – The tunnel interface was disabled with the disable command.
Line protocol status	<p>The status of the line protocol can be one of the following:</p> <ul style="list-style-type: none"> • up – IPv6 is enabled through the ipv6 enable or ipv6 address command. • down – The line protocol is not functioning and is down.

ECMP load sharing for IPv6

The IPv6 route table selects the best route to a given destination from among the routes in the tables maintained by the configured routing protocols (BGP4, OSPF, static, and so on). The IPv6 route table can contain more than one path to a given destination. When this occurs, the Brocade device selects the path with the lowest cost for insertion into the routing table. If more than one path with the lowest cost exists, all of these paths are inserted into the routing table, subject to the configured maximum number of load sharing paths (by default 4). The device uses **Equal-Cost Multi-Path (ECMP) load sharing** to select a path to a destination.

When a route is installed by routing protocols or configured static route for the first time, and the IPv6 route table contains multiple, equal-cost paths to that route, the device checks the IPv6 neighbor for each next hop. Every next hop where the link layer address has been resolved will be stored in hardware. The device will initiate neighbor discovery for the next hops whose link layer addresses are not resolved. The hardware will hash the packet and choose one of the paths. The number of paths would be updated in hardware as the link layer gets resolved for a next hop.

If the path selected by the device becomes unavailable, the IPv6 neighbor should change state and trigger the update of the destination in the hardware.

Brocade devices support network-based ECMP load-sharing methods for IPv6 traffic. The Brocade device distributes traffic across equal-cost paths based on a XOR of some bits from the MAC source address, MAC destination address, IPv6 source address, IPv6 destination address, IPv6 flow label, IPv6 next header. The software selects a path based on a calculation involving the maximum number of load-sharing paths allowed and the actual number of paths to the destination network. This is the default ECMP load-sharing method for IPv6.

You can manually disable or enable ECMP load sharing for IPv6 and specify the number of equal-cost paths the device can distribute traffic across. In addition, you can display information about the status of ECMP load-sharing on the device.

Disabling or re-enabling ECMP load sharing for IPv6

ECMP load sharing for IPv6 is enabled by default. To disable the feature, enter the following command.

```
Brocade(config)#no ipv6 load-sharing
```

If you want to re-enable the feature after disabling it, you must specify the number of load-sharing paths. The maximum number of paths the device supports is a value from 2–8. By entering a command such as the following, IPv6 load-sharing will be re-enabled.

```
Brocade(config)#ipv6 load-sharing 4
```

Syntax: `[no] ipv6 load-sharing <num>`

The `<num>` parameter specifies the number of paths and can be from 2–8. The default is 4.

Changing the maximum load sharing paths for IPv6

By default, IPv6 ECMP load sharing allows traffic to be balanced across up to four equal paths. You can change the maximum number of paths the device supports to a value from 2–8.

To change the number of ECMP load sharing paths for IPv6, enter a command such as the following.

```
Brocade(config)#ipv6 load-sharing 6
```

Syntax: `[no] ipv6 load-sharing [<num>]`

The `<num>` parameter specifies the number of paths and can be from 2–8. The default is 4.

Enabling support for network-based ECMP load sharing for IPv6

Network-based ECMP load sharing is supported. In this configuration, traffic is distributed across equal-cost paths based on the destination network address. Routes to each network are stored in CAM and accessed when a path to a network is required. Because multiple hosts are likely to reside on a network, this method uses fewer CAM entries.

Displaying ECMP load-sharing information for IPv6

To display the status of ECMP load sharing for IPv6, enter the following command.

```
Brocade#show ipv6
Global Settings
  unicast-routing enabled, hop-limit 64
  No Inbound Access List Set
  No Outbound Access List Set
  Prefix-based IPv6 Load-sharing is Enabled, Number of load share paths: 4
```

Syntax: `show ipv6`

IPv6 ICMP feature configuration

As with the Internet Control Message Protocol (ICMP) for IPv4, ICMP for IPv6 provides error and informational messages. Implementation of the stateless auto configuration, neighbor discovery, and path MTU discovery features use ICMP messages.

This section explains how to configure following IPv6 ICMP features:

- ICMP rate limiting
- ICMP redirects

Configuring ICMP rate limiting

You can limit the rate at which IPv6 ICMP error messages are sent out on a network. IPv6 ICMP implements a token bucket algorithm.

To illustrate how this algorithm works, imagine a virtual bucket that contains a number of tokens. Each token represents the ability to send one ICMP error message. Tokens are placed in the bucket at a specified interval until the maximum number of tokens allowed in the bucket is reached. For each error message that ICMP sends, a token is removed from the bucket. If ICMP generates a series of error messages, messages can be sent until the bucket is empty. If the bucket is empty of tokens, error messages cannot be sent until a new token is placed in the bucket.

You can adjust the following elements related to the token bucket algorithm:

- The interval at which tokens are added to the bucket. The default is 100 milliseconds.
- The maximum number of tokens in the bucket. The default is 10 tokens.

For example, to adjust the interval to 1000 milliseconds and the number of tokens to 100 tokens, enter the following command.

```
Brocade(config)# ipv6 icmp error-interval 1000 100
```

Syntax: `ipv6 icmp error-interval <interval> [<number-of-tokens>]`

The interval in milliseconds at which tokens are placed in the bucket can range from 0 – 2147483647. The maximum number of tokens stored in the bucket can range from 1 – 200.

NOTE

If you retain the default interval value or explicitly set the value to 100 milliseconds, output from the **show run** command does not include the setting of the **ipv6 icmp error-interval** command because the setting is the default.

Also, if you configure the interval value to a number that does not evenly divide into 100000 (100 milliseconds), the system rounds up the value to a next higher value that does divide evenly into 100000. For example, if you specify an interval value of 150, the system rounds up the value to 200.

ICMP rate limiting is enabled by default. To disable ICMP rate limiting, set the interval to zero.

Enabling IPv6 ICMP redirect messages

NOTE

This feature is supported only with the IPv6 Layer 3 PROM and the full Layer 3 image.

You can enable a Layer 3 switch to send an IPv6 ICMP redirect message to a neighboring host to inform it of a better first-hop router on a path to a destination. By default, the sending of IPv6 ICMP redirect messages by a Layer 3 switch is disabled. (For more information about how ICMP redirect messages are implemented for IPv6, refer to “[IPv6 neighbor discovery configuration](#)” on page 384.)

NOTE

This feature is supported on Virtual Ethernet (VE) interfaces only.

For example, to enable the sending of IPv6 ICMP redirect messages on VE 2, enter the following commands.

```
Brocade(config)#interface ve2
Brocade(config-vif-2)#ipv6 redirects
```

To disable the sending of IPv6 ICMP redirect messages after it has been enabled on VE 2, enter the following commands.

```
Brocade(config)#interface ve2
Brocade(config-vif-2)#no ipv6 redirects
```

Syntax: [no] ipv6 redirects

Use the **show ipv6 interface** command to verify that the sending of IPv6 ICMP redirect messages is enabled on a particular interface.

IPv6 neighbor discovery configuration

The neighbor discovery feature for IPv6 uses IPv6 ICMP messages to do the following tasks:

- Determine the link-layer address of a neighbor on the same link.
- Verify that a neighbor is reachable.
- Track neighbor routers.

An IPv6 host is required to listen for and recognize the following addresses that identify itself:

- Link-local address.
- Assigned unicast address.
- Loopback address.
- All-nodes multicast address.
- Solicited-node multicast address.
- Multicast address to all other groups to which it belongs.

You can adjust the following IPv6 neighbor discovery features:

- Neighbor solicitation messages for duplicate address detection.
- Router advertisement messages:

- Interval between router advertisement messages.
- Value that indicates a router is advertised as a default router (for use by all nodes on a given link).
- Prefixes advertised in router advertisement messages.
- Flags for host stateful autoconfiguration.
- Amount of time during which an IPv6 node considers a remote node reachable (for use by all nodes on a given link).

IPv6 neighbor discovery configuration notes

NOTE

For all solicitation and advertisement messages, Brocade uses seconds as the unit of measure instead of milliseconds.

- If you add a port to a port-based VLAN, and the port has IPv6 neighbor discovery configuration, the system will clean up the neighbor discovery configuration from the port and display the following message on the console.
`ND6 port config on the new member ports removed`
- Neighbor discovery is not supported on tunnel interfaces.

Neighbor solicitation and advertisement messages

Neighbor solicitation and advertisement messages enable a node to determine the link-layer address of another node (neighbor) on the same link. (This function is similar to the function provided by the Address Resolution Protocol [ARP] in IPv4.) For example, node 1 on a link wants to determine the link-layer address of node 2 on the same link. To do so, node 1, the source node, multicasts a neighbor solicitation message. The neighbor solicitation message, which has a value of 135 in the Type field of the ICMP packet header, contains the following information:

- **Source address:** IPv6 address of node 1 interface that sends the message.
- **Destination address:** solicited-node multicast address (FF02:0:0:0:0:1:FF00::/104) that corresponds the IPv6 address of node 2.
- Link-layer address of node 1.
- A query for the link-layer address of node 2.

After receiving the neighbor solicitation message from node 1, node 2 replies by sending a neighbor advertisement message, which has a value of 136 in the Type field of the ICMP packet header. The neighbor solicitation message contains the following information:

- **Source address:** IPv6 address of the node 2 interface that sends the message.
- **Destination address:** IPv6 address of node 1.
- Link-layer address of node 2.

After node 1 receives the neighbor advertisement message from node 2, nodes 1 and 2 can now exchange packets on the link.

After the link-layer address of node 2 is determined, node 1 can send neighbor solicitation messages to node 2 to verify that it is reachable. Also, nodes 1, 2, or any other node on the same link can send a neighbor advertisement message to the all-nodes multicast address (FF02::1) if there is a change in their link-layer address.

Router advertisement and solicitation messages

Router advertisement and solicitation messages enable a node on a link to discover the routers on the same link.

Each configured router interface on a link sends out a router advertisement message, which has a value of 134 in the Type field of the ICMP packet header, periodically to the all-nodes link-local multicast address (FF02::1).

A configured router interface can also send a router advertisement message in response to a router solicitation message from a node on the same link. This message is sent to the unicast IPv6 address of the node that sent the router solicitation message.

At system startup, a host on a link sends a router solicitation message to the all-routers multicast address (FF01). Sending a router solicitation message, which has a value of 133 in the Type field of the ICMP packet header, enables the host to automatically configure its IPv6 address immediately instead of awaiting the next periodic router advertisement message.

Because a host at system startup typically does not have a unicast IPv6 address, the source address in the router solicitation message is usually the unspecified IPv6 address (0:0:0:0:0:0:0:0). If the host has a unicast IPv6 address, the source address is the unicast IPv6 address of the host interface sending the router solicitation message.

Entering the **ipv6 unicast-routing** command automatically enables the sending of router advertisement messages on all configured router Ethernet interfaces. You can configure several router advertisement message parameters. For information about disabling the sending of router advertisement messages and the router advertisement parameters that you can configure, refer to [“Enabling and disabling IPv6 router advertisements”](#) on page 390 and [“Setting IPv6 router advertisement parameters”](#) on page 387.

Neighbor redirect messages

After forwarding a packet, by default, a router can send a neighbor redirect message to a host to inform it of a better first-hop router. The host receiving the neighbor redirect message will then readdress the packet to the better router.

A router sends a neighbor redirect message only for unicast packets, only to the originating node, and to be processed by the node.

A neighbor redirect message has a value of 137 in the Type field of the ICMP packet header.

Setting neighbor solicitation parameters for duplicate address detection

Although the stateless auto configuration feature assigns the 64-bit interface ID portion of an IPv6 address using the MAC address of the host's NIC, duplicate MAC addresses can occur. Therefore, the duplicate address detection feature verifies that a unicast IPv6 address is unique before it is assigned to a host interface by the stateless auto configuration feature. Duplicate address detection verifies that a unicast IPv6 address is unique.

If duplicate address detection identifies a duplicate unicast IPv6 address, the address is not used. If the duplicate address is the link-local address of the host interface, the interface stops processing IPv6 packets.

NOTE

Duplicate Address Detection (DAD) is not currently supported with IPv6 tunnels. Make sure tunnel endpoints do not have duplicate IP addresses.

You can configure the following neighbor solicitation message parameters that affect duplicate address detection while it verifies that a tentative unicast IPv6 address is unique:

- The number of consecutive neighbor solicitation messages that duplicate address detection sends on an interface. By default, duplicate address detection sends three neighbor solicitation messages without any follow-up messages.
- The interval in seconds at which duplicate address detection sends a neighbor solicitation message on an interface. By default, duplicate address detection sends a neighbor solicitation message every 1000 milliseconds.

For example, to change the number of neighbor solicitation messages sent on Ethernet interface 3/1 to two and the interval between the transmission of the two messages to 9 seconds, enter the following commands.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 nd dad attempt 2
Brocade(config-if-e1000-3/1)#ipv6 nd ns-interval 9000
```

Syntax: `[no] ipv6 nd dad attempt <number>`

Syntax: `[no] ipv6 nd ns-interval <number>`

For the number of neighbor solicitation messages, specify a number from 0 – 255. The default is 3. Configuring a value of 0 disables duplicate address detection processing on the specified interface. To restore the number of messages to the default value, use the **no** form of this command.

For the interval between neighbor solicitation messages and the value for the retrans timer in router advertisements, specify a number from 0 – 4294967295 milliseconds. The default value for the interval between neighbor solicitation messages is 1000 milliseconds. The default value for the retrans timer is 0. Brocade does not recommend very short intervals in normal IPv6 operation. When a non-default value is configured, the configured time is both advertised and used by the router itself. To restore the default interval, use the **no** form of this command.

Setting IPv6 router advertisement parameters

You can adjust the following parameters for router advertisement messages:

- The interval (in seconds) at which an interface sends router advertisement messages. By default, an interface sends a router advertisement message every 200 seconds.
- The "router lifetime" value, which is included in router advertisements sent from a particular interface. The value (in seconds) indicates if the router is advertised as a default router on this interface. If you set the value of this parameter to 0, the router is not advertised as a default router on an interface. If you set this parameter to a value that is not 0, the router is advertised as a default router on this interface. By default, the router lifetime value included in router advertisement messages sent from an interface is 1800 seconds.
- The hop limit to be advertised in the router advertisement.

When adjusting these parameter settings, Brocade recommends that the interval between router advertisement transmission be less than or equal to the router lifetime value if the router is advertised as a default router. For example, to adjust the interval of router advertisements to 300 seconds and the router lifetime value to 1900 seconds on Ethernet interface 3/1, enter the following commands.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 nd ra-interval 300
Brocade(config-if-e1000-3/1)#ipv6 nd ra-lifetime 1900
Brocade(config-if-e1000-3/1)#ipv6 nd ra-hop-limit 1
```

Here is another example with a specified range.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 nd ra-interval range 33 55
Brocade(config-if-e1000-3/1)#ipv6 nd ra-lifetime 1900
Brocade(config-if-e1000-3/1)#ipv6 nd ra-hop-limit 1
```

Syntax: [no] **ipv6 nd ra-interval** <number> | <min range value> <max range value>

Syntax: [no] **ipv6 nd ra-lifetime** <number>

Syntax: **ipv6 nd ra-hop-limit** <number>

<number> is a value from 0 – 255. The default is 64.

The **ipv6 nd ra-interval** <number> can be a value between 3 – 1800 seconds. The default is 200 seconds. The actual RA interval will be from .5 to 1.5 times the configured or default value. For example, in the above configuration, for **ipv6 nd ra-interval 300**, the range would be 150 – 450. To restore the default interval of 200 seconds, use the **no** form of the command.

The **ipv6 nd ra-interval range** <min range value> <max range value> command lets you specify a range of values instead of a single value.

The <min range value> specifies the minimum number of seconds allowed between sending unsolicited multicast router advertisements from the interface. The default is 0.33 times the <max range value> if the <max range value> is greater than or equal to 9 seconds. Otherwise, the default is the value specified by the <max range value>. The <min range value> can be a number between -3 – (.75 x <max range value>).

The <max range value> parameter specifies the maximum number of seconds allowed between sending unsolicited multicast router advertisements from the interface. This number can be between 4 – 1800 seconds and must be greater than the <min range value> x 1.33. The default is 600 seconds.

The **ipv6 nd ra-lifetime** <number> is a value between 0 – 9000 seconds. To restore the router lifetime value of 1800 seconds, use the **no** form of the command.

The **ipv6 nd ra-hop-limit** <number> is a value from 0 – 255. The default is 64.

NOTE

By default, router advertisements will always have the MTU option. To suppress the MTU option, use the following command at the Interface level of the CLI: **ipv6 nd suppress-mtu-option**.

Prefixes advertised in IPv6 router advertisement messages

By default, router advertisement messages include prefixes configured as addresses on router interfaces using the **ipv6 address** command. You can use the **ipv6 nd prefix-advertisement** command to control exactly which prefixes are included in router advertisement messages. Along with which prefixes the router advertisement messages contain, you can also specify the following parameters:

- **Valid lifetime**—(Mandatory) The time interval (in seconds) in which the specified prefix is advertised as valid. The default is 2592000 seconds (30 days). When the timer expires, the prefix is no longer considered to be valid.
- **Preferred lifetime**—(Mandatory) The time interval (in seconds) in which the specified prefix is advertised as preferred. The default is 604800 seconds (7 days). When the timer expires, the prefix is no longer considered to be preferred.
- **Onlink flag**—(Optional) If this flag is set, the specified prefix is assigned to the link upon which it is advertised. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be reachable on the local link.
- **Autoconfiguration flag**—(Optional) If this flag is set, the stateless auto configuration feature can use the specified prefix in the automatic configuration of 128-bit IPv6 addresses for hosts on the local link, provided the specified prefix is aggregatable, as specified in RFC 2374.

For example, to advertise the prefix 2001:e077:a487:7365::/64 in router advertisement messages sent out on Ethernet interface 3/1 with a valid lifetime of 1000 seconds, a preferred lifetime of 800 seconds, and the Onlink and Autoconfig flags set, enter the following commands.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 nd prefix-advertisement
2001:e077:a487:7365::/64 1000 800 onlink autoconfig
```

Syntax: **[no] ipv6 nd prefix-advertisement** <ipv6-prefix>/<prefix-length> <valid-lifetime> <preferred-lifetime> **[autoconfig] [onlink]**

You must specify the <ipv6-prefix> parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

You must specify the <prefix-length> parameter as a decimal value. A slash mark (/) must follow the <ipv6-prefix> parameter and precede the <prefix-length> parameter.

The valid lifetime and preferred lifetime is a numerical value between 0 – 4294967295 seconds. The default valid lifetime is 2592000 seconds (30 days), while the default preferred lifetime is 604800 seconds (7 days).

To remove a prefix from the router advertisement messages sent from a particular interface, use the **no** form of this command.

Setting flags in IPv6 router advertisement messages

An IPv6 router advertisement message can include the following flags:

- **Managed Address Configuration**—This flag indicates to hosts on a local link if they should use the stateful autoconfiguration feature to get IPv6 addresses for their interfaces. If the flag is set, the hosts use stateful autoconfiguration to get addresses as well as non-IPv6-address information. If the flag is not set, the hosts do not use stateful autoconfiguration to get addresses and if the hosts can get non-IPv6-address information from stateful autoconfiguration is determined by the setting of the Other Stateful Configuration flag.
- **Other Stateful Configuration**—This flag indicates to hosts on a local link if they can get non-IPv6 address autoconfiguration information. If the flag is set, the hosts can use stateful autoconfiguration to get non-IPv6-address information.

NOTE

When determining if hosts can use stateful autoconfiguration to get non-IPv6-address information, a set Managed Address Configuration flag overrides an unset Other Stateful Configuration flag. In this situation, the hosts can obtain nonaddress information. However, if the Managed Address Configuration flag is not set and the Other Stateful Configuration flag is set, then the setting of the Other Stateful Configuration flag is used.

By default, the Managed Address Configuration and Other Stateful Configuration flags are not set in router advertisement messages. For example, to set these flags in router advertisement messages sent from Ethernet interface 3/1, enter the following commands.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 nd managed-config-flag
Brocade(config-if-e1000-3/1)#ipv6 nd other-config-flag
```

Syntax: [no] ipv6 nd managed-config-flag

Syntax: [no] ipv6 nd other-config-flag

To remove either flag from router advertisement messages sent on an interface, use the **no** form of the respective command.

Enabling and disabling IPv6 router advertisements

If IPv6 unicast routing is enabled on an Ethernet interface, by default, this interface sends IPv6 router advertisement messages. However, by default, non-LAN interface types, for example, tunnel interfaces, do not send router advertisement messages.

To disable the sending of router advertisement messages on an Ethernet interface, enter commands such as the following.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 nd suppress-ra
```

To enable the sending of router advertisement messages on a tunnel interface, enter commands such as the following.

```
Brocade(config)#interface tunnel 1
Brocade(config-tnif-1)#no ipv6 nd suppress-ra
```

Syntax: [no] ipv6 nd suppress-ra

Configuring reachable time for remote IPv6 nodes

You can configure the duration (in seconds) that a router considers a remote IPv6 node reachable. By default, a router interface uses the value of 30 seconds.

The router advertisement messages sent by a router interface include the amount of time specified by the **ipv6 nd reachable-time** command so that nodes on a link use the same reachable time duration. By default, the messages include a default value of 0.

Brocade does not recommend configuring a short reachable time duration, because a short duration causes the IPv6 network devices to process the information at a greater frequency.

For example, to configure the reachable time of 40 seconds for Ethernet interface 3/1, enter the following commands.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 nd reachable-time 40
```

Syntax: [no] **ipv6 nd reachable-time** <seconds>

For the <seconds> parameter, specify a number from 0 – 3600 seconds. To restore the default time, use the **no** form of this command.

NOTE

The actual reachable time will be from .5 to 1.5 times the configured or default value.

IPv6 MTU

The IPv6 maximum transmission unit (MTU) is the maximum length of an IPv6 packet that can be transmitted on a particular interface. If an IPv6 packet is longer than an MTU, the host that originated the packet fragments the packet and transmits its contents in multiple packets that are shorter than the configured MTU.

By default, in *non-jumbo mode*, the maximum Ethernet MTU size is 1500 bytes. When **jumbo** is enabled, the default maximum Ethernet MTU size is 10218.

Configuration notes and feature limitations for IPv6 MTU

- The IPv6 MTU command is applicable to VEs and physical IP interfaces. It applies to traffic routed between networks.
- You cannot use this command to set Layer 2 maximum frame sizes per interface. The global **jumbo** command causes all interfaces to accept Layer 2 frames.
- For non-jumbo mode, you can configure an IPv6 MTU greater than 1500 bytes, although the default remains at 1500 bytes. The value of the MTU you can define depends on the following:
 - For a physical port, the maximum value of the MTU is the equal to the maximum frame size of the port minus 18 (Layer 2 MAC header + CRC).
 - If the size of a jumbo packet received on a port is equal to the maximum frame size – 18 (Layer 2 MAC header + CRC) and if this value is greater than the outgoing port's IPv4/IPv6 MTU, then it will be forwarded in the CPU.

- For a virtual routing interface, the maximum value of the MTU is the maximum frame size configured for the VLAN to which it is associated, minus 18 (Layer 2 MAC header + CRC). If a maximum frame size for a VLAN is not configured, then configure the MTU based on the smallest maximum frame size of all the ports of the VLAN that corresponds to the virtual routing interface, minus 18 (Layer 2 MAC header + CRC).

Changing the IPv6 MTU

To define IPv6 maximum transmission unit (MTU) globally, enter the **ipv6 mtu** command at the Global CONFIG level of the CLI:

```
Brocade(config)#ipv6 mtu 1300
```

You can configure the IPv6 MTU on individual interfaces. For example, to configure the MTU on Ethernet interface 3/1 as 1280 bytes, enter the following commands.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#ipv6 mtu 1280
```

Syntax: [no] **ipv6 mtu** <bytes>

For <bytes>, specify a value between 1280 – 1500, or 1280 – 10218 if **jumbo** mode is enabled. If a nondefault value is configured for an interface, router advertisements include an MTU option.

Static neighbor entries configuration

In some special cases, a neighbor cannot be reached using the neighbor discovery feature. In this situation, you can add a static entry to the IPv6 neighbor discovery cache, which causes a neighbor to be reachable at all times without using neighbor discovery. (A static entry in the IPv6 neighbor discovery cache functions like a static ARP entry in IPv4.)

NOTE

A port that has a statically assigned IPv6 entry cannot be added to a VLAN.

NOTE

Static neighbor configurations will be cleared on secondary ports when a trunk is formed.

For example, to add a static entry for a neighbor with the IPv6 address 3001::ffe0:2678:47b and link-layer address 0004.6a2b.8641 that is reachable through Ethernet interface 3/1, enter the **ipv6 neighbor** command.

```
Brocade(config)#ipv6 neighbor 3001::ffe0:2678:47b ethernet 3/1 0004.6a2b.8641
```

Syntax: [no] **ipv6 neighbor** <ipv6-address> **ethernet** <port> | **ve** <ve-number> [**ethernet** <port>] <link-layer-address>

The <ipv6-address> parameter specifies the address of the neighbor.

The **ethernet** | **ve** parameter specifies the interface through which to reach a neighbor. If you specify an Ethernet interface, specify the port number of the Ethernet interface. If you specify a VE, specify the VE number and then the Ethernet port numbers associated with the VE. The link-layer address is a 48-bit hardware address of the neighbor.

If you attempt to add an entry that already exists in the neighbor discovery cache, the software changes the already existing entry to a static entry.

To remove a static IPv6 entry from the IPv6 neighbor discovery cache, use the **no** form of this command.

Limiting the number of hops an IPv6 packet can traverse

By default, the maximum number of hops an IPv6 packet can traverse is 64. You can change this value to between 0 – 255 hops. For example, to change the maximum number of hops to 70, enter the following command.

```
Brocade(config)#ipv6 hop-limit 70
```

Syntax: [no] **ipv6 hop-limit** <number>

Use the **no** form of the command to restore the default value.

hop-limit 0 will transmit packets with default (64) hop limit.

<number> can be from 0 – 255.

IPv6 source routing security enhancements

The IPv6 specification (RFC 2460) specifies support for IPv6 source-routed packets using a type 0 Routing extension header, requiring device and host to process the type 0 routing extension header. However, this requirement may leave a network open to a DoS attack.

A security enhancement disables sending IPv6 source-routed packets to IPv6 devices. (This enhancement conforms to RFC 5095.)

By default, when the router drops a source-routed packet, it sends an ICMP Parameter Problem (type 4), Header Error (code 0) message to the packet's source address, pointing to the unrecognized routing type. To disable these ICMP error messages, enter the following command:

```
Brocade(config)# no ipv6 icmp source-route
```

Syntax: [no] **ipv6 icmp source-route**

Use the **ipv6 icmp source-route** form of the command to enable the ICMP error messages.

TCAM space on FCX device configuration

FCX devices store routing information for IPv4 and IPv6 and GRE tunnel information in the same TCAM table. You can configure the amount of TCAM space to allocate for IPv4 routing information and GRE tunnels. The remaining space is allocated automatically for IPv6 routing information.

FCX devices have TCAM space to store 16,000 IPv4 route entries. Each IPv6 route entry and GRE tunnel use as much storage space as four IPv4 route entries. The default, maximum, and minimum allocation values for each type of data are shown in [Table 65](#).

TABLE 65 TCAM space allocation on FCX devices

	Default	Maximum	Minimum
IPv4 route entries	12000	15168	4096
IPv6 route entries	908	2884	68
GRE tunnels	16	64	16

Allocating TCAM space for IPv4 routing information

For example, to allocate 13,512 IPv4 route entries, enter the following command:

```
Brocade(config)# system-max ip-route 13512
```

Syntax: `system-max ip-route <routes>`

The `<routes>` parameter specifies how many IPv4 route entries get allocated. The command output shows the new space allocations for IPv4 and IPv6. You must save the running configuration to the startup configuration and reload the device for the changes to take effect.

After the device reloads, the space allocated for IPv4 and IPv6 routing information appears in the device running configuration in this format:

```
system-max ip-route 13512
system-max ip6-route 514
```

NOTE

If you disable IPv6 routing, the TCAM space allocations do not change. If you want to allocate the maximum possible space for IPv4 routing information, you must configure the TCAM space manually.

Allocating TCAM space for GRE tunnel information

For example, to allocate space for 64 GRE tunnels, enter the following command at the Privileged EXEC level:

```
Brocade#system-max gre-tunnels 64
```

Syntax: `system-max gre-tunnels <tunnels>`

The `<tunnels>` parameter specifies the number of GRE tunnels to allocate.

Clearing global IPv6 information

You can clear the following global IPv6 information:

- Entries from the IPv6 cache.
- Entries from the IPv6 neighbor table.
- IPv6 routes from the IPv6 route table.
- IPv6 traffic statistics.

Clearing the IPv6 cache

You can remove all entries from the IPv6 cache or specify an entry based on the following:

- IPv6 prefix.
- IPv6 address.
- Interface type.

For example, to remove entries for IPv6 address 2000:e0ff::1, enter the following command at the Privileged EXEC level or any of the Config levels of the CLI.

```
Brocade#clear ipv6 cache 2000:e0ff::1
```

Syntax: `clear ipv6 cache [<ipv6-prefix>/<prefix-length> | <ipv6-address> | ethernet <port> | tunnel <number> | ve <number>]`

You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the `<prefix-length>` parameter as a decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

You must specify the `<ipv6-address>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The **ethernet | tunnel | ve** parameter specifies the interfaces for which you can remove cache entries. If you specify an Ethernet interface, also specify the port number associated with the interface. If you specify a VE or tunnel interface, also specify the VE or tunnel number, respectively.

Clearing IPv6 neighbor information

You can remove all entries from the IPv6 neighbor table or specify an entry based on the following:

- IPv6 prefix
- IPv6 address
- Interface type

For example, to remove entries for Ethernet interface 3/1, enter the following command at the Privileged EXEC level or any of the CONFIG levels of the CLI.

```
Brocade#clear ipv6 neighbor ethernet 3/1
```

Syntax: `clear ipv6 neighbor [<ipv6-prefix>/<prefix-length> | <ipv6-address> | ethernet <port> | ve <number>]`

You must specify the *<ipv6-prefix>* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the *<prefix-length>* parameter as a decimal value. A slash mark (/) must follow the *<ipv6-prefix>* parameter and precede the *<prefix-length>* parameter.

You must specify the *<ipv6-address>* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The **ethernet | ve** parameter specifies the interfaces for which you can remove cache entries. If you specify an Ethernet interface, also specify the port number associated with the interface. If you specify a VE, also specify the VE number.

Clearing IPv6 routes from the IPv6 route table

You can clear all IPv6 routes or only those routes associated with a particular IPv6 prefix from the IPv6 route table and reset the routes.

For example, to clear IPv6 routes associated with the prefix 2000:7838::/32, enter the following command at the Privileged EXEC level or any of the Config levels of the CLI.

```
Brocade#clear ipv6 route 2000:7838::/32
```

Syntax: `clear ipv6 route [<ipv6-prefix>/<prefix-length>]`

The *<ipv6-prefix>/<prefix-length>* parameter clears routes associated with a particular IPv6 prefix. You must specify the *<ipv6-prefix>* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the *<prefix-length>* parameter as a decimal value. A slash mark (/) must follow the *<ipv6-prefix>* parameter and precede the *<prefix-length>* parameter.

Clearing IPv6 traffic statistics

To clear all IPv6 traffic statistics (reset all fields to zero), enter the following command at the Privileged EXEC level or any of the Config levels of the CLI.

```
Brocade(config)#clear ipv6 traffic
```

Syntax: `clear ipv6 traffic`

Displaying global IPv6 information

You can display output for the following global IPv6 parameters:

- IPv6 cache
- IPv6 interfaces
- IPv6 neighbors
- IPv6 route table
- Local IPv6 routers
- IPv6 TCP connections and the status of individual connections
- IPv6 traffic statistics

Displaying IPv6 cache information

The IPv6 cache contains an IPv6 host table that has indices to the next hop gateway and the router interface on which the route was learned.

To display IPv6 cache information, enter the following command at any CLI level.

```
Brocade#show ipv6 cache
Total number of cache entries: 10
  IPv6 Address      Next Hop      Port
1  5000:2::2        LOCAL        tunnel 2
2  2000:4::106      LOCAL        ethe 3/2
3  2000:4::110      DIRECT       ethe 3/2
4  2002:c0a8:46a::1 LOCAL        ethe 3/2
5  5005::2e0:52ff:fe99:9737 LOCAL        ethe 3/2
6  5005::ffff:ffff:feff:ffff LOCAL        loopback 2
7  5005::c0a8:46a    LOCAL        tunnel 2
8  5005::c0a8:46a    LOCAL        tunnel 6
9  2999::1          LOCAL        loopback 2
10 5005::2e0:52ff:fe99:9700 LOCAL        ethe 3/1
```

Syntax: `show ipv6 cache [<index-number> | <ipv6-prefix>/<prefix-length> | <ipv6-address> | ethernet <port> | ve <number> | tunnel <number>]`

The `<index-number>` parameter restricts the display to the entry for the specified index number and subsequent entries.

The `<ipv6-prefix>/<prefix-length>` parameter restricts the display to the entries for the specified IPv6 prefix. You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the `<prefix-length>` parameter as a decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

The **ethernet | ve | tunnel** parameter restricts the display to the entries for the specified interface. The `<ipv6-address>` parameter restricts the display to the entries for the specified IPv6 address. You must specify this parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

If you specify an Ethernet interface, also specify the port number associated with the interface. If you specify a VE interface, also specify the VE number. If you specify a tunnel interface, also specify the tunnel number.

This display shows the following information.

TABLE 66 IPv6 cache information fields

Field	Description
Total number of cache entries	The number of entries in the cache table.
IPv6 Address	The host IPv6 address.
Next Hop	The next hop, which can be one of the following: <ul style="list-style-type: none"> Direct – The next hop is directly connected to the router. Local – The next hop is originated on this router. <code><ipv6 address></code> – The IPv6 address of the next hop.
Port	The port on which the entry was learned.

Displaying IPv6 interface information

To display IPv6 interface information, enter the following command at any CLI level.

```
Brocade#show ipv6 interface
Routing Protocols : R - RIP  O - OSPF
Interface          Status      Routing  Global Unicast Address
Ethernet 3/3        down/down  R
Ethernet 3/5        down/down
Ethernet 3/17       up/up      2017::c017:101/64
Ethernet 3/19       up/up      2019::c019:101/64
VE 4                down/down
VE 14               up/up      2024::c060:101/64
Loopback 1          up/up      ::1/128
Loopback 2          up/up      2005::303:303/128
Loopback 3          up/up
```

Syntax: `show ipv6 interface [<interface> [<port-number> | <number>]]`

The `<interface>` parameter displays detailed information for a specified interface. For the interface, you can specify the **Ethernet**, **loopback**, **tunnel**, or **VE** keywords. If you specify an Ethernet interface, also specify the port number associated with the interface. If you specify a loopback, tunnel, or VE interface, also specify the number associated with the interface.

This display shows the following information.

TABLE 67 General IPv6 interface information fields

Field	Description
Routing protocols	A one-letter code that represents a routing protocol that can be enabled on an interface.
Interface	The interface type, and the port number or number of the interface.
Status	The status of the interface. The entry in the Status field will be either “up/up” or “down/down”.
Routing	The routing protocols enabled on the interface.
Global Unicast Address	The global unicast address of the interface.

To display detailed information for a specific interface, enter a command such as the following at any CLI level.

```

Brocade#show ipv6 interface ethernet 3/1
Interface Ethernet 3/1 is up, line protocol is up
  IPv6 is enabled, link-local address is fe80::2e0:52ff:fe99:97
  Global unicast address(es):
  Joined group address(es):
    ff02::9
    ff02::1:ff99:9700
    ff02::2
    ff02::1
  MTU is 1500 bytes
  ICMP redirects are enabled
  ND DAD is enabled, number of DAD attempts: 3
  ND reachable time is 30 seconds
  ND advertised reachable time is 0 seconds
  ND retransmit interval is 1 seconds
  ND advertised retransmit interval is 0 seconds
  ND router advertisements are sent every 200 seconds
  ND router advertisements live for 1800 seconds
  No Inbound Access List Set
  No Outbound Access List Set
  RIP enabled

```

This display shows the following information.

TABLE 68 Detailed IPv6 interface information fields

Field	Description
Interface/line protocol status	The status of interface and line protocol. If you have disabled the interface with the disable command, the status will be “administratively down”. Otherwise, the status is either “up” or “down”.
IPv6 status/link-local address	The status of IPv6. The status is either “enabled” or “disabled”. Displays the link-local address, if one is configured for the interface.
Global unicast address(es)	Displays the global unicast address(es), if one or more are configured for the interface.
Joined group address(es)	The multicast address(es) that a router interface listens for and recognizes.
MTU	The setting of the maximum transmission unit (MTU) configured for the IPv6 interface. The MTU is the maximum length an IPv6 packet can have to be transmitted on the interface. If an IPv6 packet is longer than an MTU, the host that originated the packet fragments the packet and transmits its contents in multiple packets that are shorter than the configured MTU.
ICMP	The setting of the ICMP redirect parameter for the interface.
ND	The setting of the various neighbor discovery parameters for the interface.
Access List	The inbound and outbound access control lists applied to the interface.
Routing protocols	The routing protocols enabled on the interface.

Displaying IPv6 neighbor information

You can display the IPv6 neighbor table, which contains an entry for each IPv6 neighbor with which the router exchanges IPv6 packets.

To display the IPv6 neighbor table, enter the following command at any CLI level.

```
Brocade(config)#show ipv6 neighbor
Total number of Neighbor entries: 3
  IPv6 Address                               LinkLayer-Addr State Age Port  vlan
IsR 5555::55                                0002.0002.0002 *REACH0 e 3/11 - 0
2000:4::110                                  00e0.5291.bb37 REACH 20 e 3/1 5 1
fe80::2e0:52ff:fe91:bb37                     00e0.5291.bb37 DELAY 1 e 3/2 4 1
fe80::2e0:52ff:fe91:bb40                     00e0.5291.bb40 STALE 5930e 3/3 5 1
```

Syntax: `show ipv6 neighbor [<ipv6-prefix>/<prefix-length> | <ipv6-address> | <interface> [<port> | <number>]]`

The `<ipv6-prefix>/<prefix-length>` parameters restrict the display to the entries for the specified IPv6 prefix. You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the `<prefix-length>` parameter as a decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

The `<ipv6-address>` parameter restricts the display to the entries for the specified IPv6 address. You must specify this parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<interface>` parameter restricts the display to the entries for the specified router interface. For this parameter, you can specify the **Ethernet** or **VE** keywords. If you specify an Ethernet interface, also specify the port number associated with the interface. If you specify a VE interface, also specify the VE number.

This display shows the following information.

TABLE 69 IPv6 neighbor information fields

Field	Description
Total number of neighbor entries	The total number of entries in the IPv6 neighbor table.
IPv6 Address	The 128-bit IPv6 address of the neighbor.
Link-Layer Address	The 48-bit interface ID of the neighbor.
State	<p>The current state of the neighbor. Possible states are as follows:</p> <ul style="list-style-type: none"> • INCOMPLETE – Address resolution of the entry is being performed. • *REACH – The static forward path to the neighbor is functioning properly. • REACH – The forward path to the neighbor is functioning properly. • STALE – This entry has remained unused for the maximum interval. While stale, no action takes place until a packet is sent. • DELAY – This entry has remained unused for the maximum interval, and a packet was sent before another interval elapsed. • PROBE – Neighbor solicitation are transmitted until a reachability confirmation is received.

TABLE 69 IPv6 neighbor information fields (Continued)

Field	Description
Age	The number of seconds the entry has remained unused. If this value remains unused for the number of seconds specified by the ipv6 nd reachable-time command (the default is 30 seconds), the entry is removed from the table.
Port	The physical port on which the entry was learned.
vlan	The VLAN on which the entry was learned.
IsR	Determines if the neighbor is a router or host: 0 – Indicates that the neighbor is a host. 1 – Indicates that the neighbor is a router.

Displaying the IPv6 route table

To display the IPv6 route table, enter the following command at any CLI level.

```
Brocade#show ipv6 route
IPv6 Routing Table - 7 entries:
Type Codes: C - Connected, S - Static, R - RIP, O - OSPF, B - BGP
OSPF Sub Type Codes: O - Intra, Oi - Inter, Ol - Type1 external, O2 - Type2
external
Type IPv6 Prefix                Next Hop Router                Interface  Dis/Metric
C  2000:4::/64                  ::                             ethe 3/2  0/0
S  2002::/16                    ::                             tunnel 6   1/1
S  2002:1234::/32               ::                             tunnel 6   1/1
C  2002:c0a8:46a::/64          ::                             ethe 3/2  0/0
C  2999::1/128                  ::                             loopback 2 0/0
O  2999::2/128                  fe80::2e0:52ff:fe91:bb37      ethe 3/2  110/1
C  5000:2::/64                  ::                             tunnel 2   0/0
```

Syntax: `show ipv6 route [<ipv6-address> | <ipv6-prefix>/<prefix-length> | bgp | connect | ospf | rip | static | summary]`

The `<ipv6-address>` parameter restricts the display to the entries for the specified IPv6 address. You must specify the `<ipv6-address>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<ipv6-prefix>/<prefix-length>` parameters restrict the display to the entries for the specified IPv6 prefix. You must specify the `<ipv6-prefix>` parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the `<prefix-length>` parameter as a decimal value. A slash mark (/) must follow the `<ipv6-prefix>` parameter and precede the `<prefix-length>` parameter.

The **bgp** keyword restricts the display to entries for BGP4 routes.

The **connect** keyword restricts the display to entries for directly connected interface IPv6 routes.

The **ospf** keyword restricts the display to entries for OSPFv3 routes.

The **rip** keyword restricts the display to entries for RIPng routes.

The **static** keyword restricts the display to entries for static IPv6 routes.

The **summary** keyword displays a summary of the prefixes and different route types.

The following table lists the information displayed by the **show ipv6 route** command.

TABLE 70 IPv6 route table fields

Field	Description
Number of entries	The number of entries in the IPv6 route table.
Type	The route type, which can be one of the following: <ul style="list-style-type: none"> • C – The destination is directly connected to the router. • S – The route is a static route. • R – The route is learned from RIPng. • O – The route is learned from OSPFv3. • B – The route is learned from BGP4.
IPv6 Prefix	The destination network of the route.
Next-Hop Router	The next-hop router.
Interface	The interface through which this router sends packets to reach the route's destination.
Dis/Metric	The route's administrative distance and metric value.

To display a summary of the IPv6 route table, enter the following command at any CLI level.

```
Brocade#show ipv6 route summary
IPv6 Routing Table - 7 entries:
  4 connected, 2 static, 0 RIP, 1 OSPF, 0 BGP
Number of prefixes:
 /16: 1 /32: 1 /64: 3 /128: 2
```

The following table lists the information displayed by the **show ipv6 route summary** command.

TABLE 71 IPv6 route table summary fields

Field	Description
Number of entries	The number of entries in the IPv6 route table.
Number of route types	The number of entries for each route type.
Number of prefixes	A summary of prefixes in the IPv6 route table, sorted by prefix length.

Displaying local IPv6 routers

The Brocade device can function as an IPv6 host, instead of an IPv6 router, if you configure IPv6 addresses on its interfaces but do not enable IPv6 routing using the **ipv6 unicast-routing** command.

From the IPv6 host, you can display information about IPv6 routers to which the host is connected. The host learns about the routers through their router advertisement messages. To display information about the IPv6 routers connected to an IPv6 host, enter the following command at any CLI level.

```
Brocade#show ipv6 router
Router fe80::2e0:80ff:fe46:3431 on Ethernet 50, last update 0 min
Hops 64, Lifetime 1800 sec
Reachable time 0 msec, Retransmit time 0 msec
```

Syntax: show ipv6 router

If you configure your Brocade device to function as an IPv6 router (you configure IPv6 addresses on its interfaces and enable IPv6 routing using the **ipv6 unicast-routing** command) and you enter the **show ipv6 router** command, you will receive the following output.

```
No IPv6 router in table
```

Meaningful output for this command is generated for Brocade devices configured to function as IPv6 hosts only.

This display shows the following information.

TABLE 72 IPv6 local router information fields

Field	Description
Router <ipv6 address> on <interface> <port>	The IPv6 address for a particular router interface.
Last update	The amount of elapsed time (in minutes) between the current and previous updates received from a router.
Hops	The default value that should be included in the Hop Count field of the IPv6 header for outgoing IPv6 packets. The hops value applies to the router for which you are displaying information and should be followed by IPv6 hosts attached to the router. A value of 0 indicates that the router leaves this field unspecified.
Lifetime	The amount of time (in seconds) that the router is useful as the default router.
Reachable time	The amount of time (in milliseconds) that a router assumes a neighbor is reachable after receiving a reachability confirmation. The reachable time value applies to the router for which you are displaying information and should be followed by IPv6 hosts attached to the router. A value of 0 indicates that the router leaves this field unspecified.
Retransmit time	The amount of time (in milliseconds) between retransmissions of neighbor solicitation messages. The retransmit time value applies to the router for which you are displaying information and should be followed by IPv6 hosts attached to the router. A value of 0 indicates that the router leaves this field unspecified.

Displaying IPv6 TCP information

You can display the following IPv6 TCP information:

- General information about each TCP connection on the router, including the percentage of free memory for each of the internal TCP buffers.
- Detailed information about a specified TCP connection.

To display general information about each TCP connection on the router, enter the following command at any CLI level.

Displaying global IPv6 information

```
Brocade#show ipv6 tcp connections
Local IP address:port <-> Remote IP address:port TCP state
192.168.182.110:23 <-> 192.168.8.186:4933 ESTABLISHED
192.168.182.110:8218 <-> 192.168.182.106:179 ESTABLISHED
192.168.182.110:8039 <-> 192.168.2.119:179 SYN-SENT
192.168.182.110:8159 <-> 192.168.2.102:179 SYN-SENT
2000:4::110:179 <-> 2000:4::106:8222 ESTABLISHED (1440)
Total 5 TCP connections

TCP MEMORY USAGE PERCENTAGE
FREE TCP = 98 percent
FREE TCP QUEUE BUFFER = 99 percent
FREE TCP SEND BUFFER = 97 percent
FREE TCP RECEIVE BUFFER = 100 percent
FREE TCP OUT OF SEQUENCE BUFFER = 100 percent
```

Syntax: show ipv6 tcp connections

This display shows the following information.

TABLE 73 General IPv6 TCP connection fields

Field	Description
Local IP address:port	The IPv4 or IPv6 address and port number of the local router interface over which the TCP connection occurs.
Remote IP address:port	The IPv4 or IPv6 address and port number of the remote router interface over which the TCP connection occurs.
TCP state	<p>The state of the TCP connection. Possible states include the following:</p> <ul style="list-style-type: none">• LISTEN – Waiting for a connection request.• SYN-SENT – Waiting for a matching connection request after having sent a connection request.• SYN-RECEIVED – Waiting for a confirming connection request acknowledgment after having both received and sent a connection request.• ESTABLISHED – Data can be sent and received over the connection. This is the normal operational state of the connection.• FIN-WAIT-1 – Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent.• FIN-WAIT-2 – Waiting for a connection termination request from the remote TCP.• CLOSE-WAIT – Waiting for a connection termination request from the local user.• CLOSING – Waiting for a connection termination request acknowledgment from the remote TCP.• LAST-ACK – Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request).• TIME-WAIT – Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request.• CLOSED – There is no connection state.
FREE TCP = <percentage>	The percentage of free TCP control block (TCP) space.

TABLE 73 General IPv6 TCP connection fields (Continued)

Field	Description
FREE TCP QUEUE BUFFER = <percentage>	The percentage of free TCP queue buffer space.
FREE TCP SEND BUFFER = <percentage>	The percentage of free TCP send buffer space.
FREE TCP RECEIVE BUFFER = <percentage>	The percentage of free TCP receive buffer space.
FREE TCP OUT OF SEQUENCE BUFFER = <percentage>	The percentage of free TCP out of sequence buffer space.

To display detailed information about a specified TCP connection, enter a command such as the following at any CLI level.

```
Brocade#show ipv6 tcp status 2000:4::110 179 2000:4::106 8222
TCP: TCP = 0x217fc300
TCP: 2000:4::110:179 <-> 2000:4::106:8222: state: ESTABLISHED Port: 1
  Send: initial sequence number = 242365900
  Send: first unacknowledged sequence number = 242434080
  Send: current send pointer = 242434080
  Send: next sequence number to send = 242434080
  Send: remote received window = 16384
  Send: total unacknowledged sequence number = 0
  Send: total used buffers 0
  Receive: initial incoming sequence number = 740437769
  Receive: expected incoming sequence number = 740507227
  Receive: received window = 16384
  Receive: bytes in receive queue = 0
  Receive: congestion window = 1459
```

Syntax: `show ipv6 tcp status <local-ip-address> <local-port-number> <remote-ip-address>
<remote-port-number>`

The <local-ip-address> parameter can be the IPv4 or IPv6 address of the local interface over which the TCP connection is taking place.

The <local-port-number> parameter is the local port number over which a TCP connection is taking place.

The <remote-ip-address> parameter can be the IPv4 or IPv6 address of the remote interface over which the TCP connection is taking place.

The <remote-port-number> parameter is the local port number over which a TCP connection is taking place.

This display shows the following information.

TABLE 74 Specific IPv6 TCP connection fields

Field	Description
TCP = <i><location></i>	The location of the TCP.
<i><local-ip-address> <local-port-number> <remote-ip-address> <remote-port-number> <state> <port></i>	This field provides a general summary of the following: <ul style="list-style-type: none"> • The local IPv4 or IPv6 address and port number. • The remote IPv4 or IPv6 address and port number. • The state of the TCP connection. For information on possible states, refer to Table 73 on page 404. • The port numbers of the local interface.
Send: initial sequence number = <i><number></i>	The initial sequence number sent by the local router.
Send: first unacknowledged sequence number = <i><number></i>	The first unacknowledged sequence number sent by the local router.
Send: current send pointer = <i><number></i>	The current send pointer.
Send: next sequence number to send = <i><number></i>	The next sequence number sent by the local router.
Send: remote received window = <i><number></i>	The size of the remote received window.
Send: total unacknowledged sequence number = <i><number></i>	The total number of unacknowledged sequence numbers sent by the local router.
Send: total used buffers <i><number></i>	The total number of buffers used by the local router in setting up the TCP connection.
Receive: initial incoming sequence number = <i><number></i>	The initial incoming sequence number received by the local router.
Receive: expected incoming sequence number = <i><number></i>	The incoming sequence number expected by the local router.
Receive: received window = <i><number></i>	The size of the local router's receive window.
Receive: bytes in receive queue = <i><number></i>	The number of bytes in the local router's receive queue.
Receive: congestion window = <i><number></i>	The size of the local router's receive congestion window.

Displaying IPv6 traffic statistics

To display IPv6 traffic statistics, enter the following command at any CLI level.

```
Brocade#show ipv6 traffic
IP6 Statistics
    36947 received, 66818 sent, 0 forwarded, 36867 delivered, 0 rawout
    0 bad vers, 23 bad scope, 0 bad options, 0 too many hdr
    0 no route, 0 can not forward, 0 redirect sent
    0 frag recv, 0 frag dropped, 0 frag timeout, 0 frag overflow
    0 reassembled, 0 fragmented, 0 ofragments, 0 can not frag
    0 too short, 0 too small, 11 not member
    0 no buffer, 66819 allocated, 21769 freed
    0 forward cache hit, 46 forward cache miss

ICMP6 Statistics
Received:

    565189 in segments, 618152 out segments, 171337 retransmission
```

Syntax: show ipv6 traffic

This **show ipv6 traffic** command displays the following information.

Field	Description
IPv6 statistics	
received	The total number of IPv6 packets received by the router.
sent	The total number of IPv6 packets originated and sent by the router.
forwarded	The total number of IPv6 packets received by the router and forwarded to other routers.
delivered	The total number of IPv6 packets delivered to the upper layer protocol.
rawout	This information is used by Brocade Technical Support.
bad vers	The number of IPv6 packets dropped by the router because the version number is not 6.

Field	Description (Continued)
bad scope	The number of IPv6 packets dropped by the router because of a bad address scope.
bad options	The number of IPv6 packets dropped by the router because of bad options.
too many hdr	The number of IPv6 packets dropped by the router because the packets had too many headers.
no route	The number of IPv6 packets dropped by the router because there was no route.
can not forward	The number of IPv6 packets the router could not forward to another router.
redirect sent	This information is used by Brocade Technical Support.
frag rcv	The number of fragments received by the router.
frag dropped	The number of fragments dropped by the router.
frag timeout	The number of fragment timeouts that occurred.
frag overflow	The number of fragment overflows that occurred.
reassembled	The number of fragmented IPv6 packets that the router reassembled.
fragmented	The number of IPv6 packets fragmented by the router to accommodate the MTU of this router or of another device.
ofragments	The number of output fragments generated by the router.
can not frag	The number of IPv6 packets the router could not fragment.
too short	The number of IPv6 packets dropped because they are too short.
too small	The number of IPv6 packets dropped because they do not have enough data.
not member	The number of IPv6 packets dropped because the recipient is not a member of a multicast group.
no buffer	The number of IPv6 packets dropped because there is no buffer available.
forward cache miss	The number of IPv6 packets received for which there is no corresponding cache entry.
ICMP6 statistics	
Some ICMP statistics apply to both Received and Sent, some apply to Received only, some apply to Sent only, and some apply to Sent Errors only.	
Applies to received and sent	
dest unreachable	The number of Destination Unreachable messages sent or received by the router.
pkt too big	The number of Packet Too Big messages sent or received by the router.
time exceeded	The number of Time Exceeded messages sent or received by the router.
param prob	The number of Parameter Problem messages sent or received by the router.
echo req	The number of Echo Request messages sent or received by the router.
echo reply	The number of Echo Reply messages sent or received by the router.
mem query	The number of Group Membership Query messages sent or received by the router.
mem report	The number of Membership Report messages sent or received by the router.
mem red	The number of Membership Reduction messages sent or received by the router.
router soli	The number of Router Solicitation messages sent or received by the router.

Field	Description (Continued)
router adv	The number of Router Advertisement messages sent or received by the router.
nei soli	The number of Neighbor Solicitation messages sent or received by the router.
nei adv	The number of Router Advertisement messages sent or received by the router.
redirect	The number of redirect messages sent or received by the router.
Applies to received only	
bad code	The number of Bad Code messages received by the router.
too short	The number of Too Short messages received by the router.
bad checksum	The number of Bad Checksum messages received by the router.
bad len	The number of Bad Length messages received by the router.
nd toomany opt	The number of Neighbor Discovery Too Many Options messages received by the router.
badhopcount	The number of Bad Hop Count messages received by the router.
Applies to sent only	
error	The number of Error messages sent by the router.
can not send error	The number of times the node encountered errors in ICMP error messages.
too freq	The number of times the node has exceeded the frequency of sending error messages.
Applies to sent errors only	
unreach no route	The number of Unreachable No Route errors sent by the router.
admin	The number of Admin errors sent by the router.
beyond scope	The number of Beyond Scope errors sent by the router.
address	The number of Address errors sent by the router.
no port	The number of No Port errors sent by the router.
pkt too big	The number of Packet Too Big errors sent by the router.
time exceed transit	The number of Time Exceed Transit errors sent by the router.
time exceed reassembly	The number of Time Exceed Reassembly errors sent by the router.
param problem header	The number of Parameter Problem Header errors sent by the router.
nextheader	The number of Next Header errors sent by the router.
option	The number of Option errors sent by the router.
redirect	The number of Redirect errors sent by the router.
unknown	The number of Unknown errors sent by the router.
UDP statistics	
received	The number of UDP packets received by the router.
sent	The number of UDP packets sent by the router.
no port	The number of UDP packets dropped because the packet did not contain a valid UDP port number.
input errors	This information is used by Brocade Technical Support.
TCP statistics	

Field	Description (Continued)
active opens	The number of TCP connections opened by the router by sending a TCP SYN to another device.
passive opens	The number of TCP connections opened by the router in response to connection requests (TCP SYNs) received from other devices.
failed attempts	This information is used by Brocade Technical Support.
active resets	The number of TCP connections the router reset by sending a TCP RESET message to the device at the other end of the connection.
passive resets	The number of TCP connections the router reset because the device at the other end of the connection sent a TCP RESET message.
input errors	This information is used by Brocade Technical Support.
in segments	The number of TCP segments received by the router.
out segments	The number of TCP segments sent by the router.
retransmission	The number of segments that the router retransmitted because the retransmission timer for the segment had expired before the device at the other end of the connection had acknowledged receipt of the segment.

FWS Series Switch IPv6 management

[Table 75](#) lists the individual Brocade FastIron switches and the IPv6 management features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 75 Supported IPv6 management features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX
Link-Local IPv6 address	For information about IPv6 management features on FastIron X Series switches, refer to Chapter 8, “IPv6 Configuration on FastIron X Series, FCX, and ICX Series Switches” .	Yes	For information about IPv6 management features on Brocade FCX Series switches, refer to Chapter 8, “IPv6 Configuration on FastIron X Series, FCX, and ICX Series Switches”	For information about IPv6 management features on ICX switches, refer to Chapter 8, “IPv6 Configuration on FastIron X Series, FCX, and ICX Series Switches”
IPv6 copy ¹		Yes		
IPv6 ncopy ¹		Yes		
IPv6 debug		Yes		
IPv6 access-list (management ACLs)		Yes		
IPv6 ping		Yes		
IPv6 traceroute		Yes		
DNS server name resolution		Yes		
HTTP/HTTPS		Yes		
Logging (Syslog)		Yes		
RADIUS ¹		Yes		
SCP		Yes		
SSH		Yes		
SNMP		Yes		
SNMP traps		Yes		
SNTP		Yes		
Telnet		Yes		
TFTP ¹		Yes		

¹The following IPv6 management features, listed in [Table 75](#), are documented in other chapters of this guide:

- IPv6 copy – [“Using the IPv6 copy command”](#) on page 87
- IPv6 ncopy – [“IPv6 ncopy command”](#) on page 89
- RADIUS – [“Setting RADIUS over IPv6”](#) on page 167
- TFTP – [“Loading and saving configuration files with IPv6”](#) on page 87

This chapter describes the IPv6 management features, including command syntax and management examples.

IPv6 management overview

IPv6 was designed to replace IPv4, the Internet protocol that is most commonly used currently throughout the world. IPv6 increases the number of network address bits from 32 (IPv4) to 128, which provides more than enough unique IP addresses to support all of the network devices on the planet into the future. IPv6 is expected to quickly become the network standard.

Brocade FastIron devices that support IPv6 may be used as management hosts. Interfaces on these devices are configured with IPv6 addresses, but do not have full IPv6 routing enabled. IPv6 is available on all FastIron devices that are running Layer 2, base Layer 3, or full Layer 3 software images.

NOTE

Brocade FastIron devices can serve as management hosts on an IPv6 network. However, **IPv6 routing** functionality is not supported for these devices.

IPv6 addressing

IPv4 is limited because of the 32-bit addressing format, which cannot satisfy potential increases in the number of users, geographical needs, and emerging applications. To address this limitation, IPv6 introduces a new 128-bit addressing format.

An IPv6 address is composed of 8 fields of 16-bit hexadecimal values separated by colons (:). [Figure 33](#) shows the IPv6 address format.

FIGURE 33 IPv6 address format

As shown in [Figure 33](#), HHHH is a 16-bit hexadecimal value, while H is a 4-bit hexadecimal value. The following is an example of an IPv6 address.

2001:0000:0000:0200:002D:D0FF:FE48:4672

Note that this IPv6 address includes hexadecimal fields of zeros. To make the address less cumbersome, you can do the following:

- Omit the leading zeros; for example, 2001:0:0:200:2D:D0FF:FE48:4672.
- Compress the successive groups of zeros at the beginning, middle, or end of an IPv6 address to two colons (::) once per address; for example, 2001::200:2D:D0FF:FE48:4672.

When specifying an IPv6 address in a command syntax, keep the following in mind:

- You can use the two colons (::) only once in the address to represent the longest successive hexadecimal fields of zeros
- The hexadecimal letters in IPv6 addresses are not case-sensitive

As shown in [Figure 33](#), the IPv6 network prefix is composed of the left-most bits of the address. As with an IPv4 address, you can specify the IPv6 prefix using the `<prefix>/<prefix-length>` format, where the following applies.

The `<prefix>` parameter is specified as 16-bit hexadecimal values separated by a colon.

The `<prefix-length>` parameter is specified as a decimal value that indicates the left-most bits of the IPv6 address.

The following is an example of an IPv6 prefix.

```
2001:FF08:49EA:D088::/64
```

Enabling and disabling IPv6

IPv6 is enabled by default for Brocade devices that support it. If desired, you can disable IPv6 on a global basis on an device by entering the following command at the Global CONFIG level of the CLI.

```
Brocade(config)#no ipv6 enable
```

Syntax: `no ipv6 enable`

To re-enable IPv6 after it has been disabled, enter the `ipv6 enable` command.

IPv6 management features

This section describes the CLI management commands that are available to FastIron devices that support IPv6.

IPv6 management ACLs

When you enter the `ipv6 access-list` command, the Brocade device enters the IPv6 Access List configuration level, where you can access several commands for configuring IPv6 ACL entries. After configuring the ACL entries, you can apply them to network management access features such as Telnet, SSH, Web, and SNMP.

NOTE

Unlike IPv4, there is no distinction between standard and extended ACLs in IPv6.

Example

```
Brocade(config)#ipv6 access-list netw
Brocade(config-ipv6-access-list-netw)#
```

Syntax: `[no] ipv6 access-list <ACL name>`

The `<ACL name>` variable specifies a name for the IPv6 ACL. An IPv6 ACL name cannot start with a numeral, for example, `1access`. Also, an IPv4 ACL and an IPv6 ACL cannot share the same name.

IPv6 Web management using HTTP and HTTPS

When you have an IPv6 management station connected to a switch with an IPv6 address applied to the management port, you can manage the switch from a Web browser by entering `http://[<ipv6 address>]` or

`https://[<ipv6 address>]` in the browser address field.

NOTE

You must enclose the IPv6 address with square brackets [] in order for the Web browser to work.

Restricting web access

You can restrict Web management access to include only management functions on a Brocade device that is acting as an IPv6 host, or restrict access so that the Brocade host can be reached by a specified IPv6 device.

Restricting Web management access by specifying an IPv6 ACL

You can specify an IPv6 ACL that restricts Web management access to management functions on the device that is acting as the IPv6 host.

Example

```
Brocade(config)#access-list 12 deny host 2000:2383:e0bb::2/128 log
Brocade(config)#access-list 12 deny 30ff:3782::ff89/128 log
Brocade(config)#access-list 12 deny 3000:4828::fe19/128 log
Brocade(config)#access-list 12 permit any
Brocade(config)#web access-group ipv6 12
```

Syntax: `web access-group ipv6 <ipv6 ACL name>`

where `<ipv6 ACL name>` is a valid IPv6 ACL.

Restricting Web management access to an IPv6 host

You can specify a single device with an IPv6 address to have Web management access to the host device. No other device except the one with the specified IPv6 address can access the Web Management Interface.

Example

```
Brocade(config)#web client ipv6 3000:2383:e0bb::2/128
```

Syntax: `web client ipv6 <ipv6-address>`

The `<ipv6-address>` you specify must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

IPv6 logging

This feature allows you to specify an IPv6 server as the Syslog server.

Specifying an IPv6 Syslog server

To specify an IPv6 Syslog server, enter the log host ipv6 command as shown below.

Example

```
Brocade(config)#log host ipv6 2000:2383:e0bb::4/128
```

Syntax: `[no] log host ipv6 <ipv6-address> [<udp-port-num>]`

The `<ipv6-address>` must be in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The `<udp-port-num>` optional parameter specifies the UDP application port used for the Syslog facility.

Name-to-IPv6 address resolution using IPv6 DNS server

The Domain Name Server (DNS) resolver feature lets you use a host name to perform Telnet, ping, and traceroute commands. You can also define a DNS domain on a Brocade device and thereby recognize all hosts within that domain. After you define a domain name, the Brocade device automatically appends the appropriate domain to the host and forwards it to the domain name server.

For example, if the domain “newyork.com” is defined on a Brocade device, and you want to initiate a ping to host “NYC01” on that domain, you need to reference only the host name in the command instead of the host name and its domain name. For example, you could enter either of the following commands to initiate the ping.

```
Brocade#ping nyc01
Brocade#ping nyc01.newyork.com
```

Defining an IPv6 DNS entry

IPv6 defines new DNS record types to resolve queries for domain names to IPv6 addresses, as well as IPv6 addresses to domain names. Brocade devices running IPv6 software support AAAA DNS records, which are defined in RFC 1886.

AAAA DNS records are analogous to the A DNS records used with IPv4. They store a complete IPv6 address in each record. AAAA records have a type value of 28.

To establish an IPv6 DNS entry for the device, enter the following command.

```
Brocade(config)#ipv6 dns domain-name companynet.com
```

Syntax: `[no] ipv6 dns domain-name <domain name>`

To define an IPv6 DNS server address, enter the following command.

```
Brocade(config)#ipv6 dns server-address 200::1
```

Syntax: `[no] ipv6 dns server-address <ipv6-addr> [<ipv6-addr>] [<ipv6-addr>] [<ipv6-addr>]`

As an example, in a configuration where **ftp6.companynet.com** is a server with an IPv6 protocol stack, when a user pings ftp6.companynet.com, the Brocade device attempts to resolve the AAAA DNS record. In addition, if the DNS server does not have an IPv6 address, as long as it is able to resolve AAAA records, it can still respond to DNS queries.

Pinging IPv6

The **ping** command allows you to verify the connectivity from a Brocade device to an IPv6 device by performing an ICMP for IPv6 echo test.

For example, to ping a device with the IPv6 address of 2001:3424:847f:a385:34dd::45 from the Brocade device, enter the **ping ipv6** command:

```
Brocade#ping ipv6 2001:3424:847f:a385:34dd::45
```

Syntax: `ping ipv6 <ipv6-address> [outgoing-interface [<port> | ve <number>]] [source <ipv6-address>] [count <number>] [timeout <milliseconds>] [ttl <number>] [size`

<bytes>] [quiet] [numeric] [no-fragment] [verify]
[data <1-to-4 byte hex>] [brief]

- The **<ipv6-address>** parameter specifies the address of the router. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.
- The **outgoing-interface** keyword specifies a physical interface over which you can verify connectivity. If you specify a physical interface, such as an Ethernet interface, you must also specify the port number of the interface. If you specify a virtual interface, such as a VE, you must specify the number associated with the VE.
- The **source <ipv6-address>** parameter specifies an IPv6 address to be used as the origin of the ping packets.

NOTE

The **outgoing-interface** and **source** options are available only on Layer 3 code and not on Layer 2 code.

- The **count <number>** parameter specifies how many ping packets the router sends. You can specify from 1 - 4294967296. The default is 1.
- The **timeout <milliseconds>** parameter specifies how many milliseconds the router waits for a reply from the pinged device. You can specify a timeout from 1 - 4294967294 milliseconds. The default is 5000 (5 seconds).
- The **ttl <number>** parameter specifies the maximum number of hops. You can specify a TTL from 1 - 255. The default is 64.
- The **size <bytes>** parameter specifies the size of the ICMP data portion of the packet. This is the payload and does not include the header. You can specify from 0 - 10173. The default is 16.
- The **no-fragment** keyword turns on the "do not fragment" bit in the IPv6 header of the ping packet. This option is disabled by default.
- The **quiet** keyword hides informational messages such as a summary of the ping parameters sent to the device, and instead only displays messages indicating the success or failure of the ping. This option is disabled by default.
- The **verify** keyword verifies that the data in the echo packet (the reply packet) is the same as the data in the echo request (the ping). By default the device does not verify the data.
- The **data <1 - 4 byte hex>** parameter lets you specify a specific data pattern for the payload instead of the default data pattern, "abcd", in the packet's data payload. The pattern repeats itself throughout the ICMP message (payload) portion of the packet.

NOTE

For parameters that require a numeric value, the CLI does not check whether the value you enter is within the allowed range. Instead, if you do exceed the range for a numeric value, the software rounds the value to the nearest valid value.

- The **brief** keyword causes ping test characters to be displayed. The following ping test characters are supported.

! Indicates that a reply was received.

. Indicates that the network server timed out while waiting for a reply.

U Indicates that a destination unreachable error PDU was received.

I Indicates that the user interrupted ping.

NOTE

On 48GC modules in non-jumbo mode, the maximum size of ping packets is 1486 bytes and the maximum frame size of tagged traffic is no larger than 1581 bytes.

SNTP over IPv6

To enable the Brocade device to send SNTP packets over IPv6, enter the **sntp server ipv6** command at the Global CONFIG level of the CLI.

```
Brocade(config)#sntp server ipv6 3000::400
```

Syntax: **sntp server ipv6** <ipv6-address>

The <ipv6-address> is the IPv6 address of the SNTP server. When you enter the IPv6 address, you do not need to specify the prefix length. A prefix length of 128 is implied.

SNMP3 over IPv6

Brocade FastIron devices support IPv6 for SNMP version 3. For more information about how to configure SNMP, refer to [Chapter 10, “SNMP Access”](#).

Specifying an IPv6 SNMP trap receiver

You can specify an IPv6 host as a trap receiver to ensure that all SNMP traps sent by the device will go to the same SNMP trap receiver or set of receivers, typically one or more host devices on the network. To do so, enter a command such as the following.

```
Brocade(config)#snmp-server host ipv6 2001:efff:89::13
```

Syntax: **snmp-server host ipv6** <ipv6-address>

The <ipv6-address> you specify must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

Secure Shell, SCP, and IPv6

Secure Shell (SSH) is a mechanism that allows secure remote access to management functions on the Brocade device. SSH provides a function similar to Telnet. You can log in to and configure the Brocade device using a publicly or commercially available SSH client program, just as you can with Telnet. However, unlike Telnet, which provides no security, SSH provides a secure, encrypted connection to the Brocade device.

To open an SSH session between an IPv6 host running an SSH client program and the Brocade device, open the SSH client program and specify the IPv6 address of the device. For more information about configuring SSH on the Brocade device, refer to [“SSH2 and SCP”](#) on page 179.

IPv6 Telnet

Telnet sessions can be established between a Brocade device to a remote IPv6 host, and from a remote IPv6 host to the Brocade device using IPv6 addresses.

The **telnet** command establishes a Telnet connection from a Brocade device to a remote IPv6 host using the console. Up to five **read-access** Telnet sessions are supported on the router at one time. **Write-access** through Telnet is limited to one session, and only one outgoing Telnet session is supported on the router at one time. To see the number of open Telnet sessions at any time, enter the **show telnet** command.

Example

To establish a Telnet connection to a remote host with the IPv6 address of 3001:2837:3de2:c37::6, enter the following command.

```
Brocade#telnet 3001:2837:3de2:c37::6
```

Syntax: **telnet** <ipv6-address> [<port-number> | **outgoing-interface ethernet** <port> | **ve** <number>]

The <ipv6-address> parameter specifies the address of a remote host. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

The <port-number> parameter specifies the port number on which the Brocade device establishes the Telnet connection. You can specify a value between 1 - 65535. If you do not specify a port number, the Brocade device establishes the Telnet connection on port 23.

If the IPv6 address you specify is a link-local address, you must specify the **outgoing-interface ethernet <port> | ve <number>** parameter. This parameter identifies the interface that must be used to reach the remote host. If you specify an Ethernet interface, you must also specify the port number associated with the interface. If you specify a VE interface, also specify the VE number.

Establishing a Telnet session from an IPv6 host

To establish a Telnet session from an IPv6 host to the Brocade device, open your Telnet application and specify the IPv6 address of the Layer 3 Switch.

IPv6 traceroute

The **traceroute** command allows you to trace a path from the Brocade device to an IPv6 host.

The CLI displays trace route information for each hop as soon as the information is received. Traceroute requests display all responses to a minimum TTL of 1 second and a maximum TTL of 30 seconds. In addition, if there are multiple equal-cost routes to the destination, the Brocade device displays up to three responses.

For example, to trace the path from the Brocade device to a host with an IPv6 address of 3301:23dd:349e:a384::34, enter the **traceroute ipv6** command.

```
Brocade#traceroute ipv6 3301:23dd:349e:a384::34
```

Syntax: **traceroute ipv6** <ipv6-address>

The <ipv6-address> parameter specifies the address of a host. You must specify this address in hexadecimal using 16-bit values between colons as documented in RFC 2373.

IPv6 management commands

The following management CLI commands are available in FastIron devices that support IPv6:

- show ipv6 traffic
- clear ipv6 traffic
- show ipv6 TCP
- show ipv6 access-list
- show ipv6 neighbor
- clear ipv6 neighbor

SNMP Access

[Table 76](#) lists individual Brocade switches and the SNMP access methods they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 76 Supported SNMP access features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
SNMP v1, v2, v3	Yes	Yes	Yes	Yes	Yes
Community strings	Yes	Yes	Yes	Yes	Yes
User-based security model for SNMP v3	Yes	Yes	Yes	Yes	Yes
SNMP v3 traps	Yes	Yes	Yes	Yes	Yes
Defining the UDP port for SNMP v3 traps	Yes	Yes	Yes	Yes	Yes
SNMP v3 over IPv6	Yes	Yes	Yes	Yes	Yes
AES encryption for SNMP v3	Yes	Yes	Yes	Yes	Yes

SNMP overview

SNMP is a set of protocols for managing complex networks. SNMP sends messages, called protocol data units (PDUs), to different parts of a network. SNMP-compliant devices, called agents, store data about themselves in Management Information Bases (MIBs) and return this data to the SNMP requesters.

[Chapter 4, “Security Access”](#) introduced a few methods used to secure SNMP access. They included the following:

- [“Using ACLs to restrict SNMP access”](#) on page 114
- [“Restricting SNMP access to a specific IP address”](#) on page 116
- [“Restricting SNMP access to a specific VLAN”](#) on page 119
- [“Disabling SNMP access”](#) on page 124

This chapter presents additional methods for securing SNMP access to Brocade devices. It contains the following sections:

- [“SNMP community strings”](#)
- [“User-based security model”](#)
- [“SNMP v3 configuration examples”](#)
- [“SNMP version 3 traps”](#)
- [“Displaying SNMP Information”](#)
- [“SNMP v3 configuration examples”](#)

Restricting SNMP access using ACL, VLAN, or a specific IP address constitute the first level of defense when the packet arrives at a Brocade device. The next level uses one of the following methods:

- Community string match In SNMP versions 1 and 2
- User-based model in SNMP version 3

SNMP views are incorporated in community strings and the user-based model.

SNMP community strings

SNMP versions 1 and 2 use community strings to restrict SNMP access. The default passwords for Web management access are the SNMP community strings configured on the device:

- The default read-only community string is “public”. To open a read-only Web management session, enter “get” and “public” for the user name and password.
- There is no default read-write community string. Thus, by default, you cannot open a read-write management session using the Web Management Interface. You first must configure a read-write community string using the CLI. Then you can log on using “set” as the user name and the read-write community string you configure as the password.

You can configure as many additional read-only and read-write community strings as you need. The number of strings you can configure depends on the memory on the device. There is no practical limit.

The Web Management Interface supports only one read-write session at a time. When a read-write session is open on the Web Management Interface, subsequent sessions are read-only, even if the session login is “set” with a valid read-write password.

NOTE

If you delete the startup-config file, the device automatically re-adds the default “public” read-only community string the next time you load the software.

NOTE

As an alternative to the SNMP community strings, you can secure Web management access using local user accounts or ACLs. Refer to [“Local user accounts”](#) on page 129 or [“Using an ACL to restrict Web management access”](#) on page 114.

Encryption of SNMP community strings

The software automatically encrypts SNMP community strings. Users with read-only access or who do not have access to management functions in the CLI cannot display the strings. For users with read-write access, the strings are encrypted in the CLI but are shown in the clear in the Web Management Interface.

Encryption is enabled by default. You can disable encryption for individual strings or trap receivers if desired. Refer to the next section for information about encryption.

Adding an SNMP community string

The default SNMP community name (string) on a device is “public” with read only privilege.

You can assign other SNMP community strings, and indicate if the string is encrypted or clear. By default, the string is encrypted.

To add an encrypted community string, enter commands such as the following.

```
Brocade(config)#snmp-server community private rw
Brocade(config)#write memory
```

Syntax: `snmp-server community [0 | 1] <string>`
`ro | rw [view <viewname>] [<standard-ACL-name> | <standard-ACL-id>]`

The `<string>` parameter specifies the community string name. The string can be up to 32 characters long.

The `ro | rw` parameter specifies whether the string is **read-only (ro)** or **read-write (rw)**.

NOTE

If you issue a **no snmp-server community public ro** command and then enter a **write memory** command to save that configuration, the “public” community name is removed and will have no SNMP access. If for some reason the device is brought down and then brought up, the “no snmp-server community public ro” command is restored in the system and the “public” community string has no SNMP access.

The `0 | 1` parameter affects encryption for display of the string in the running-config and the startup-config file. Encryption is enabled by default. When encryption is enabled, the community string is encrypted in the CLI regardless of the access level you are using. In the Web Management Interface, the community string is encrypted at the read-only access level but is visible at the read-write access level.

The encryption option can be omitted (the default) or can be one of the following:

- **0** – Disables encryption for the community string you specify with the command. The community string is shown as clear text in the running-config and the startup-config file. Use this option if you do not want the display of the community string to be encrypted.
 - **1** – Assumes that the community string you enter is encrypted, and decrypts the value before using it.
-

NOTE

If you want the software to assume that the value you enter is the clear-text form, and to encrypt display of that form, do not enter **0** or **1**. Instead, omit the encryption option and allow the software to use the default behavior.

NOTE

If you specify encryption option **1**, the software assumes that you are entering the encrypted form of the community string. In this case, the software decrypts the community string you enter before using the value for authentication. If you accidentally enter option **1** followed by the clear-text version of the community string, authentication will fail because the value used by the software will not match the value you intended to use.

The command in the example above adds the read-write SNMP community string “private”. When you save the new community string to the startup-config file (using the **write memory** command), the software adds the following command to the file.

```
snmp-server community 1 <encrypted-string> rw
```

To add a non-encrypted community string, you must explicitly specify that you do not want the software to encrypt the string. Here is an example.

```
Brocade(config)#snmp-server community 0 private rw
Brocade(config)#write memory
```

The command in this example adds the string “private” in the clear, which means the string is displayed in the clear. When you save the new community string to the startup-config file, the software adds the following command to the file.

```
snmp-server community 0 private rw
```

The **view** <viewname> parameter is optional. It allows you to associate a view to the members of this community string. Enter up to 32 alphanumeric characters. If no view is specified, access to the full MIB is granted. The view that you want must exist before you can associate it to a community string. Here is an example of how to use the view parameter in the community string command.

```
Brocade(config)#snmp-s community myread ro view sysview
```

The command in this example associates the view “sysview” to the community string named “myread”. The community string has read-only access to “sysview”. For information on how to create views, refer to [“SNMP v3 configuration examples”](#) on page 436.

The <standard-ACL-name> | <standard-ACL-id> parameter is optional. It allows you to specify which ACL group will be used to filter incoming SNMP packets. You can enter either the ACL name or its ID. Here are some examples.

```
Brocade(config)#snmp-s community myread ro view sysview 2
Brocade(config)#snmp-s community myread ro view sysview myACL
```

The command in the first example indicates that ACL group 2 will filter incoming SNMP packets; whereas, the command in the second example uses the ACL group called “myACL” to filter incoming packets. Refer to [“Using ACLs to restrict SNMP access”](#) on page 114 for more information.

NOTE

To make configuration changes, including changes involving SNMP community strings, you must first configure a read-write community string using the CLI. Alternatively, you must configure another authentication method and log on to the CLI using a valid password for that method.

Displaying the SNMP community strings

To display the configured community strings, enter the following command at any CLI level.

```

Brocade#show snmp server
Contact: Marshall
Location: Copy Center
Community(ro): public
Community(rw): private
Traps
    Cold start: Enable
    Link up: Enable
    Link down: Enable
    Authentication: Enable
    Locked address violation: Enable
    Power supply failure: Enable
    Fan failure: Enable
    Temperature warning: Enable
    STP new root: Enable
    STP topology change: Enable
    ospf: Enable

Total Trap-Receiver Entries: 4
Trap-Receiver IP Address      Community
1          207.95.6.211
2          207.95.5.21

```

Syntax: show snmp server

NOTE

If display of the strings is encrypted, the strings are not displayed. Encryption is enabled by default.

User-based security model

SNMP version 3 (RFC 2570 through 2575) introduces a User-Based Security model (RFC 2574) for authentication and privacy services.

SNMP version 1 and version 2 use community strings to authenticate SNMP access to management modules. This method can still be used for authentication. In SNMP version 3, the User-Based Security model of SNMP can be used to secure against the following threats:

- Modification of information
- Masquerading the identity of an authorized entity
- Message stream modification
- Disclosure of information

SNMP version 3 also supports View-Based Access Control Mechanism (RFC 2575) to control access at the PDU level. It defines mechanisms for determining whether or not access to a managed object in a local MIB by a remote principal should be allowed. (refer to [“SNMP v3 configuration examples”](#) on page 436.)

Configuring your NMS

In order to use the SNMP version 3 features.

1. Make sure that your Network Manager System (NMS) supports SNMP version 3.
2. Configure your NMS agent with the necessary users.
3. Configure the SNMP version 3 features in Brocade devices.

Configuring SNMP version 3 on Brocade devices

Follow the steps given below to configure SNMP version 3 on Brocade devices.

1. Enter an engine ID for the management module using the **snmp-server engineid** command if you will not use the default engine ID. Refer to [“Defining the engine id”](#) on page 426.
2. Create views that will be assigned to SNMP user groups using the **snmp-server view** command. Refer to [“SNMP v3 configuration examples”](#) on page 436 for details.
3. Create ACL groups that will be assigned to SNMP user groups using the **access-list** command.
4. Create user groups using the **snmp-server group** command. Refer to [“Defining an SNMP group”](#) on page 427.
5. Create user accounts and associate these accounts to user groups using the **snmp-server user** command. Refer to [“Defining an SNMP user account”](#) on page 428.

If SNMP version 3 is not configured, then community strings by default are used to authenticate access.

Defining the engine id

A default engine ID is generated during system start up. To determine what the default engine ID of the device is, enter the **show snmp engineid** command and find the following line:

```
Local SNMP Engine ID: 800007c70300e05290ab60
```

See the section [“Displaying the Engine ID”](#) on page 434 for details.

The default engine ID guarantees the uniqueness of the engine ID for SNMP version 3. If you want to change the default engine ID, enter the **snmp-server engineid local** command.

```
Brocade(config)#snmp-server engineid local 800007c70300e05290ab60
```

Syntax: [no] **snmp-server engineid local** <hex-string>

The **local** parameter indicates that engine ID to be entered is the ID of this device, representing an SNMP management entity.

NOTE

Each user localized key depends on the SNMP server engine ID, so all users need to be reconfigured whenever the SNMP server engine ID changes.

NOTE

Since the current implementation of SNMP version 3 does not support Notification, remote engine IDs cannot be configured at this time.

The *<hex-string>* variable consists of 11 octets, entered as hexadecimal values. There are two hexadecimal characters in each octet. There should be an even number of hexadecimal characters in an engine ID.

The default engine ID has a maximum of 11 octets:

- Octets 1 through 4 represent the agent's SNMP management private enterprise number as assigned by the Internet Assigned Numbers Authority (IANA). The most significant bit of Octet 1 is "1". For example, "000007c7" is the ID for Brocade Communications, Inc. in hexadecimal. With Octet 1 always equal to "1", the first four octets in the default engine ID is always "800007c7" (which is 1991 in decimal).
- Octet 5 is always 03 in hexadecimal and indicates that the next set of values represent a MAC address.
- Octets 6 through 11 form the MAC address of the lowest port in the management module.

NOTE

Engine ID must be a unique number among the various SNMP engines in the management domain. Using the default engine ID ensures the uniqueness of the numbers.

Defining an SNMP group

SNMP groups map SNMP users to SNMP views. For each SNMP group, you can configure a read view, a write view, or both. Users who are mapped to a group will use its views for access control.

To configure an SNMP user group, enter a command such as the following.

```
Brocade(config)#snmp-server group admin v3 auth read all write all
```

Syntax: [no] **snmp-server group** *<groupname>* **v1** | **v2** | **v3** **auth** | **noauth** | **priv** [**access** *<standard-ACL-id>*] [**read** *<viewstring>* | **write** *<viewstring>*]

NOTE

This command is not used for SNMP version 1 and SNMP version 2. In these versions, groups and group views are created internally using community strings. (refer to [“SNMP community strings”](#) on page 422.) When a community string is created, two groups are created, based on the community string name. One group is for SNMP version 1 packets, while the other is for SNMP version 2 packets.

The **group** *<groupname>* parameter defines the name of the SNMP group to be created.

The **v1**, **v2**, or **v3** parameter indicates which version of SNMP is used. In most cases, you will be using v3, since groups are automatically created in SNMP versions 1 and 2 from community strings.

The **auth** | **noauth** parameter determines whether or not authentication will be required to access the supported views. If **auth** is selected, then only authenticated packets are allowed to access the view specified for the user group. Selecting **noauth** means that no authentication is required to access the specified view. Selecting **priv** means that an authentication password will be required from the users.

The **access** *<standard-ACL-id>* parameter is optional. It allows incoming SNMP packets to be filtered based on the standard ACL attached to the group.

The **read** *<viewstring>* | **write** *<viewstring>* parameter is optional. It indicates that users who belong to this group have either read or write access to the MIB.

The `<viewstring>` variable is the name of the view to which the SNMP group members have access. If no view is specified, then the group has no access to the MIB.

The value of `<viewstring>` is defined using the **snmp-server view** command. The SNMP agent comes with the "all" default view, which provides access to the entire MIB; however, it must be specified when creating the group. The "all" view also allows SNMP version 3 to be backwards compatible with SNMP version 1 and version 2.

NOTE

If you will be using a view other than the "all" view, that view must be configured before creating the user group. Refer to the section [“SNMP v3 configuration examples”](#) on page 436, especially for details on the include | exclude parameters.

Defining an SNMP user account

The **snmp-server user** command does the following:

- Creates an SNMP user.
- Defines the group to which the user will be associated.
- Defines the type of authentication to be used for SNMP access by this user.
- Specifies one of the following encryption types used to encrypt the privacy password:
 - Data Encryption Standard (DES) – A symmetric-key algorithm that uses a 56-bit key.
 - Advanced Encryption Standard (AES) – The 128-bit encryption standard adopted by the U.S. government. This standard is a symmetric cipher algorithm chosen by the National Institute of Standards and Technology (NIST) as the replacement for DES.

Here is an example of how to create an SNMP User account.

```
Brocade(config)#snmp-s user bob admin v3 access 2 auth md5 bobmd5 priv des bobdes
```

The CLI for creating SNMP version 3 users has been updated as follows.

Syntax: `[no] snmp-server user <name> <groupname> v3`
`[[access <standard-ACL-id>]`
`[[encrypted] [auth md5 <md5-password> | sha <sha-password>]`
`[priv [encrypted] des <des-password-key> | aes <aes-password-key>]]]`

The `<name>` parameter defines the SNMP user name or security name used to access the management module.

The `<groupname>` parameter identifies the SNMP group to which this user is associated or mapped. All users must be mapped to an SNMP group. Groups are defined using the **snmp-server group** command.

NOTE

The SNMP group to which the user account will be mapped should be configured before creating the user accounts; otherwise, the group will be created without any views. Also, ACL groups must be configured before configuring user accounts.

The **v3** parameter is required.

The **access <standard-ACL-id>** parameter is optional. It indicates that incoming SNMP packets are filtered based on the ACL attached to the user account.

NOTE

The ACL specified in a user account overrides the ACL assigned to the group to which the user is mapped. If no ACL is entered for the user account, then the ACL configured for the group will be used to filter packets.

The **encrypted** parameter means that the MD5 or SHA password will be a digest value. MD5 has 16 octets in the digest. SHA has 20. The digest string has to be entered as a hexadecimal string. In this case, the agent need not generate any explicit digest. If the **encrypted** parameter is not used, the user is expected to enter the authentication password string for MD5 or SHA. The agent will convert the password string to a digest, as described in RFC 2574.

The **auth md5 | sha** parameter is optional. It defines the type of encryption that the user must have to be authenticated. Choose between MD5 or SHA encryption. MD5 and SHA are two authentication protocols used in SNMP version 3.

The `<md5-password>` and `<sha-password>` define the password the user must use to be authenticated. These password must have a minimum of 8 characters. If the encrypted parameter is used, then the digest has 16 octets for MD5 or 20 octets for SHA.

NOTE

Once a password string is entered, the generated configuration displays the digest (for security reasons), not the actual password.

The **priv [encrypted]** parameter is optional after you enter the md5 or sha password. The **priv** parameter specifies the encryption type (DES or AES) used to encrypt the privacy password. If the **encrypted** keyword is used, do the following:

- If DES is the privacy protocol to be used, enter **des** followed by a 16-octet DES key in hexadecimal format for the `<des-password-key>`. If you include the encrypted keyword, enter a password string of at least 8 characters.
- If AES is the privacy protocol to be used, enter **aes** followed by the AES password key. For a small password key, enter 12 characters. For a big password key, enter 16 characters. If you include the encrypted keyword, enter a password string containing 32 hexadecimal characters.

Defining SNMP views

SNMP views are named groups of MIB objects that can be associated with user accounts to allow limited access for viewing and modification of SNMP statistics and system configuration. SNMP views can also be used with other commands that take SNMP views as an argument. SNMP views reference MIB objects using object names, numbers, wildcards, or a combination of the three. The numbers represent the hierarchical location of the object in the MIB tree. You can reference individual objects in the MIB tree or a subset of objects from the MIB tree.

To configure the number of SNMP views available on the Brocade device, enter the following command.

```
Brocade(config)#system-max view 15
```

Syntax: **system-max view** *<number-of-views>*

This command specifies the maximum number of SNMPv2 and v3 views that can be configured on a device. The number of views can be from 10 – 65536. The default is 10 views.

To add an SNMP view, enter one of the following commands.

```
Brocade(config)#snmp-server view Maynes system included
Brocade(config)#snmp-server view Maynes system.2 excluded
Brocade(config)#snmp-server view Maynes 2.3.*.6 included
Brocade(config)#write mem
```

NOTE

The **snmp-server view** command supports the MIB objects as defined in RFC 1445.

Syntax: [no] **snmp-server view** <name> <mib_tree> **included** | **excluded**

The <name> parameter can be any alphanumeric name you choose to identify the view. The names cannot contain spaces.

The <mib_tree> parameter is the name of the MIB object or family. MIB objects and MIB sub-trees can be identified by a name or by the numbers called Object Identifiers (OIDs) that represent the position of the object or sub-tree in the MIB hierarchy. You can use a wildcard (*) in the numbers to specify a sub-tree family.

The **included** | **excluded** parameter specifies whether the MIB objects identified by the <mib_family> parameter are included in the view or excluded from the view.

NOTE

All MIB objects are automatically excluded from any view unless they are explicitly included; therefore, when creating views using the **snmp-server view** command, indicate which portion of the MIB you want users to access.

For example, you may want to assign the view called “admin” a community string or user group. The “admin” view will allow access to the Brocade MIBs objects that begin with the 1.3.6.1.4.1.1991 object identifier. Enter the following command.

```
Brocade(config)#snmp-server view admin 1.3.6.1.4.1.1991 included
```

You can exclude portions of the MIB within an inclusion scope. For example, if you want to exclude the snAgentSys objects, which begin with 1.3.6.1.4.1.1991.1.1.2 object identifier from the admin view, enter a second command such as the following.

```
Brocade(config)#snmp-server view admin 1.3.6.1.4.1.1991.1.1.2 excluded
```

NOTE

Note that the exclusion is within the scope of the inclusion.

To delete a view, use the no parameter before the command.

SNMP version 3 traps

Brocade devices support SNMP notifications in SMIv2 format. This allows notifications to be encrypted and sent to the target hosts in a secure manner.

Defining an SNMP group and specifying which view is notified of traps

The SNMP group command allows configuration of a viewname for notification purpose, similar to the read and write view. The default viewname is "all", which allows access to the entire MIB.

To configure an SNMP user group, first configure SNMP v3 views using the **snmp-server view** command. Refer to “[SNMP v3 configuration examples](#)” on page 436. Then enter a command such as the following.

```
Brocade(config)#snmp-server group admin v3 auth read all write all
notify all
```

Syntax: [no] **snmp-server group** <groupname>
 v1 | **v2** | **v3**
 auth | **noauth** | **priv**
 [**access** <standard-ACL-id>] [**read** <viewstring> | **write** <viewstring> | **notify** <viewstring>]

The **group** <groupname> parameter defines the name of the SNMP group to be created.

The **v1**, **v2**, or **v3** parameter indicates which version of SNMP to use. In most cases, you will use v3, since groups are automatically created in SNMP versions 1 and 2 from community strings.

The **auth** | **noauth** parameter determines whether or not authentication will be required to access the supported views. If **auth** is selected, then only authenticated packets are allowed to access the view specified for the user group. Selecting **noauth** means that no authentication is required to access the specified view. Selecting **priv** means that an authentication password will be required from the users.

The **access** <standard-ACL-id> parameter is optional. It allows incoming SNMP packets to be filtered based on the standard ACL attached to the group.

The **read** <viewstring> | **write** <viewstring> parameter is optional. It indicates that users who belong to this group have either read or write access to the MIB.

The **notify** view allows administrators to restrict the scope of varbind objects that will be part of the notification. All of the varbinds need to be in the included view for the notification to be created.

The <viewstring> variable is the name of the view to which the SNMP group members have access. If no view is specified, then the group has no access to the MIB.

Defining the UDP port for SNMP v3 traps

The SNMP host command enhancements allow configuration of notifications in SMIv2 format, with or without encryption, in addition to the previously supported SMIv1 trap format.

You can define a port that receives the SNMP v3 traps by entering a command such as the following.

```
Brocade(config)#snmp-server host 192.168.4.11 version v3 auth security-name port
4/1
```

Syntax: [no] **snmp-server host** <ip-addr> | <ipv6-addr> **version** [**v1** | **v2c** <community-string> | **v3** **auth** | **noauth** | **priv** <security-name>] [**port** <trap-UDP-port-number>]

The <ip-addr> parameter specifies the IP address of the host that will receive the trap.

For **version**, indicate one of the following

For SNMP version 1, enter **v1** and the name of the community string (<community-string>). This string is encrypted within the system.

NOTE

If the configured version is v2c, then the notification is sent out in SMIv2 format, using the community string, but in cleartext mode. To send the SMIv2 notification in SNMPv3 packet format, configure v3 with auth or privacy parameters, or both, by specifying a security name. The actual authorization and privacy values are obtained from the security name.

For SNMP version 2c, enter **v2** and the name of the community string. This string is encrypted within the system.

For SNMP version 3, enter one of the following depending on the authorization required for the host:

- **v3 auth** <security-name>: Allow only authenticated packets.
- **v3 no auth** <security-name>: Allow all packets.
- **v3 priv** <security-name>: A password is required

For **port** <trap-UDP-port-number>, specify the UDP port number on the host that will receive the trap.

Trap MIB changes

To support the SNMP V3 trap feature, the Brocade Enterprise Trap MIB was rewritten in SMIv2 format, as follows:

- The MIB name was changed from FOUNDRY-SN-TRAP-MIB to FOUNDRY-SN-NOTIFICATION-MIB
- Individual notifications were changed to NOTIFICATION-TYPE instead of TRAP-TYPE.
- As per the SMIv2 format, each notification has an OID associated with it. The root node of the notification is snTraps (OID enterprise.foundry.0). For example, OID for snTrapRunningConfigChanged is {snTraps.73}. Earlier, each trap had a trap ID associated with it, as per the SMIv1 format.

Backward compatibility with SMIv1 trap format

The Brocade device will continue to support creation of traps in SMIv1 format, as before. To allow the device to send notifications in SMIv2 format, configure the device as described above. The default mode is still the original SMIv1 format.

Specifying an IPv6 host as an SNMP trap receiver

You can specify an IPv6 host as a trap receiver to ensure that all SNMP traps sent by the device will go to the same SNMP trap receiver or set of receivers, typically one or more host devices on the network. To do so, enter a command such as the following.

```
Brocade(config)#snmp-server host ipv6 2001:efff:89::13
```

Syntax: `snmp-server host ipv6 <ipv6-address>`

The <ipv6-address> must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

SNMP v3 over IPv6

Some FastIron devices support IPv6 for SNMP version 3.

Restricting SNMP Access to an IPv6 Node

You can restrict SNMP access so that the Brocade device can only be accessed by the IPv6 host address that you specify. To do so, enter a command such as the following .

```
Brocade(config)#snmp-client ipv6 2001:efff:89::23
```

Syntax: **snmp-client ipv6** <ipv6-address>

The <ipv6-address> must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

Specifying an IPv6 host as an SNMP trap receiver

You can specify an IPv6 host as a trap receiver to ensure that all SNMP traps sent by the Brocade device will go to the same SNMP trap receiver or set of receivers, typically one or more host devices on the network. To do so, enter the **snmp-server host ipv6** command .

```
Brocade(config)#snmp-server host ipv6 2001:efff:89::13
```

Syntax: **snmp-server host ipv6** <ipv6-address>

The <ipv6-address> must be in hexadecimal format using 16-bit values between colons as documented in RFC 2373.

Viewing IPv6 SNMP server addresses

Many of the existing **show** commands display IPv6 addresses for IPv6 SNMP servers. The following example shows output for the **show snmp server** command.

Displaying SNMP Information

```
Brocade#show snmp server
  Contact:
  Location:
  Community(ro): .....
  Traps
    Warm/Cold start: Enable
    Link up: Enable
    Link down: Enable
    Authentication: Enable
    Locked address violation: Enable
    Power supply failure: Enable
    Fan failure: Enable
    Temperature warning: Enable
    STP new root: Enable
    STP topology change: Enable
    vsrp: Enable

  Total Trap-Receiver Entries: 4
  Trap-Receiver IP-Address      Port-Number Community
  1      192.147.201.100        162      .....
  2      4000::200              162      .....
  3      192.147.202.100        162      .....
  4      3000::200              162      .....
```

Displaying SNMP Information

This section lists the commands for viewing SNMP-related information.

Displaying the Engine ID

To display the engine ID of a management module, enter a command such as the following.

```
Brocade#show snmp engineid
Local SNMP Engine ID: 800007c70300e05290ab60
Engine Boots: 3
Engine time: 5
```

Syntax: show snmp engineid

The engine ID identifies the source or destination of the packet.

The engine boots represents the number of times that the SNMP engine reinitialized itself with the same engine ID. If the engineID is modified, the boot count is reset to 0.

The engine time represents the current time with the SNMP agent.

Displaying SNMP groups

To display the definition of an SNMP group, enter a command such as the following.

```
Brocade#show snmp group
groupname = exceptifgrp
security model = v3
security level = authNoPriv
ACL id = 2
readview = exceptif
writeview = <none>
```

Syntax: show snmp group

The value for security level can be one of the following.

Security level	Authentication
<none>	If the security model shows v1 or v2, then security level is blank. User names are not used to authenticate users; community strings are used instead.
noauthNoPriv	Displays if the security model shows v3 and user authentication is by user name only.
authNoPriv	Displays if the security model shows v3 and user authentication is by user name and the MD5 or SHA algorithm.

Displaying user information

To display the definition of an SNMP user account, enter a command such as the following.

```
Brocade#show snmp user
username = bob
ACL id = 2
group = admin
security model = v3
group ACL id = 0
authtype = md5
authkey = 3aca18d90b8d172760e2dd2e8f59b7fe
privtype = des, privkey = 1088359afb3701730173a6332d406eec
engine ID= 800007c70300e052ab0000
```

Syntax: show snmp user

Interpreting varbinds in report packets

If an SNMP version 3 request packet is to be rejected by an SNMP agent, the agent sends a report packet that contains one or more varbinds. The varbinds contain additional information, showing the cause of failures. An SNMP manager application decodes the description from the varbind. The following table presents a list of varbinds supported by the SNMP agent.

Varbind object Identifier	Description
1. 3. 6. 1. 6. 3. 11. 2. 1. 3. 0	Unknown packet data unit.
1. 3. 6. 1. 6. 3. 12. 1. 5. 0	The value of the varbind shows the engine ID that needs to be used in the snmp-server engineid command
1. 3. 6. 1. 6. 3. 15. 1. 1. 1. 0	Unsupported security level.

Varbind object Identifier	Description
1. 3. 6. 1. 6. 3. 15. 1. 1. 2. 0	Not in time packet.
1. 3. 6. 1. 6. 3. 15. 1. 1. 3. 0	Unknown user name. This varbind may also be generated: <ul style="list-style-type: none"> • If the configured ACL for this user filters out this packet. • If the group associated with the user is unknown.
1. 3. 6. 1. 6. 3. 15. 1. 1. 4. 0	Unknown engine ID. The value of this varbind would be the correct authoritative engineID that should be used.
1. 3. 6. 1. 6. 3. 15. 1. 1. 5. 0	Wrong digest.
1. 3. 6. 1. 6. 3. 15. 1. 1. 6. 0	Decryption error.

SNMP v3 configuration examples

The following sections present examples of how to configure SNMP v3.

Simple SNMP v3 configuration

```
Brocade(config)#snmp-s group admingrp v3 priv read all write all notify all
Brocade(config)#snmp-s user adminuser admingrp v3 auth md5 <auth password> priv
<privacy password>
Brocade(config)#snmp-s host <dest-ip> version v3 privacy adminuser
```

More detailed SNMP v3 configuration

```
Brocade(config)#snmp-server view internet internet included
Brocade(config)#snmp-server view system system included
Brocade(config)#snmp-server community ..... ro
Brocade(config)#snmp-server community ..... rw
Brocade(config)#snmp-server contact isc-operations
Brocade(config)#snmp-server location sdh-pillbox
Brocade(config)#snmp-server host 128.91.255.32 .....
Brocade(config)#snmp-server group ops v3 priv read internet write system
Brocade(config)#snmp-server group admin v3 priv read internet write internet
Brocade(config)#snmp-server group restricted v3 priv read internet

Foundry Discovery Protocol (FDP) and Cisco Discovery Protocol (CDP) Packets

Table 77 lists individual Brocade switches and the discovery protocols they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 77 Supported discovery protocol features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Foundry Discovery Protocol (FDP) for IPv4 and IPv6 traffic	Yes	Yes	Yes	Yes	Yes
Cisco Discovery Protocol (CDP) for IPv4 and IPV6 traffic	Yes	Yes	Yes	Yes	Yes

FDP Overview

The Foundry Discovery Protocol (FDP) enables Brocade devices to advertise themselves to other Brocade devices on the network. When you enable FDP on a Brocade device, the device periodically advertises information including the following:

- Hostname (device ID)
- Product platform and capability
- Software version
- VLAN and Layer 3 protocol address information for the port sending the update. IP, IPX, and AppleTalk Layer 3 information is supported.

A Brocade device running FDP sends FDP updates on Layer 2 to MAC address 01-E0-52-CC-CC-CC. Other Brocade devices listening on that address receive the updates and can display the information in the updates. Brocade devices can send and receive FDP updates on Ethernet interfaces.

FDP is disabled by default.

NOTE

If FDP is not enabled on a Brocade device that receives an FDP update or the device is running a software release that does not support FDP, the update passes through the device at Layer 2.

FDP configuration

The following sections describe how to enable Foundry Discovery Protocol (FDP) and how to change the FDP update and hold timers.

Enabling FDP globally

To enable a Brocade device to globally send FDP packets, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)# fdp run
```

Syntax: [no] fdp run

The feature is disabled by default.

Enabling FDP at the interface level

By default, FDP is enabled at the interface level after FDP is enabled on the device.

When FDP is enabled globally, you can disable and re-enable FDP on individual ports.

Disable FDP by entering commands such as the following:

```
Brocade(config)# int e 2/1
Brocade(config-if-2/1)# no fdp enable
```

Enable or reenable FDP by entering commands such as the following:

```
Brocade(config-if-2/1)# fdp enable
```

Syntax: [no] fdp enable

Specifying the IP management address to advertise

When FDP is enabled, by default, the Brocade device advertises one IPv4 address and one IPv6 address to its FDP neighbors. If desired, you can configure the device to advertise only the IPv4 management address or only the IPv6 management address. You can set the configuration globally on a Layer 2 switch, or on an interface on a Layer 3 switch.

For example, to configure a Layer 2 switch to advertise the IPv4 address, enter the following command at the Global CONFIG level of the CLI:

```
Brocade(config)# fdp advertise ipv4
```

To configure a Layer 3 switch to advertise the IPv6 address, enter the following command at the Interface level of the CLI:

```
Brocade(config-if-2/1)# fdp advertise ipv6
```

Syntax: fdp advertise ipv4 | ipv6

Changing the FDP update timer

By default, a Brocade device enabled for FDP sends an FDP update every 60 seconds. You can change the update timer to a value from 5 – 900 seconds.

To change the FDP update timer, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)# fdp timer 120
```

Syntax: [no] **fdp timer** <secs>

The <secs> parameter specifies the number of seconds between updates and can be from 5 – 900 seconds. The default is 60 seconds.

Changing the FDP hold time

By default, a Brocade device that receives an FDP update holds the information until one of the following events occurs:

- The device receives a new update.
- 180 seconds have passed since receipt of the last update. This is the hold time.

Once either of these events occurs, the device discards the update.

To change the FDP hold time, enter the **fdp holdtime** command at the global CONFIG level of the CLI.

```
Brocade(config)# fdp holdtime 360
```

Syntax: [no] **fdp holdtime** <secs>

The <secs> parameter specifies the number of seconds a Brocade device that receives an FDP update can hold the update before discarding it. You can specify from 10 – 255 seconds. The default is 180 seconds.

Displaying FDP information

You can display the following Foundry Discovery Protocol (FDP) information:

- FDP entries for Brocade neighbors
- Individual FDP entries
- FDP information for an interface on the device you are managing
- FDP packet statistics

NOTE

If the Brocade device has intercepted CDP updates, then the CDP information is also displayed.

Displaying neighbor information

To display a summary list of all the Brocade neighbors that have sent FDP updates to this Brocade device, enter the **show fdp neighbor** command.

```
Brocade# show fdp neighbor
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, r - Repeater
(*) indicates a CDP device
```

Device ID	Local Int	Holdtm	Capability	Platform	Port ID
FastIronB	Eth 2/9	178	Router	FastIron Rou	Eth 2/9

Syntax: `show fdp neighbor [ethernet <port>] [detail]`

The **ethernet <port>** parameter lists the information for updates received on the specified port.

The **detail** parameter lists detailed information for each device.

The **show fdp neighbor** command, without optional parameters, displays the following information.

TABLE 78 Summary FDP and CDP neighbor information

This line...	Displays...
Device ID	The hostname of the neighbor.
Local Int	The interface on which this Brocade device received an FDP or CDP update for the neighbor.
Holdtm	The maximum number of seconds this device can keep the information received in the update before discarding it.
Capability	The role the neighbor is capable of playing in the network.
Platform	The product platform of the neighbor.
Port ID	The interface through which the neighbor sent the update.

To display detailed information, enter the **show fdp neighbor detail** command.

```
BrocadeA# show fdp neighbor detail
Device ID: FastIronB configured as default VLAN1, tag-type8100
Entry address(es):
  IP address: 192.168.0.13
  IPv6 address (Global): c:a:f:e:c:a:f:e
Platform: FastIron Router, Capabilities: Router
Interface: Eth 2/9
Port ID (outgoing port): Eth 2/9 is TAGGED in following VLAN(s):
  9 10 11
Holdtime : 176 seconds
Version :
Foundry, Inc. Router, IronWare Version 07.6.01b1T53 Compiled on Aug 29
2002 at 10:35:21 labeled as B2R07601b1
```

The **show fdp neighbor detail** command displays the following information.

TABLE 79 Detailed FDP and CDP neighbor information

Parameter	Definition
Device ID	The hostname of the neighbor. In addition, this line lists the VLAN memberships and other VLAN information for the neighbor port that sent the update to this device.
Entry address(es)	The Layer 3 protocol addresses configured on the neighbor port that sent the update to this device. If the neighbor is a Layer 2 Switch, this field lists the management IP address.
Platform	The product platform of the neighbor.
Capabilities	The role the neighbor is capable of playing in the network.
Interface	The interface on which this device received an FDP or CDP update for the neighbor.
Port ID	The interface through which the neighbor sent the update.
Holdtime	The maximum number of seconds this device can keep the information received in the update before discarding it.
Version	The software version running on the neighbor.

Displaying FDP entries

To display the detailed neighbor information for a specific device, enter the **show fdp entry FastIronx** command.

```
BrocadeA# show fdp entry FastIronB
Device ID: FastIronB configured as default VLAN1, tag-type8100
Entry address(es):
Platform: FastIron Router, Capabilities: Router
Interface: Eth 2/9
Port ID (outgoing port): Eth 2/9 is TAGGED in following VLAN(s):
 9 10 11
Holdtime : 176 seconds
Version :
Foundry, Inc. Router, IronWare Version 07.6.01b1T53 Compiled on Aug 29
2002 at 10:35:21 labeled as B2R07601b1
```

Syntax: **show fdp entry * | <device-id>**

The *** | <device-id>** parameter specifies the device ID. If you enter *****, the detailed updates for all neighbor devices are displayed. If you enter a specific device ID, the update for that device is displayed. For information about the display, refer to [Table 79](#).

Displaying FDP information for an interface

To display FDP information for an interface, enter a command such as the following.

```
BrocadeA# show fdp interface ethernet 2/3
FastEthernet2/3 is up, line protocol is up
Encapsulation ethernet
Sending FDP packets every 5 seconds
Holdtime is 180 seconds
```

This example shows information for Ethernet port 2/3. The port sends FDP updates every 5 seconds. Neighbors that receive the updates can hold them for up to 180 seconds before discarding them.

Syntax: `show fdp interface [ethernet <port>]`

The **ethernet <port>** parameter lists the information only for the specified interface.

Displaying FDP and CDP statistics

To display FDP and CDP packet statistics, enter the following command.

```
BrocadeA# show fdp traffic
CDP/FDP counters:
  Total packets output: 6, Input: 5
  Hdr syntax: 0, Chksum error: 0, Encaps failed: 0
  No memory: 0, Invalid packet: 0, Fragmented: 0
  Internal errors: 0
```

Syntax: `show fdp traffic`

Clearing FDP and CDP information

You can clear the following FDP and CDP information:

- Information received in FDP and CDP updates
- FDP and CDP statistics

The same commands clear information for both FDP and CDP.

Clearing FDP and CDP neighbor information

To clear the information received in FDP and CDP updates from neighboring devices, enter the following command.

```
Brocade# clear fdp table
```

Syntax: `clear fdp table`

NOTE

This command clears all the updates for FDP and CDP.

Clearing FDP and CDP statistics

To clear FDP and CDP statistics, enter the following command.

```
Brocade# clear fdp counters
```

Syntax: `clear fdp counters`

CDP packets

Cisco Discovery Protocol (CDP) packets are used by Cisco devices to advertise themselves to other Cisco devices. By default, Brocade devices forward these packets without examining their contents. You can configure a Brocade device to intercept and display the contents of CDP packets. This feature is useful for learning device and interface information for Cisco devices in the network.

Brocade devices support intercepting and interpreting CDP version 1 and version 2 packets.

NOTE

The Brocade device can interpret only the information fields that are common to both CDP version 1 and CDP version 2.

NOTE

When you enable interception of CDP packets, the Brocade device drops the packets. As a result, Cisco devices will no longer receive the packets.

Enabling interception of CDP packets globally

To enable the device to intercept and display CDP packets, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)# cdp run
```

Syntax: [no] cdp run

The feature is disabled by default.

Enabling interception of CDP packets on an interface

You can disable and enable CDP at the interface level.

You can enter commands such as the following.

```
Brocade(config)# int e 2/1
Brocade(config-if-2/1)# cdp enable
```

Syntax: [no] cdp enable

By default, the feature is enabled on an interface once CDP is enabled on the device.

Displaying CDP information

You can display the following CDP information:

- Cisco neighbors
- CDP entries for all Cisco neighbors or a specific neighbor
- CDP packet statistics

Displaying neighbors

To display the Cisco neighbors the Brocade device has learned from CDP packets, enter the **show fdp neighbors** command.

```
Brocade# show fdp neighbors
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, r - Repeater
(*) indicates a Cisco device

   Device ID      Local Int    Holdtm Capability Platform    Port ID
   -----
  (*)Router      Eth 1/1      124    R          cisco RSP4
FastEthernet5/0/0
```

To display detailed information for the neighbors, enter the **show fdp neighbors detail** command.

```
Brocade# show fdp neighbors detail
Device ID: Router
Entry address(es):
  IP address: 207.95.6.143
Platform: cisco RSP4, Capabilities: Router
Interface: Eth 1/1, Port ID (outgoing port): FastEthernet5/0/0
Holdtime : 150 seconds
Version :
Cisco Internetwork Operating System Software

(fc1)
Copyright (c) 1986-1999 by cisco Systems, Inc.
Compiled Thu 19-Aug-99 04:12 by cmong
```

To display information about a neighbor attached to a specific port, enter a command such as the following.

```
Brocade# show fdp neighbors ethernet 1/1
Device ID: Router
Entry address(es):
  IP address: 207.95.6.143
Platform: cisco RSP4, Capabilities: Router
Interface: Eth 1/1, Port ID (outgoing port): FastEthernet5/0/0
Holdtime : 127 seconds
Version :
Cisco Internetwork Operating System Software

Compiled Thu 19-Aug-99 04:12 by cmong
```

Syntax: **show fdp neighbors** [**detail** | **ethernet** <port>]

Displaying CDP entries

To display CDP entries for all neighbors, enter the **show fdp entry** command.

```
Brocade# show fdp entry *
Device ID: Router
Entry address(es):
  IP address: 207.95.6.143
Platform: cisco RSP4, Capabilities: Router
Interface: Eth 1/1, Port ID (outgoing port): FastEthernet5/0/0
Holdtime : 124 seconds
Version :
Cisco Internetwork Operating System Software
IOS (tm) RSP Software (RSP-JSV-M), Version 12.0(5)T1, RELEASE SOFTWARE
(fcl)
Copyright (c) 1986-1999 by cisco Systems, Inc.
Compiled Thu 19-Aug-99 04:12 by cmong
```

To display CDP entries for a specific device, specify the device ID, as shown in the following example.

```
Brocade# show fdp entry Router1
Device ID: Router1
Entry address(es):
  IP address: 207.95.6.143
Platform: cisco RSP4, Capabilities: Router
Interface: Eth 1/1, Port ID (outgoing port): FastEthernet5/0/0
Holdtime : 156 seconds
Version :
Cisco Internetwork Operating System Software
IOS (tm) RSP Software (RSP-JSV-M), Version 12.0(5)T1, RELEASE SOFTWARE
(fcl)
Copyright (c) 1986-1999 by cisco Systems, Inc.
Compiled Thu 19-Aug-99 04:12 by cmong
```

Syntax: **show fdp entry *** | <device-id>

Displaying CDP statistics

To display CDP packet statistics, enter the **show fdp traffic** command.

```
Brocade# show fdp traffic
CDP counters:
  Total packets output: 0, Input: 3
  Hdr syntax: 0, Chksum error: 0, Encaps failed: 0
  No memory: 0, Invalid packet: 0, Fragmented: 0
```

Syntax: **show fdp traffic**

Clearing CDP information

You can clear the following CDP information:

- Cisco Neighbor information
- CDP statistics

CDP packets

To clear the Cisco neighbor information, enter the **clear fdp table** command.

```
Brocade# clear fdp table
```

Syntax: clear fdp table

To clear CDP statistics, enter the following command.

```
Brocade# clear fdp counters
```

Syntax: clear fdp counters

LLDP and LLDP-MED

Table 80 lists the individual Brocade FastIron switches and the Link Layer Discovery Protocol (LLDP) features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 80 Supported LLDP features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
LLDP	Yes	Yes	Yes	Yes	Yes
LLDP-MED	Yes	Yes	Yes	Yes	Yes
Support for tagged LLDP packets	Yes	Yes	Yes	Yes	Yes
IPv4 management address advertisement	Yes	Yes	Yes	Yes	Yes
IPv6 management address advertisement	Yes	Yes	Yes	Yes	Yes
LLDP operating mode setting per port	Yes	Yes	Yes	Yes	Yes
Setting the maximum number of LLDP neighbors	Yes	Yes	Yes	Yes	Yes
SNMP and Syslog messages	Yes	Yes	Yes	Yes	Yes
LLDP transmission intervals	Yes	Yes	Yes	Yes	Yes
Holdtime multiplier for transmit TTL	Yes	Yes	Yes	Yes	Yes
Configuring the minimum time between port reinitializations	Yes	Yes	Yes	Yes	Yes
Fast start repeat count for LLDP-MED	Yes	Yes	Yes	Yes	Yes
Location ID for LLDP-MED	Yes	Yes	Yes	Yes	Yes
LLDP-MED network policy	Yes	Yes	Yes	Yes	Yes
LLDP statistics and configuration details	Yes	Yes	Yes	Yes	Yes

This chapter describes how to configure the following protocols:

Link layer discovery protocol (LLDP) – The Layer 2 network discovery protocol described in the IEEE 802.1AB standard, *Station and Media Access Control Connectivity Discovery*. This protocol enables a station to advertise its capabilities to, and to discover, other LLDP-enabled stations in the same 802 LAN segments.

LLDP media endpoint devices (LLDP-MED) – The Layer 2 network discovery protocol extension described in the ANSI/TIA-1057 standard, *LLDP for Media Endpoint Devices*. This protocol enables a switch to configure and manage connected Media Endpoint devices that need to send media streams across the network (e.g., IP telephones and security cameras).

LLDP enables network discovery between Network Connectivity devices (such as switches), whereas LLDP-MED enables network discovery at the edge of the network, between Network Connectivity devices and media Endpoint devices (such as IP phones).

The information generated by LLDP and LLDP-MED can be used to diagnose and troubleshoot misconfigurations on both sides of a link. For example, the information generated can be used to discover devices with misconfigured or unreachable IP addresses, and to detect port speed and duplex mismatches.

LLDP and LLDP-MED facilitate interoperability across multiple vendor devices. Brocade devices running LLDP can interoperate with third-party devices running LLDP.

The Brocade LLDP and LLDP-MED implementation adheres to the IEEE 802.1AB and TIA-1057 standards.

LLDP terms used in this chapter

Endpoint device – An LLDP-MED device located at the network edge, that provides some aspect of IP communications service based on IEEE 802 LAN technology. An Endpoint device is classified in one of three class types (I, II, or III) and can be an IP telephone, softphone, VoIP gateway, or conference bridge, among others.

LLDP agent – The protocol entity that implements LLDP for a particular IEEE 802 device. Depending on the configured LLDP operating mode, an LLDP agent can send and receive LLDP advertisements (frames), or send LLDP advertisements only, or receive LLDP advertisements only.

LLDPDU (LLDP Data Unit) – A unit of information in an LLDP packet that consists of a sequence of short variable length information elements, known as **TLVs**. LLDP pass-through is not supported in conformance to IEEE standard.

MIB (Management Information Base) – A virtual database that identifies each manageable object by its name, syntax, accessibility, and status, along with a text description and unique object identifier (OID). The database is accessible by a Network Management Station (NMS) using a management protocol such as the Simple Network Management Protocol (SNMP).

Network connectivity device – A forwarding 802 LAN device, such as a router, switch, or wireless access point.

Station – A node in a network.

TLV (Type-Length-Value) – An information element in an LLDPDU that describes the type of information being sent, the length of the information string, and the value (actual information) that will be transmitted.

TTL (Time-to-Live) – Specifies the length of time that the receiving device should maintain the information acquired through LLDP in its MIB.

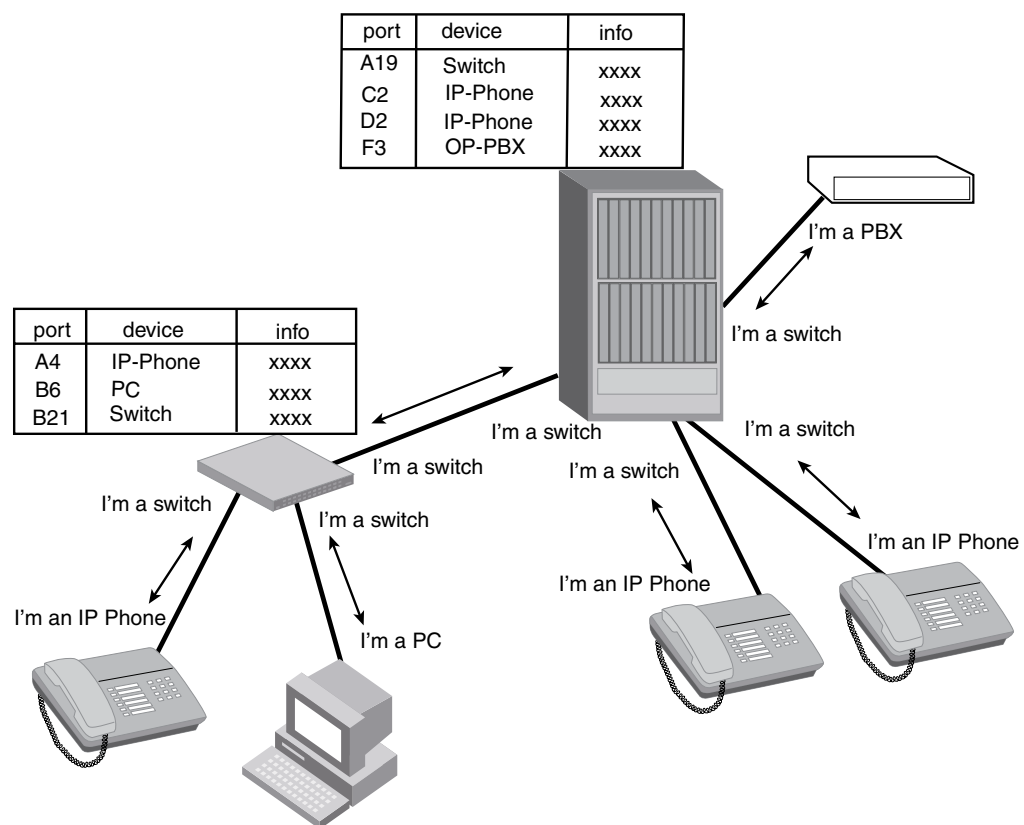

LLDP overview

LLDP enables a station attached to an IEEE 802 LAN/MAN to advertise its capabilities to, and to discover, other stations in the same 802 LAN segments.

The information distributed by LLDP (the advertisement) is stored by the receiving device in a standard Management Information Base (MIB), accessible by a Network Management System (NMS) using a management protocol such as the Simple Network Management Protocol (SNMP). The information also can be viewed from the CLI, using **show LLDP** commands.

Figure 34 illustrates LLDP connectivity

FIGURE 34 LLDP connectivity

Benefits of LLDP

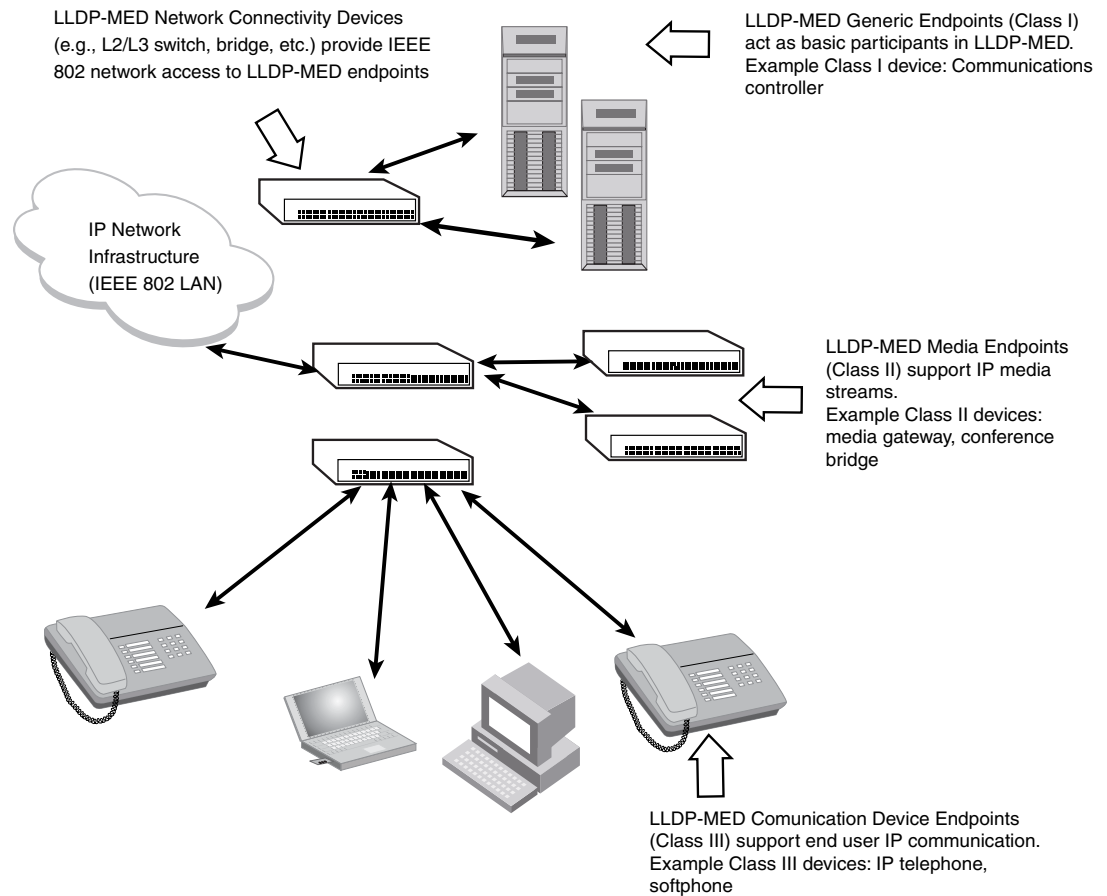

LLDP provides the following benefits:

- Network Management:
 - Simplifies the use of and enhances the ability of network management tools in multi-vendor environments
 - Enables discovery of accurate physical network topologies such as which devices are neighbors and through which ports they connect
 - Enables discovery of stations in multi-vendor environments
- Network Inventory Data:
 - Supports optional system name, system description, system capabilities and management address
 - System description can contain the device product name or model number, version of hardware type, and operating system
 - Provides device capability, such as switch, router, or WLAN access point
- Network troubleshooting:
 - Information generated by LLDP can be used to detect speed and duplex mismatches
 - Accurate topologies simplify troubleshooting within enterprise networks
 - Can discover devices with misconfigured or unreachable IP addresses

LLDP-MED overview

LLDP-MED is an extension to LLDP. This protocol enables advanced LLDP features in a Voice over IP (VoIP) network. Whereas LLDP enables network discovery between Network Connectivity devices, LLDP-MED enables network discovery between Network Connectivity devices and media Endpoints such as, IP telephones, softphones, VoIP gateways and conference bridges

.[Figure 35](#) demonstrates LLDP-MED connectivity.

FIGURE 35 LLDP-MED connectivity

Benefits of LLDP-MED

LLDP-MED provides the following benefits:

- Vendor-independent management capabilities, enabling different IP telephony systems to interoperate in one network.
- Automatically deploys network policies, such as Layer 2 and Layer 3 QoS policies and Voice VLANs.
- Supports E-911 Emergency Call Services (ECS) for IP telephony
- Collects Endpoint inventory information
- Network troubleshooting
 - Helps to detect improper network policy configuration

LLDP-MED class

An LLDP-MED class specifies an Endpoint type and its capabilities. An Endpoint can belong to one of three LLDP-MED class types:

- **Class 1 (Generic endpoint)** – A Class 1 Endpoint requires basic LLDP discovery services, but does not support IP media nor does it act as an end-user communication appliance. A Class 1 Endpoint can be an IP communications controller, other communication-related server, or other device requiring basic LLDP discovery services.
- **Class 2 (Media endpoint)** – A Class 2 Endpoint supports media streams and may or may not be associated with a particular end user. Device capabilities include media streaming, as well as all of the capabilities defined for Class 1 Endpoints. A Class 2 Endpoint can be a voice/media gateway, conference, bridge, media server, etc..
- **Class 3 (Communication endpoint)** – A Class 3 Endpoint supports end user IP communication. Capabilities include aspects related to end user devices, as well as all of the capabilities defined for Class 1 and Class 2 Endpoints. A Class 3 Endpoint can be an IP telephone, softphone (PC-based phone), or other communication device that directly supports the end user.

Discovery services defined in Class 3 include location identifier (ECS/E911) information and inventory management.

The LLDP-MED device class is advertised when LLDP-MED is enabled on a port.

Figure 35 illustrates LLDP-MED connectivity and supported LLDP-MED classes.

General LLDP operating principles

LLDP and LLDP-MED use the services of the Data Link sublayers, Logical Link Control and Media Access Control, to transmit and receive information to and from other **LLDP Agents** (protocol entities that implement LLDP).

LLDP is a one-way protocol. An LLDP agent can transmit and receive information to and from another LLDP agent located on an adjacent device, but it cannot solicit information from another LLDP agent, nor can it acknowledge information received from another LLDP agent.

LLDP operating modes

When LLDP is enabled on a global basis, by default, each port on the Brocade device will be capable of transmitting and receiving LLDP packets. You can disable a port's ability to transmit and receive LLDP packets, or change the operating mode to one of the following:

- Transmit LLDP information only
- Receive LLDP information only

LLDP transmit mode

An LLDP agent sends LLDP packets to adjacent LLDP-enabled devices. The LLDP packets contain information about the transmitting device and port.

An LLDP agent initiates the transmission of LLDP packets whenever the transmit countdown timing counter expires, or whenever LLDP information has changed. When a transmit cycle is initiated, the LLDP manager extracts the MIB objects and formats this information into TLVs. The TLVs are inserted into an LLDPDU, addressing parameters are prepended to the LLDPDU, and the information is sent out LLDP-enabled ports to adjacent LLDP-enabled devices.

LLDP receive mode

An LLDP agent receives LLDP packets from adjacent LLDP-enabled devices. The LLDP packets contain information about the transmitting device and port.

When an LLDP agent receives LLDP packets, it checks to ensure that the LLDPDUs contain the correct sequence of mandatory TLVs, then validates optional TLVs. If the LLDP agent detects any errors in the LLDPDUs and TLVs, it drops them in software. TLVs that are not recognized but do not contain basic formatting errors, are assumed to be valid and are assigned a temporary identification index and stored for future possible alter retrieval by network management. All validated TLVs are stored in the neighbor database.

LLDP packets

LLDP agents transmit information about a sending device/port in packets called LLDP Data Units (LLDPDUs). All the LLDP information to be communicated by a device is contained within a single 1500 byte packet. A device receiving LLDP packets is not permitted to combine information from multiple packets.

As shown in [Figure 36](#), each LLDPDU has three mandatory TLVs, an End of LLDPDU TLV, plus optional TLVs as selected by network management.

FIGURE 36 LLDPDU packet format

M = mandatory TLV (required for all LLDPDUs)

Each LLDPDU consists of an untagged Ethernet header and a sequence of short, variable length information elements known as type, length, value (TLV).

TLVs have Type, Length, and Value fields, where:

- **Type** identifies the kind of information being sent
- **Length** indicates the length (in octets) of the information string
- **Value** is the actual information being sent (for example, a binary bit map or an alpha-numeric string containing one or more fields).

TLV support

This section lists the LLDP and LLDP-MED TLV support.

LLDP TLVs

There are two types of LLDP TLVs, as specified in the IEEE 802.3AB standard:

- **Basic management TLVs** consist of both optional general system information TLVs as well as mandatory TLVs.

Mandatory TLVs cannot be manually configured. They are always the first three TLVs in the LLDPDU, and are part of the packet header.

General system information TLVs are optional in LLDP implementations and are defined by the Network Administrator.

Brocade devices support the following Basic Management TLVs:

- Chassis ID (mandatory)
- Port ID (mandatory)
- Time to Live (mandatory)
- Port description
- System name
- System description
- System capabilities
- Management address
- End of LLDPDU
- **Organizationally-specific TLVs** are optional in LLDP implementations and are defined and encoded by individual organizations or vendors. These TLVs include support for, but are not limited to, the IEEE 802.1 and 802.3 standards and the TIA-1057 standard.

Brocade devices support the following Organizationally-specific TLVs:

- **802.1 organizationally-specific TLVs**

Port VLAN ID

VLAN name TLV

- **802.3 organizationally-specific TLVs**

MAC/PHY configuration/status

Power through MDI

Link aggregation

Maximum frame size

LLDP-MED TLVs

Brocade devices honor and send the following LLDP-MED TLVs, as defined in the TIA-1057 standard:

- LLDP-MED capabilities
- Network policy
- Location identification
- Extended power-via-MDI

Mandatory TLVs

When an LLDP agent transmits LLDP packets to other agents in the same 802 LAN segments, the following mandatory TLVs are always included:

- Chassis ID
- Port ID
- Time to Live (TTL)

This section describes the above TLVs in detail.

Chassis ID

The Chassis ID identifies the device that sent the LLDP packets.

There are several ways in which a device may be identified. A chassis ID subtype, included in the TLV and shown in [Table 81](#), indicates how the device is being referenced in the Chassis ID field.

TABLE 81 Chassis ID subtypes

ID subtype	Description
0	Reserved
1	Chassis component
2	Interface alias
3	Port component
4	MAC address
5	Network address
6	Interface name
7	Locally assigned
8 – 255	Reserved

Brocade devices use chassis ID subtype 4, the base MAC address of the device. Other third party devices may use a chassis ID subtype other than 4. The chassis ID will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
Chassis ID (MAC address): 0012.f233.e2c0
```

The chassis ID TLV is always the first TLV in the LLDPDU.

Port ID

The Port ID identifies the port from which LLDP packets were sent.

There are several ways in which a port may be identified, as shown in [Figure 82](#). A port ID subtype, included in the TLV, indicates how the port is being referenced in the Port ID field.

TABLE 82 Port ID subtypes

ID subtype	Description
0	Reserved
1	Interface alias
2	Port component
3	MAC address
4	Network address
5	Interface name
6	Agent circuit ID
7	Locally assigned
8 – 255	Reserved

Brocade devices use port ID subtype 3, the permanent MAC address associated with the port. Other third party devices may use a port ID subtype other than 3. The port ID appears similar to the following on the remote device, and in the CLI display output on the Brocade device (show lldp local-info).

```
Port ID (MAC address): 0012.f233.e2d3
```

The LLDPDU format is shown in [“LLDPDU packet format”](#) on page 453.

The Port ID TLV format is shown below.

FIGURE 37 Port ID TLV packet format

TTL value

The Time to Live (TTL) Value is the length of time the receiving device should maintain the information acquired by LLDP in its MIB.

The TTL value is automatically computed based on the LLDP configuration settings. The TTL value will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (show lldp local-info).

```
Time to live: 40 seconds
```

If the TTL field has a value other than zero, the receiving LLDP agent is notified to completely replace all information associated with the LLDP agent/port with the information in the received LLDPDU.

If the TTL field value is zero, the receiving LLDP agent is notified that all system information associated with the LLDP agent/port is to be deleted. This TLV may be used, for example, to signal that the sending port has initiated a port shutdown procedure.

The LLDPDU format is shown in [“LLDPDU packet format”](#) on page 453.

The TTL TLV format is shown below.

FIGURE 38 TTL TLV packet format

MIB support

Brocade devices support the following standard management information base (MIB) modules:

- LLDP-MIB
- LLDP-EXT-DOT1-MIB
- LLDP-EXT-DOT3-MIB
- LLDP-EXT-MED-MIB

Syslog messages

Syslog messages for LLDP provide management applications with information related to MIB data consistency and general status. These Syslog messages correspond to the `IldpRemTablesChange` SNMP notifications. Refer to [“Enabling LLDP SNMP notifications and Syslog messages”](#) on page 462.

Syslog messages for LLDP-MED provide management applications with information related to topology changes. These Syslog messages correspond to the `IldpXMedTopologyChangeDetected` SNMP notifications. Refer to [“Enabling SNMP notifications and Syslog messages for LLDP-MED topology changes”](#) on page 475.

LLDP configuration

This section describes how to enable and configure LLDP.

[Table 83](#) lists the LLDP global-level tasks and the default behavior/value for each task.

TABLE 83 LLDP global configuration tasks and default behavior /value

Global task	Default behavior / value when LLDP is enabled
Enabling LLDP on a global basis	Disabled
Specifying the maximum number of LLDP neighbors per device	Automatically set to 392 neighbors per device
Specifying the maximum number of LLDP neighbors per port	Automatically set to 4 neighbors per port
Enabling SNMP notifications and Syslog messages	Disabled
Changing the minimum time between SNMP traps and Syslog messages	Automatically set to 2 seconds when SNMP notifications and Syslog messages for LLDP are enabled
Enabling and disabling TLV advertisements	When LLDP transmit is enabled, by default, the Brocade device will automatically advertise LLDP capabilities, except for the system description, VLAN name, and power-via-MDI information, which may be configured by the system administrator. Also, if desired, you can disable the advertisement of individual TLVs.
Changing the minimum time between LLDP transmissions	Automatically set to 2 seconds
Changing the interval between regular LLDP transmissions	Automatically set to 30 seconds
Changing the holdtime multiplier for transmit TTL	Automatically set to 4
Changing the minimum time between port reinitializations	Automatically set to 2 seconds

LLDP configuration notes and considerations

- LLDP is supported on Ethernet interfaces only.
- If a port is 802.1X-enabled, the transmission and reception of LLDP packets will only take place while the port is authorized.
- Cisco Discovery Protocol (CDP) and Brocade Discovery Protocol (FDP) run independently of LLDP. Therefore, these discovery protocols can run simultaneously on the same device.
- By default, the Brocade device limits the number of neighbors per port to four, and staggers the transmission of LLDP packets on different ports, in order to minimize any high-usage spikes to the CPU.
- By default, the Brocade device forwards
- Ports that are in blocking mode (spanning tree) can still receive LLDP packets from a forwarding port.
- Auto-negotiation status indicates what is being advertised by the port for 802.3 auto-negotiation.

Enabling and disabling LLDP

LLDP is enabled by default on individual ports. However, to run LLDP, you must first enable it on a global basis (on the entire device).

To enable LLDP globally, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)#lldp run
```

Syntax: [no] lldp run

Enabling support for tagged LLDP packets

By default, Brocade devices do not accept tagged LLDP packets from other vendors' devices. To enable support, apply the command **lldp tagged-packets process** at the Global CONFIG level of the CLI. When enabled, the device will accept incoming LLDP tagged packets if the VLAN tag matches any of the following:

- a configured VLAN on the port
- the default VLAN for a tagged port
- the configured untagged VLAN for a dual-mode port

To enable support for tagged LLDP packets, enter the following command.

```
Brocade(config)#lldp tagged-packets process
```

Syntax: [no] lldp tagged-packets process

Changing a port LLDP operating mode

LLDP packets are not exchanged until LLDP is enabled on a global basis. When LLDP is enabled on a global basis, by default, each port on the Brocade device will be capable of transmitting and receiving LLDP packets. You can disable a port's ability to transmit and receive LLDP packets, or change the operating mode to one of the following:

- Transmit LLDP information only
- Receive LLDP information only

You can configure a different operating mode for each port on the Brocade device. For example, you could disable the receipt and transmission of LLDP packets on port e 2/1, configure port e 2/3 to only receive LLDP packets, and configure port e 2/5 to only transmit LLDP packets.

The following sections show how to change the operating mode.

Enabling and disabling receive and transmit mode

To disable the receipt and transmission of LLDP packets on individual ports, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#no lldp enable ports e 2/4 e 2/5
```

The above command disables LLDP on ports 2/4 and 2/5. These ports will not transmit nor receive LLDP packets.

To enable LLDP on a port after it has been disabled, enter the following command.

```
Brocade(config)#lldp enable ports e 2/4
```

Syntax: `[no] lldp enable ports ethernet <port-list> | all`

Use the `[no]` form of the command to disable the receipt and transmission of LLDP packets on a port.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

NOTE

When a port is configured to both receive and transmit LLDP packets and the MED capabilities TLV is enabled, LLDP-MED is enabled as well. LLDP-MED is not enabled if the operating mode is set to receive only or transmit only.

Enabling and disabling receive only mode

When LLDP is enabled on a global basis, by default, each port on the Brocade device will be capable of transmitting and receiving LLDP packets. To change the LLDP operating mode from receive and transmit mode to receive only mode, simply disable the transmit mode. Enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#no lldp enable transmit ports e 2/4 e 2/5 e 2/6
```

The above command changes the LLDP operating mode on ports 2/4, 2/5, and 2/6 from transmit and receive mode to receive only mode.

To change a port LLDP operating mode from transmit only to receive only, first disable the transmit only mode, then enable the receive only mode. Enter commands such as the following.

```
Brocade(config)#no lldp enable transmit ports e 2/7 e 2/8 e 2/9
Brocade(config)#lldp enable receive ports e 2/7 e 2/8 e 2/9
```

The above commands change the LLDP operating mode on ports 2/7, 2/8, and 2/9, from transmit only to receive only. Note that if you do not disable the transmit only mode, you will configure the port to both transmit and receive LLDP packets.

NOTE

LLDP-MED is not enabled when you enable the receive only operating mode. To enable LLDP-MED, you must configure the port to both receive and transmit LLDP packets. Refer to [“Enabling and disabling receive and transmit mode”](#) on page 459.

Syntax: `[no] lldp enable receive ports ethernet <port-list> | all`

Use the `[no]` form of the command to disable the receive only mode.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Enabling and Disabling Transmit Only Mode

When LLDP is enabled on a global basis, by default, each port on the Brocade device will be capable of transmitting and receiving LLDP packets. To change the LLDP operating mode to transmit only mode, simply disable the receive mode. Enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#no lldp enable receive ports e 2/4 e 2/5 e 2/6
```

The above command changes the LLDP operating mode on ports 2/4, 2/5, and 2/6 from transmit and receive mode to transmit only mode. Any incoming LLDP packets will be dropped in software.

To change a port LLDP operating mode from receive only to transmit only, first disable the receive only mode, then enable the transmit only mode. For example, enter commands such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#no lldp enable receive ports e 2/7 e 2/8
Brocade(config)#lldp enable transmit ports e 2/7 e 2/8
```

The above commands change the LLDP operating mode on ports 2/7 and 2/8 from receive only mode to transmit only mode. Any incoming LLDP packets will be dropped in software. Note that if you do not disable receive only mode, you will configure the port to both receive and transmit LLDP packets.

NOTE

LLDP-MED is not enabled when you enable the transmit only operating mode. To enable LLDP-MED, you must configure the port to both receive and transmit LLDP packets. Refer to [“Enabling and disabling receive and transmit mode”](#) on page 459.

Syntax: `[no] lldp enable transmit ports ethernet <port-list> | all`

Use the [no] form of the command to disable the *transmit only* mode.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Maximum number of LLDP neighbors

You can change the limit of the number of LLDP neighbors for which LLDP data will be retained, per device as well as per port.

Specifying the maximum number of LLDP neighbors per device

You can change the maximum number of neighbors for which LLDP data will be retained for the entire system.

For example, to change the maximum number of LLDP neighbors for the entire device to 26, enter the following command.

```
Brocade(config)#lldp max-total-neighbors 26
```

Syntax: [no] lldp max-total-neighbors <value>

Use the [no] form of the command to remove the static configuration and revert to the default value of 392.

where <value> is a number between 16 and 8192. The default number of LLDP neighbors per device is 392.

Use the **show lldp** command to view the configuration.

Specifying the maximum number of LLDP neighbors per port

You can change the maximum number of LLDP neighbors for which LLDP data will be retained for each port. By default, the maximum number is four and you can change this to a value between one and 64.

For example, to change the maximum number of LLDP neighbors to six, enter the following command.

```
Brocade(config)#lldp max-neighbors-per-port 6
```

Syntax: [no] lldp max-neighbors-per-port <value>

Use the [no] form of the command to remove the static configuration and revert to the default value of four.

where <value> is a number from 1 to 64. The default is number of LLDP neighbors per port is four.

Use the **show lldp** command to view the configuration.

Enabling LLDP SNMP notifications and Syslog messages

SNMP notifications and Syslog messages for LLDP provide management applications with information related to MIB data updates and general status.

When you enable LLDP SNMP notifications, corresponding Syslog messages are enabled as well. When you enable LLDP SNMP notifications, the device will send traps and corresponding Syslog messages whenever there are changes to the LLDP data received from neighboring devices.

LLDP SNMP notifications and corresponding Syslog messages are disabled by default. To enable them, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp enable snmp notifications ports e 4/2 to 4/6
```

The above command enables SNMP notifications and corresponding Syslog messages on ports 4/2 and 4/6. By default, the device will send no more than one SNMP notification and Syslog message within a five second period. If desired, you can change this interval. Refer to [“Specifying the minimum time between SNMP traps and Syslog messages”](#) on page 463.

Syntax: [no] lldp enable snmp notifications ports ethernet <port-list> | all

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Specifying the minimum time between SNMP traps and Syslog messages

When SNMP notifications and Syslog messages for LLDP are enabled, the device will send no more than one SNMP notification and corresponding Syslog message within a five second period. If desired, you can throttle the amount of time between transmission of SNMP traps (lldpRemTablesChange) and Syslog messages from five seconds up to a value equal to one hour (3600 seconds).

NOTE

Because LLDP Syslog messages are rate limited, some LLDP information given by the system will not match the current LLDP statistics (as shown in the **show lldp statistics** command output).

To change the minimum time interval between traps and Syslog messages, enter a command such as the following.

```
Brocade(config)#lldp snmp-notification-interval 60
```

When the above command is applied, the LLDP agent will send no more than one SNMP notification and Syslog message every 60 seconds.

Syntax: [no] lldp snmp-notification-interval <seconds>

where <seconds> is a value between 5 and 3600. The default is 5 seconds.

Changing the minimum time between LLDP transmissions

The LLDP transmit delay timer limits the number of LLDP frames an LLDP agent can send within a specified time frame. When you enable LLDP, the system automatically sets the LLDP transmit delay timer to two seconds. If desired, you can change the default behavior from two seconds to a value between 1 and 8192 seconds.

NOTE

The LLDP transmit delay timer must not be greater than one quarter of the LLDP transmission interval (CLI command **lldp transmit-interval**).

The LLDP transmit delay timer prevents an LLDP agent from transmitting a series of successive LLDP frames during a short time period, when rapid changes occur in LLDP. It also increases the probability that multiple changes, rather than single changes, will be reported in each LLDP frame.

To change the LLDP transmit delay timer, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp transmit-delay 7
```

The above command causes the LLDP agent to wait a minimum of seven seconds after transmitting an LLDP frame and before sending another LLDP frame.

Syntax: **[no] lldp transmit-delay <seconds>**

where <seconds> is a value between 1 and 8192. The default is two seconds. Note that this value must not be greater than one quarter of the LLDP transmission interval (CLI command **lldp transmit-interval**).

Changing the interval between regular LLDP transmissions

The LLDP transmit interval specifies the number of seconds between regular LLDP packet transmissions. When you enable LLDP, by default, the device will wait 30 seconds between regular LLDP packet transmissions. If desired, you can change the default behavior from 30 seconds to a value between 5 and 32768 seconds.

To change the LLDP transmission interval, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp transmit-interval 40
```

The above command causes the LLDP agent to transmit LLDP frames every 40 seconds.

Syntax: **[no] lldp transmit-interval <seconds>**

where <seconds> is a value from 5 to 32768. The default is 30 seconds.

NOTE

Setting the transmit interval or transmit holdtime multiplier, or both, to inappropriate values can cause the LLDP agent to transmit LLDPDUs with TTL values that are excessively high. This in turn can affect how long a receiving device will retain the information if it is not refreshed.

Changing the holdtime multiplier for transmit TTL

The holdtime multiplier for transmit TTL is used to compute the actual time-to-live (TTL) value used in an LLDP frame. The TTL value is the length of time the receiving device should maintain the information in its MIB. When you enable LLDP, the device automatically sets the holdtime multiplier for TTL to four. If desired, you can change the default behavior from four to a value between two and ten.

To compute the TTL value, the system multiplies the LLDP transmit interval by the holdtime multiplier. For example, if the LLDP transmit interval is 30 and the holdtime multiplier for TTL is 4, then the value 120 is encoded in the TTL field in the LLDP header.

To change the holdtime multiplier, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp transmit-hold 6
```

Syntax: [no] lldp transmit-hold <value>

where <value> is a number from 2 to 10. The default value is 4.

NOTE

Setting the transmit interval or transmit holdtime multiplier, or both, to inappropriate values can cause the LLDP agent to transmit LLDPDUs with TTL values that are excessively high. This in turn can affect how long a receiving device will retain the information if it is not refreshed.

Changing the minimum time between port reinitializations

The LLDP re-initialization delay timer specifies the minimum number of seconds the device will wait from when LLDP is disabled on a port, until it will honor a request to re-enable LLDP on that port. When you enable LLDP, the system sets the re-initialization delay timer to two seconds. If desired, you can change the default behavior from two seconds to a value between one and ten seconds.

To set the re-initialization delay timer, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp reinit-delay 5
```

The above command causes the device to wait five seconds after LLDP is disabled, before attempting to honor a request to re-enable it.

Syntax: [no] lldp reinit-delay <seconds>

where <seconds> is a value from 1 – 10. The default is two seconds.

LLDP TLVs advertised by the Brocade device

When LLDP is enabled on a global basis, the Brocade device will automatically advertise the following information, except for the features noted:

General system information:

- Management address
- Port description
- System capabilities
- System description (not automatically advertised)
- System name

802.1 capabilities:

- VLAN name (not automatically advertised)
- Untagged VLAN ID

802.3 capabilities:

- Link aggregation information
- MAC/PHY configuration and status
- Maximum frame size
- Power-via-MDI information (not automatically advertised)

The above TLVs are described in detail in the following sections.

NOTE

The system description, VLAN name, and power-via-MDI information TLVs are not automatically enabled. The following sections show how to enable these advertisements.

General system information for LLDP

Except for the system description, the Brocade device will advertise the following system information when LLDP is enabled on a global basis:

- Management address
- Port description
- System capabilities
- System description (not automatically advertised)
- System name

Management Address

A management address is normally an IPv4 or IPv6 address that can be used to manage the device. Management address advertising has two modes: default, or explicitly configured. The default mode is used when no addresses are configured to be advertised for a given port. If any addresses are configured to be advertised for a given port, then only those addresses are advertised. This applies across address types, so for example, if just one IPv4 address is explicitly configured to be advertised for a port, then no IPv6 addresses will be advertised for that port (since none were configured to be advertised), even if IPv6 addresses are configured within the system.

If no management address is explicitly configured to be advertised, the Brocade device will use the first available IPv4 address and the first available IPv6 address (so it may advertise IPv4, IPv6 or both). A Layer 3 switch will select the first available address of each type from those configured on the following types of interfaces, in the following order of preference:

- Physical port on which LLDP will be transmitting the packet
- Virtual router interface (VE) on a VLAN that the port is a member of
- Dedicated management port
- Loopback interface
- Virtual router interface (VE) on any other VLAN
- Other physical port
- Other interface

For IPv6 addresses, link-local and anycast addresses will be excluded from these searches.

If no IP address is configured on any of the above, the port's current MAC address will be advertised.

To advertise a IPv4 management address, enter a command such as the following:

```
Brocade(config)#lldp advertise management-address ipv4 209.157.2.1 ports e 1/4
```

The management address will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**):

```
Management address (IPv4): 209.157.2.1
```

Syntax: [no] lldp advertise management-address ipv4 <ipv4 address> **ports ethernet** <port list> | **all**

To support an IPv6 management address, there is a similar command that has equivalent behavior as the IPv4 command.

To advertise an IPv6 management address, enter a command such as the following:

```
Brocade(config)#lldp advertise management-address ipv6 1234:5678::90 ports e 2/7
```

Syntax: [no] lldp advertise management-address ipv6 <ipv6 address> **ports ethernet** <port list> | **all**

<ipv4 address> or <ipv6 address> or both are the addresses that may be used to reach higher layer entities to assist discovery by network management. In addition to management addresses, the advertisement will include the system interface number associated with the management address.

For <port list>, specify the port(s) in the format [<slotnum>/]<portnum>, where <slotnum> is required on chassis devices only. You can list all of the ports individually; use the keyword to specify a range of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Port description

The port description TLV identifies the port from which the LLDP agent transmitted the advertisement. The port description is taken from the ifDescr MIB object from MIB-II.

By default, the port description is automatically advertised when LLDP is enabled on a global basis. To disable advertisement of the port description, enter a command such as the following.

```
Brocade(config)#no lldp advertise port-description ports e 2/4 to 2/12
```

The port description will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
Port description: "GigabitEthernet20"
```

Syntax: [no] lldp advertise port-description **ports ethernet** <port-list> | **all**

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

System capabilities

The system capabilities TLV identifies the primary functions of the device and indicates whether these primary functions are enabled. The primary functions can be one or more of the following (more than one for example, if the device is both a bridge and a router):

- Repeater
- Bridge
- WLAN access point
- Router
- Telephone
- DOCSIS cable device
- Station only (devices that implement end station capability)
- Other

System capabilities for Brocade devices are based on the type of software image in use (e.g., Layer 2 switch or Layer 3 router). The enabled capabilities will be the same as the available capabilities, except that when using a router image (base or full Layer 3), if the global route-only feature is turned on, the bridge capability will not be included, since no bridging takes place.

By default, the system capabilities are automatically advertised when LLDP is enabled on a global basis. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise system-capabilities ports e 2/4 to 2/12
```

The system capabilities will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
System capabilities :   bridge
Enabled capabilities:   bridge
```

Syntax: [no] lldp advertise system-capabilities ports ethernet <port-list> | all

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

System description

The system description is the network entity, which can include information such as the product name or model number, the version of the system hardware type, the software operating system level, and the networking software version. The information corresponds to the sysDescr MIB object in MIB-II.

To advertise the system description, enter a command such as the following.

```
Brocade(config)#lldp advertise system-description ports e 2/4 to 2/12
```

The system description will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ System description : "Brocade Communications, Inc., FESX424-PREM-PoE,
IronWare Version 04.0.00b256T3e1 Compiled on Sep 04 2007 at 0\
3:54:29 labeled as SXS04000b256"
```

NOTE

The contents of the show command output will vary depending on which TLVs are configured to be advertised.

Syntax: [no] lldp advertise system-description ports ethernet <port-list> | all

For *port-list* , specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

System name

The system name is the system administratively assigned name, taken from the sysName MIB object in MIB-II. The sysName MIB object corresponds to the name defined with the CLI command **hostname**.

By default, the system name is automatically advertised when LLDP is enabled on a global basis. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise system-name ports e 2/4 to 2/12
```

The system name will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
System name: "FESX424_POE"
```

Syntax: [no] lldp advertise system-name ports ethernet <port-list> | all

For *port-list* , specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

802.1 capabilities

Except for the VLAN name, the Brocade device will advertise the following 802.1 attributes when LLDP is enabled on a global basis:

- VLAN name (not automatically advertised)
- Untagged VLAN ID

VLAN name

The VLAN name TLV contains the name and VLAN ID of a VLAN configured on a port. An LLDPDU may include multiple instances of this TLV, each for a different VLAN.

To advertise the VLAN name, enter a command such as the following.

```
Brocade(config)#lldp advertise vlan-name vlan 99 ports e 2/4 to 2/12
```

The VLAN name will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
VLAN name (VLAN 99): "Voice-VLAN-99"
```

Syntax: [no] **lldp advertise vlan-name vlan** <vlan ID> **ports ethernet** <port-list> | **all**

For <vlan ID>, enter the VLAN ID to advertise.

For <port-list>, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

Untagged VLAN ID

The port VLAN ID TLV advertises the Port VLAN Identifier (PVID) that will be associated with untagged or priority-tagged frames. If the port is not an untagged member of any VLAN (i.e., the port is strictly a tagged port), the value zero will indicate that.

By default, the port VLAN ID is automatically advertised when LLDP is enabled on a global basis. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise port-vlan-id ports e 2/4 to 2/12
```

The untagged VLAN ID will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
Port VLAN ID: 99
```

Syntax: [no] lldp advertise port-vlan-id ports ethernet <port-list> | all

For *port-list* , specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

802.3 capabilities

Except for Power-via-MDI information, the Brocade device will advertise the following 802.3 attributes when LLDP is enabled on a global basis:

- Link aggregation information
- MAC/PHY configuration and status
- Maximum frame size
- Power-via-MDI information (not automatically advertised)

Link aggregation TLV

The **link-aggregation** time, length, value (TLV) indicates the following:

- Whether the link is capable of being aggregated
- Whether the link is currently aggregated
- The primary trunk port

Brocade devices advertise link aggregation information about standard link aggregation (LACP) as well as static trunk configuration.

By default, link-aggregation information is automatically advertised when LLDP is enabled on a global basis. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise link-aggregation ports e 2/12
```

Syntax: [no] lldp advertise link-aggregation ports ethernet <port-list> | all

The link aggregation advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
Link aggregation: not capable
```

For *port-list* , specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

MAC and PHY configuration status

The MAC and PHY configuration and status TLV includes the following information:

- Auto-negotiation capability and status
- Speed and duplex mode
- Flow control capabilities for auto-negotiation
- Port speed down-shift and maximum port speed advertisement
- If applicable, indicates if the above settings are the result of auto-negotiation during link initiation or of a manual set override action

The advertisement reflects the effects of the following CLI commands:

- `speed-duplex`
- `flow-control`
- `gig-default`
- `link-config`

By default, the MAC/PHY configuration and status information are automatically advertised when LLDP is enabled on a global basis. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise mac-phy-config-status ports e 2/4 to 2/12
```

The MAC/PHY configuration advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ 802.3 MAC/PHY      : auto-negotiation enabled
  Advertised capabilities: 10baseT-HD, 10baseT-FD, 100baseTX-HD,
100baseTX-FD,
  fdxSPause, fdxBPause, 1000baseT-HD, 1000baseT-FD
  Operational MAU type: 100BaseTX-FD
```

Syntax: `[no] lldp advertise mac-phy-config-status ports ethernet <port-list> | all`

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

Maximum frame size

The maximum frame size TLV provides the maximum 802.3 frame size capability of the port. This value is expressed in octets and includes the four-octet Frame Check Sequence (FCS). The default maximum frame size is 1522. The advertised value may change depending on whether the **aggregated-vlan** or **jumbo** CLI commands are in effect.

NOTE

On 48GC modules in non-jumbo mode, the maximum size of ping packets is 1486 bytes and the maximum frame size of tagged traffic is no larger than 1581 bytes.

By default, the maximum frame size is automatically advertised when LLDP is enabled on a global basis. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise max-frame-size ports e 2/4 to 2/12
```

The maximum frame size advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
Maximum frame size: 1522 octets
```

Syntax: **[no] lldp advertise max-frame-size ports ethernet <port-list> | all**

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

Power-via-MDI

The power-via-MDI TLV provides general information about Power over Ethernet (POE) capabilities and status of the port. It indicates the following:

- POE capability (supported or not supported)
- POE status (enabled or disabled)
- Power Sourcing Equipment (PSE) power pair – indicates which pair of wires is in use and whether the pair selection can be controlled. The Brocade implementation always uses pair A, and cannot be controlled.

- Power class – Indicates the range of power that the connected powered device has negotiated or requested.

NOTE

The power-via-MDI TLV described in this section applies to LLDP. There is also a power-via-MDI TLV for LLDP-MED devices, which provides extensive POE information. Refer to [“Extended power-via-MDI information”](#) on page 486.

To advertise the power-via-MDI information, enter a command such as the following.

```
Brocade(config)#lldp advertise power-via-mdi ports e 2/4 to 2/12
```

The power-via-MDI advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ 802.3 Power via MDI: PSE port, power enabled, class 0
Power Pair          : A (not controllable)
```

Syntax: [no] lldp advertise power-via-mdi ports ethernet <port-list> | all

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

LLDP-MED configuration

This section provides the details for configuring LLDP-MED.

[Table 84](#) lists the global and interface-level tasks and the default behavior/value for each task.

TABLE 84 LLDP-MED configuration tasks and default behavior / value

Task	Default behavior / value
Global CONFIG-level tasks	
Enabling LLDP-MED on a global basis	Disabled
Enabling SNMP notifications and Syslog messages for LLDP-MED topology change	Disabled

TABLE 84 LLDP-MED configuration tasks and default behavior / value

Task	Default behavior / value
Changing the Fast Start Repeat Count	The system automatically sets the fast start repeat count to 3 when a Network Connectivity Device receives an LLDP packet from an Endpoint that is newly connected to the network. NOTE: The LLDP-MED fast start mechanism is only intended to run on links between Network Connectivity devices and Endpoint devices. It does not apply to links between LAN infrastructure elements, including between Network Connectivity devices, or to other types of links.
Interface-level tasks	
Defining a location ID	Not configured
Defining a network policy	Not configured

Enabling LLDP-MED

When LLDP is enabled globally, LLDP-MED is enabled if the LLDP-MED capabilities TLV is also enabled. By default, the LLDP-MED capabilities TLV is automatically enabled. To enable LLDP, refer to [“Enabling and disabling LLDP”](#) on page 459.

NOTE

LLDP-MED is not enabled on ports where the LLDP operating mode is receive only or transmit only. LLDP-MED is enabled on ports that are configured to both receive and transmit LLDP packets and have the LLDP-MED capabilities TLV enabled.

Enabling SNMP notifications and Syslog messages for LLDP-MED topology changes

SNMP notifications and Syslog messages for LLDP-MED provide management applications with information related to topology changes. For example, SNMP notifications can alert the system whenever a remote Endpoint device is connected to or removed from a local port. SNMP notifications identify the local port where the topology change occurred, as well as the device capability of the remote Endpoint device that was connected to or removed from the port.

When you enable LLDP-MED SNMP notifications, corresponding Syslog messages are enabled as well. When you enable LLDP-MED SNMP notifications, the device will send traps and Syslog messages when an LLDP-MED Endpoint neighbor entry is added or removed.

SNMP notifications and corresponding Syslog messages are disabled by default. To enable them, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp enable snmp med-topo-change-notifications ports ethernet 4/4 to 4/6
```

Syntax: no lldp enable snmp med-topo-change-notifications ports ethernet <port-list> | all

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*

- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

Changing the fast start repeat count

The fast start feature enables a Network Connectivity Device to initially advertise itself at a faster rate for a limited time when an LLDP-MED Endpoint has been newly detected or connected to the network. This feature is important within a VoIP network, for example, where rapid availability is crucial for applications such as emergency call service location (E911).

The fast start timer starts when a Network Connectivity Device receives the first LLDP frame from a newly detected Endpoint.

The **LLDP-MED fast start repeat count** specifies the number of LLDP packets that will be sent during the LLDP-MED fast start period. By default, the device will send three packets at one-second intervals. If desired, you can change the number of packets the device will send per second, up to a maximum of 10.

NOTE

The LLDP-MED fast start mechanism is only intended to run on links between Network Connectivity devices and Endpoint devices. It does not apply to links between LAN infrastructure elements, including between Network Connectivity devices, or to other types of links.

To change the LLDP-MED fast start repeat count, enter commands such as the following.

```
Brocade(config)#lldp med fast-start-repeat-count 5
```

The above command causes the device to send five LLDP packets during the LLDP-MED fast start period.

Syntax: [no] **lldp med fast-start-repeat-count** <value>

where value is a number from 1 to 10, which specifies the number of packets that will be sent during the LLDP-MED fast start period. The default is 3.

Defining a location id

The LLDP-MED Location Identification extension enables the Brocade device to set the physical location that an attached Class III Endpoint will use for location-based applications. This feature is important for applications such as IP telephony, for example, where emergency responders need to quickly determine the physical location of a user in North America that has just dialed 911.

For each port, you can define one or more of the following location ID formats:

- Geographic location (coordinate-based)
- Civic address
- Emergency Call Services (ECS) Emergency Location Identification Number (ELIN)

The above location ID formats are defined in the following sections.

Coordinate-based location

Coordinate-based location is based on the IETF RFC 3825 [6] standard, which specifies a Dynamic Host Configuration Protocol (DHCP) option for the coordinate-based geographic location of a client.

When you configure an Endpoint location information using the coordinate-based location, you specify the latitude, longitude, and altitude, along with **resolution indicators** (a measure of the accuracy of the coordinates), and the reference **datum** (the map used for the given coordinates).

To configure a coordinate-based location for an Endpoint device, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp med location-id coordinate-based latitude
-78.303 resolution 20 longitude 34.27 resolution 18 altitude meters 50 resolution
16 wgs84
```

Syntax: [no] lldp med location-id coordinate-based

latitude <degrees> **resolution** <bits>

longitude <degrees> **resolution** <bits>

altitude floors <number> **resolution** <bits> | **meters** <number> **resolution** <bits>
<datum>

latitude <degrees> is the angular distance north or south from the earth equator measured through 90 degrees. Positive numbers indicate a location north of the equator and negative numbers indicate a location south of the equator.

resolution <bits> specifies the precision of the value given for latitude. A smaller value increases the area within which the device is located. For latitude, enter a number between 1 and 34.

longitude <degrees> is the angular distance from the intersection of the zero meridian. Positive values indicate a location east of the prime meridian and negative numbers indicate a location west of the prime meridian.

resolution <bits> specifies the precision of the value given for longitude. A smaller value increases the area within which the device is located. For longitude resolution, enter a number between 1 and 34.

altitude floors <number> is the vertical elevation of a building above the ground, where 0 represents the floor level associated with the ground level at the main entrance and larger values represent floors that are above (higher in altitude) floors with lower values. For example, 2 for the 2nd floor. Sub-floors can be represented by non-integer values. For example, a mezzanine between floor 1 and floor 2 could be represented as 1.1. Similarly, the mezzanines between floor 4 and floor 5 could be represented as 4.1 and 4.2 respectively. Floors located below ground level could be represented by negative values.

resolution <bits> specifies the precision of the value given for altitude. A smaller value increases the area within which the device is located. For floors resolution, enter the value 0 if the floor is unknown, or 30 if a valid floor is being specified.

altitude meters <number> is the vertical elevation in number of meters, as opposed to floors.

resolution <bits> specifies the precision of the value given for altitude. A smaller value increases the area within which the device is located. For meters resolution, enter a value from 0 to 30.

<Datum> is the map used as the basis for calculating the location. Specify one of the following:

- **wgs84** – (geographical 3D) – World Geodesic System 1984, CRS Code 4327, Prime Meridian Name: Greenwich
- **nad83-navd88** – North American Datum 1983, CRS Code 4269, Prime Meridian Name: Greenwich; The associated vertical datum is the North American Vertical Datum of 1988 (NAVD88). Use this datum when referencing locations on land. If land is near tidal water, use nad83-mllw (below).
- **nad83-mllw** – North American Datum 1983, CRS Code 4269, Prime Meridian Name: Greenwich; The associated vertical datum is mean lower low water (MLLW). Use this datum when referencing locations on water, sea, or ocean.

Example coordinate-based location configuration

The following shows an example coordinate-based location configuration for the Sears Tower, at the following location.

103rd Floor
233 South Wacker Drive
Chicago, IL 60606

```
Brocade(config)#lldp med location-id coordinate-based latitude 41.87884
resolution 18 longitude 87.63602 resolution 18 altitude floors 103 resolution 30
wgs84
```

The above configuration shows the following:

- Latitude is 41.87884 degrees north (or 41.87884 degrees).
- Longitude is 87.63602 degrees west (or 87.63602 degrees).
- The latitude and longitude resolution of 18 describes a geo-location area that is latitude 41.8769531 to latitude 41.8789062 and extends from -87.6367188 to -87.6347657 degrees longitude. This is an area of approximately 373412 square feet (713.3 ft. x 523.5 ft.).
- The location is inside a structure, on the 103rd floor.
- The WGS 84 map was used as the basis for calculating the location.

Example coordinate-based location advertisement

The coordinate-based location advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ MED Location ID
  Data Format: Coordinate-based
  Latitude Resolution : 20 bits
  Latitude Value      : -78.303 degrees
  Longitude Resolution : 18 bits
  Longitude Value     : 34.27 degrees
  Altitude Resolution : 16 bits
  Altitude Value      : 50. meters
  Datum               : WGS 84
```

Configuring civic address location

When you configure a media Endpoint location using the address-based location, you specify the location the entry refers to, the country code, and the elements that describe the civic or postal address.

To configure a civic address-based location for LLDP-MED, enter commands such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp med location-id civic-address refers-to client country US
elem 1 CA elem 3 "Santa Clara" elem 6 "4980 Great America Pkwy" elem 24 95054 elem
27 5 elem 28 551 elem 29 office elem 23 "John Doe"
```

Syntax: `[no] lldp med location-id civic-address refers-to <elem> country <country code> elem <CA type> <value> [elem <CA type> <value>] [elem <CA type> <value>]...`

refers-to <elem> describes the location that the entry refers to. Specify one of the following:

- client
- dhcp-server
- network-element

where **dhcp-server** or **network-element** should only be used if it is known that the Endpoint is in close physical proximity to the DHCP server or network element.

<country code> is the two-letter ISO 3166 country code in capital ASCII letters.

Example

- CA – Canada
- DE – Germany
- JP – Japan
- KR – Korea
- US – United States

<CA type> is a value from 0 – 255, that describes the civic address element. For example, a CA type of 24 specifies a postal or zip code. Valid elements and their types are listed in [Table 85](#).

<value> is the actual value of the elem <CA type>, above. For example, 95123 for the postal or zip code. Acceptable values are listed in [Table 85](#), below.

NOTE

If the value of an element contains one or more spaces, use double quotation marks (") at the beginning and end of the string. For example, `elem 3 "Santa Clara"`.

TABLE 85 Elements used with civic address

Civic Address (CA) type	Description	Acceptable values / examples
0	Language	The ISO 639 language code used for presenting the address information.
1	National subdivisions (state, canton, region, province, or prefecture)	Examples: Canada – Province Germany – State Japan – Metropolis Korea – Province United States – State
2	County, parish, gun (JP), or district (IN)	Examples: Canada – County Germany – County Japan – City or rural area Korea – County United States – County
3	City, township, or shi (JP)	Examples: Canada – City or town Germany – City Japan – Ward or village Korea – City or village United States – City or town
4	City division, borough, city district, ward, or chou (JP)	Examples: Canada – N/A Germany – District Japan – Town Korea – Urban district United States – N/A
5	Neighborhood or block	Examples: Canada – N/A Germany – N/A Japan – City district Korea – Neighborhood United States – N/A
6	Street	Examples: Canada – Street Germany – Street Japan – Block Korea – Street United States – Street
16	Leading street direction	N (north), E (east), S (south), W (west), NE, NW, SE, SW
17	Trailing street suffix	N (north), E (east), S (south), W (west), NE, NW, SE, SW
18	Street suffix	Acceptable values for the United States are listed in the United States Postal Service Publication 28 [18], Appendix C. Example: Ave, Place
19	House number	The house number (street address) Example: 1234

TABLE 85 Elements used with civic address (Continued)

Civic Address (CA) type	Description	Acceptable values / examples
20	House number suffix	A modifier to the house number. It does not include parts of the house number. Example: A, 1/2
21	Landmark or vanity address	A string name for a location. It conveys a common local designation of a structure, a group of buildings, or a place that helps to locate the place. Example: UC Berkeley
22	Additional location information	An unstructured string name that conveys additional information about the location. Example: west wing
23	Name (residence and office occupant)	Identifies the person or organization associated with the address. Example: Textures Beauty Salon
24	Postal / zip code	The valid postal / zip code for the address. Example: 95054-1234
25	Building (structure)	The name of a single building if the street address includes more than one building or if the building name is helpful in identifying the location. Example: Law Library
26	Unit (apartment, suite)	The name or number of a part of a structure where there are separate administrative units, owners, or tenants, such as separate companies or families who occupy that structure. Common examples include suite or apartment designations. Example: Apt 27
27	Floor	Example: 4
28	Room number	The smallest identifiable subdivision of a structure. Example: 7A
29	Placetype	The type of place described by the civic coordinates. For example, a home, office, street, or other public space. Example: Office
30	Postal community name	When the postal community name is defined, the civic community name (typically CA type 3) is replaced by this value. Example: Alviso
31	Post office box (P.O. box)	When a P.O. box is defined, the street address components (CA types 6, 16, 17, 18, 19, and 20) are replaced with this value. Example: P.O. Box 1234
32	Additional code	An additional country-specific code that identifies the location. For example, for Japan, this is the Japan Industry Standard (JIS) address code. The JIS address code provides a unique address inside of Japan, down to the level of indicating the floor of the building.

TABLE 85 Elements used with civic address (Continued)

Civic Address (CA) type	Description	Acceptable values / examples
128	Script	The script (from ISO 15924 [14]) used to present the address information. Example: Latn NOTE: If not manually configured, the system assigns the default value Latn
255	Reserved	

Example civic address location advertisement

The Civic address location advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ MED Location ID
  Data Format: Civic Address
  Location of: Client
  Country    : "US"
  CA Type    : 1
  CA Value   : "CA"
  CA Type    : 3
  CA Value   : "Santa Clara"
  CA Type    : 6
  CA Value   : "4980 Great America Pkwy."
  CA Type    : 24
  CA Value   : "95054"
  CA Type    : 27
  CA Value   : "5"
  CA Type    : 28
  CA Value   : "551"
  CA Type    : 29
  CA Value   : "office"
  CA Type    : 23
  CA Value   : "John Doe"
```

Configuring emergency call service

The Emergency Call Service (ECS) location is used specifically for Emergency Call Services applications.

When you configure a media Endpoint location using the emergency call services location, you specify the Emergency Location Identification Number (ELIN) from the North America Numbering Plan format, supplied to the Public Safety Answering Point (PSAP) for ECS purposes.

To configure an ECS-based location for LLDP-MED, enter a command such as the following at the Global CONFIG level of the CLI.

```
Brocade(config)#lldp med location-id ecs-elin 4082071700
```

Syntax: [no] lldp med location-id ecs-elin <number> ports ethernet <port-list> | all

<number> is a number from 10 to 25 digits in length.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Example ECS ELIN location advertisements

The ECS ELIN location advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ MED Location ID
  Data Format: ECS ELIN
  Value      : 4082071700
```

Defining an LLDP-MED network policy

An LLDP-MED network policy defines an Endpoint VLAN configuration (VLAN type and VLAN ID) and associated Layer 2 and Layer 3 priorities that apply to a specific set of applications on a port.

NOTE

This feature applies to applications that have specific real-time network policy requirements, such as interactive voice or video services. It is not intended to run on links other than between Network Connectivity devices and Endpoints, and therefore does not advertise the multitude of network policies that frequently run on an aggregated link.

To define an LLDP-MED network policy for an Endpoint, enter a command such as the following.

```
Brocade(config)#lldp med network-policy application voice tagged vlan 99 priority
3 dscp 22 port e 2/6
```

The network policy advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ MED Network Policy
  Application Type : Voice
  Policy Flags    : Known Policy, Tagged
  VLAN ID        : 99
  L2 Priority     : 3
  DSCP Value     : 22
```

NOTE

Endpoints will advertise a policy as “unknown” in the **show lldp neighbor detail** command output, if it is a policy that is required by the Endpoint and the Endpoint has not yet received it.

LLDP-MED network policy configuration syntax

The CLI syntax for defining an LLDP-MED network policy differs for tagged, untagged, and priority tagged traffic. Refer to the appropriate syntax, below.

For tagged traffic

Syntax: `[no] lldp med network-policy application <application type> tagged vlan <vlan ID> priority <0 – 7> dscp <0 – 63> ports ethernet <port-list> | all`

For untagged traffic

Syntax: `[no] lldp med network-policy application <application type> untagged dscp <0 – 63> ports ethernet <port-list> | all`

For priority-tagged traffic

Syntax: `[no] lldp med network-policy application <application type> priority-tagged priority <0 – 7> dscp <0 – 63> ports ethernet <port-list> | all`

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

<application type> indicates the primary function of the applications defined by this network policy. Application type can be one of the following:

- **guest-voice** – Limited voice service for guest users and visitors with their own IP telephony handsets or similar devices that support interactive voice services.
- **guest-voice-signaling** – Limited voice service for use in network topologies that require a different policy for guest voice signaling than for guest voice media.
- **softphone-voice** – Softphone voice service for use with multi-media applications that work in association with VoIP technology, enabling phone calls direct from a PC or laptop. Softphones do not usually support multiple VLANs, and are typically configured to use an untagged VLAN or a single tagged data-specific VLAN. Note that when a network policy is defined for use with an untagged VLAN, the Layer 2 priority field is ignored and only the DSCP value is relevant.
- **streaming-video** – Applies to broadcast- or multicast-based video content distribution and similar applications that support streaming video services requiring specific network policy treatment. Video applications that rely on TCP without buffering would not be an intended use of this application type.
- **video-conferencing** – Applies to dedicated video conferencing equipment and similar devices that support real-time interactive video/audio services.
- **video-signaling** – For use in network topologies that require a separate policy for video signaling than for video media. Note that this application type should not be advertised if all the same network policies apply as those advertised in the video conferencing policy TLV.
- **voice** – For use by dedicated IP telephony handsets and similar devices that support interactive voice services.

- **voice-signaling** – For use in network topologies that require a different policy for voice signaling than for voice media. Note that this application type should not be advertised if all the same network policies apply as those advertised in the voice policy TLV.
- **tagged vlan** <vlan id> specifies the tagged VLAN that the specified application type will use.
- **untagged** indicates that the device is using an untagged frame format.
- **priority-tagged** indicates that the device uses priority-tagged frames. In this case, the device uses the default VLAN (PVID) of the ingress port.
- **priority** <0 – 7> indicates the Layer 2 priority value to be used for the specified application type. Enter 0 to use the default priority.
- **dscp** <0 – 63> specifies the Layer 3 Differentiated Service codepoint priority value to be used for the specified application type. Enter 0 to use the default priority.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

LLDP-MED attributes advertised by the Brocade device

LLDP-MED attributes are only advertised on a port if LLDP-MED is enabled (which is done by enabling the LLDP-MED capabilities TLV), the port operating mode is *receive* and *transmit* (the default), and the port has received an LLDP-MED advertisement from an Endpoint. By default, the Brocade device will automatically advertise the following LLDP-MED attributes when the above criteria are met:

- LLDP-MED capabilities
- Location ID
- Network policy
- Power-via-MDI information

NOTE

Although the Location ID and Network policy attributes are automatically advertised, they will have no effect until they are actually defined.

LLDP-MED capabilities

When enabled, LLDP-MED is enabled, and the LLDP-MED capabilities TLV is sent whenever any other LLDP-MED TLV is sent. When disabled, LLDP-MED is disabled and no LLDP-MED TLVs are sent.

The LLDP-MED capabilities advertisement includes the following information:

- The supported LLDP-MED TLVs
- The device type (Network Connectivity device or Endpoint (Class 1, 2, or 3))

By default, LLDP-MED information is automatically advertised when LLDP-MED is enabled. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise med-capabilities ports e 2/4 to 2/12
```

NOTE

Disabling the LLDP-MED capabilities TLV disables LLDP-MED.

To re-enable the LLDP-MED Capabilities TLV (and LLDP-MED) after it has been disabled, enter a command such as the following.

```
Brocade(config)#lldp advertise med-capabilities ports e 2/4 to 2/12
```

The LLDP-MED capabilities advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
      + MED capabilities: capabilities, networkPolicy, location, extendedPSE
MED device type : Network Connectivity
```

Syntax: [no] lldp advertise med-capabilities ports ethernet <port-list> | all

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

Extended power-via-MDI information

The extended Power-via-MDI TLV enables advanced power management between LLDP-MED Endpoints and Network Connectivity Devices. This TLV provides significantly more information than the 802.1AB Power-via-MDI TLV referenced in [“Power-via-MDI”](#) on page 473. For example, this TLV enables an Endpoint to communicate a more precise required power level, thereby enabling the device to allocate less power to the Endpoint, while making more power available to other ports.

The LLDP-MED Power-via-MDI TLV advertises an Endpoint IEEE 802.3af power-related information, including the following:

- **Power type** – indicates whether the LLDP-MED device transmitting the LLPDU is a power sourcing device or a powered device:

- **Power sourcing device/equipment (PSE)** – This is the source of the power, or the device that integrates the power onto the network. Power sourcing devices/equipment have embedded POE technology. In this case, the power sourcing device is the Brocade POE device.
- **Powered device (PD)** – This is the Ethernet device that requires power and is situated on the other end of the cable opposite the power sourcing device.
- **Power source** – The power source being utilized by a PSE or PD, for example, primary power source, backup power source, or unknown.

For Endpoint devices, the power source information indicates the power capability of the Network Connectivity Device it is attached to. When the Network Connectivity device advertises that it is using its primary power source, the Endpoint should expect to have uninterrupted access to its available power. Likewise, if the Network Connectivity device advertises that it is using backup power, the Endpoint should not expect continuous power. The Endpoint may additionally choose to power down non-essential subsystems or to conserve power as long as the PSE is advertising that it is operating on backup power.

NOTE

Brocade devices always advertise the power source as “unknown”.

- **Power priority** – The in-line power priority level for the PSE or PD:
 - 3 – low
 - 2 – high
 - 1 – critical
 - unknown
- **Power level** – The total power, in tenths of watts, required by a PD from a PSE, or the total power a PSE is capable of sourcing over a maximum length cable based on its current configuration.

If the exact power is not known for a PSE or PD, it will advertise the power level associated with its 802.3af power class (listed in [Table 86](#)).

TABLE 86 802.3af power classes

Power class	Minimum power level output at the PSE	Maximum power levels at the PD
0	15.4 watts	0.44 – 12.95 watts
1	4.0 watts	0.44 – 3.84 watts
2	7.0 watts	3.84 – 6.49 watts
3	15.4 watts	6.49 – 12.95 watts

For a PD (Endpoint device), the power level represents the maximum power it can consume during normal operations in its current configuration, even if its actual power draw at that instance is less than the advertised power draw.

For a PSE (Network Connectivity device), the power level represents the amount of power that is available on the port at the time. If the PSE is operating in reduced power (i.e., it is using backup power), the reduced power capacity is advertised as long as the condition persists.

By default, LLDP-MED power-via-MDI information is automatically advertised when LLDP-MED is enabled, the port is a POE port, and POE is enabled on the port. To disable this advertisement, enter a command such as the following.

```
Brocade(config)#no lldp advertise med-power-via-mdi ports e 2/4 to 2/12
```

The LLDP-MED power-via-MDI advertisement will appear similar to the following on the remote device, and in the CLI display output on the Brocade device (**show lldp local-info**).

```
+ MED Extended Power via MDI
  Power Type      : PSE device
  Power Source    : Unknown Power Source
  Power Priority   : Low (3)
  Power Value     : 6.5 watts (PSE equivalent: 7005 mWatts)
```

Syntax: [no] lldp advertise med-power-via-mdi ports ethernet <port-list> | all

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually. Note that using the keyword **all** may cause undesirable effects on some ports. For example, if you configure all ports to advertise their VLAN name, and the configuration includes ports that are not members of any VLAN, the system will warn of the misconfigurations on non-member VLAN ports. The configuration will be applied to all ports, however, the ports that are not members of any VLAN will not send VLAN name advertisements.

Displaying LLDP statistics and configuration settings

You can use the following CLI **show** commands to display information about LLDP settings and statistics:

- **show lldp** – Displays a summary of the LLDP configuration settings.
- **show lldp statistics** – Displays LLDP global and per-port statistics.
- **show lldp neighbors** – Displays a list of the current LLDP neighbors.
- **show lldp neighbors detail** – Displays the details of the latest advertisements received from LLDP neighbors.
- **show lldp local-info** – Displays the details of the LLDP advertisements that will be transmitted on each port.

This above **show** commands are described in this section.

LLDP configuration summary

To display a summary of the LLDP configuration settings on the device, enter the **show lldp** command at any level of the CLI.

The following shows an example report.

LLDP-MED attributes advertised by the Brocade device

```
Brocade#show lldp
LLDP transmit interval      : 10 seconds
LLDP transmit hold multiplier : 4 (transmit TTL: 40 seconds)
LLDP transmit delay        : 1 seconds
LLDP SNMP notification interval : 5 seconds
LLDP reinitialize delay    : 1 seconds
LLDP-MED fast start repeat count : 3

LLDP maximum neighbors      : 392
LLDP maximum neighbors per port : 4
```

Syntax: show lldp

The following table describes the information displayed by the **show lldp statistics** command.

Field	Description
LLDP transmit interval	The number of seconds between regular LLDP packet transmissions.
LLDP transmit hold multiplier	The multiplier used to compute the actual time-to-live (TTL) value of an LLDP advertisement. The TTL value is the transmit interval multiplied by the transmit hold multiplier.
LLDP transmit delay	The number of seconds the LLDP agent will wait after transmitting an LLDP frame and before transmitting another LLDP frame.
LLDP SNMP notification interval	The number of seconds between transmission of SNMP LLDP traps (lldpRemTablesChange) and SNMP LLDP-MED traps (lldpXMedTopologyChangeDetected).
LLDP reinitialize delay	The minimum number of seconds the device will wait from when LLDP is disabled on a port, until a request to re-enable LLDP on that port will be honored.
LLDP-MED fast start repeat count	The number of seconds between LLDP frame transmissions when an LLDP-MED Endpoint is newly detected.
LLDP maximum neighbors	The maximum number of LLDP neighbors for which LLDP data will be retained, per device.
LLDP maximum neighbors per port	The maximum number of LLDP neighbors for which LLDP data will be retained, per port.

Displaying LLDP statistics

The **show lldp statistics** command displays an overview of LLDP neighbor detection on the device, as well as packet counters and protocol statistics. The statistics are displayed on a global basis.

The following shows an example report.

LLDP-MED attributes advertised by the Brocade device

```
Brocade#show lldp statistics
Last neighbor change time: 23 hours 50 minutes 40 seconds ago

Neighbor entries added      : 14
Neighbor entries deleted    : 5
Neighbor entries aged out   : 4
Neighbor advertisements dropped : 0
```

Port	Tx Pkts	Rx Pkts	Rx Pkts	Rx Pkts	Rx TLVs	Rx TLVs	Neighbors
	Total	Total	w/Errors	Discarded	Unrecognz	Discarded	Aged Out
1	60963	75179	0	0	0	0	4
2	0	0	0	0	0	0	0
3	60963	60963	0	0	0	0	0
4	60963	121925	0	0	0	0	0
5	0	0	0	0	0	0	0
6	0	0	0	0	0	0	0
7	0	0	0	0	0	0	0
8	0	0	0	0	0	0	0
9	0	0	0	0	0	0	0
10	60974	0	0	0	0	0	0
11	0	0	0	0	0	0	0
12	0	0	0	0	0	0	0
13	0	0	0	0	0	0	0
14	0	0	0	0	0	0	0

Syntax: show lldp statistics

NOTE

You can reset LLDP statistics using the CLI command **clear LLDP statistics**. Refer to [“Resetting LLDP statistics”](#) on page 495.

The following table describes the information displayed by the **show lldp statistics** command.

Field	Description
Last neighbor change time	The elapsed time (in hours, minutes, and seconds) since a neighbor last advertised information. For example, the elapsed time since a neighbor was last added, deleted, or its advertised information changed.
Neighbor entries added	The number of new LLDP neighbors detected since the last reboot or since the last time the clear lldp statistics all command was issued.
Neighbor entries deleted	The number of LLDP neighbors deleted since the last reboot or since the last time the clear lldp statistics all command was issued.
Neighbor entries aged out	The number of LLDP neighbors dropped on all ports after the time-to-live expired. Note that LLDP entries age out naturally when a port cable or module is disconnected or when a port becomes disabled. However, if a disabled port is re-enabled, the system will delete the old LLDP entries.
Neighbor advertisements dropped	The number of valid LLDP neighbors the device detected, but could not add. This can occur, for example, when a new neighbor is detected and the device is already supporting the maximum number of neighbors possible. This can also occur when an LLDPDU is missing a mandatory TLV or is not formatted correctly.
Port	The local port number.
Tx Pkts Total	The number of LLDP packets the port transmitted.
Rx Pkts Total	The number of LLDP packets the port received.

Field	Description
Rx Pkts w/Errors	The number of LLDP packets the port received that have one or more detectable errors.
Rx Pkts Discarded	The number of LLDP packets the port received then discarded.
Rx TLVs Unrecognz	The number of TLVs the port received that were not recognized by the LLDP local agent. Unrecognized TLVs are retained by the system and can be viewed in the output of the show LLDP neighbors detail command or retrieved through SNMP.
Rx TLVs Discarded	The number of TLVs the port received then discarded.
Neighbors Aged Out	The number of times a neighbor information was deleted because its TTL timer expired.

Displaying LLDP neighbors

The **show lldp neighbors** command displays a list of the current LLDP neighbors per port.

The following shows an example report.

```
Brocade#show lldp neighbors
```

Lcl Port	Chassis ID	Port ID	Port Description	System Name
1	0004.1234.0fc0	0004.1234.0fc0	GigabitEthernet9/1	FastIron Supe~
1	00e0.5201.4000	00e0.5201.4000	GigabitEthernet0/1/1	FGS624XGP Swi~
3	00e0.5211.0200	00e0.5211.0203	GigabitEthernet4	FESX424+2XG S~
4	00e0.5211.0200	00e0.5211.0202	GigabitEthernet3	FESX424+2XG S~
4	00e0.5211.0200	00e0.5211.0210	GigabitEthernet17	FESX424+2XG S~
15	00e0.5211.0200	00e0.5211.020f	GigabitEthernet16	FESX424+2XG S~
16	00e0.5211.0200	00e0.5211.020e	GigabitEthernet15	FESX424+2XG S~
17	00e0.5211.0200	00e0.5211.0211	GigabitEthernet18	FESX424+2XG S~
18	00e0.5211.0200	00e0.5211.0210	GigabitEthernet17	FESX424+2XG S~

Syntax: show lldp neighbors

The following table describes the information displayed by the **show lldp neighbors** command.

Field	Description
Lcl Port	The local LLDP port number.
Chassis ID	The identifier for the chassis. Brocade devices use the base MAC address of the device as the Chassis ID.
Port ID	The identifier for the port. Brocade devices use the permanent MAC address associated with the port as the port ID.
Port Description	The description for the port. Brocade devices use the ifDescr MIB object from MIB-II as the port description.
System Name	The administratively-assigned name for the system. Brocade devices use the sysName MIB object from MIB-II, which corresponds to the CLI hostname command setting. NOTE: A tilde (~) at the end of a line indicates that the value in the field is too long to display in full and is truncated.

Displaying LLDP neighbors detail

The **show lldp neighbors detail** command displays the LLDP advertisements received from LLDP neighbors.

The following shows an example **show lldp neighbors detail** report.

NOTE

The **show lldp neighbors detail** output will vary depending on the data received. Also, values that are not recognized or do not have a recognizable format, may be displayed in hexadecimal binary form.

```
Brocade#show lldp neighbors detail ports e 1/9
Local port: 1/9
Neighbor: 0800.0f18.cc03, TTL 101 seconds
+ Chassis ID (network address): 10.43.39.151
+ Port ID (MAC address): 0800.0f18.cc03
+ Time to live: 120 seconds
+ Port description      : "LAN port"
+ System name          : "regDN 1015,MITEL 5235 DM"
+ System description   : "regDN 1015,MITEL 5235 DM,h/w rev 2,ASIC rev 1,f/w\
                        Boot 02.01.00.11,f/w Main 02.01.00.11"
+ System capabilities : bridge, telephone
  Enabled capabilities: bridge, telephone
+ Management address (IPv4): 10.43.39.151
+ 802.3 MAC/PHY       : auto-negotiation enabled
  Advertised capabilities: 10BaseT-HD, 10BaseT-FD, 100BaseTX-HD,
                        100BaseTX-FD
  Operational MAU type   : 100BaseTX-FD
+ MED capabilities: capabilities, networkPolicy, extendedPD

+ MED Model name        : "MITEL 5235 DM"
+ MED Asset ID          : ""
```

A backslash (\) at the end of a line indicates that the text continues on the next line.

Except for the following field, the fields in the above output are described in the individual TLV advertisement sections in this chapter.

Field	Description
Neighbor	The source MAC address from which the packet was received, and the remaining TTL for the neighbor entry.

Syntax: `show lldp neighbors detail [ports ethernet <port-list> | all]`

If you do not specify any ports or use the keyword **all**, by default, the report will show the LLDP neighbor details for all ports.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Displaying LLDP configuration details

The **show lldp local-info** command displays the local information advertisements (TLVs) that will be transmitted by the LLDP agent.

NOTE

The **show lldp local-info** output will vary based on LLDP configuration settings.

The following shows an example report.

```
Brocade#show lldp local-info ports e 20
Local port: 20
+ Chassis ID (MAC address): 0012.f233.e2c0
+ Port ID (MAC address): 0012.f233.e2d3
+ Time to live: 40 seconds
+ System name: "FESX424_POE"

+ VLAN name (VLAN 99): "Voice-VLAN-99"
```

NOTE

The contents of the **show** output will vary depending on which TLVs are configured to be advertised.

A backslash (\) at the end of a line indicates that the text continues on the next line.

The fields in the above output are described in the individual TLV advertisement sections in this chapter.

Syntax: `show lldp local-info [ports ethernet <port-list> | all]`

If you do not specify any ports or use the keyword **all**, by default, the report will show the local information advertisements for all ports.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Resetting LLDP statistics

To reset LLDP statistics, enter the **clear lldp statistics** command at the Global CONFIG level of the CLI. The Brocade device will clear the global and per-port LLDP neighbor statistics on the device (refer to “[Displaying LLDP statistics](#)” on page 489).

```
Brocade#clear lldp statistics
```

Syntax: **clear lldp statistics** [**ports ethernet** <*port-list*> | **all**]

If you do not specify any ports or use the keyword **all**, by default, the system will clear lldp statistics on all ports.

For *port-list*, specify the ports in one of the following formats:

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Clearing cached LLDP neighbor information

The Brocade device clears cached LLDP neighbor information after a port becomes disabled and the LLDP neighbor information ages out. However, if a port is disabled then re-enabled before the neighbor information ages out, the device will clear the cached LLDP neighbor information when the port is re-enabled.

If desired, you can manually clear the cache. For example, to clear the cached LLDP neighbor information for port e 20, enter the following command at the Global CONFIG level of the CLI.

```
Brocade#clear lldp neighbors ports e 20
```

Syntax: **clear lldp neighbors** [**ports ethernet** <*port-list*> | **all**]

If you do not specify any ports or use the keyword **all**, by default, the system will clear the cached LLDP neighbor information for all ports.

For *port-list*, specify the ports in one of the following formats:

Clearing cached LLDP neighbor information

- FWS, FCX and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or a combination of both. To apply the configuration to all ports on the device, use the keyword **all** instead of listing the ports individually.

Hardware Component Monitoring

Table 87 lists the individual Brocade FastIron switches and the hardware monitoring features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images.

TABLE 87 Supported hardware monitoring features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Virtual cable testing (VCT)	Yes	Yes	Yes	No	No
Digital optical monitoring	Yes	Yes	Yes	Yes	Yes

NOTE

VCT is not supported on SX-FI48GPP, SX-FI-24GPP, SX-FI-24HF, SX-FI-2XG, and SX-FI-8XG.

The procedures in this chapter describe how to configure the software to monitor hardware components.

Virtual cable testing

FastIron devices support **Virtual Cable Test** (VCT) technology. VCT technology enables the diagnosis of a conductor (wire or cable) by sending a pulsed signal into the conductor, then examining the reflection of that pulse. This method of cable analysis is referred to as Time Domain Reflectometry (TDR). By examining the reflection, the Brocade device can detect and report cable statistics such as local and remote link pair, cable length, and link status.

Virtual cable testing configuration notes

- This feature is supported on copper ports only. It is not supported on fiber ports.
- This feature is not supported on the SX-FI48GPP module running software release 07.2.02 or later.
- This feature is not supported on SX-FI2XG, SX-FI8XG, SX-FI24HF, SX-FI24GPP, and SX-FI48GPP modules running software release 07.3.00 or later.
- The port to which the cable is connected must be enabled when you issue the command to diagnose the cable. If the port is disabled, the command is rejected.
- If the port is operating at 100 Mbps half-duplex, the TDR test on one pair will fail.
- If the remote pair is set to forced 100 Mbps, any change in MDI/MDIX may cause the device to interpret the Multilevel Threshold-3 (MLT-3) as a reflected pulse, in which case, the device will report a faulty condition. In this scenario, it is recommended that you run the TDR test a few times for accurate results.

Virtual cable testing command syntax

To diagnose a cable using TDR, enter commands such as the following at the Privileged EXEC level of the CLI.

```
Brocade#phy cable-diag tdr 1
```

The above command diagnoses the cable attached to port 1.

When you issue the **phy-cable-diag** command, the command brings the port down for a second or two, then immediately brings the port back up.

Syntax: **phy cable-diag tdr** <port>

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Viewing the results of the cable analysis

To display the results of the cable analysis, enter a command such as the following at the Privileged EXEC level of the CLI.

```
Brocade>show cable-diag tdr 1
```

Port	Speed	Local pair	Pair Length	Remote pair	Pair status
01	1000M	Pair A	<50M	Pair B	Terminated
		Pair B	<50M	Pair A	Terminated
		Pair C	<50M	Pair D	Terminated
		Pair D	<50M	Pair C	Terminated

In the above output, **Local pair** indicates the assignment of wire pairs from left to right, where Pair A is the left-most pair. [Table 88](#) shows the **Local pair** mapping to the T568A pin/pair and color assignment from the TIA/EIA-568-B standard.

TABLE 88 Local pair definition

Local pair	T568A pair and color assignment
Pair A	Pair 3 (green)
Pair B	Pair 2 (orange)
Pair C	Pair 1 (blue)
Pair D	Pair 4 (brown)

[Figure 39](#) illustrates the T568A pin/pair assignment.

FIGURE 39 T568A pin/pair assignment

Syntax: `show cable-diag tdr <port>`

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

[Table 89](#) defines the fields shown in the command output.

TABLE 89 Cable statistics

This line...	Displays...
Port	The port that was tested.
Speed	The port current line speed.
Local pair	The local link name. Refer to Table 88 .
Pair Length	The cable length when terminated, or the distance to the point of fault when the line is not up.
Remote pair	The remote link name.
Pair status	The status of the link. This field displays one of the following: <ul style="list-style-type: none"> • Terminated: The link is up. • Shorted: A short is detected in the cable. • Open: An opening is detected in the cable. • ImpedMis: The impedance is mismatched. • Failed: The TDR test failed.

Digital optical monitoring

You can configure your Brocade device to monitor optical transceivers in the system, either globally or by specified ports. When this feature is enabled, the system will monitor the temperature and signal power levels for the optical transceivers in the specified ports. Console messages and Syslog messages are sent when optical operating conditions fall below or rise above the XFP, SFP, and SFP+ manufacturer recommended thresholds.

Digital optical monitoring configuration limitations

A Brocade chassis device can monitor a maximum of 24 SFPs and 12 XFPs.

Enabling digital optical monitoring

To enable optical monitoring on all Brocade-qualified optics installed in the device, use the following command.

```
Brocade(config)#optical-monitor
```

To enable optical monitoring on a specific port, use the following command.

```
Brocade(config)#interface ethernet 1/1
Brocade(config-if-e10000-1/1)#optical-monitor
```

To enable optical monitoring on a range of ports, use the following command.

```
Brocade(config)#interface ethernet 1/1 to 1/2
Brocade(config-mif-e10000-1/1-1/2)#optical-monitor
```

Syntax: `[no] optical-monitor`

Use the **no** form of the command to disable digital optical monitoring.

Setting the alarm interval

You can optionally change the interval between which alarms and warning messages are sent. The default interval is three minutes. To change the interval, use the following command.

```
Brocade(config)#interface ethernet 1/1 to 1/2
Brocade(config-mif-e10000-1/1-1/2)#optical-monitor 10
```

Syntax: `[no] optical-monitor [<alarm-interval>]`

For `<alarm-interval>`, enter a value between 1 and 65535. Enter 0 to disable alarms and warning messages.

NOTE

The commands **no optical-monitor** and **optical-monitor 0** perform the same function. That is, they both disable digital optical monitoring.

Displaying information about installed media

Use the **show media**, **show media slot**, and **show media ethernet** commands to obtain information about the media devices installed per device, per slot, and per port. The results displayed from these commands provide the Type, Vendor, Part number, Version and Serial number of the SFP, SFP+, or XFP optical device installed in the port. If there is no SFP, SFP+, or XFP optical device installed in a port, the “Type” field will display “EMPTY”.

On ICX 6430 and ICX 6450 devices, 1G copper ports will always be shown with the type as 1G M-C (Gig-Copper), even if the ports are not connected.

Use the **show media** command to obtain information about the media devices installed in a device.

```
Brocade#show media
Port 1/1/1:  Type : 1G M-C (Gig-Copper)
Port 1/1/2:  Type : 1G M-C (Gig-Copper)
Port 1/1/3:  Type : 1G M-C (Gig-Copper)
Port 1/1/4:  Type : 1G M-C (Gig-Copper)
Port 1/1/5:  Type : 1G M-C (Gig-Copper)
Port 1/1/6:  Type : 1G M-C (Gig-Copper)
Port 1/1/7:  Type : 1G M-C (Gig-Copper)
Port 1/1/8:  Type : 1G M-C (Gig-Copper)
Port 1/1/9:  Type : 1G M-C (Gig-Copper)
Port 1/1/10: Type : 1G M-C (Gig-Copper)
Port 1/1/11: Type : 1G M-C (Gig-Copper)
Port 1/1/12: Type : 1G M-C (Gig-Copper)
Port 1/1/13: Type : 1G M-C (Gig-Copper)
Port 1/1/14: Type : 1G M-C (Gig-Copper)
Port 1/1/15: Type : 1G M-C (Gig-Copper)
Port 1/1/16: Type : 1G M-C (Gig-Copper)
Port 1/1/17: Type : 1G M-C (Gig-Copper)
Port 1/1/18: Type : 1G M-C (Gig-Copper)
Port 1/1/19: Type : 1G M-C (Gig-Copper)
Port 1/1/20: Type : 1G M-C (Gig-Copper)
Port 1/1/21: Type : 1G M-C (Gig-Copper)
Port 1/1/22: Type : 1G M-C (Gig-Copper)
Port 1/1/23: Type : 1G M-C (Gig-Copper)
Port 1/1/24: Type : 1G M-C (Gig-Copper)
Port 1/2/1:  Type : 10GE SR 300m (SFP +)
Port 1/2/2:  Type : EMPTY
Port 1/2/3:  Type : 1G Twinax    1m (SFP)
Port 1/2/4:  Type : 1G Twinax    1m (SFP)
```

Use the **show media slot** command to obtain information about the media device installed in a slot.

```
Brocade#show media slot 1
Port    1/1: Type   : 1G M-SX(SFP)
          Vendor: Brocade Communications, Inc.  Version:
          Part#  : PL-XPL-VC-S13-19   Serial#: 425HC109
Port    1/2: Type   : 1G M-SX(SFP)
          Vendor: Brocade Communications, Inc.  Version:
          Part#  : PL-XPL-VC-S13-19   Serial#: 411HC0AH
Port    1/3: Type   : EMPTY
Port    1/4: Type   : 1G M-SX(SFP)
          Vendor: Brocade Communications, Inc.  Version: X1
          Part#  : FTRJ-8519-3       Serial#: H11654K
Port    1/5: Type   : EMPTY
Port    1/6: Type   : EMPTY
Port    1/7: Type   : 100M M-FX-IR(SFP)
```

```

Vendor: Brocade Communications, Inc. Version: A
Part# : FTLF1323P1BTR-FD Serial#: UCT000T
Port 1/8: Type : EMPTY
Port 1/9: Type : 100M M-FX-LR(SFP)
Vendor: Brocade Communications, Inc. Version: A
Part# : FTLF1323P1BTL-FD Serial#: UD3085J
Port 1/10: Type : EMPTY
Port 1/11: Type : 100M M-FX-SR(SFP)
Vendor: Brocade Communications, Inc. Version: A
Part# : FTLF1217P2BTL-F1 Serial#: UCQ003J
Port 1/12: Type : EMPTY
Port 1/13: Type : 100M M-FX-IR(SFP)
Vendor: Brocade Communications, Inc. Version: A
Part# : FTLF1323P1BTR-F1 Serial#: PCA2XC5

```

Use the **show media ethernet** command to obtain information about the media device installed in a port.

```

Brocade#show media e 1/17
Port 1/17: Type : 1G M-SX(SFP)
Vendor: Brocade Communications, Inc. Version:
Part# : PL-XPL-VC-S13-19 Serial#: 425HC109

```

Syntax: **show media** [**slot** <slot-num> | **ethernet** [<slot-num>/]<port-num>]

Viewing optical monitoring information

You can view temperature and power information for qualified XFPs, SFPs, and SFP+ installed in a FastIron device.

Use the **show optic** <port-number> command to view information about an XFP, SFP, or SFP+ installed in a particular port. The following shows example output.

Optical monitoring feature will not work in the following scenarios:

- The port is DOWN.
- The port is configured as a stacking port.
- The the optic module does not support optical monitoring.
- For ICX 6430 devices only:
 - If an SFP+ optic is inserted in an SFP only port, the optic will not initialize.
 - If an SFP optic is inserted in an SFP+ only port, the optic will not initialize.
 - If an optic is inserted into a device that supports both SFP and SFP+ optics, use the **speed-duplex** command to set the port speed correctly.

```

Brocade#show optic 13
Port Temperature Tx Power Rx Power Tx Bias Current
+---+-----+-----+-----+-----+
13 33.2968 C -005.4075 dBm -007.4328 dBm 6.306 mA
Normal Normal Normal Normal

```

Syntax: **show optic** <port-number>

Use the **show optic slot** <slot-number> command on a FastIron X Series chassis to view information about all qualified XFPs, SFPs, and SFP+ in a particular slot. The following shows example output.

```
Brocade>show optic slot 4
Port  Temperature      Tx Power      Rx Power      Tx Bias Current
-----+-----+-----+-----+-----+
4/1    30.8242 C    -001.8822 dBm -002.5908 dBm  41.790 mA
        Normal        Normal        Normal        Normal
4/2    31.7070 C    -001.4116 dBm -006.4092 dBm  41.976 mA
        Normal        Normal        Normal        Normal
4/3    30.1835 C           -000.5794 dBm   0.000 mA
        Normal    Low-Alarm        Normal    Low-Alarm
4/4     0.0000 C           0.000 mA
        Normal        Normal        Normal        Normal
```

Syntax: **show optic slot** <slot-number>

NOTE

The **show optic slot** <slot-number> command is supported on the FSX 800 and FSX 1600 only.

NOTE

The **show optic** function takes advantage of information stored and supplied by the manufacturer of the XFP, SFP, or SFP+ transceiver. This information is an optional feature of the Multi-Source Agreement standard defining the optical interface. Not all component suppliers have implemented this feature set. In such cases where the XFP, SFP, or SFP+ transceiver does not supply the information, a “Not Available” message will be displayed for the specific port on which the module is installed.

The following table describes the information displayed by the **show optic** command.

TABLE 90 Output from the show optic command

Field	Description
Port	The Brocade port number.
Temperature	<ul style="list-style-type: none"> The operating temperature, in degrees Celsius, of the optical transceiver. The alarm status, as described in Table 91.
Tx Power	<ul style="list-style-type: none"> The transmit power signal, in decibels (dB), of the measured power referenced to one milliwatt (mW). The alarm status, as described in Table 91.
Rx Power	<ul style="list-style-type: none"> The receive power signal, in decibels (dB), of the measured power referenced to one milliwatt (mW). The alarm status, as described in Table 91.
Tx Bias Current	<ul style="list-style-type: none"> The transmit bias power signal, in milliamperes (mA). The alarm status, as described in Table 91.

For Temperature, Tx Power, Rx Power, and Tx Bias Current in the **show optic** command output, values are displayed along with one of the following alarm status values: Low-Alarm, Low-Warn, Normal, High-Warn or High-Alarm. The thresholds that determine these status values are set by the manufacturer of the optical transceivers. [Table 91](#) describes each of these status values.

TABLE 91 Alarm status value description

Status value	Description
Low-Alarm	Monitored level has dropped below the "low-alarm" threshold set by the manufacturer of the optical transceiver.
Low-Warn	Monitored level has dropped below the "low-warn" threshold set by the manufacturer of the optical transceiver.
Normal	Monitored level is within the "normal" range set by the manufacturer of the optical transceiver.
High-Warn	Monitored level has climbed above the "high-warn" threshold set by the manufacturer of the optical transceiver.
High-Alarm	Monitored level has climbed above the "high-alarm" threshold set by the manufacturer of the optical transceiver.

Viewing optical transceiver thresholds

The thresholds that determine the alarm status values for an optical transceiver are set by the manufacturer of the XFP, SFP, or SFP+. To view the thresholds for a qualified optical transceiver in a particular port, use the **show optic threshold** command as shown below.

```
Brocade>show optic threshold 2/2
Port 2/2 sfp monitor thresholds:
Temperature High alarm          5a00          90.0000 C
Temperature Low alarm           d300         -45.0000 C
Temperature High warning        5500          85.0000 C
Temperature Low warning         d800         -40.0000 C
Supply Voltage High alarm       9088
Supply Voltage Low alarm       7148
Supply Voltage High warning     8ca0
Supply Voltage Low warning     7530
TX Bias High alarm              7530          60.000 mA
TX Bias Low alarm              01f4           1.000 mA
TX Bias High warning           61a8          50.000 mA
TX Bias Low warning            05dc           3.000 mA
TX Power High alarm            1f07         -001.0001 dBm
TX Power Low alarm             02c4         -011.4996 dBm
TX Power High warning          18a6         -001.9997 dBm
TX Power Low warning           037b         -010.5012 dBm
RX Power High alarm            2710          000.0000 dBm
RX Power Low alarm             0028         -023.9794 dBm
RX Power High warning          1f07         -001.0001 dBm
RX Power Low warning           0032         -023.0102 dBm
```

Syntax: **show optic threshold** <port>

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

For Temperature, Supply Voltage, TX Bias, TX Power, and RX Power, values are displayed for each of the following four alarm and warning settings: High alarm, Low alarm, High warning, and Low warning. The hexadecimal values are the manufacturer internal calibrations, as defined in the SFF-8472 standard. The other values indicate at what level (above the high setting or below the low setting) the system should send a warning message or an alarm. Note that these values are set by the manufacturer of the optical transceiver, and cannot be configured.

Syslog messages for optical transceivers

The system generates Syslog messages for optical transceivers in the following circumstances:

- The temperature, supply voltage, TX Bias, TX power, or TX power value goes above or below the high or low warning or alarm threshold set by the manufacturer.
- The optical transceiver does not support digital optical monitoring.
- The optical transceiver is not qualified, and therefore not supported by Brocade.

For details about the above Syslog messages, refer to [Appendix A, “Syslog messages”](#).

Digital optical monitoring

Syslog

[Table 92](#) lists individual Brocade switches and the Syslog features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 92 Supported Syslog features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Syslog messages	Yes	Yes	Yes	Yes	Yes
Real-time display of Syslog messages	Yes	Yes	Yes	Yes	Yes
Real-time display for Telnet or SSH sessions	Yes	Yes	Yes	Yes	Yes
Show log on all terminals	Yes	Yes	Yes	Yes	Yes
Time stamps	Yes	Yes	Yes	Yes	Yes
Multiple Syslog server logging (up to 6 Syslog servers)	Yes	Yes	Yes	Yes	Yes
Disabling logging of a message level	Yes	Yes	Yes	Yes	Yes
Changing the number of entries the local buffer can hold	Yes	Yes	Yes	Yes	Yes
Changing the log facility	Yes	Yes	Yes	Yes	Yes
Displaying Interface names in Syslog messages	Yes	Yes	Yes	Yes	Yes
Displaying TCP and UDP port numbers in Syslog messages	Yes	Yes	Yes	Yes	Yes
Retaining Syslog messages after a soft reboot	Yes	Yes	Yes	Yes	Yes
Clearing Syslog messages from the local buffer	Yes	Yes	Yes	Yes	Yes
Syslog messages for hardware errors	Yes	No	No	No	No

This chapter describes how to display Syslog messages and how to configure the Syslog facility, and lists the Syslog messages that Brocade devices can display during standard operation. Refer to [“Syslog”](#) on page 507 for a list of Syslog messages.

About Syslog messages

Brocade software can write syslog messages to provide information at the following severity levels:

- Emergencies
- Alerts
- Critical
- Errors
- Warnings
- Notifications
- Informational
- Debugging

The device writes the messages to a local buffer.

You also can specify the IP address or host name of up to six Syslog servers. When you specify a Syslog server, the Brocade device writes the messages both to the system log and to the Syslog server.

Using a Syslog server ensures that the messages remain available even after a system reload. The Brocade local Syslog buffer is cleared during a system reload or reboot, but the Syslog messages sent to the Syslog server remain on the server.

NOTE

To enable the Brocade device to retain Syslog messages after a soft reboot (**reload** command). Refer to [“Retaining Syslog messages after a soft reboot”](#) on page 518.

The Syslog service on a Syslog server receives logging messages from applications on the local host or from devices such as a Layer 2 Switch or Layer 3 Switch. Syslog adds a time stamp to each received message and directs messages to a log file. Most Unix workstations come with Syslog configured. Some third party vendor products also provide Syslog running on NT.

Syslog uses UDP port 514 and each Syslog message thus is sent with destination port 514. Each Syslog message is one line with Syslog message format. The message is embedded in the text portion of the Syslog format. There are several subfields in the format. Keywords are used to identify each subfield, and commas are delimiters. The subfield order is insensitive except that the text subfield should be the last field in the message. All the subfields are optional.

Displaying Syslog messages

To display the Syslog messages in the device local buffer, enter the **show logging** command at any level of the CLI. The following shows an example display output.

```
Brocade>#show logging
```

```
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 3 messages logged
    level code: A=alert C=critical D=debugging M=emergency E=error
                I=informational N=notification W=warning
```

```
Static Log Buffer:
```

```
Dec 15 19:04:14:A:Fan 1, fan on right connector, failed
```

```
Dynamic Log Buffer (50 entries):
Dec 15 18:46:17:I:Interface ethernet 4, state up
Dec 15 18:45:21:I:Bridge topology change, vlan 4095, interface 4, changed
state to forwarding
Dec 15 18:45:15:I:Warm start
```

For information about the Syslog configuration information, time stamps, and dynamic and static buffers, refer to [“Displaying the Syslog configuration”](#) on page 510.

Enabling real-time display of Syslog messages

By default, to view Syslog messages generated by a Brocade device, you need to display the Syslog buffer or the log on a Syslog server used by the Brocade device.

You can enable real-time display of Syslog messages on the management console. When you enable this feature, the software displays a Syslog message on the management console when the message is generated. However, to enable display of real-time Syslog messages in Telnet or SSH sessions, you also must enable display within the individual sessions.

To enable real-time display of Syslog messages, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)#logging console
```

Syntax: [no] logging console

This command enables the real-time display of Syslog messages on the serial console. You can enter this command from the serial console or a Telnet or SSH session.

Enabling real-time display for a Telnet or SSH session

To also enable the real-time display for a Telnet or SSH session, enter the following command from the Privileged EXEC level of the session.

```
telnet@Brocade#terminal monitor
Syslog trace was turned ON
```

Syntax: terminal monitor

Notice that the CLI displays a message to indicate the status change for the feature. To disable the feature in the management session, enter the **terminal monitor** command again. The command toggles the feature on and off.

```
telnet@Brocade#terminal monitor
Syslog trace was turned OFF
```

Here is an example of how the Syslog messages are displayed.

```
telnet@Brocade#terminal monitor
Syslog trace was turned ON
SYSLOG: <9>Brocade, Power supply 2, power supply on left connector, failed

SYSLOG: <14>Brocade, Interface ethernet 6, state down

SYSLOG: <14>Brocade, Interface ethernet 2, state up
```

Displaying real-time Syslog messages

Any terminal logged on to a Brocade switch can receive real-time Syslog messages when the **terminal monitor** command is issued.

Syslog service configuration

The procedures in this section describe how to perform the following Syslog configuration tasks:

- Specify a Syslog server. You can configure the Brocade device to use up to six Syslog servers. (Use of a Syslog server is optional. The system can hold up to 1000 Syslog messages in an internal buffer.)
- Change the level of messages the system logs.
- Change the number of messages the local Syslog buffer can hold.
- Display the Syslog configuration.
- Clear the local Syslog buffer.

Logging is enabled by default, with the following settings:

- Messages of all severity levels (Emergencies – Debugging) are logged.
- By default, up to 50 messages are retained in the local Syslog buffer. This can be changed.
- No Syslog server is specified.

Displaying the Syslog configuration

To display the Syslog parameters currently in effect on a Brocade device, enter the following command from any level of the CLI.

```
Brocade>#show logging
```

```
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 3 messages logged
  level code: A=alert C=critical D=debugging M=emergency E=error
              I=informational N=notification W=warning
```

```
Static Log Buffer:
```

```
Dec 15 19:04:14:A:Fan 1, fan on right connector, failed
```

```
Dynamic Log Buffer (50 entries):
```

```
Dec 15 18:46:17:I:Interface ethernet 1/4, state up
```

```
Dec 15 18:45:21:I:Bridge topology change, vlan 4095, interface 4, changed
state to forwarding
```

```
Dec 15 18:45:15:I:Warm start
```

Syntax: show logging

The Syslog display shows the following configuration information, in the rows above the log entries themselves.

TABLE 93 CLI display of Syslog buffer configuration

Field	Definition
Syslog logging	The state (enabled or disabled) of the Syslog buffer.
messages dropped	The number of Syslog messages dropped due to user-configured filters. By default, the software logs messages for all Syslog levels. You can disable individual Syslog levels, in which case the software filters out messages at those levels. Refer to “Disabling logging of a message level” on page 515. Each time the software filters out a Syslog message, this counter is incremented.
flushes	The number of times the Syslog buffer has been cleared by the clear logging command or equivalent Web Management Interface option. Refer to “Clearing the Syslog messages from the local buffer” on page 518.
overruns	The number of times the dynamic log buffer has filled up and been cleared to hold new entries. For example, if the buffer is set for 100 entries, the 101st entry causes an overrun. After that, the 201st entry causes a second overrun.
level	The message levels that are enabled. Each letter represents a message type and is identified by the key (level code) below the value. If you disable logging of a message level, the code for that level is not listed.
messages logged	The total number of messages that have been logged since the software was loaded.
level code	The message levels represented by the one-letter codes.

Static and dynamic buffers

The software provides two buffers:

- Static – logs power supply failures, fan failures, and temperature warning or shutdown messages
- Dynamic – logs all other message types

In the static log, new messages replace older ones, so only the most recent message is displayed. For example, only the most recent temperature warning message will be present in the log. If multiple temperature warning messages are sent to the log, the latest one replaces the previous one. The static buffer is not configurable.

The message types that appear in the static buffer do not appear in the dynamic buffer. The dynamic buffer contains up to the maximum number of messages configured for the buffer (50 by default), then begins removing the oldest messages (at the bottom of the log) to make room for new ones.

The static and dynamic buffers are both displayed when you display the log.

```
Brocade#show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 3 messages logged
  level code: A=alert C=critical D=debugging M=emergency E=error
              I=informational N=notification W=warning
```

Static Log Buffer:

```
Dec 15 19:04:14:A:Fan 1, fan on right connector, failed
Dec 15 19:00:14:A:Fan 2, fan on left connector, failed
```

Dynamic Log Buffer (50 entries):

```
Dec 15 18:46:17:I:Interface ethernet 4, state up
Dec 15 18:45:21:I:Bridge topology change, vlan 4095, interface 4, changed
state to forwarding
Dec 15 18:45:15:I:Warm start
```

Notice that the static buffer contains two separate messages for fan failures. Each message of each type has its own buffer. Thus, if you replace fan 1 but for some reason that fan also fails, the software replaces the first message about the failure of fan 1 with the newer message. The software does not overwrite the message for fan 2, unless the software sends a newer message for fan 2.

Clearing log entries

When you clear log entries, you can selectively clear the static or dynamic buffer, or you can clear both. For example, to clear only the dynamic buffer, enter the following command at the Privileged EXEC level.

```
Brocade#clear logging dynamic-buffer
```

Syntax: clear logging [dynamic-buffer | static-buffer]

You can specify **dynamic-buffer** to clear the dynamic buffer or **static-buffer** to clear the static buffer. If you do not specify a buffer, both buffers are cleared.

Time stamps

The contents of the time stamp differ depending on whether you have set the time and date on the onboard system clock:

- If you have set the time and date on the onboard system clock, the date and time are shown in the following format.

mm dd hh:mm:ss

where

- *mm* – abbreviation for the name of the month
- *dd* – day
- *hh* – hours
- *mm* – minutes
- *ss* – seconds

For example, “Oct 15 17:38:03” means October 15 at 5:38 PM and 3 seconds.

- If you have not set the time and date on the onboard system clock, the time stamp shows the amount of time that has passed since the device was booted, in the following format.

<num>d<num>h<num>m<num>s

where

- <num>d – day
- <num>h – hours
- <num>m – minutes
- <num>s – seconds

For example, “188d1h01m00s” means the device had been running for 188 days, 11 hours, one minute, and zero seconds when the Syslog entry with this time stamp was generated.

Example of Syslog messages on a device with the onboard clock set

The example shows the format of messages on a device where the onboard system clock has been set. Each time stamp shows the month, the day, and the time of the system clock when the message was generated. For example, the system time when the most recent message (the one at the top) was generated was October 15 at 5:38 PM and 3 seconds.

```
Brocade#show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 38 messages logged
    level code: A=alert C=critical D=debugging M=emergency E=error
                I=informational N=notification W=warning
```

```
Static Log Buffer:
Dec 15 19:04:14:A:Fan 1, fan on right connector, failed
Dec 15 19:00:14:A:Fan 2, fan on left connector, failed
```

```
Dynamic Log Buffer (50 entries):
Oct 15 17:38:03:warning:list 101 denied tcp 209.157.22.191(0)(Ethernet 18
0010.5alf.77ed) -> 198.99.4.69(http), 1 event(s)
Oct 15 07:03:30:warning:list 101 denied tcp 209.157.22.26(0)(Ethernet 18
0010.5alf.77ed) -> 198.99.4.69(http), 1 event(s)
Oct 15 06:58:30:warning:list 101 denied tcp 209.157.22.198(0)(Ethernet 18
0010.5alf.77ed) -> 198.99.4.69(http), 1 event(s)
```

Example of Syslog messages on a device with the onboard clock not set

The example shows the format of messages on a device where the onboard system clock is not set. Each time stamp shows the amount of time the device had been running when the message was generated. For example, the most recent message, at the top of the list of messages, was generated when the device had been running for 21 days, seven hours, two minutes, and 40 seconds.

```
Brocade#show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 38 messages logged
  level code: A=alert C=critical D=debugging M=emergency E=error
              I=informational N=notification W=warning

Static Log Buffer:

Dynamic Log Buffer (50 entries):
21d07h02m40s:warning:list 101 denied tcp 209.157.22.191(0)(Ethernet 4/18
0010.5alf.77ed) -> 198.99.4.69(http), 1 event(s)
19d07h03m30s:warning:list 101 denied tcp 209.157.22.26(0)(Ethernet 4/18
0010.5alf.77ed) -> 198.99.4.69(http), 1 event(s)
17d06h58m30s:warning:list 101 denied tcp 209.157.22.198(0)(Ethernet 4/18
0010.5alf.77ed) -> 198.99.4.69(http), 1 event(s)
```

Disabling or re-enabling Syslog

Syslog is enabled by default. To disable it, enter the **logging on** command at the global CONFIG level.

```
Brocade(config)#no logging on
```

Syntax: [no] **logging on** [<udp-port>]

The <udp-port> parameter specifies the application port used for the Syslog facility. The default is 514.

To re-enable logging, re-enter the **logging on** command.

```
Brocade(config)#logging on
```

This command enables local Syslog logging with the following defaults:

- Messages of all severity levels (Emergencies – Debugging) are logged.
- Up to 50 messages are retained in the local Syslog buffer.
- No Syslog server is specified.

Specifying a Syslog server

To specify a Syslog server, enter the **logging host** command.

```
Brocade(config)#logging host 10.0.0.99
```

Syntax: **logging host** <ip-addr> | <server-name>

Specifying an additional Syslog server

To specify an additional Syslog server, enter the **logging host** <ip-addr> command again. You can specify up to six Syslog servers.

```
Brocade(config)#logging host 10.0.0.99
```

Syntax: **logging host** <ip-addr> | <server-name>

Disabling logging of a message level

To change the message level, disable logging of specific message levels. You must disable the message levels on an individual basis.

For example, to disable logging of debugging and informational messages, enter the following commands.

```
Brocade(config)#no logging buffered debugging
Brocade(config)#no logging buffered informational
```

Syntax: [no] **logging buffered** <level> | <num-entries>

The <level> parameter can have one of the following values:

- alerts
- critical
- debugging
- emergencies
- errors
- informational
- notifications
- warnings

The commands in the example above change the log level to notification messages or higher. The software will not log informational or debugging messages. The changed message level also applies to the Syslog servers.

Changing the number of entries the local buffer can hold

You also can use the **logging buffered** command to change the number of entries the local Syslog buffer can store. For example.

```
Brocade(config)#logging buffered 100
Brocade(config)#write mem
Brocade(config)#exit
Brocade#reload
```

Syntax: **logging buffered** <num>

The default number of messages is 50. For FastIron Layer 2 switches, you can set the Syslog buffer limit from 1 – 100 entries. For FastIron Layer 3 switches, you can set the Syslog buffer limit from 1 – 1000 entries.

Local buffer configuration notes

- You must save the configuration and reload the software to place the change into effect.
- If you decrease the size of the buffer, the software clears the buffer before placing the change into effect.
- If you increase the size of the Syslog buffer, the software will clear some of the older locally buffered Syslog messages.

Changing the log facility

The Syslog daemon on the Syslog server uses a facility to determine where to log the messages from the Brocade device. The default facility for messages the Brocade device sends to the Syslog server is “user”. You can change the facility using the following command.

NOTE

You can specify only one facility. If you configure the Brocade device to use two Syslog servers, the device uses the same facility on both servers.

```
Brocade(config)#logging facility local0
```

Syntax: `logging facility <facility-name>`

The <facility-name> can be one of the following:

- kern – kernel messages
- user – random user-level messages
- mail – mail system
- daemon – system daemons
- auth – security or authorization messages
- syslog – messages generated internally by Syslog
- lpr – line printer subsystem
- news – netnews subsystem
- uucp – uucp subsystem
- sys9 – cron/at subsystem
- sys10 – reserved for system use
- sys11 – reserved for system use
- sys12 – reserved for system use
- sys13 – reserved for system use
- sys14 – reserved for system use
- cron – cron/at subsystem
- local0 – reserved for local use
- local1 – reserved for local use
- local2 – reserved for local use
- local3 – reserved for local use
- local4 – reserved for local use
- local5 – reserved for local use
- local6 – reserved for local use
- local7 – reserved for local use

Displaying interface names in Syslog messages

By default, an interface slot number (if applicable) and port number are displayed when you display Syslog messages. If you want to display the name of the interface instead of its number, enter the following command:

```
FastIron(config)# ip show-portname
```

This command is applied globally to all interfaces on Layer 2 Switches and Layer 3 Switches.

Syntax: [no] ip show-portname

By default, Syslog messages show the interface type, such as “ethernet”, “pos”, and so on. For example, you see the following

```
SYSLOG: <14>0d00h02m18s:ICX6610-48P Router System: Interface ethernet 1/1/5,
state up
```

However, if ip show-portname is configured and a name has been assigned to the port, the port name replaces the interface type as in the example below, where “port5_name” is the name of the port.

```
SYSLOG: <14>0d00h02m18s:ICX6610-48P Router System: Interface port5_name 1/1/5,
state up
```

Also, when you display the messages in the Syslog, you see the interface name under the Dynamic Log Buffer section. The actual interface number is appended to the interface name. For example, if the interface name is “lab” and its port number is “2”, you see “lab2” displayed as in the example below:

```
Brocade# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Buffer logging: level ACDMEINW, 3 messages logged
    level code: A=alert C=critical D=debugging M=emergency E=error
                I=informational N=notification W=warning
Static Log Buffer:
Dec 15 19:04:14:A:Fan 1, fan on right connector, failed
Dynamic Log Buffer (50 entries):
Dec 15 18:46:17:I:Interface ethernet Lab2, state up
Dec 15 18:45:15:I:Warm start
```

Displaying TCP or UDP port numbers in Syslog messages

The command **ip show-service-number-in-log** allows you to change the display of TCP or UDP application information from the TCP or UDP well-known port name to the TCP or UDP port number. For example, when this command is in effect, the Brocade device will display **http** (the well-known port name) instead of **80** (the port number) in the output of show commands, and other commands that contain application port information. By default, Brocade devices display TCP or UDP application information in named notation.

To display TCP or UDP port numbers instead of their names, enter the following command.

```
Brocade(config)#ip show-service-number-in-log
```

Syntax: [no] ip show-service-number-in-log

Retaining Syslog messages after a soft reboot

You can configure the device to save the System log (Syslog) after a soft reboot (**reload** command).

Syslog reboot configuration considerations

- If the Syslog buffer size was set to a different value using the CLI command **logging buffered**, the System log will be cleared after a soft reboot, even when this feature (**logging persistence**) is in effect. This will occur only with a soft reboot immediately following a Syslog buffer size change. A soft reboot by itself will not clear the System log. To prevent the system from clearing the System log, leave the number of entries allowed in the Syslog buffer unchanged.
- This feature does not save Syslog messages after a hard reboot. When the Brocade device is power-cycled, the Syslog messages are cleared.
- If **logging persistence** is enabled and you load a new software image on the device, you must first clear the log if you want to reload the device. (Refer to [“Clearing the Syslog messages from the local buffer”](#) on page 518.)

To configure the device to save the System log messages after a soft reboot, enter the following command.

```
Brocade(config)#logging persistence
```

Syntax: [no] **logging persistence**

Enter **no logging persistence** to disable this feature after it has been enabled.

Clearing the Syslog messages from the local buffer

To clear the Syslog messages stored in the local buffer of the Brocade device, enter the **clear logging** command.

```
Brocade#clear logging
```

Syntax: **clear logging**

Syslog messages for hardware errors

NOTE

This feature is supported on FastIron X Series devices only. It is **not** supported on FWS, FCX, and ICX devices.

FastIron Chassis devices support the display of hardware read and write errors encountered on a slot or module during bootup and during normal system operations. There are four types of errors, which may cause the system to disable or power down the modules on which they occur:

- Configuration read error
- Configuration write error
- Memory read error
- Memory write error

The following shows examples of some hardware errors in the **show logging** display output.

```
Brocade>#show logging
```

```
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
```

```
  Buffer logging: level ACDMEINW, 3 messages logged
```

```
  level code: A=alert C=critical D=debugging M=emergency E=error
```

```
               I=informational N=notification W=warning
```

```
Dynamic Log Buffer (50 lines):
```

```
0d00h00m27s:I:System: Interface ethernet mgmt1, state up
```

```
0d00h00m26s:N:powered On switch Fabric
```

```
0d00h00m17s:N:powered On switch Fabric
```

```
0d00h00m08s:I:System: Warm start
```

```
0d00h00m08s:I:SNMP: read-only community added by from session
```

```
0d00h00m02s:A:System: Module in slot 5 encountered unrecoverable PCI bridge  
validation failure. Module will be deleted.
```

```
0d00h00m02s:A:System: Module in slot 5 encountered unrecoverable PCI config read  
failure. Module will be deleted.
```

```
0d00h00m02s:A:System: Module in slot 5 encountered PCI config read error: Bus 10,  
Dev 3, Reg Offset 0.
```

```
0d00h00m00s:W:System: Fan speed changed automatically to 1
```

Syslog messages (alerts) for hardware errors are listed in [Table 1](#) on page 1995.

Syslog service configuration

Network Monitoring

Table 94 lists the individual FastIron switches and the network monitoring features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 94 Supported network monitoring features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Traffic counters for outbound traffic	Yes	No	No	No	Yes
Egress queue counters	No	No	Yes	Yes	No
Remote monitoring (RMON)	Yes	Yes	Yes	Yes	Yes
Specifying the maximum number of entries allowed in the RMON Control Table	Yes	No	Yes	Yes	Yes
sFlow version 2	Yes	Yes	Yes	Yes	ICX 6450 only
sFlow version 5 (default)	Yes	Yes	Yes	Yes	ICX 6450 only
sFlow support for IPv6 packets	Yes	Yes	Yes	Yes	ICX 6450 only
Uplink utilization lists	Yes	Yes	Yes	Yes	Yes

Basic system management

The following sections contain procedures for basic system management tasks.

Viewing system information

You can access software and hardware specifics for a Brocade Layer 2 Switch or Layer 3 Switch. For software specifics, refer to [“Software versions installed and running on a device”](#) on page 72.

To view the software and hardware details for the system, enter the **show version** command. The following shows an example output.

```

Brocade#show version

=====
Active Management CPU [Slot-9]:

The system : started=warm start reloaded=by "reload"
*** NOT FOR PRODUCTION ***
*** AUTO SHUTDOWN IS OFF. PLEASE ACTIVATE WITH auto-shutdown ***

```

The following hardware details are listed in the output of the **show version** command:

- Chassis type
- PROM type (if applicable)
- Chassis serial number
- Management and interface module serial numbers and ASIC types

For a description of the software details in the output of the **show version** command, refer to [“Software versions installed and running on a device”](#) on page 72.

Syntax: **show version**

Viewing configuration information

You can view a variety of configuration details and statistics with the **show** option. The **show** option provides a convenient way to check configuration changes before saving them to flash.

The show options available will vary for Layer 2 Switches and Layer 3 Switches and by configuration level.

To determine the available show commands for the system or a specific level of the CLI, enter the following command.

```
Brocade#show ?
```

Syntax: **show** <option>

You also can enter “show” at the command prompt, then press the TAB key.

Viewing port statistics

Port statistics are polled by default every 10 seconds.

You can view statistics for ports by entering the following **show** commands:

- show interfaces
- show configuration
- show statistics

To display the statistics, enter a command such as the following.

```
Brocade#show statistics ethernet 1/3
Port  Link State      Dupl Speed Trunk Tag Priori MAC              Name
1/3    Up    Forward    Half 100M  None  No   level0 00e0.5200.0102

Port 1/3 Counters:
      InOctets          3200          OutOctets          256
      InPkts            50          OutPkts            4
InBroadcastPkts          0    OutBroadcastPkts          3
InMulticastPkts         48    OutMulticastPkts          0
InUnicastPkts           2    OutUnicastPkts          1
      InBadPkts          0
      InFragments        0
      InDiscards          0          OutErrors          0
      CRC                0          Collisions          0
      InErrors           0          LateCollisions          0
      InGiantPkts         0
      InShortPkts          0
      InJabber             0
InFlowCtrlPkts           0    OutFlowCtrlPkts          0
InBitsPerSec            264    OutBitsPerSec          16
InPktsPerSec             0    OutPktsPerSec           0
InUtilization            0.00%    OutUtilization          0.00%
```

Syntax: **show statistics** [ethernet [<port>]]

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

[Table 95](#) lists the statistics displayed in the output of the **show statistics** command.

TABLE 95 Port statistics

Parameter	Description
Port configuration	
Port	The port number.
Link	The link state.
State	The STP state.
Dupl	The mode (full-duplex or half-duplex).
Speed	The port speed (10M, 100M, or 1000M).
Trunk	The trunk group number, if the port is a member of a trunk group.
Tag	Whether the port is a tagged member of a VLAN.
Priori	The QoS forwarding priority of the port (level0 – level7).
MAC	The MAC address of the port.
Name	The name of the port, if you assigned a name.
Statistics	
InOctets	The total number of good octets and bad octets received.
OutOctets	The total number of good octets and bad octets sent.
InPkts	The total number of packets received. The count includes rejected and local packets that are not sent to the switching core for transmission.
OutPkts	The total number of good packets sent. The count includes unicast, multicast, and broadcast packets.
InBroadcastPkts	The total number of good broadcast packets received.
OutBroadcastPkts	The total number of good broadcast packets sent.
InMulticastPkts	The total number of good multicast packets received.
OutMulticastPkts	The total number of good multicast packets sent.
InUnicastPkts	The total number of good unicast packets received.
OutUnicastPkts	The total number of good unicast packets sent.
InBadPkts	The total number of packets received for which one of the following is true: <ul style="list-style-type: none"> • The CRC was invalid. • The packet was oversized. • Jabbers: The packets were longer than 1518 octets and had a bad FCS. • Fragments: The packets were less than 64 octets long and had a bad FCS. • The packet was undersized (short).
InFragments	The total number of packets received for which both of the following was true: <ul style="list-style-type: none"> • The length was less than 64 bytes. • The CRC was invalid.
InDiscards	The total number of packets that were received and then dropped due to a lack of receive buffers.
OutErrors	The total number of packets with internal transmit errors such as TX underruns.

TABLE 95 Port statistics (Continued)

Parameter	Description
CRC	The total number of packets received for which all of the following was true: <ul style="list-style-type: none"> • The data length was between 64 bytes and the maximum allowable frame size. • No Collision or Late Collision was detected. • The CRC was invalid.
Collisions	The total number of packets received in which a Collision event was detected.
InErrors	The total number of packets received that had Alignment errors or phy errors.
LateCollisions	The total number of packets received in which a Collision event was detected, but for which a receive error (Rx Error) event was not detected.
InGiantPkts	The total number of packets for which all of the following was true: <ul style="list-style-type: none"> • The data length was longer than the maximum allowable frame size. • No Rx Error was detected. <p>NOTE: Packets are counted for this statistic regardless of whether the CRC is valid or invalid.</p>
InShortPkts	The total number of packets received for which all of the following was true: <ul style="list-style-type: none"> • The data length was less than 64 bytes. • No Rx Error was detected. • No Collision or Late Collision was detected. <p>NOTE: Packets are counted for this statistic regardless of whether the CRC is valid or invalid.</p>
InJabber	The total number of packets received for which all of the following was true: <ul style="list-style-type: none"> • The data length was longer than the maximum allowable frame size. • No Rx Error was detected. • The CRC was invalid.
InFlowCtrlPkts	The total number of flow control packets received.
OutFlowCtrlPkts	The total number of flow control packets transmitted.
InBitsPerSec	The number of bits received per second.
OutBitsPerSec	The number of bits sent per second.
InPktsPerSec	The number of packets received per second.
OutPktsPerSec	The number of packets sent per second.
InUtilization	The percentage of the port bandwidth used by received traffic.
OutUtilization	The percentage of the port bandwidth used by sent traffic.

Viewing STP statistics

You can view a summary of STP statistics for Layer 2 Switches and Layer 3 Switches. STP statistics are by default polled every 10 seconds.

To view spanning tree statistics, enter the **show span** command. To view STP statistics for a VLAN, enter the **span vlan** command.

Clearing statistics

You can clear statistics for many parameters using the **clear** command.

To determine the available **clear** commands for the system, enter the **clear** command at the Privileged EXEC level of the CLI.

```
Brocade#clear ?
```

Syntax: **clear** <option>

You also can enter “clear” at the command prompt, then press the TAB key.

Traffic counters for outbound traffic

You can configure traffic counters (also called transmit counters) that enable the Brocade device to count the following packet types on a port or port region:

- broadcast packets
- multicast packets
- unicast packets
- dropped packets due to congestion and egress filtering

Depending on the parameters specified with the traffic counter configuration, traffic counters record the number of outbound packets from any combination of the following sources:

- a specific port or all ports in a specific port region
- a specific VLAN or all VLANs
- a specific 802.1p priority queue or all priority queues

Traffic counters configuration notes

Consider the following rules when configuring traffic counters for outbound traffic.

- This feature is supported on FastIron X Series devices only.
- This feature is supported in the Layer 2, base Layer 3, and full Layer 3 codes.
- This feature applies to physical ports only, including 10 Gbps Ethernet ports and trunk ports. It does not apply to virtual interfaces.
- Once the enhanced traffic counters are read using the **show transmit-counter values** command, the counters are cleared (reset to zero).
- For each port region, you can enable a maximum of two traffic counters, regardless of whether traffic counters are enabled on individual ports or on all ports in the port region.
- Traffic counters increase for bridged filtered outbound traffic when any of the following conditions occur:
 - The port is disabled or the link is down.
 - The port or port region does not belong to the VLAN specified in the transmit counter configuration.
 - A Layer 2 protocol (e.g., spanning tree) has the port in a Blocked state.
 - The source port needs to be suppressed for multi-target packets.
 - The priority queue specified in the traffic counter is not allowed for some other reason.

- Unknown unicast and unregistered multicast packets are filtered.

Traffic counters configuration syntax

This section provides the syntax and configuration examples for enhanced traffic counters.

Example

To configure traffic counters for outbound traffic on a specific port, enter a command such as the following.

```
Brocade(config)#transmit-counter 4 port 18 only vlan 1 prio 7 enable
```

The above command creates and enables traffic counter 4 on port 18. The device will count the number of packets sent out on port 18 that are in VLAN 1 and have a priority queue of 7.

Example

To configure traffic counters for outbound traffic in a specific port region, enter a command such as the following.

```
Brocade(config)#transmit-counter 1 port 1 region vlan all prio all enable
```

The above command creates and enables traffic counter 1 on all ports that are in the same port region as port 1. The device will count the number of packets transmitted in this port region that belong to any VLAN and have any assigned priority queue.

Syntax: [no] **transmit-counter** <counter-ID> **port** [<slotnum>/]<port-num> **only** | **region** **vlan** <vlan-ID> | **all** **priority** <priority-queue> | **all** **enable**

Enter the **no** form of the command to remove the outbound traffic counter.

The <counter-ID> parameter identifies the traffic counter. You can configure up to 64 traffic counters. Enter a number from 1 – 64.

The <slotnum> parameter is required on chassis devices.

The <port-num> parameter is the port number to which enhanced traffic counters will apply. Enter the port number followed by **only** to apply the enhanced traffic counter to a specific port, or enter the port number followed by **region** to apply the enhanced traffic counter to all of the ports in the port region.

The <vlan-ID> parameter identifies the VLAN ID for which outbound traffic will be counted. Enter a number from 0 – 4095 or enter **all** to indicate all VLANs.

The <priority-queue> parameter identifies the 802.1p priority queue for which traffic will be counted. Enter a number from 0 – 7 or enter **all** to indicate all priority queues.

Displaying enhanced traffic counter profiles

To display the details of the traffic counters configured on your device, enter the **show transmit-counter profiles** command. The following shows an example output.

```
Brocade#show transmit-counter profiles
```

Tx Counter	Port(s)	Vlan Id	Priority	Device	Set
1	1 - 12	All	All	Dev 0	Set0
4	18	1	7	Dev 1	Set0
10	13 - 24	100	All	Dev 1	Set1

Displaying enhanced traffic counter statistics

To display the traffic counters for outbound traffic, enter the **show transmit-counter profiles** command.

NOTE

Once the enhanced traffic counters are displayed, the counters are cleared (reset to zero).

The following shows an example output.

```
Brocade#show transmit-counter values 1

Transmit Queue Counter Values for Counter 1:
Transmitted Frames:
  Known Unicast           : 17204
  Multicast & Unknown Unicast : 2797
  Broadcast               : 5
Dropped Frames:
  Bridge Egress Filtered   : 2
  Congestion Drops         : 0

Brocade#show transmit-counter values 4

Transmit Queue Counter Values for Counter 4:
Transmitted Frames:
  Known Unicast           : 124
  Multicast & Unknown Unicast : 2752
  Broadcast               : 0
Dropped Frames:
  Bridge Egress Filtered   : 37
  Congestion Drops         : 0
```

Syntax: **show transmit-counter values** *<number>*

where *<number>* identifies a valid enhanced traffic counter and is a value from 1 – 64.

TABLE 96 Outbound traffic counter statistics

This line...	Displays...
Transmitted frames	
Known Unicast	The number of known unicast packets transmitted.
Multicast & Unknown Unicast	The number of multicast and unknown unicast packets transmitted.
Broadcast	The number of broadcast packets transmitted.
Dropped Frames	

TABLE 96 Outbound traffic counter statistics (Continued)

This line...	Displays...
Bridge Egress Filtered	<p>The number of bridged outbound packets that were filtered and dropped. This number includes the number of packets that were dropped because of any one of the following conditions:</p> <ul style="list-style-type: none"> • The port was disabled or the link was down. • The port or port region does not belong to the VLAN specified in the transmit counter configuration. • A Layer 2 protocol (e.g., spanning tree) had the port in a Blocked state. • The source port was suppressed for multi-target packets. • The priority queue specified in the traffic counter was not allowed for some other reason. • Unknown unicast and unregistered multicast packets were filtered.
Congestion Drops	The number of outbound packets that were dropped because of traffic congestion.

Viewing egress queue counters on FCX devices

The **show interface** command displays the number of packets on a port that were queued for each QoS priority (traffic class) and dropped because of congestion.

NOTE

These counters do not include traffic on management ports or for a stack member unit that is down.

The egress queue counters display at the end of the **show interface** command output as shown in the following example.

```
Brocade#show interface e 1/1/1
GigabitEthernet1/1/1 is up, line protocol is up
  Hardware is GigabitEthernet, address is 0024.3877.8080 (bia 0024.3877.8080)
  Configured speed auto, actual 1Gbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual none
  Member of L2 VLAN ID 52, port is untagged, port state is FORWARDING
  BPDU guard is Disabled, ROOT protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, mac-learning is enabled
  Flow Control is config enabled, oper enabled, negotiation disabled
  mirror disabled, monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  Inter-Packet Gap (IPG) is 96 bit times
  IP MTU 1500 bytes
  300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  300 second output rate: 256 bits/sec, 0 packets/sec, 0.00% utilization
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 input errors, 0 CRC, 0 frame, 0 ignored
  0 runts, 0 giants
  215704 packets output, 13805066 bytes, 0 underruns
  Transmitted 0 broadcasts, 215704 multicasts, 0 unicasts
  0 output errors, 0 collisions
  Relay Agent Information option: Disabled
```

Egress queues:

Queue counters	Queued packets	Dropped Packets
0	0	0
1	0	0
2	1	0
3	0	0
4	0	0
5	0	0
6	0	0
7	215703	0

Syntax: **show interface** [ethernet <port>]

Specify the <port> variable in the format *stack-unit/slotnum/portnum*.

Table 97 defines the egress queue statistics displayed in the output.

TABLE 97 Egress queue statistics

Parameter	Description
Queue counters	The QoS traffic class.
Queued packets	The number of packets queued on the port for the given traffic class.
Dropped packets	The number of packets for the given traffic class that were dropped because of congestion.

Clearing the egress queue counters

You can clear egress queue statistics (reset them to zero), using the **clear statistics** and **clear statistics ethernet <port>** command.

Syntax: **clear statistics** [**ethernet <port>**]

Specify the <port> variable in the format *stack-unit/slotnum/portnum*.

RMON support

The Brocade RMON agent supports the following groups. The group numbers come from the RMON specification (RFC 1757):

- Statistics (RMON Group 1)
- History (RMON Group 2)
- Alarms (RMON Group 3)
- Events (RMON Group 9)

The CLI allows you to make configuration changes to the control data for these groups, but you need a separate RMON application to view and display the data graphically.

Maximum number of entries allowed in the RMON control table

You can specify the maximum number of entries allowed in the RMON control table, including alarms, history, and events. The default number of RMON entries allowed in the RMON control table is 1024 on the FESX, and 2048 on the FSX 800 and FSX 1600. The maximum number of RMON entries supported is 32768.

To set the maximum number of allowable entries to 3000 in the RMON history table, enter commands such as the following.

```
Brocade(config)#system-max rmon-entries 3000
Brocade(config)#write mem
Brocade(config)#exit
Brocade#reload
```

NOTE

You must save the change to the startup-config file and reload or reboot. The change does not take effect until you reload or reboot.

Syntax: **system-max rmon-entries <value>**

where *<value>* can be:

- 1536 – 32768 for FSX 800 and FSX 1600 devices
- 128 – 32768 for FESX devices

Statistics (RMON group 1)

Count information on multicast and broadcast packets, total packets sent, undersized and oversized packets, CRC alignment errors, jabbers, collision, fragments and dropped events is collected for each port on a Brocade Layer 2 Switch or Layer 3 Switch.

The statistics group collects statistics on promiscuous traffic across an interface. The interface group collects statistics on total traffic into and out of the agent interface.

No configuration is required to activate collection of statistics for the Layer 2 Switch or Layer 3 Switch. This activity is by default automatically activated at system start-up.

You can view a textual summary of the statistics for all ports by entering the following CLI command.

```
Brocade#show rmon statistics
Ethernet statistics 1 is active, owned by monitor
Interface 1/1 (ifIndex 1) counters
      Octets      0
      Drop events  0
      Broadcast pkts  0
      CRC alignment errors  0
      Oversize pkts  0
      Jabbers      0
      64 octets pkts  0
      128 to 255 octets pkts  0
      512 to 1023 octets pkts  0
      Packets      0
      Multicast pkts  0
      Undersize pkts  0
      Fragments    0
      Collisions   0
      65 to 127 octets pkts  0
      256 to 511 octets pkts  0
      1024 to 1518 octets pkts  0
```

Syntax: `show rmon statistics [ethernet <port>]`

NOTE

Though 48GC modules receive oversized packets and jabbers, they do not support count information for oversized packets and jabbers and the output of the **show rmon statistics** command reports 0 for both of these counters.

The *<port>* parameter specifies the port number. You can use the physical port number or the SNMP port number. The physical port number is based on the product. If you specify a physical port, specify the *<port>* variable in one of the following formats:

- FCX stackable switches – *<stack-unit/slotnum/portnum>*
- FSX 800 and FSX 1600 chassis devices – *<slotnum/portnum>*
- FESX compact switches – *<portnum>*

The SNMP numbers of the ports start at 1 and increase sequentially. For example, if you are using a Chassis device and slot 1 contains an 8-port module, the SNMP number of the first port in slot 2 is 9. The physical port number of the same port is 2/1.

This command shows the following information.

TABLE 98 Export configuration and statistics

Parameter	Definition
Octets	The total number of octets of data received on the network. This number includes octets in bad packets. This number does not include framing bits but does include Frame Check Sequence (FCS) octets.
Drop events	Indicates an overrun at the port. The port logic could not receive the traffic at full line rate and had to drop some packets as a result. The counter indicates the total number of events in which packets were dropped by the RMON probe due to lack of resources. This number is not necessarily the number of packets dropped, but is the number of times an overrun condition has been detected.
Packets	The total number of packets received. This number includes bad packets, broadcast packets, and multicast packets.
Broadcast pkts	The total number of good packets received that were directed to the broadcast address. This number does not include multicast packets.
Multicast pkts	The total number of good packets received that were directed to a multicast address. This number does not include packets directed to the broadcast address.
CRC alignment errors	The total number of packets received that were from 64 – 1518 octets long, but had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). The packet length does not include framing bits but does include FCS octets.
Undersize pkts	The total number of packets received that were less than 64 octets long and were otherwise well formed. This number does not include framing bits but does include FCS octets.
Fragments	The total number of packets received that were less than 64 octets long and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). It is normal for this counter to increment, since it counts both runts (which are normal occurrences due to collisions) and noise hits. This number does not include framing bits but does include FCS octets.
Oversize packets	The total number of packets received that were longer than 1518 octets and were otherwise well formed. This number does not include framing bits but does include FCS octets. NOTE: 48GC modules do not support count information on oversized packets and report 0.
Jabbers	The total number of packets received that were longer than 1518 octets and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). NOTE: This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms. This number does not include framing bits but does include FCS octets. NOTE: 48GC modules do not support count information on jabbers and report 0.
Collisions	The best estimate of the total number of collisions on this Ethernet segment.
64 octets pkts	The total number of packets received that were 64 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.

TABLE 98 Export configuration and statistics (Continued)

Parameter	Definition
65 to 127 octets pkts	The total number of packets received that were 65 – 127 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
128 to 255 octets pkts	The total number of packets received that were 128 – 255 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
256 to 511 octets pkts	The total number of packets received that were 256 – 511 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
512 to 1023 octets pkts	The total number of packets received that were 512 – 1023 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
1024 to 1518 octets pkts	The total number of packets received that were 1024 – 1518 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.

History (RMON group 2)

All active ports by default will generate two history control data entries per active Brocade Layer 2 Switch port or Layer 3 Switch interface. An active port is defined as one with a link up. If the link goes down the two entries are automatically deleted.

Two history entries are generated for each device:

- A sampling of statistics every 30 seconds
- A sampling of statistics every 30 minutes

The history data can be accessed and displayed using any of the popular RMON applications

A sample RMON history command and its syntax is shown below.

```
Brocade(config)#rmon history 1 interface 1 buckets 10 interval 10 owner nyc02
```

Syntax: **rmon history** <entry-number> **interface** <port> **buckets** <number> **interval** <sampling-interval> **owner** <text-string>

You can modify the sampling interval and the bucket (number of entries saved before overwrite) using the CLI. In the above example, owner refers to the RMON station that will request the information.

NOTE

To review the control data entry for each port or interface, enter the **show rmon history** command.

Alarm (RMON group 3)

Alarm is designed to monitor configured thresholds for any SNMP integer, time tick, gauge or counter MIB object. Using the CLI, you can define what MIB objects are monitored, the type of thresholds that are monitored (falling, rising or both), the value of those thresholds, and the sample type (absolute or delta).

An alarm event is reported each time that a threshold is exceeded. The alarm entry also indicates the action (event) to be taken if the threshold be exceeded.

A sample CLI alarm entry and its syntax is shown below.

```
Brocade(config)#rmon alarm 1 ifInOctets.6 10 delta rising-threshold 100 1 falling
threshold 50 1 owner nyc02
```

Syntax: **rmon alarm** <entry-number> <MIB-object.interface-num> <sampling-time>
 <sample-type>
 <threshold-type> <threshold-value> <event-number> <threshold-type> <threshold-value>
 <event-number>
owner <text-string>

Event (RMON group 9)

There are two elements to the Event Group—the **event control table** and the **event log table**.

The event control table defines the action to be taken when an alarm is reported. Defined events can be found by entering the CLI command, show event. The Event Log Table collects and stores reported events for retrieval by an RMON application.

A sample entry and syntax of the event control table is shown below.

```
Brocade(config)#rmon event 1 description 'testing a longer string' log-and-trap
public owner nyc02
```

Syntax: **rmon event** <event-entry> **description** <text-string> **log | trap | log-and-trap** **owner**
 <rmon-station>

sFlow

NOTE

FastIron devices support sFlow version 5 by default.

sFlow is a standards-based protocol that allows network traffic to be sampled at a user-defined rate for the purpose of monitoring traffic flow patterns and identifying packet transfer rates on user-specified interfaces.

When sFlow is enabled on a Layer 2 or Layer 3 switch, the system performs the following sFlow-related tasks:

- Samples traffic flows by copying packet header information
- Identifies ingress and egress interfaces for the sampled flows
- Combines sFlow samples into UDP packets and forwards them to the sFlow collectors for analysis
- Forwards byte and packet count data, or counter samples, to sFlow collectors

sFlow is described in RFC 3176, “InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks”.

On FWS and FCX Series devices, you can use QoS queue 1 for priority traffic, even when sFlow is enabled on the port. This differs from FastIron X Series devices, which support seven priorities instead of eight when sFlow is enabled. In this case, QoS queue 1 is reserved for sFlow and is not used by other packets. Any non-sFlow packets assigned to QoS queue 1 will be directed to QoS queue 0.

sFlow version 5

sFlow version 5 enhances and modifies the format of the data sent to the sFlow collector. sFlow version 5 introduces several new sFlow features and also defines a new datagram syntax used by the sFlow agent to report flow samples and interface counters to the sFlow collector.

sFlow version 5 adds support for the following:

- sFlow version 5 datagrams
- Sub-agent support
- Configurable sFlow export packet size
- Support for the new data field and sample type length in flow samples
- Configurable interval for exporting Brocade-specific data structure

sFlow version 5 is backward-compatible with sFlow version 2. By default, the sFlow agent exports sFlow version 5 flow samples by default, but you can configure the device to export the data in sFlow version 2 format. You can switch between sFlow version 2 and sFlow version 5 formats. The sFlow collector automatically parses each incoming sample and decodes it based on the version number.

The configuration procedures for sFlow version 5 are the same as for sFlow version 2, except where explicitly noted. Configuration procedures for sFlow are in the section [“Configuring and enabling sFlow”](#) on page 539. The features and CLI commands that are specific to sFlow version 5 are described in the section [“sFlow version 5 feature configuration”](#) on page 546.

sFlow support for IPv6 packets

The Brocade implementation of sFlow features support IPv6 packets. This support includes extended router information and extended gateway information in the sampled packet. Note that sFlow support for IPv6 packets exists only on devices running software that supports IPv6.

The configuration procedures for this feature are the same as for IPv4, except where the collector is a link-local address on a Layer 3 switch. For details refer to [“Specifying the collector”](#) on page 539.

Extended router information

IPv6 sFlow sampled packets include the following extended router information:

- IP address of the next hop router
- Outgoing VLAN ID
- Source IP address prefix length
- Destination IP address prefix length

Note that in IPv6 devices, the prefix lengths of the source and destination IP addresses are collected if BGP is configured and the route lookup is completed. In IPv4 devices, this information is collected only if BGP is configured on the devices.

Extended gateway information

If BGP is enabled, extended gateway information is included in IPv6 sFlow sampled packets, including the following BGP information about a packet destination route:

- The autonomous system (AS) number for the router
- The source IP AS of the route
- The source peer AS for the route
- The AS patch to the destination

NOTE

AS communities and local preferences are not included in the sampled packets.

To obtain extended gateway information, use “struct extended_gateway” as described in RFC 3176.

IPv6 packet sampling

IPv6 sampling is performed by the packet processor. The system uses the sampling rate setting to selectively mark the monitoring bit in the header of an incoming packet. Marked packets tell the CPU that the packets are subject to sFlow sampling.

sFlow configuration considerations

This section lists the sFlow configuration considerations on Brocade devices.

On FWS and FCX Series devices, you can use QoS queue 1 for priority traffic, even when sFlow is enabled on the port. This differs from FastIron X Series devices, which support seven priorities instead of eight when sFlow is enabled. In this case, QoS queue 1 is reserved for sFlow and is not used by other packets. Any non-sFlow packets assigned to QoS queue 1 will be directed to QoS queue 0.

If an FCX stack is rebooted, sFlow is disabled on standby and member units until the configuration is synchronized between the Active and Standby Controllers.

sFlow and hardware support

- Brocade devices support sFlow packet sampling of inbound traffic only. These devices do not sample outbound packets. However, Brocade devices support byte and packet count statistics for both traffic directions.
- sFlow is supported on all Ethernet ports (10/100, Gbps, and 10 Gbps)

sFlow and CPU utilization

Enabling sFlow may cause a slight and noticeable increase of up to 20% in CPU utilization. In typical scenarios, this is normal behavior for sFlow, and does not affect the functionality of other features on the switch.

sFlow and source address

The sampled sFlow data sent to the collectors includes an agent_address field. This field identifies the IP address of the device that sent the data:

- On a Layer 2 Switch, agent_address is the Layer 2 Switch management IP address. You must configure the management IP address in order to export sFlow data from the device. If the switch has both an IPv4 and IPv6 address, the agent_address is the IPv4 address. If the switch has an IPv6 address only, the agent_address is the global IPv6 address.
- On a Layer 3 Switch with IPv6 interfaces only, sFlow looks for an IPv6 address in the following order, and uses the first address found:
 - The first IPv6 address on the lowest-numbered loopback interface
 - The first IPv6 address on the lowest-numbered VE interface
 - The first IPv6 address on any interface
- On a Layer 3 Switch with both IPv4 and IPv6 interfaces, or with IPv4 interfaces only, sFlow looks for an IP address in the following order, and uses the first address found:
 - The IPv4 router ID configured by the **ip router-id** command
 - The first IPv4 address on the lowest-numbered loopback interface
 - The first IPv4 address on the lowest-numbered virtual interface
 - The first IPv4 address on any interface

NOTE

The device uses the router ID only if the device also has an IP interface with the same address. Router ID is not supported on IPv6 devices.

NOTE

If an IP address is not already configured when you enable sFlow, the feature uses the source address 0.0.0.0. To display the agent_address, enable sFlow, then enter the **show sflow** command. Refer to [“Enabling sFlow forwarding”](#) on page 545 and [“Displaying sFlow information”](#) on page 549.

NOTE

In sFlow version 5, you can set an arbitrary IPv4 or IPv6 address as the sFlow agent IP address. Refer to [“Specifying the sFlow agent IP address”](#) on page 547.

sFlow and source port

By default, sFlow sends data to the collector out of UDP source port 8888, but you can specify a different source port. For more information, refer to [“Changing the sFlow source port”](#) on page 545.

sFlow and sampling rate

The **sampling rate** is the average ratio of the number of packets incoming on an sFlow enabled port, to the number of flow samples taken from those packets. sFlow sampling can affect performance in some configurations.

Note that on the FastIron devices, the configured sampling rate and the actual rate are the same. The software does not adjust the configured sampling rate as on other Brocade devices.

sFlow and port monitoring

- FWS and FCX Series devices support sFlow and port monitoring together on the same port.

- FastIron X Series devices support port monitoring and sFlow together on the same device. The caveat is that these features cannot be configured together within the same port region on non-third generation modules. The following third-generation SX modules support sFlow and mirroring on the same port:
 - SX-FI48GPP
 - SX-FI-24GPP
 - SX-FI-24HF
 - SX-FI-2XG
 - SX-FI-8XG

Configuring and enabling sFlow

NOTE

The commands in this section apply to sFlow version 2 and sFlow version 5. CLI commands that are specific to sFlow version 5 are documented in [“sFlow version 5 feature configuration”](#) on page 546.

To configure sFlow, perform the following tasks:

- Optional – If your device supports sFlow version 5, change the version used for exporting sFlow data
- Specify collector information. The collector is the external device to which you are exporting the sFlow data. You can specify up to four collectors.
- Optional – Change the polling interval
- Optional – Change the sampling rate
- Optional – Change the sFlow source port
- Enable sFlow globally
- Enable sFlow forwarding on individual interfaces
- Enable sFlow forwarding on individual trunk ports
- If your device supports sFlow version 5, configure sFlow version 5 features

NOTE

If you change the router ID or other IP address value that sFlow uses for its agent_address, you need to disable and then re-enable sFlow to cause the feature to use the new source address.

Specifying the collector

sFlow exports traffic statistics to an external collector. You can specify up to four collectors. You can specify more than one collector with the same IP address if the UDP port numbers are unique. You can have up to four unique combinations of IP addresses and UDP port numbers.

Specifying an sFlow collector on IPv4 devices

To specify an sFlow collector on an IPv4 device, enter a command such as the following.

```
Brocade(config)#sflow destination 10.10.10.1
```

This command specifies a collector with IPv4 address 10.10.10.1, listening for sFlow data on UDP port 6343.

Syntax: [no] sflow destination <ip-addr> [<dest-udp-port>]

The <ip-addr> parameter specifies the IP address of the collector.

The <dest-udp-port> parameter specifies the UDP port on which the sFlow collector will be listening for exported sFlow data. The default port number is 6343.

The sampled sFlow data sent to the collectors includes an agent_address field. This field identifies the device that sent the data. Refer to [“sFlow and source address”](#) on page 537.

Specifying an sFlow collector on IPv6 devices

To specify an sFlow collector on an IPv6 device, enter a command such as the following.

```
Brocade(config)#sflow destination ipv6 2003:0:0::0b:02a
```

This command specifies a collector with IPv6 address 2003:0::0b:02a, listening for sFlow data on UDP port 6343.

Syntax: [no] sflow destination ipv6 <ip-addr> [<dest-udp-port>]

The <ip-addr> parameter specifies the IP address of the collector.

The <dest-udp-port> parameter specifies the UDP port on which the sFlow collector will be listening for exported sFlow data. The default port number is 6343.

If the IPv6 address you specify is a link-local address on a Layer 3 switch, you must also specify the **outgoing-interface ethernet** <port-num> or the **ve** <port-num>. This identifies the outgoing interface through which the sampled packets will be sent.

The sampled sFlow data sent to the collectors includes an agent_address field. This field identifies the device that sent the data. Refer to “[sFlow and source address](#)” on page 537.

Changing the polling interval

The polling interval defines how often sFlow byte and packet counter data for a port are sent to the sFlow collectors. If multiple ports are enabled for sFlow, the Brocade device staggers transmission of the counter data to smooth performance. For example, if sFlow is enabled on two ports and the polling interval is 20 seconds, the Brocade device sends counter data every ten seconds. The counter data for one of the ports are sent after ten seconds, and counter data for the other port are sent after an additional ten seconds. Ten seconds later, new counter data for the first port are sent. Similarly, if sFlow is enabled on five ports and the polling interval is 20 seconds, the Brocade device sends counter data every four seconds.

The default polling interval is 20 seconds. You can change the interval to a value from 1 to any higher value. The interval value applies to all interfaces on which sFlow is enabled. If you set the polling interval to 0, counter data sampling is disabled.

To change the polling interval, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#sflow polling-interval 30
```

Syntax: [no] sflow polling-interval <secs>

The <secs> parameter specifies the interval and can be from 1 to any higher value. The default is 20 seconds. If you specify 0, counter data sampling is disabled.

Changing the sampling rate

The sampling rate is the average ratio of the number of packets incoming on an sFlow-enabled port, to the number of flow samples taken from those packets.

You can change the default (global) sampling rate. You also can change the rate on an individual port, overriding the default sampling rate of 512. With a sampling rate of 512, on average, one in every 512 packets forwarded on an interface is sampled.

Configuration considerations

The sampling rate is a fraction in the form $1/N$, meaning that, on average, one out of every N packets will be sampled. The **sflow sample** command at the global level or port level specifies N , the denominator of the fraction. Thus a higher number for the denominator means a lower sampling rate since fewer packets are sampled. Likewise, a lower number for the denominator means a higher sampling rate because more packets are sampled. For example, if you change the denominator from 512 to 128, the sampling rate increases because four times as many packets will be sampled.

NOTE

Brocade recommends that you do not change the denominator to a value lower than the default. Sampling requires CPU resources. Using a low denominator for the sampling rate can cause high CPU utilization.

Configured rate and actual rate

When you enter a sampling rate value, this value is the *configured rate* as well as the *actual sampling rate*.

Change to global rate

If you change the global sampling rate, the change is applied to all sFlow-enabled ports **except** those ports on which you have already explicitly set the sampling rate. For example, suppose that sFlow is enabled on ports 1/1, 1/2, and 5/1. If you configure the sampling rate on port 1/1 but leave the other two ports using the default rate, then a change to the global sampling rate applies to ports 1/2 and 5/1 but not port 1/1. sFlow assumes that you want to continue using the sampling rate you explicitly configured on an individual port even if you globally change the sampling rate for the other ports.

Module rate

While different ports on a module may be configured to have different sampling rates, the hardware for the module will be programmed to take samples at a single rate (the module sampling rate). The module sampling rate will be the highest sampling rate (i.e. lowest number) configured for any of the ports on the module.

When ports on a given module are configured with different sampling rates, the CPU discards some of the samples supplied by the hardware for ports with configured sampling rates which are lower than the module sampling rate. This is referred to as subsampling, and the ratio between the port sampling rate and the module sampling rate is known as the subsampling factor. For example, if the module in slot 4 has sFlow enabled on ports 4/2 and 4/8, and port 4/2 is using the default sampling rate of 512, and port 4/8 is configured explicitly for a rate of 2048, then the module sampling rate will be 512 because this is the highest port sampling rate (lowest number). The subsampling factor for port 4/2 will be 1, meaning that every sample taken by the hardware will be exported, while the subsampling factor for port 4/8 will be 4, meaning that one out of every four samples taken by the hardware will be exported. Whether a port's sampling rate is configured explicitly, or whether it uses the global default setting, has no effect on the calculations.

You do not need to perform any of these calculations to change a sampling rate. For simplicity, the syntax information in this section lists the valid sampling rates. You can display the rates you entered for the default sampling rate, module rates, and all sFlow-enabled ports by entering the **show sflow** command. Refer to [“Displaying sFlow information”](#) on page 549.

Sampling rate for new ports

When you enable sFlow on a port, the port's sampling rate is set to the global default sampling rate. This also applies to ports on which you disable and then re-enable sFlow. The port does not retain the sampling rate it had when you disabled sFlow on the port, even if you had explicitly set the sampling rate on the port.

Changing the default sampling rate

To change the default (global) sampling rate, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#sflow sample 2048
```

Syntax: [no] sflow sample <num>

The <num> parameter specifies the average number of packets from which each sample will be taken. The software rounds the value you enter to the next higher odd power of 2. This value becomes the actual default sampling rate and is one of the following:

- 2
- 8
- 32
- 128
- 512
- 2048
- 4096
- 8192
- 32768
- 131072
- 524288
- 2097152
- 8388608
- 33554432
- 134217728
- 536870912
- 2147483648

For example, if the configured sampling rate is 1000, then the actual rate is 2048 and 1 in 2048 packets are sampled by the hardware.

Changing the sampling rate of a module

You cannot change a module sampling rate directly. You can change a module sampling rate only by changing the sampling rate of a port on that module.

Changing the sampling rate on a port

You can configure an individual port to use a different sampling rate than the global default sampling rate. This is useful in cases where ports have different bandwidths. For example, if you are using sFlow on 10/100 ports and Gbps Ethernet ports, you might want to configure the Gbps ports to use a higher sampling rate (and thus gather fewer samples per number of packets) than the 10/100 ports.

To change the sampling rate on an individual port, enter a command such as the following at the configuration level for the port.

```
Brocade(config-if-1/1)#sflow sample 8192
```

Syntax: [no] sflow sample <num>

The <num> parameter specifies the average number of packets from which each sample will be taken. The software rounds the value you enter up to the next odd power of 2. The actual sampling rate becomes one of the values listed in [“Changing the default sampling rate”](#).

NOTE

Configuring a sampling rate on a port that is the primary port of a trunk applies that same sampling rate to all ports in the trunk.

Changing the sampling rate for a trunk port

You can configure an individual static trunk port to use a different sampling rate than the global default sampling rate. This feature is also supported on LACP trunk ports. This feature is useful in cases where ports have different bandwidths. For example, if you are using sFlow on 10/100 ports and Gbps Ethernet ports, you might want to configure the Gbps ports to use a higher sampling rate (and thus gather fewer samples per number of packets) than the 10/100 ports.

To configure a static trunk port to use a different sampling rate than the global default sampling rate, enter commands such as the following:

```
Brocade(config)#trunk e 4/1 to 4/8
Brocade(config-trunk-4/1-4/8)sflow sample 8192
```

Syntax: [no] sflow sample <num>

The <num> parameter specifies the average number of packets from which each sample will be taken. The software rounds the value you enter up to the next odd power of 2. The actual sampling rate becomes one of the values listed in [“Changing the default sampling rate”](#).

NOTE

Configuring a sampling rate on only the port that is the primary port of a trunk automatically applies that same sampling rate to all ports in the trunk.

Changing the sFlow source port

By default, sFlow sends data to the collector using UDP source port 8888, but you can change the source UDP port to any port number in the range 1025-65535.

To change the source UDP port, enter a command such as the following:

```
Brocade(config)#sflow source-port 8000
```

Syntax: [no] sflow source-port <num>

The <num> parameter specifies the sFlow source port.

Enabling sFlow forwarding

sFlow exports data only for the interfaces on which you enable sFlow forwarding. You can enable sFlow forwarding on Ethernet interfaces.

To enable sFlow forwarding, perform the following:

- Globally enable the sFlow feature
- Enable sFlow forwarding on individual interfaces
- Enable sFlow forwarding on individual trunk ports

NOTE

Before you enable sFlow, make sure the device has an IP address that sFlow can use as its source address. Refer to [“sFlow and source address”](#) on page 537 for the source address requirements.

NOTE

When you enable sFlow forwarding on an 802.1X-enabled interface, the samples taken from the interface include the username used to obtain access to either or both the inbound and outbound ports, if that information is available. For information about 802.1X, refer to [Chapter 43, “802.1X Port Security”](#).

Command syntax for enabling sFlow forwarding

This section shows how to enable sFlow forwarding.

Globally enabling sFlow forwarding

To enable sFlow forwarding, you must first enable it on a global basis, then on individual interfaces or trunk ports, or both.

To globally enable sFlow forwarding, enter the following command.

```
Brocade(config)#sflow enable
```

You can now enable sFlow forwarding on individual ports as described in the next two sections.

Syntax: [no] sflow enable

Enabling sFlow forwarding on individual interfaces

To enable sFlow forwarding enter commands such as the following.

```
Brocade(config)#sflow enable
Brocade(config)#interface ethernet 1/1 to 1/8
Brocade(config-mif-1/1-1/8)#sflow forwarding
```

These commands globally enable sFlow, then enable sFlow forwarding on Ethernet ports 1/1 – 1/8. You must use both the **sflow enable** and **sflow forwarding** commands to enable the feature.

Syntax: [no] sflow enable

Syntax: [no] sflow forwarding

Enabling sFlow forwarding on individual trunk ports

This feature is supported on individual ports of a static trunk group. It is also supported on LACP trunk ports.

NOTE

When you enable sFlow forwarding on a trunk port, only the primary port of the trunk group forwards sFlow samples.

To enable sFlow forwarding on a trunk port, enter commands such as the following.

```
Brocade(config)#sflow enable
Brocade(config)#trunk e 4/1 to 4/8
Brocade(config-trunk-4/1-4/8)#config-trunk-ind
Brocade(config-trunk-4/1-4/8)#sflow forwarding e 4/2
```

These commands globally enable sFlow, then enable sFlow forwarding on trunk port e 4/2. You must use both the **sflow enable** and **sflow forwarding** commands to enable the feature.

Syntax: [no] sflow enable

Syntax: [no] sflow forwarding

sFlow version 5 feature configuration

NOTE

The commands in this section are supported when sFlow version 5 is enabled on the device. These commands are not supported with sFlow version 2. sFlow version 5 also supports all of the sFlow configuration commands in [“Configuring and enabling sFlow”](#) on page 539.

When sFlow version 5 is enabled on the device, you can do the following:

- Specify the sFlow version (version 2 or version 5)
- Specify the sFlow agent IP address
- Specify the maximum flow sample size
- Export CPU and memory usage Information to the sFlow collector
- Specify the polling interval for exporting CPU and memory usage information to the sFlow collector
- Export CPU-directed data (management traffic) to the sFlow collector

Egress interface ID for sampled broadcast and multicast packets

For broadcast and multicast traffic, the egress interface ID for sampled traffic is always 0x80000000. When broadcast and multicast packets are sampled, they are usually forwarded to more than one port. However, the output port field in an sFlow datagram supports the display of one egress interface ID only. Therefore, the sFlow version 5 agent always sets the output port ID to 0x80000000 for broadcast and multicast packets that are sampled.

Specifying the sFlow version format

If your device supports sFlow version 5, you can optionally specify the version used for exporting sFlow data. Refer [“Specifying the sFlow agent IP address”](#).

Specifying the sFlow agent IP address

The sampled sFlow data sent to the collectors includes an agent_address field. This field identifies the device (the sFlow agent) that sent the data. By default, the device automatically selects the sFlow agent IP address based on the configuration, as described in the section [“sFlow and source address”](#) on page 537. Alternatively, you can configure the device to instead use an arbitrary IPv4 or IPv6 address as the sFlow agent IP address.

To specify an IPv4 address as the sFlow agent IP address, enter a command such as the following

```
Brocade(config)#sflow agent-ip 10.10.10.1
```

Syntax: [no] sflow agent-ip <ipv4-addr>

The <ipv4-addr> specifies the address of the device that sent the data.

To specify an IPv6 address as the sFlow agent IP address, enter a command such as the following.

```
Brocade(config)#sflow agent-ip FE80::240:D0FF:FE48:4672
```

Syntax: [no] sflow agent-ip <ipv6-addr>

The <ipv6-addr> specifies the address of the device that sent the data.

Specifying the version used for exporting sFlow data

By default, when sFlow is enabled globally on the Brocade device, the sFlow agent exports sFlow data in version 5 format. You can change this setting so that the sFlow agent exports data in version 2 format. You can switch between versions without rebooting the device or disabling sFlow.

NOTE

When the sFlow version number is changed, the system will reset sFlow counters and flow sample sequence numbers.

To specify the sFlow version used for exporting sFlow data, enter the following command.

```
Brocade(config)#sflow version 2
```

Syntax: [no] sflow version 2 | 5

The default is 5.

Specifying the maximum flow sample size

With sFlow version 5, you can specify the maximum size of the flow sample sent to the sFlow collector. If a packet is larger than the specified maximum size, then only the contents of the packet up to the specified maximum number of bytes is exported. If the size of the packet is smaller than the specified maximum, then the entire packet is exported.

For example, to specify 1024 bytes as the maximum flow sample size, enter the following command.

```
Brocade(config)# sflow max-packet-size 1024
```

Syntax: [no] sflow max-packet-size <size>

For both sFlow version 2 and version 5, the default maximum flow sample size is 256 bytes.

For sFlow version 5, the maximum flow sample size is 1300 bytes.

Exporting CPU and memory usage information to the sFlow collector

With sFlow version 5, you can optionally configure the sFlow agent on the Brocade device to export information about CPU and memory usage to the sFlow collector.

To export CPU usage and memory usage information, enter the following command.

```
Brocade(config)# sflow export system-info
```

Syntax: [no] sflow export system-info

By default, CPU usage information and memory usage information are not exported.

Specifying the polling interval for exporting CPU and memory usage information to the sFlow collector

The polling interval defines how often sFlow data for a port is sent to the sFlow collector. With sFlow version 5, you can optionally set the polling interval used for exporting CPU and memory usage information.

For example, to set the polling interval for exporting CPU and memory usage information to 30 seconds, enter the following command.

```
Brocade(config)# sflow export system-info 30
```

Syntax: [no] sflow export system-info <seconds>

You can specify a polling interval from 5 seconds to 1,800 seconds (30 minutes). The default polling interval for exporting CPU and memory usage information is 300 seconds (5 minutes).

Exporting CPU-directed data (management traffic) to the sFlow collector

You can select which and how often data destined to the CPU (for example, Telnet sessions) is sent to the sFlow collector.

CLI commands allow you to do the following:

- Enable the sFlow agent to export CPU-directed data
- Specify the sampling rate for exported CPU-directed data

Enabling the sFlow agent to export CPU-directed data

To enable the sFlow agent on a Brocade device to export data destined to the CPU to the sFlow collector, enter the following command.

```
Brocade(config)# sflow export cpu-traffic
```

Syntax: [no] sflow export cpu-traffic

By default, this feature is disabled. The sFlow agent does not send data destined to the CPU to the sFlow collector.

Specifying the sampling rate for exported CPU-directed data

The sampling rate is the average ratio of the number of packets incoming on an sFlow-enabled port, to the number of flow samples taken from those packets. You can optionally set the sampling rate for CPU-directed data exported to the sFlow collector. For example, to set this sampling rate to 2048, enter the following command.

```
Brocade(config)# sflow export cpu-traffic 2048
```

Syntax: [no] sflow export cpu-traffic <rate>

The default sampling rate depends on the Brocade device being configured. Refer to [“Changing the sampling rate”](#) on page 541 for the default sampling rate for each kind of Brocade device.

Displaying sFlow information

To display sFlow configuration information and statistics, enter the following command at any level of the CLI.

```

Brocade#show sflow
sFlow version:5
sFlow services are enabled.
sFlow agent IP address: 123.123.123.1
4 collector destinations configured:
Collector IP 192.168.4.204, UDP 6343
Collector IP 192.168.4.200, UDP 6333
Collector IP 192.168.4.202, UDP 6355
Collector IP 192.168.4.203, UDP 6565
Configured UDP source port: 33333
Polling interval is 0 seconds.
Configured default sampling rate: 1 per 512 packets
Actual default sampling rate: 1 per 512 packets
The maximum sFlow sample size:512
exporting cpu-traffic is enabled
exporting cpu-traffic sample rate:16
exporting system-info is enabled
exporting system-info polling interval:20 seconds
10552 UDP packets exported
24127 sFlow samples collected.
sFlow ports: ethe 1/2 to 1/12 ethe 1/15 ethe 1/25 to 1/26 ethe 4/1 ethe 5/10 to

Syntax: show sflow

The show sflow command displays the following information.

TABLE 99 sFlow information

Parameter	Definition
sFlow version	The version of sFlow enabled on the device, which can be one of the following: <ul style="list-style-type: none"> • 2 • 5
sFlow services	The feature state, which can be one of the following: <ul style="list-style-type: none"> • disabled • enabled
sFlow agent IP address	The IP address that sFlow is using in the agent_address field of packets sent to the collectors. Refer to “sFlow and source address” on page 537.
Collector	The collector information. The following information is displayed for each collector: <ul style="list-style-type: none"> • IP address • UDP port If more than one collector is configured, the line above the collectors indicates how many have been configured.
Configured UDP source port	The UDP source port used to send data to the collector.
Polling interval	The port counter polling interval.
Configured default sampling rate	The configured global sampling rate. If you changed the global sampling rate, the value you entered is shown here. The actual rate calculated by the software based on the value you entered is listed on the next line, “Actual default sampling rate”.
Actual default sampling rate	The actual default sampling rate.
The maximum sFlow sample size	The maximum size of a flow sample sent to the sFlow collector.
exporting cpu-traffic	Indicates whether or not the sFlow agent is configured to export data destined to the CPU (e.g., Telnet sessions) to the sFlow collector: <ul style="list-style-type: none"> • enabled • disabled
exporting cpu-traffic sample rate	The sampling rate for CPU-directed data, which is the average ratio of the number of incoming packets on an sFlow-enabled port, to the number of flow samples taken from those packets.

TABLE 99 sFlow information (Continued)

Parameter	Definition
exporting system-info	Indicates whether or not the sFlow agent is configured to export information about CPU and memory usage to the sFlow collector: <ul style="list-style-type: none"> • enabled • disabled
exporting system-info polling interval	Specifies the interval, in seconds, that sFlow data is sent to the sFlow collector.
UDP packets exported	The number of sFlow export packets the Brocade device has sent. NOTE: Each UDP packet can contain multiple samples.
sFlow samples collected	The number of sampled packets that have been sent to the collectors.
sFlow ports	The ports on which you enabled sFlow.
Module Sampling Rates	The configured and actual sampling rates for each module. If a module does not have any sFlow-enabled ports, the rates are listed as 0.
Port Sampling Rates	The configured and actual sampling rates for each sFlow-enabled port. The Subsampling factor indicates how many times the sampling rate of the port's module is multiplied to achieve the port's sampling rate. Because of the way the actual sampling rates are computed, the Subsampling factors are always whole numbers.

Clearing sFlow statistics

To clear the UDP packet and sFlow sample counters in the **show sflow** display, enter the following command.

```
Brocade#clear statistics
```

Syntax: clear statistics

This command clears the values in the following fields of the **show sflow** display:

- UDP packets exported
- sFlow samples collected

NOTE

This command also clears the statistics counters used by other features.

Utilization list for an uplink port

You can configure uplink utilization lists that display the percentage of a given uplink port bandwidth that is used by a specific list of downlink ports. The percentages are based on 30-second intervals of RMON packet statistics for the ports. Both transmit and receive traffic is counted in each percentage.

NOTE

This feature is intended for ISP or collocation environments in which downlink ports are dedicated to various customers' traffic and are isolated from one another. If traffic regularly passes between the downlink ports, the information displayed by the utilization lists does not provide a clear depiction of traffic exchanged by the downlink ports and the uplink port.

Each uplink utilization list consists of the following:

- Utilization list number (1, 2, 3, or 4)
- One or more uplink ports
- One or more downlink ports

Each list displays the uplink port and the percentage of that port bandwidth that was utilized by the downlink ports over the most recent 30-second interval.

You can configure up to four bandwidth utilization lists.

Utilization list for an uplink port command syntax

To configure an uplink utilization list, enter commands such as the following. The commands in this example configure a link utilization list with port 1/1 as the uplink port and ports 1/2 and 1/3 as the downlink ports.

```
Brocade(config)#relative-utilization 1 uplink eth 1/1 downlink eth 1/2 to 1/3
Brocade(config)#write memory
```

Syntax: [no] **relative-utilization** <num> **uplink ethernet** <port> [to <port> | <port>...] **downlink ethernet** <port> [to <port> | [<port>...]

The <num> parameter specifies the list number. You can configure up to four lists. Specify a number from 1 – 4.

The **uplink ethernet** parameters and the port numbers you specify after the parameters indicate the uplink ports.

The **downlink ethernet** parameters and the port numbers you specify after the parameters indicate the downlink ports.

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Displaying utilization percentages for an uplink

After you configure an uplink utilization list, you can display the list to observe the percentage of the uplink bandwidth that each of the downlink ports used during the most recent 30-second port statistics interval. The number of packets sent and received between the two ports is listed, as well as the ratio of each individual downlink port packets relative to the total number of packets on the uplink.

To display an uplink utilization list, enter a command such as the following at any level of the CLI.

```
Brocade#show relative-utilization 1
uplink: ethe 1
30-sec total uplink packet count = 3011
packet count ratio (%)
  1/ 2:60   1/ 3:40
```

In this example, ports 1/2 and 1/3 are sending traffic to port 1/1. Port 1/2 and port 1/3 are isolated (not shared by multiple clients) and typically do not exchange traffic with other ports except for the uplink port, 1/1.

Syntax: `show relative-utilization <num>`

The `<num>` parameter specifies the list number.

NOTE

The example above represents a pure configuration in which traffic is exchanged only by ports 1/2 and 1/1, and by ports 1/3 and 1/1. For this reason, the percentages for the two downlink ports equal 100%. In some cases, the percentages do not always equal 100%. This is true in cases where the ports exchange some traffic with other ports in the system or when the downlink ports are configured together in a port-based VLAN.

In the following example, ports 1/2 and 1/3 are in the same port-based VLAN.

```
Brocade#show relative-utilization 1
uplink: ethe 1
30-sec total uplink packet count = 3011
packet count ratio (%)
  1/ 2:100   1/ 3:100
```

Here is another example showing different data for the same link utilization list. In this example, port 1/2 is connected to a hub and is sending traffic to port 1/1. Port 1/3 is unconnected.

```
Brocade#show relative-utilization 1
uplink: ethe 1
30-sec total uplink packet count = 2996
packet count ratio (%)
  1 /2:100   1/ 3:---
```

Basic Layer 2 Features

Table 100 lists the individual Brocade FastIron switches and the basic Layer 2 features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 100 Supported basic Layer 2 features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
16,000 MAC addresses per switch	Yes	Yes	Yes	Yes	Yes (ICX 6450 only) 8000 for ICX 6430
32,000 MAC addresses per switch	Yes (when flow-based MAC address learning is enabled)	No	Yes	Yes	No
MAC learning rate control	No	Yes	Yes	Yes	Yes
Multi-port static MAC address	Yes	Yes	Yes	Yes	Yes
Static MAC entries with option to set traffic priority	Yes	Yes	Yes	Yes	Yes
Flow-based MAC address learning	Yes To enable, use the mac-learning -flow-based command.	No	Yes Enabled by default on FCX devices. There is no CLI command to enable or disable it.	No	No
Port-based VLANs	Yes	Yes	Yes	Yes	Yes
Address locking (for MAC addresses)	Yes	Yes	Yes	Yes	Yes
MAC address filter override of 802.1X	Yes	Yes	Yes	Yes	Yes
MAC address filtering (filtering on source and destination MAC addresses)	Yes	Yes	Yes	Yes	Yes
MAC address move notification	Yes	Yes	Yes	Yes	Yes
Ability to disable MAC learning	Yes	Yes	Yes	Yes	Yes
Dynamic buffer allocation for QoS priorities	Yes	Yes	Yes	Yes	Yes
Remote Fault Notificatoin (RFN) for 1G fiber	Yes	Yes	Yes	Yes	No

TABLE 100 Supported basic Layer 2 features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Link Fault Signaling (LFS) for 10G	Yes	Yes	Yes	Yes	ICX 6450 only
Layer 2 jumbo frames	Yes	Yes	Yes	Yes	Yes
User-configurable buffer profiles	No	No	Yes	Yes	Yes
Buffer profile for VoIP on FastIron Stackable devices	No	Yes	Yes	Yes	No

The procedures in this chapter describe how to configure basic Layer 2 parameters.

Brocade devices are configured at the factory with default parameters that allow you to begin using the basic features of the system immediately. However, many of the advanced features such as VLANs or routing protocols for the device must first be enabled at the system (global) level before they can be configured. If you use the Command Line Interface (CLI) to configure system parameters, you can find these system level parameters at the Global CONFIG level of the CLI.

NOTE:

- Before assigning or modifying any router parameters, you must assign the IP subnet (interface) addresses for each port.
- For information about configuring IP addresses, DNS resolver, DHCP assist, and other IP-related parameters, refer to [Chapter 26, “IP Configuration”](#).
- For information about the Syslog buffer and messages, refer to [Appendix A, “Syslog messages”](#).

About port regions

This section describes port regions on FastIron switches.

FastIron X Series device port regions

Ports on the FastIron X Series devices are grouped into regions. For a few features, you will need to know the region to which a port belongs. However, for most features, a port region does not affect configuration or operation of the feature.

NOTE

Port regions do not apply to trunk group configurations on the FastIron X Series devices. However, port regions do apply to port monitoring and unknown unicast configurations on FastIron X Series devices.

FastIron Edge Switch X424 and X424HF:

- Ports 1 – 12 belong to port region 0
- Ports 13 – 24 belong to port region 1
- Port 25 belongs to port region 2
- Port 26 belongs to port region 3

FastIron Edge Switch X448:

- Ports 1 – 12 belong to port region 0
- Ports 13 – 24 belong to port region 1
- Ports 25 – 36 belong to port region 2
- Ports 37 – 48 belong to port region 3
- Port 49 belongs to port region 4
- Port 50 belongs to port region 5

FCX and FWS device port regions

The port region rules for FWS and FCX devices are as follows:

- For all platforms, a 24-port Gbps module has one port region. In addition, any 10 Gbps ports on the device also belong to this single port region.
- For all platforms, the 48-port Gbps module has two port regions:
 - Ports 1 - 24 belong to port region 0
 - Ports 25 - 48 belong to port region 1
- For FCX648 devices with two 10 Gbps XFP ports, and a two 10 Gbps CX4 stacking ports:
 - The two 10 Gbps XFP ports belong to port region 0 (along with ports 1 -24)
 - The two 10 Gbps CX4 stacking ports belong to port region 1 (along with ports 25 - 48)
- For FCX648 devices with four 10 Gbps SFP+ ports:
 - 10 Gbps SFP+ ports 3 and 4 belong to port region 0 (along with ports 1 -24)
 - 10 Gbps SFP+ ports 1 and 2 ports belong to port region 1 (along with ports 25 - 48)

ICX 6610 device port regions

- A 24-port Gbps has the following port regions:
 - Ports 1-6 and SFP ports 1-4 belong to region 0
 - Ports 7-12 and SFP ports 5-8 belong to region 1
 - Ports 13-18 belong to region 2
 - Ports 19-24 belong to region 3
- A 48-port Gbps has the following port regions:
 - Ports 1-6 and 25-30 and SFP ports 1-4 belong to region 0
 - Ports 7-12 and 31-36 and SFP ports 5-8 belong to region 1
 - Ports 13-18 and 37-42 belong to region 2
 - Ports 19-24 and 43-45 belong to region 3

ICX 6430 device port regions

- A 24-port Gbps module has one port region. The four SFP ports on the device also belong to this single port region.

- A 48-port Gbps module has two port regions:
 - Ports 1-24 and SFP ports 1& 2 belong to port region 0
 - Ports 25-48 and SFP ports 3 & 4 belong to port region 1

ICX 6450 device port regions

- A 24-port Gbps module has one port region. The four SFP+ ports on the device also belong to this single port region.
- A 48-port Gbps module has two port regions:
 - Ports 1-24 and SFP+ ports 1& 2 belong to port region 0
 - Ports 25-48 and SFP+ ports 3 & 4 belong to port region 1

Enabling or disabling the Spanning Tree Protocol (STP)

STP (IEEE 802.1D bridge protocol) is supported on all Brocade devices. STP detects and eliminates logical loops in the network. STP also ensures that the least cost path is taken when multiple paths exist between ports or VLANs. If the selected path fails, STP searches for and then establishes an alternate path to prevent or limit retransmission of data.

NOTE

This section provides instructions for enabling and disabling STP. For configuration procedures and more information about STP, refer to [Chapter 27, “Spanning Tree Protocol”](#) in this guide.

STP must be enabled at the system level to allow assignment of this capability on the VLAN level. On devices running Layer 2 code, STP is enabled by default. On devices running Layer 3 code, STP is disabled by default.

To enable STP for all ports on a Brocade device, enter the following command.

```
Brocade(config)#spanning tree
```

Syntax: [no] spanning-tree

You can also enable and disable spanning tree on a port-based VLAN and on an individual port basis, and enable advanced STP features. Refer to [Chapter 27, “Spanning Tree Protocol”](#).

Modifying STP bridge and port parameters

You can modify the following STP Parameters:

- Bridge parameters – forward delay, maximum age, hello time, and priority
- Port parameters – priority and path cost

For configuration details, refer to [“Changing STP bridge and port parameters”](#) on page 1091.

Management MAC address for stackable devices

In an IronStack, the management MAC address of the Active Controller is always used as the STP bridge ID. The Active Controller management MAC address is always used for control protocols for the following reasons:

- Unlike standalone devices, each stack member has a different range of MAC addresses.
- In a stack, the management MAC address is software generated, and is always the MAC address of the Active Controller first port. This ensures consistency across the stack during resets, assuming that the Active Controller is always the same unit.
- This helps avoid the disruption of frequent topology changes in the stack.

For more information about stacking and Brocade stackable devices, see [Chapter 7, “Brocade Stackable Devices”](#).

MAC learning rate control

NOTE

The MAC learning rate control feature is not supported on FastIron X Series devices.

You can set a rate limit to control CPU address updating. The range for this rate limit is 200 to 50,000 per second. The MAC learning rate limit applies to each packet processor, which means that for a system with two packet processors, each processor can send address messages to the CPU at the established rate limit.

Syntax: `[no] cpu-limit addr-msgs <msgsRateLimit>`

NOTE

Actual rates in hardware may have a variance of +200 or -100.

Changing the MAC age time and disabling MAC address learning

To change the MAC address age timer, enter a command such as the following.

```
Brocade(config)#mac-age-time 60
```

Syntax: [no] **mac-age-time** <secs>

<secs> specifies the number of seconds. Possible values differ depending on the version of software running on your device, as follows:

- On FastIron WS and Brocade FCX Series devices, learned MAC address entries do not age out until they are unused for 300 – 600 seconds. If necessary, you can change the MAC address age timer to 0 or a value from 60 – 600 (seconds), in 60-second intervals. For example, you can specify 60 or 120, but not 100. If you set the MAC age time to 0, aging is disabled.
- On FastIron X Series devices, you can configure 0 or a value from 10 – 86,400 (seconds), in 10-second intervals. If you set the MAC age time to 0, aging is disabled.
- On ICX devices, you can configure a value between 0 to 570 seconds.

NOTE: Usually, the actual MAC age time is from one to two times the configured value. For example, if you set the MAC age timer to 60 seconds, learned MAC entries age out after remaining unused for between 60 – 120 seconds. However, if all of the following conditions are met, then the MAC entries age out after a longer than expected duration:

- The MAC age timer is greater than 630 seconds.
- The number of MAC entries is over 6000.
- All MAC entries are learned from the same packet processor.
- All MAC entries age out at the same time.

Disabling the automatic learning of MAC addresses

By default, when a packet with an unknown Source MAC address is received on a port, the Brocade device learns this MAC address on the port.

You can prevent a physical port from learning MAC addresses by entering the following command.

```
Brocade(config)#interface ethernet 3/1
Brocade(config-if-e1000-3/1)#mac-learn-disable
```

Syntax: [no] **mac-learn disable**

Use the no form of the command to allow a physical port to learn MAC addresses.

MAC address learning configuration notes and feature limitations

- This command is not available on virtual routing interfaces. Also, if this command is configured on the primary port of a trunk, MAC address learning will be disabled on all the ports in the trunk.
- Entering the **mac-learn-disable** command on tagged ports disables MAC learning for that port in all VLANs to which that port is a member. For example, if tagged port 3/1 is a member of VLAN 10, 20, and 30 and you issue the **mac-learn-disable** command on port 3/1, port 3/1 will not learn MAC addresses, even if it is a member of VLAN 10, 20, and 30.

Displaying the MAC address table

To display the MAC table, enter the **show mac-address** command.

```
Brocade#show mac-address
Total active entries from all ports = 3
Total static entries from all ports = 1
  MAC-Address      Port      Type      VLAN
1234.1234.1234      15      Static      1
0004.8038.2f24      14      Dynamic      1
0004.8038.2f00      13      Dynamic      1
0010.5a86.b159      10      Dynamic      1
```

In the output of the **show mac-address** command, the *Type* column indicates whether the MAC entry is static or dynamic. A static entry is one you create using the **static-mac-address** command. A dynamic entry is one that is learned by the software from network traffic.

The output of the **show mac-address** command on FESX and FSX devices include an *Index* column which indicates the index where the entry exists in the hardware MAC table.

NOTE

The **show mac-address** command output does not include MAC addresses for management ports, since these ports do not support typical MAC learning and MAC-based forwarding.

Static MAC entry configuration

Static MAC addresses can be assigned to Brocade devices.

NOTE

Brocade devices running Layer 3 code also support the assignment of static IP Routes, static ARP, and static RARP entries. For details on configuring these types of static entries, refer to [“Adding a static IP route”](#) on page 1186 and [“Adding a static ARP entry”](#) on page 1187.

You can manually input the MAC address of a device to prevent it from being aged out of the system address table.

This option can be used to prevent traffic for a specific device, such as a server, from flooding the network with traffic when it is down. Additionally, the static MAC address entry is used to assign higher priorities to specific MAC addresses.

You can specify traffic priority (QoS) and VLAN membership (VLAN ID) for the MAC Address as well as specify the device type of either router or host.

The default and maximum configurable MAC table sizes can differ depending on the device. To determine the default and maximum MAC table sizes for your device, display the system parameter values. Refer to [“Displaying and modifying system parameter default settings”](#) on page 578.

Multi-port static MAC address

Many applications, such as Microsoft NLB, Juniper IPS, and Netscreen Firewall, use the same MAC address to announce load-balancing services. As a result, a switch must be able to learn the same MAC address on several ports. Multi-port static MAC allows you to statically configure a MAC address on multiple ports using a single command.

Multi-port static MAC address configuration notes

- This feature is applicable for Layer 2 traffic.
- This feature can be used to configure unicast as well as IPv4 and IPv6 multicast MAC addresses on one or more ports. However, when a multicast MAC address is configured, the corresponding MAC address entry cannot be used for IGMP snooping. For IPv4 multicast addresses (range 0100.5e00.000 to 0100.5e7f.ffff) and IPv6 multicast addresses (range 3333.0000.0000 to 3333.ffff.ffff), use IGMP/MLD snooping. Other multicast addresses can also be configured on the ports using this feature.
- FastIron devices support a maximum of 15 multi-port static MAC addresses.
- Hosts or physical interfaces normally join multicast groups dynamically, but you can also statically configure a host or an interface to join a multicast group.

Configuring a multi-port static MAC address

For example, to add a static entry for a server with a MAC address of 0045.5563.67ff and a priority of 7, enter the following command.

```
Brocade(config)#static-mac-address 0045.5563.67ff ethernet 4/2 ethernet 4/3
ethernet 4/4 priority 7
```

To specify a range of ports, enter the following command.

```
Brocade(config)#static-mac-address 0045.5563.67ff ethernet 4/2 to 4/6 priority 7
```

Syntax: [no] **static-mac-address** <mac-addr> **ethernet** [<slotnum>/]<portnum> **ethernet** [<slotnum>/]<portnum> **ethernet** [<slotnum>/]<portnum> [**priority** <num>]

or

Syntax: [no] **static-mac-address** <mac-addr> **ethernet** [<slotnum>/]<portnum> **to ethernet** [<slotnum>/]<portnum> [**priority** <num>]

The <slotnum> parameter is required on chassis devices.

The <portnum> parameter is a valid port number.

The priority <num> is optional and can be a value from 0 – 7 (0 is lowest priority and 7 is highest priority). The default priority is 0.

NOTE

The location of the **static-mac-address** command in the CLI depends on whether you configure port-based VLANs on the device. If the device does not have more than one port-based VLAN (VLAN 1, which is the default VLAN that contains all the ports), the **static-mac-address** command is at the global CONFIG level of the CLI. If the device has more than one port-based VLAN, then the **static-mac-address** command is not available at the global CONFIG level. In this case, the command is available at the configuration level for each port-based VLAN.

VLAN-based static MAC entries configuration

You can configure a VLAN to drop packets that have a particular source or destination MAC address.

You can configure a maximum of 2048 static MAC address drop entries on a Brocade device.

Use the CLI command **show running-config** to view the static MAC address drop entries currently configured on the device.

Configuring a VLAN to drop static MAC entries

To configure a VLAN to drop packets with a source or destination MAC address of 1145.5563.67FF, enter the following commands.

```
Brocade(config)#vlan 2
Brocade(config-vlan-2)#static-mac-address 1145.5563.67FF drop
```

Syntax: [no] **static-mac-address** <mac-addr> **drop**

Use the **no** form of the command to remove the static MAC address drop configuration.

Clearing MAC address entries

You can remove learned MAC address entries from the MAC address table. The types of MAC address that can be removed are as follows:

- All MAC address entries
- All MAC address entries for a specified Ethernet port
- All MAC address entries for a specified VLAN
- All specified MAC address entry in all VLANs

For example, to remove entries for the MAC address 000d.cd80.00d0 in all VLANs, enter the following command at the Privilege EXEC level of the CLI.

```
Brocade#clear mac-address 000d.cb80.00d0
```

Syntax: **clear mac-address** <mac-address> | **ethernet** <port-num> | **vlan** <vlan-num>

If you enter **clear mac-address** without any parameter, the software removes all MAC address entries.

Use the <mac-address> parameter to remove a specific MAC address from all VLANs. Specify the MAC address in the following format: HHHH.HHHH.HHHH.

Use the **ethernet** <port-num> parameter to remove all MAC addresses for a specific Ethernet port.

Use the **vlan** <num> parameter to remove all MAC addresses for a specific VLAN.

Flow-based MAC address learning

NOTE

Flow-based MAC address learning is supported on FastIron X Series and Brocade FCX Series devices. It does not apply to FastIron WS Series devices. However, on Brocade FCX Series devices, this feature is enabled by default. There is no command to enable or disable it. Therefore, the CLI commands in this section apply to FastIron X Series devices only.

This section describes flow-based MAC address learning and how to enable it on a FastIron X Series switch.

Flow-based learning overview

With regular MAC address learning, when a new MAC address is learned, it is programmed in the same location (hardware index) in all packet processors in a FastIron Layer 2 or Layer 3 switch. There are multiple packet processors (one per port region) in a compact switch, and in each module in a chassis-based switch. With regular MAC address learning, MAC addresses are *global*, meaning the hardware MAC table is identical across all packet processors.

With the introduction of **flow-based MAC address learning**, when a new source MAC address is learned, it is programmed only in the source packet processor (the processor that received the packet). The destination MAC address gets added to other packet processors on demand, whenever a traffic flow that needs it is detected. With flow-based MAC address learning, the MAC address is programmed in different hardware locations and the hardware MAC table is different across all packet processors.

The benefits of flow-based learning

With global MAC address learning, all MAC addresses are programmed in all packet processors, even though they may not be required and are never used by all packet processors. Global MAC address learning wastes some space in the hardware MAC table and limits the number of supported MAC addresses to 16K.

With flow-based MAC address learning, MAC addresses are learned and programmed selectively, only in the packet processors that need them. Since the MAC addresses are distributed across several packet processors, flow-based learning frees up space in the hardware MAC table and increases the number of supported MAC addresses from 16K to 32K.

How flow-based learning works

When a packet processor, for example, *PP 1*, receives an incoming packet with source MAC address *X*, it sends a *new address* message to the CPU. The system learns MAC address *X* by adding it to the software MAC table in the CPU, then programming it in the hardware MAC table in the *source* packet processor, in this case *PP 1*. If the MAC address is learned on a trunk port, the MAC address is also programmed on all of the packet processors that have ports in the same trunk group.

When another packet processor, let call it *PP 2*, receives an incoming packet and the packet destination MAC address matches *source MAC address X*, it floods the packet in hardware as an unknown unicast packet and copies the packet to the CPU. The system locates the MAC address in the software MAC table, then programs the MAC address in the hardware MAC table in *PP 2*. If the

MAC address is learned on a trunk port, the MAC address is also programmed on all of the packet processors that have ports in the same trunk group. Once the MAC address is programmed in hardware, subsequent packets with this destination MAC are forwarded as known unicast packets and are not copied to the CPU.

Flow-based MAC addresses are aged out by the source packet processor according to the MAC age time learned on the local port. Furthermore, when a flow-based MAC address is aged out from the source packet processor, it is also aged out from all other packet processors on which the address is programmed. In the above example, when MAC address X is aged out from *PP 1*, it is also aged out from *PP2*.

NOTE

Even when flow-based MAC address learning is enabled, some MAC addresses, including but not limited to control MACs, static MACs, multicast MACs, and MAC addresses resolved through ARP, will continue to be global MAC addresses. These MAC addresses are always programmed in all packet processors in a Layer 2 or Layer 3 switch.

NOTE

Global MAC addresses have priority over dynamic flow-based MAC addresses. To ensure that global MAC addresses are in sync across all packet processors, flow-based MAC addresses may be overwritten in one or more packet processors. The MAC addresses will be relearned and reprogrammed using the flow-based method as needed by incoming traffic flows.

Flow-based learning configuration considerations

When configuring flow-based MAC learning, consider the rules and limitations in this section.

- Flow-based MAC learning is not supported with the following features:
 - Disabling the automatic learning of MAC addresses (CLI command **mac-learn-disable**).
 - Globally disabling Layer 2 switching (CLI command **route-only**)
- When flow-based MAC learning is enabled, unknown unicast packets are copied to the CPU. Therefore, flow-based MAC learning should not be enabled if a continuous high rate of unknown unicast packet flooding is expected, as this will cause high CPU utilization.
- Unknown unicast flooding can occur for a known destination MAC address, if the system fails to program that destination MAC address because the hardware MAC table or hash bucket is full. This condition can also lead to high CPU utilization.
- A source MAC address is learned only on the ingress (source) packet processor. The MAC address is added to other packet processors as needed by their incoming traffic flows. During a brief period until the destination MAC address is successfully added to the hardware MAC table, unknown unicast flooding is expected on the VLAN.
- When a flow-based MAC address moves, it is deleted from all of the packet processors, then relearned on each packet processor individually, as needed by incoming traffic flows.
- The software MAC address table in the CPU uses a hashing algorithm. Because hash collisions can occur and may consume software resources, the FastIron may not be able to support up to 32K MAC addresses.
- The system can scale up to 32K MAC addresses, however, each packet processor is limited to a maximum of 16K MAC addresses. This limit still applies, as this is a hardware limitation.

Configuring flow-based MAC address learning

To configure flow-based MAC address learning, simply enable it globally. If necessary, increase the capacity of the MAC address table as well.

Enabling flow-based MAC address learning

To enable flow-based MAC address learning, enter the following command at the Global CONFIG level of the CLI.

```
Brocade(config)#mac-learning-flow-based
```

This command enables flow-based MAC address learning. All dynamically-learned MAC addresses are flushed from the hardware and software MAC tables and are subsequently learned using flow-based MAC address learning.

Syntax: [no] mac-learning-flow-based

Use the **no** form of the command to disable flow-based MAC address learning. When disabled, all dynamically-learned MAC addresses are flushed from the hardware and software MAC tables and are subsequently learned using global MAC address learning.

Increasing the capacity of the MAC address table (optional)

After enabling support for flow-based MACs, you can increase the capacity of the MAC address table of up to 32K MAC addresses. By default, up to 32K MAC addresses are supported.

NOTE

FCX devices do not support flow-based MACs and the capacity of the MAC address table cannot be altered on FCX devices.

To increase the capacity of the MAC table, enter commands such as the following.

```
Brocade(config)#system-max mac 32768
Brocade(config)#write memory
Brocade(config)#exit
Brocade#reload
```

NOTE

You must save the configuration and reload the software to place the **system-max mac** change into effect.

Syntax: system-max mac <max-flow-MACs>

The <max-flow-MACs> parameter specifies the maximum number of MAC addresses in the MAC table. For flow-based MACs, the minimum value is 16K and the default value is 32K.

Use the command **show default values** to display the default, maximum, and currently configured values for the MAC address table.

Displaying information about flow-based MACs

The **show mac-address** command includes information related to flow-based MAC address learning. The following shows an example **show mac** output.

```
Brocade# show mac
Total active entries from all ports = 15
MAC-Address      Port          Type          Index
0000.0000.0001   1/1           Dynamic       NA
0000.0000.0002   1/1           Dynamic       NA
```

In the above example, since both MAC address entries are flow-based and are located on different packet processors (hardware index), the **Index** field displays **NA** (not applicable).

Syntax: show mac

To display all of the packet processors that have a particular flow-based MAC address, use the **show mac-address vlan** command.

```
Brocade#show mac-address vlan 1 0000.0000.0001
Total active entries from all ports = 16
MAC-Address      Port          Type          Index
0000.0000.0001   1/1           Dynamic       NA
```

```
Present in following devices (at hw index) :-
0  (8196 )          4  (8196 )
```

In the above example, the MAC address 0000.0000.0001 is programmed in packet processors 0 and 4, and the hardware index is 8196.

Syntax: show mac-address vlan <vlan-num> <mac address>

Clearing flow-based MAC address entries

To remove dynamically-learned MAC addresses from the MAC table, use the CLI command **clear mac**. This command clears all dynamically-learned MACs from the hardware and software MAC tables.

Enabling port-based VLANs

When using the CLI, port and protocol-based VLANs are created by entering one of the following commands at the global CONFIG level of the CLI.

To create a port-based VLAN, enter commands such as the following.

```
Brocade(config)#vlan 222 by port
Brocade(config)#vlan 222 name Mktg
```

Syntax: vlan <num> by port

Syntax: vlan <num> name <string>

The **<num>** parameter specifies the VLAN ID. The valid range for VLAN IDs starts at 1 on all systems but the upper limit of the range differs depending on the device. In addition, you can change the upper limit on some devices using the **system max-vlans...** command.

The `<string>` parameter is the VLAN name and can be a string up to 32 characters. You can use blank spaces in the name if you enclose the name in double quotes (for example, “Product Marketing”).)

You can configure up to 4063 port-based VLANs on a device running Layer 2 code or 4061 port-based VLANs on a device running Layer 3 code. Each port-based VLAN can contain either tagged or untagged ports. A port cannot be a member of more than one port-based VLAN unless the port is tagged. On both device types, valid VLAN IDs are 1 – 4095. You can configure up to the maximum number of VLANs within that ID range.

NOTE

VLAN IDs 4087, 4090, and 4093 are reserved for Brocade internal use only. VLAN 4094 is reserved for use by Single STP. Also, if you are running an earlier release, VLAN IDs 4091 and 4092 may be reserved for Brocade internal use only. If you want to use VLANs 4091 and 4092 as configurable VLANs, you can assign them to different VLAN IDs. For more information, refer to [“Assigning different VLAN IDs to reserved VLANs 4091 and 4092”](#) on page 767.

NOTE

The second command is optional and also creates the VLAN if the VLAN does not already exist. You can enter the first command after you enter the second command if you first exit to the global CONFIG level of the CLI.

Assigning IEEE 802.1Q tagging to a port

When a port is tagged, it allows communication among the different VLANs to which it is assigned. A common use for this might be to place an email server that multiple groups may need access to on a tagged port, which in turn, is resident in all VLANs that need access to the server.

NOTE

Tagging does not apply to the default VLAN.

When using the CLI, ports are defined as either tagged or untagged at the VLAN level.

Command syntax for assigning 802.1Q tagging to a port

Suppose you want to make port 5 a member of port-based VLAN 4, a tagged port. To do so, enter the following.

```
Brocade(config)#vlan 4
Brocade(config-vlan-4)#tagged e 5
```

Syntax: `tagged ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum>] [ethernet [<slotnum>/]<portnum>...]`

The `<slotnum>` parameter is required on chassis devices.

Defining MAC address filters

MAC layer filtering enables you to build access lists based on MAC layer headers in the Ethernet/IEEE 802.3 frame. You can filter on the source and destination MAC addresses. The filters apply to incoming traffic only.

You configure MAC address filters globally, then apply them to individual interfaces. To apply MAC address filters to an interface, you add the filters to that interface MAC address filter group.

The device takes the action associated with the first matching filter. If the packet does not match any of the filters in the access list, the default action is to drop the packet. If you want the system to permit traffic by default, you must specifically indicate this by making the last entry in the access list a permit filter. An example is given below.

Syntax: `mac filter <last-index-number> permit any any.`

For devices running Layer 3 code, the MAC address filter is applied to all inbound Ethernet packets, including routed traffic. This includes those port associated with a virtual routing interface. However, the filter is not applied to the virtual routing interface. It is applied to the physical port.

When you create a MAC address filter, it takes effect immediately. You do not need to reset the system. However, you do need to save the configuration to flash memory to retain the filters across system resets.

MAC address filters configuration notes and limitations

- MAC address filtering on FastIron devices is performed in hardware.
- MAC address filtering on FastIron devices differ from other Brocade devices in that you can only filter on source and destination MAC addresses. Other Brocade devices allow you to also filter on the encapsulation type and frame type.
- MAC address filtering applies to all traffic, including management traffic. To exclude management traffic from being filtered, configure a MAC address filter that explicitly permits all traffic headed to the management MAC (destination) address. The MAC address for management traffic is always the MAC address of port 1.
- MAC address filters that have a global **deny** statement can cause the device to block all BPDUs. In this case, include exception statements for control protocols in the MAC address filter configuration.

The following configuration notes apply to Brocade Layer 3 devices:

- MAC address filters apply to both switched and routed traffic. If a routing protocol (for example, OSPF) is configured on an interface, the configuration must include a MAC address filter rule that allows the routing protocol MAC and the neighbor system MAC address.
- You cannot use MAC address filters to filter Layer 4 information.
- MAC address filters are supported on tagged ports in the base Layer 3, edge Layer 3, and full Layer 3 software images.

MAC address filters command syntax

To configure and apply a MAC address filter, enter commands such as the following.

```
Brocade(config)# mac filter 1 deny 3565.3475.3676 ffff.0000.0000
Brocade(config)# mac filter 2 deny any ffff.ffff.ffff ffff.ffff.ffff
Brocade(config)# mac filter 3 deny any 0180.c200.0000 ffff.ffff.fff0
Brocade(config)# mac filter 4 deny any 0000.1234.5678 ffff.ffff.ffff
Brocade(config)# mac filter 5 deny any 0000.2345.6789 ffff.ffff.ffff
Brocade(config)# mac filter 1024 permit any any
Brocade(config)# int e 1
Brocade(config-if-e1000-1)# mac filter-group 1 to 5 1024
```

These commands configure filter 1 to deny traffic with a source MAC address that begins with “3565” to any destination, and configure filters 2 through 5 to deny traffic with the specified destination MAC addresses. Filter 1024 permits all traffic that is not denied by any other filter.

NOTE

Once you apply a MAC address filter to a port, the device drops all Ethernet traffic on the port that does not match a MAC permit filter on the port.

Syntax: `[no] mac filter <filter-num> permit | deny <src-mac> <mask> | any <dest-mac> <mask> | any`

You can configure up to 507 MAC filters for `<filter-num>`, although the output of the **show default values** command shows 512.

The **permit | deny** argument determines the action the software takes when a match occurs.

The `<src-mac> <mask> | any` parameter specifies the source MAC address. You can enter a specific address value and a comparison mask or the keyword **any** to filter on all MAC addresses. Specify the mask using f (ones) and zeros. For example, to match on the first two bytes of the address aabb.ccdd.eeff, use the mask ffff.0000.0000. In this case, the filter matches on all MAC addresses that contain "aabb" as the first two bytes. The filter accepts any value for the remaining bytes of the MAC address. If you specify **any**, do not specify a mask. In this case, the filter matches on all MAC addresses.

The `<dest-mac> <mask> | any` parameter specifies the destination MAC address. The syntax rules are the same as those for the `<src-mac> <mask> | any` parameter.

Syntax: `[no] mac filter log-enable`

Globally enables logging for filtered packets.

Syntax: `[no] mac filter-group log-enable`

Enables logging for filtered packets on a specific port.

Syntax: `[no] mac filter-group <filter-number> [to <filter-number> | <filter-number>...]`

Applies MAC address filters to a port.

When applying the filter-group to the interface, specify each line to be applied separately or use the **to** keyword to apply a consecutive range of filter lines, for example, 1 3 to 8 10.

NOTE

The filters must be applied as a group. For example, if you want to apply four filters to an interface, they must all appear on the same command line.

NOTE

You cannot add or remove individual filters in the group. To add or remove a filter on an interface, apply the filter group again containing all the filters you want to apply to the port.

NOTE

If you apply a filter group to a port that already has a filter group applied, the older filter group is replaced by the new filter group.

When a MAC address filter is applied to or removed from an interface, a Syslog message such as the following is generated.

```
SYSLOG: <14>Jan 1 00:00:00 10.44.9.11 MAC Filter applied to port 0/1/2 by tester
from telnet session (filter id=5 ).
SYSLOG: <14>Jan 1 00:00:00 10.44.9.11 MAC Filter removed from port 0/1/2 by tester
from telnet session (filter id=5 ).
```

The Syslog messages indicate that a MAC address filter was applied to the specified port by the specified user during the specified session type. Session type can be Console, Telnet, SSH, Web, SNMP, or others. The filter IDs that were added or removed are listed.

Enabling logging of management traffic permitted by MAC address filters

You can configure the Brocade device to generate Syslog entries and SNMP traps for management traffic that is permitted by MAC address filters. **Management traffic** applies to packets that are destined for the CPU, such as control packets. You can enable logging of permitted management traffic on a global basis or an individual port basis.

The first time an entry in a MAC address filter permits a management packet and logging is enabled for that entry, the software generates a Syslog message and an SNMP trap. Messages for management packets permitted by MAC address filters are at the warning level of the Syslog.

When the first Syslog entry for a management packet permitted by a MAC address filter is generated, the software starts a five-minute timer. After this, the software sends Syslog messages every five minutes. The messages list the number of management packets permitted by each MAC address filter during the previous five-minute interval. If a MAC address filter does not permit any packets during the five-minute interval, the software does not generate a Syslog entry for that MAC address filter.

NOTE

For a MAC address filter to be eligible to generate a Syslog entry for permitted management packets, logging must be enabled for the filter. The Syslog contains entries only for the MAC address filters that permit packets and have logging enabled.

When the software places the first entry in the log, the software also starts the five-minute timer for subsequent log entries. Thus, five minutes after the first log entry, the software generates another log entry and SNMP trap for permitted management packets.

MAC address filter logging command syntax

To configure MAC address filter logging globally, enter the following CLI commands at the global CONFIG level.

```
Brocade(config)#mac filter log-enable
Brocade(config)#write memory
```

Syntax: [no] mac filter log-enable

To configure MAC address filter logging for MAC address filters applied to ports 1 and 3, enter the following CLI commands.

```
Brocade(config)#int ethernet 1
Brocade(config-if-e1000-1)#mac filter-group log-enable
Brocade(config-if-e1000-1)#int ethernet 3
Brocade(config-if-e1000-3)#mac filter-group log-enable
Brocade(config-if-e1000-3)#write memory
```

Syntax: [no] mac filter-group log-enable**MAC address filter override for 802.1X-enabled ports**

The MAC address filtering feature on an 802.1X-enabled port allows 802.1X and non-802.1X devices to share the same physical port. For example, this feature enables you to connect a PC and a non-802.1X device, such as a Voice Over IP (VOIP) phone, to the same 802.1X-enabled port on the Brocade device. The IP phone will bypass 802.1X authentication and the PC will require 802.1X authentication.

To enable this feature, first create a MAC address filter, then bind it to an interface on which 802.1X is enabled. The MAC address filter includes a mask that can match on any number of bytes in the MAC address. The mask can eliminate the need to enter MAC addresses for all non-802.1X devices connected to the Brocade device, and the ports to which these devices are connected.

MAC address filter override configuration notes

- This feature is supported on untagged, tagged, and dual-mode ports.
- You can configure this feature on ports that have ACLs and MAC address filters defined.

MAC address filter override configuration syntax

To configure MAC address filtering on an 802.1X-enabled port, enter commands such as the following.

```
Brocade#(config)#mac filter 1 permit 0050.04ab.9429 ffff.ffff.0000 any
Brocade#(config)#int e1/2
Brocade#(config-if-e1000-1/2)#dot1x auth-filter 1 3 to 5 10
```

The first line defines a MAC address filter that matches on the first four bytes (ffff.ffff.0000) of the source MAC address 0050.04ab.9429, and any destination MAC address. The permit action creates an 802.1X session in the FORCE AUTHORIZE state, meaning that the device is placed unconditionally in the authorized state, bypassing 802.1X authentication and allowing all traffic from the specified MAC address. If no match is found, the implicit action is to authenticate the client.

The last line binds MAC address filters 1, 3, 4, 5, and 10 to interface 2.

Syntax: `mac filter <filter-num> permit | deny <src-mac> <mask> | any <dest-mac> <mask> | any`

Syntax: `dot1x auth-filter <filter-list>`

The **permit** | **deny** argument determines the action the software takes when a match occurs. In the previous example, the *permit* action creates an 802.1X session in the FORCE AUTHORIZE state, meaning that the device is placed unconditionally in the authorized state, bypassing 802.1X authentication and allowing all traffic from the specified MAC address. The *deny* action creates an 802.1X session in the FORCE UNAUTHORIZE state, meaning that the device will never be authorized, even if it has the appropriate credentials.

The `<src-mac> <mask> | any` parameter specifies the source MAC address. You can enter a specific address value and a comparison mask, or the keyword **any** to filter on all MAC addresses. Specify the mask using f (ones) and zeros. For example, to match on the first two bytes of the address aabb.ccdd.eeff, use the mask ffff.0000.0000. The filter matches on all MAC addresses that contain aabb as the first two bytes and accepts any value for the remaining bytes of the MAC address. If you specify **any**, do not specify a mask. In this case, the filter matches on all MAC addresses. If no match is found, the implicit action is to authenticate the client.

The `<dest-mac> <mask> | any` parameter specifies the destination MAC address. The syntax rules are the same as those for the `<src-mac> <mask> | any` parameter. Note that the 802.1x Authentication filter (**dot1x auth-filter**) does not use the destination MAC address in the MAC address filter.

The `<filter-num>` command identifies the MAC address filter. The maximum number of supported MAC address filters is determined by the **mac-filter-sys** default or configured value.

The **dot1x auth-filter** `<filter-list>` command binds MAC address filters to a port.

The following rules apply when using the **dot1x auth-filter** command:

- When you add filters to or modify the **dot1x auth-filter**, the system clears all 802.1X sessions on the port. Consequently, all users that are logged in will need to be re-authenticated.
- The maximum number of filters that can be bound to a port is limited by the **mac-filter-port** default or configured value.
- The filters must be applied as a group. For example, if you want to apply four filters to an interface, they must all appear on the same command line.
- You cannot add or remove individual filters in the group. To add or remove a filter on an interface, apply the filter group again containing all the filters you want to apply to the port.

If you apply a filter group to a port that already has a filter group applied, the older filter group is replaced by the new filter group.

Locking a port to restrict addresses

Address-lock filters allow you to limit the number of devices that have access to a specific port. Access violations are reported as SNMP traps. This feature is disabled by default. A maximum of 2048 entries can be specified for access. The default address count is eight.

Lock address configuration notes

- Static trunk ports and link-aggregation configured ports do not support the lock-address option.
- The MAC port security feature is a more robust version of this feature. Refer to [“MAC port security configuration”](#) on page 1839.

Lock address command syntax

To enable address locking for port 2 and place a limit of 15 entries, enter a command such as the following.

```
Brocade(config)#lock e 2 addr 15
```

Syntax: `lock-address ethernet [<port> [addr-count <num>]`

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

The *<num>* parameter is a value from 1 – 2048.

Monitoring MAC address movement

MAC address movement notification allows you to monitor the movement of MAC addresses that migrate from port to port. It enables you to distinguish between legitimate movement and malicious movement by allowing you to define malicious use as a threshold number of times a MAC address moves within a specific interval.

Malicious use typically involves many MAC address moves, while legitimate use usually involves a single move. Malicious movement is often the result of MAC address spoofing, in which a malicious user masquerades as a legitimate user by changing his own MAC address to that of a legitimate user. As a result, the MAC address moves back and forth between the ports where the legitimate and malicious users are connected. A legitimate use might be to spoof the MAC address of a failed device in order to continue access using a different device.

You can monitor MAC address movements in the following ways:

- Threshold-rate notifications allow you to configure the maximum number of movements over a specified interval for each MAC address before a notification is sent. For example you could define the malicious move rate as three moves every 30 seconds.

- Interval-history notifications are best suited for a statistical analysis of the number of MAC address movements for a configured time interval. For example, you may want to find out how many MAC addresses have moved in the system over a given interval or how many times a specific MAC address has moved during that interval. However, it is not possible to get this information for every MAC address if there are a lot of MAC addresses that moved during the interval. Consequently, the number of MAC addresses that can have a recorded history is limited.

NOTE

MAC address move notification does not detect MAC movements across an MCT cluster between MCT peers. It only detects MAC movements locally within a cluster MCT peer.

Configuring the MAC address movement threshold rate

To enable notification of MAC address moves, enter the **mac-movement notification threshold-rate** command at the global configuration level. This command enables a corresponding SNMP trap. Notification is triggered when a threshold number of MAC address moves occurs within a specified period for the same MAC address. This command sets the threshold level and the sampling interval.

Avoid threshold rates and sampling intervals that are too small. If you choose a small threshold and a sampling interval that is also small, an unnecessarily high number of traps could occur.

The following example enables notification of MAC address moves and sends an SNMP trap when any MAC address moves to a different port five times in a 10-second interval.

```
Brocade(config)# mac-movement notification threshold-rate 5 sampling-interval 10
```

To disable notification of MAC address moves and disable the SNMP trap, use the **no** form of the command, as shown in the following example.

```
Brocade(config)# no mac-movement notification threshold-rate 5 sampling-interval 10
```

Syntax: **[no] mac-movement notification threshold-rate** *<move-count>* **sampling-interval** *<interval>*

The *<move-count>* variable indicates the number of times a MAC address can move within the specified period until an SNMP trap is sent. It has no default value.

The *<interval>* variable specifies the sampling period in seconds. It has no default value.

Viewing the MAC address movement threshold rate configuration

To display the configuration of the MAC address movement threshold rate, enter the **show notification mac-movement threshold-rate** command at the privileged EXEC level. This command also displays ongoing statistics for the current sampling interval.

```
Brocade# show notification mac-movement threshold-rate
Threshold-Rate Mac Movement Notification is ENABLED
Configured Threshold-Rate : 5 moves
Configured Sampling-Interval : 30 seconds
Number of entries in the notification table : 100
MAC-Address      from-Port    to-Port          Last Move-Time    Vlan-id
-----
0010.9400.0022   7/1          7/2             5 minutes 30 seconds    10
0010.9400.0021   7/1          7/2             5 minutes 30 seconds    10
0010.9400.0020   7/1          7/2             5 minutes 30 seconds    10
0010.9400.001f   7/1          7/2             5 minutes 30 seconds    10
0010.9400.0024   7/1          7/2             5 minutes 30 seconds    10
0010.9400.001e   7/1          7/2             5 minutes 30 seconds    10
0010.9400.0023   7/1          7/2             5 minutes 30 seconds    10
0010.9400.001d   7/1          7/2             5 minutes 30 seconds    10
0010.9400.001c   7/1          7/2             5 minutes 30 seconds    10
(output truncated)
```

Syntax: show notification mac-movement threshold-rate

[Table 101](#) defines the fields in the output of the **show notification mac-movement threshold-rate** command.

TABLE 101 Field definitions for the show notification mac-movement threshold-rate command

Field	Description
Threshold-Rate Mac Movement Notification is	Specifies whether the MAC movement notification threshold rate is enabled.
Configured Threshold-Rate	The rate in MAC address moves per sampling interval after which a notification is issued. The range is from 1 through 50000.
Configured Sampling-Interval	The sampling interval in seconds over which the number of MAC address moves is measured. The range is from 1 through 86400, which is the number of seconds in a day.
Number of entries in the notification table	One entry for each time a MAC address notification threshold was reached.
MAC-Address	The MAC address that has moved to a different port.
from-Port	The port from which the MAC address moved.
to-Port	The port to which the MAC address moved.
Last Move-Time	The time since the last move occurred.
Vlan-id	The VLAN for the port where the MAC address movement was detected.

Configuring an interval for collecting MAC address move notifications

To configure an interval for collecting statistical data about MAC address moves, enter the **mac-movement notification interval-history** command at the privileged EXEC level. This command enables a corresponding SNMP trap. This history includes statistical information such as the number of MAC addresses that move over the specified period, the total number of MAC address moves, which MAC addresses have moved, and how many times a MAC address has moved.

The software places an upper limit on the number of MAC addresses for which MAC address-specific data is reported. This limit is necessary to do this because it is not possible to report on all MAC addresses when many move.

The following example configures a history interval of 10 seconds.

```
Brocade(config)# mac-movement notification interval-history 10
```

To disable the feature and the corresponding SNMP trap, enter the **no** version of the command, as shown in the following example.

```
Brocade(config)# no mac-movement notification interval-history 10
```

Syntax: [no] **mac-movement notification interval-history** <interval>

The <interval> variable represents the amount of time in seconds during which the MAC address movement notification data is collected. It has no default value.

Viewing MAC address movement statistics for the interval history

To display the collected history of MAC address movement notification, enter the **show notification mac-movement interval-history** command at the privileged EXEC level. This command displays how the history interval is configured in addition to the MAC address move data itself.

```
Brocade# show notification mac-movement interval-history
Interval-History Mac Movement Notification is ENABLED
Configured Interval : 30 seconds
Number of macs that moved in the interval : 100
Total number of moves in the interval: 98654
```

MAC-Address	from-Port	to-Port	Interval	Move-Count	Last Move-Time	Vlan-id
0010.9400.0052	7/1	7/2		1000	11 minutes 22 seconds	10
0010.9400.0051	7/1	7/2		1002	11 minutes 22 seconds	10
0010.9400.0050	7/1	7/2		1012	11 minutes 22 seconds	10
0010.9400.004f	7/1	7/2		1018	11 minutes 22 seconds	10
0010.9400.004e	7/1	7/2		1012	11 minutes 22 seconds	10

(output truncated)

[Table 102](#) defines the fields in the output of the **show notification mac-movement interval-history** command.

TABLE 102 Field definitions for the **show notification mac-movement interval-history** command

Field	Description
Interval-History Mac Movement Notification is	Specifies whether the interval-history data collection is enabled.
Configured Interval	The interval over which the MAC address movement statistics were collected.
Number of macs that moved in the interval	The number of MAC addresses that moved during the configured interval, regardless of how many times each address moved.
Total number of moves in the interval	The total number of MAC address moves over the configured interval.
MAC-Address	The MAC address that has moved to a different port.
from-Port	The port from which the MAC address moved.
to-Port	The port to which the MAC address moved.
Interval Move-Count	The number of times the MAC address has moved within the interval.
Last Move-Time	The time since the last move occurred.
Vlan-id	The VLAN for the port where the MAC address movement was detected.

Displaying and modifying system parameter default settings

Brocade devices have default table sizes for the system parameters shown in the following display outputs. The table sizes determine the maximum number of entries the tables can hold. You can adjust individual table sizes to accommodate your configuration needs.

The tables you can configure, as well as the default values and valid ranges for each table, differ depending on the Brocade device you are configuring. To display the adjustable tables on your Brocade device, use the **show default values** command. The following shows example outputs.

System default settings configuration considerations

- Changing the table size for a parameter reconfigures the device memory. Whenever you reconfigure the memory on a Brocade device, you must save the change to the startup-config file, then reload the software to place the change into effect.
- Configurable tables and their defaults and maximum values differ on Brocade IPv4 devices versus IPv6-capable devices.
- For more information about Layer 3 system parameter limits, refer to [“Displaying Layer 3 system parameter limits”](#) on page 1191.

Displaying system parameter default values

To display the configurable tables and their defaults and maximum values, enter the **show default values** command at any level of the CLI.

The following shows an example output of the **show default values** command on a FastIron Layer 2 device.

```
Brocade#show default values
sys log buffers:50          mac age time:300 sec          telnet sessions:5

System Parameters   Default   Maximum   Current
igmp-max-group-addr 4096      8192      1024

Table 103 defines the system parameters in the **show default values** command output.

TABLE 103 System parameters in show default values command

Parameter	Definition
dvmrp-mcache	PIM and DVMRP multicast cache flows stored in CAM
dvmrp-route	DVMRP routes
hw-ip-mcast-mll	Multicast output interfaces (clients)
hw-ip-next-hop	IP next hops and routes, including unicast next hops and multicast route entries
hw-logical-interface	Hardware logical interface pairs (physical port and VLAN pairs)
hw-traffic-conditioner	Traffic policies
ip-arp	ARP entries
ip-cache	IP forwarding cache entries
ip-filter-port	IP ACL entries per port
ip-filter-sys	IP ACL entries per system
ip-qos-session	Layer 4 session table entries
ip-route	Learned IP routes
ip-static-arp	Static IP ARP entries
ip-static-route	Static IP routes
ip-subnet-port	IP subnets per port
l3-vlan	Layer 3 VLANs
mac	MAC entries
mac-filter-port	MAC address filter entries per port
mac-filter-sys	MAC address filter entries per system
multicast-route	Multicast routes
pim-mcache	PIM multicast cache entries
rmon-entries	RMON control table entries
session-limit	Session entries
spanning-tree	Spanning tree instances
view	SNMP views
virtual-interface	Virtual routing interfaces
vlan	VLANs
mld-max-group-addr	MLD group limit
igmp-snoop-mcache	IGMP snooping cache entries
mld-snoop-mcache	MLD snooping cache entries

Modifying system parameter default values

Information for the configurable tables appears under the columns that are shown in bold type in the above examples. To simplify configuration, the command parameter you enter to configure the table is used for the table name. For example, to increase the capacity of the IP route table, enter the following commands.

```
Brocade(config)#system-max ip-route 120000
Brocade(config)#write memory
Brocade(config)#exit
Brocade#reload
```

Syntax: **system-max ip-route** *<num>*

The *<num>* parameter specifies the maximum number of routes in the IP route table. The minimum value is 4096. The maximum value is 524288 (subject to route patterns for FSX). The default is 80000 IP routes.

NOTE

If you accidentally enter a value that is not within the valid range of values, the CLI will display the valid range for you.

To increase the number of IP subnet interfaces you can configure on each port on a device running Layer 3 code from 24 to 64, enter the following commands.

```
Brocade(config)#system-max ip-subnet-port 64
Brocade(config)#write memory
Brocade(config)#exit
Brocade#reload
```

Syntax: **system-max ip-subnet-port** *<num>*

The *<num>* parameter specifies the maximum number of subnet addresses per port and can be from 24 – 128. The default is 24.

Dynamic buffer allocation for QoS priorities for FastIron X Series devices

NOTE

This section applies to FastIron X Series devices only. To configure dynamic buffer limits on FastIron WS, Brocade FCX Series, and ICX devices, refer to [“Dynamic buffer allocation for FCX, FWS, and ICX devices”](#) on page 589.

By default, Brocade IronWare software allocates a certain number of buffers to the outbound transmit queue for each port, based on QoS priority (traffic class). The buffers control the total number of packets permitted in the outbound transmit queue for the port. For each port, the Brocade device defines the maximum outbound transmit buffers, also called *queue depth limits*, as follows:

- **Total Transmit Queue Depth Limit** – The total maximum number of transmit buffers allocated for all outbound packets on a port. Packets are added to the port's outbound queue as long as the number of buffers currently in use is less than the total transmit queue depth limit. When this limit is reached, any new packets attempting to enter the port's transmit queue will be dropped until at least one buffer is freed.
- **Transmit Queue Depth Limit for a Given Traffic Class** – The maximum number of transmit buffers allocated for packets with a given traffic class (0 through 7) on a port. Packets with the specified traffic class are added to the port's outbound queue as long as the number of buffers currently in use for that traffic class is less than the transmit queue depth limit for the traffic class. When this limit is reached, any new packets with the specified traffic class attempting to enter the port's transmit queue will be dropped.

Except for the third-generation Interface modules, you can increase or decrease both of these queue depth limits per port. On the SX-FI48GPP, SX-FI-24GPP, SX-FI-24HF, SX-FI-2XG or SX-FI-8XG modules, to increase or decrease the queue depth limits for a port, you configure a buffer profile and then apply it to the port. A buffer profile can be tied to one or more ports. Therefore, if you change the configuration on one port, it will change the configuration on all ports associated with the same buffer profile.

Dynamic buffer allocation for QoS is useful in situations where applications have intermittent bursts of oversubscription. For example, by increasing the buffers on the egress port, the Brocade device will be able to forward oversubscribed packets instead of dropping them.

Default queue depth limits for FastIron X Series devices

[Table 104](#) defines the default maximum queue depth values per port, per traffic class. The Brocade device drops the packets that cause the port to exceed these limits.

NOTE

The SX-FI48GPP Interface module supports 48 tri-speed (10/100/1000) ports. When the ports are configured at lower speeds, for example, 100 Mbps or 10 Mbps, the maximum queue depth is less than 256 when egress congestion occurs at the front-end Network Processor (NP) of the SX-FI48GPP module. If egress congestion occurs at the back-end NP of the SX-FI48GPP module, the maximum queue depth is 4095. The limit for buffer sharing is 4088.

TABLE 104 Default maximum queue depth

Port type	Maximum queue depth per port, per priority 0 – 6	Maximum queue depth per port, per priority 7	Total maximum queue depth
1 Gbps port	96	224	896
10 Gbps port without jumbo enabled	400	704	3504
10 Gbps port with jumbo enabled	352	640	3104

Configuring the total transmit queue depth limit for FastIron X Series devices

NOTE

To configure the total transmit queue depth limit on a third-generation module, refer to [“Buffer profile configuration”](#) on page 587.

To set the total transmit queue depth limit on a port, enter a command such as the following.

```
Brocade(config)#qd 2 2049
```

This command sets the queue depth limit on port 2 to 2049. Packets are added to the port's outbound queue as long as the packets do not cause the port to exceed 2048 buffers. If the port reaches its queue depth limit of 2049, any new packets attempting to enter the port transmit queue will be dropped until at least one buffer is freed.

Syntax: `qd <port> <limit>`

Specify the *port* variable in one of the following formats:

- FSX, FSX 800, and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

The *<limit>* variable can be a value from 0 through 4095. [Table 104](#) on page 585 lists the default values.

Configuring the transmit queue depth limit for a given traffic class on FastIron X Series devices

NOTE

To configure transmit queue depth limits for an SX-FI48GPP module, refer to “[Buffer profile configuration](#)” on page 587.

To set the transmit queue depth limit on a port for a given traffic class, first enter the transmit queue depth limit for the traffic class, and then specify the traffic class.

```
Brocade(config)#qd 2 200 7
```

This command sets the queue depth limit on port 2 to 200 for packets with a traffic class of 7. Packets with priority 7 are added to the outbound queue on port 2 as long as the packets do not exceed 199 buffers. When the port reaches its queue depth limit of 200, packets with the given traffic class will be dropped.

Syntax: `qd <port> <limit> <traffic-class>`

Specify the *port* variable in one of the following formats:

- FSX, FSX 800, and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

The *<limit>* variable can be a value from 0 through 4095 and cannot exceed the total transmit queue depth limit configured for the port. [Table 104](#) on page 585 lists the default values.

The sum of the queue depth limits for individual traffic classes on a port does not need to equal the total queue depth limit for the port:

- If the sum of the individual traffic class queue depth limits exceeds the total port limit and the total port limit is reached, any buffer that gets released can be used by any traffic class queue that has not reached its individual limit.
- If the sum of the individual traffic class queue depth limits is less than the total port limit, the remaining buffers can be used only by packets with a priority of 7.

The *<traffic-class>* variable can be a value from 0 through 7, where 7 is the highest priority queue.

Removing buffer allocation limits on FastIron X Series devices

You can remove buffer allocation limits on all ports and all Traffic Classes globally. This permits all available buffers in a port region to be used in a first-come-first-serve basis by any of its ports, regardless of priority. This can be done using the following command.

```
Brocade(config)#buffer-sharing-full
```

Syntax: [no] **buffer-sharing-full**

The **buffer-sharing-full** command sets the total transmit queue depth limit and the transmit queue depth limits for each Traffic Class to 4095 for all ports of the device. The command overrides any existing individually configured queue depth limits.

ATTENTION

The **buffer-sharing-full** command should be used carefully. By entering this command, there is no limit on the number of buffers a port or a specific priority on a port can use. One port could potentially use up all the available buffers of its port region and cause starvation on other ports of the port region.

Buffer profile configuration

The following Interface modules support up to eight buffer profiles:

- SX-FI48GPP
- SX-FI-24GPP
- SX-FI-24HF
- SX-FI-2XG
- SX-FI-8XG

A buffer profile defines the total transmit queue depth limit for a port and the transmit queue depth limit for a given traffic class. On the listed supported Interface modules, each port is associated with a buffer profile. In contrast, Interface modules other than the SX-FI-48GPP, SX-FI-24GPP, SX-FI-24HF, SX-FI-2XG, and the SX-FI-8XG support the configuration of transmit queue depth limits per port.

By default, each port on an SX-FI48GPP, SX-FI-24GPP, SX-FI-24HF, SX-FI-2XG or SX-FI-8XG Interface module is associated with buffer profile ID 1. Profile 0 is reserved for buffer sharing. Default queue depth limits are provided in [“Default queue depth limits for FastIron X Series devices”](#) on page 585. To change the queue depth limit for a port on the supported Interface modules, configure a buffer profile ID that is different from the default or configured value, and apply the buffer profile to the port. When you change the queue depth limit on a port, the configuration will apply to all ports associated with the same buffer profile ID. For example, if ports 1/1 through 1/5 are associated with buffer profile ID 3 and you enter the **qd 1/1 1000** command, the queue depth limit of 1000 will apply to ports 1/1 through 1/5.

NOTE

In the case of SX-FI48GPP module, the queue depth configured using the **qd** command is not applicable when the port is set to speeds lower than 1Gbps. The **qd** command is applicable only when the port is set to speeds greater than 1Gbps.

Configuring a buffer profile and defining the queue depth limits

1. Create a buffer profile and assign it to a port. For example, to create buffer profile 2 and assign it to port 1/1, enter the following command.

```
Brocade(config)#qd 1/1 profile-id 2
```

Syntax: [no] **qd** <slotnum>/<portnum> **profile-id** <number>

The <number> variable specifies the buffer profile ID associated with the <slotnum>/<portnum>. The buffer profile ID can be a number from 1 through 7. Profile 0 is reserved for buffer sharing.

2. Configure the total transmit queue depth limit associated with the buffer profile. For example, to change the total transmit queue depth limit for buffer profile 2 to 1000, enter the following command.

```
Brocade(config)#qd 1/1 1000
```

Because port 1/1 is associated with buffer profile 2, this command sets the queue depth limit for buffer profile 2 to 1000. Packets are added to the outbound queue of a port as long as the packets do not cause the port to exceed 1000 buffers. If the port reaches its queue depth limit of 1000, any new packets attempting to enter the transmit queue will be dropped until at least one buffer is freed.

Syntax: [no] **qd** <slotnum>/<portnum> <limit>

The <limit> variable can be a value from 0 through 4095. The default is 4095.

3. If desired, configure the queue depth limit for a given traffic class. For example, to change the queue depth limit for buffer profile 2 to 300 for packets with a traffic class of 1, enter the following command.

```
Brocade(config)#qd 1/1 300 1
```

For ports that use buffer profile 2, packets with priority 1 are added to the outbound queue as long as the packets do not exceed 299 buffers. When the port reaches its queue depth limit of 300, packets with the given traffic class will be dropped.

Syntax: [no] **qd** <slotnum>/<portnum> <limit> <traffic-class>

The <limit> variable can be a value from 0 through 4095 and cannot exceed the total transmit queue depth limit configured in the previous step.

The sum of the queue depth limits for individual traffic classes on a port does not need to equal the total queue depth limit for the port:

- If the sum of the individual traffic class queue depth limits exceeds the total port limit and the total port limit is reached, any buffer that gets released can be used by any traffic class queue that has not reached its individual limit.
- If the sum of the individual traffic class queue depth limits is less than the total port limit, the remaining buffers can be used only by packets with a priority of 7.

The <traffic-class> variable can be a value from 0 through 7, where 7 is the highest priority queue.

4. Enter the **write memory** command to save the configuration.

Displaying the buffer profile configuration

To display the buffer profile configuration for an SX-FI48GPP Interface module, use the **show configuration** command.

The following example shows that buffer profile 2 and its configured queue depth values apply to ports 1/1 and 1/2. Although the profile configuration was changed for port 1/1 only, port 1/2 has also changed to match the configuration.

```
Brocade(config)#show configuration

qd 1/1 profile-id 2
qd 1/2 profile-id 2
!
qd 1/1 1000
qd 1/2 1000
qd 1/1 300 1
qd 1/2 300 1
```

Syntax: show configuration

Default queue depth limits for FastIron X Series devices

[Table 104](#) defines the default maximum queue depth values per port, per traffic class. The Craig Brocade device drops the packets that cause the port to exceed these limits.

NOTE

The SX-FI48GPP Interface module supports 48 tri-speed (10/100/1000) ports. When the ports are configured at lower speeds, for example 100 Mbps or 10 Mbps, the maximum queue depth is less than 256 when egress congestion occurs at the front-end Network Processor (NP) of the SX-FI48GPP module. If egress congestion occurs at the back-end NP of the SX-FI48GPP module, the maximum queue depth is 4095. The limit for buffer sharing is 4088.

Dynamic buffer allocation for FCX, FWS, and ICX devices

By default, the IronStack architecture allocates fixed buffers on a per-priority queue, per-packet processor basis. The buffers control the total number of packets that can be queued in the outbound transmit for the port. In instances of heavy traffic bursts to aggregation links, such as in stacking configurations or mixed-speed environments, momentary oversubscription of the buffers and descriptors may occur. A descriptor points to one or more packet buffers.

Brocade FastIron stackable devices provide the capability to allocate additional egress buffering and descriptors to handle momentary bursty traffic periods, especially when other priority queues may not be in use, or may not be experiencing heavy traffic. This allows users to allocate and fine-tune the depth of priority buffer queues for each packet processor.

Configuring buffer profiles

There are two different methods of allocating buffers and descriptors to the ports and its queues.

One method uses the **qd-descriptor** and **qd-buffer** CLI commands to allocate descriptors and buffers, respectively, to the port and its queues. This method is available on FWS, FCX, and ICX devices.

The other method uses user-configurable buffer profiles. This method allows you to define a template of buffer allocations to be used on a per-port per-queue basis on the devices. When applied, this buffer profile acts as if you created a series of the **qd** commands. This buffer profile is a simpler form of allocating descriptors and buffers to the port and its queues. This method is available on FCX and ICX devices.

Configuring buffer profiles with qd-descriptor and qd-buffer commands on FCX, FWS, and ICX devices

The 48-port Brocade stackable switch has two packet processors. The 24-port Brocade stackable switch has a single packet processor. For devices in an IronStack, each stack unit has the possibility of two packet processors, but the second processor for a 24-port stack unit cannot be configured. The number of actual available packet processors depends on the type and number of switches in the stack.

For example, for an 8-unit stack of 48 ports, the packet processor numbering scheme is as follows:

- Stack unit 1 - Packet processors 0 and 1
- Stack unit 2 - Packet processors 2 and 3
- Stack unit 3 - Packet processors 4 and 5
- Stack unit 4 - Packet processors 6 and 7
- Stack unit 5 - Packet processors 8 and 9
- Stack unit 6 - Packet processors 10 and 11
- Stack unit 7 - Packet processors 12 and 13
- Stack unit 8 - Packet processors 14 and 15

In this configuration, if stack unit 3 and stack unit 7 are 24-port devices, the odd-numbered packet processors 5 and 13 cannot be configured, and do not exist, although they are reserved.

Configuration steps for buffer profile with qd-descriptor and qd-buffer commands on FCX, FWS, and ICX

The descriptor and buffer allocation process occurs in four sequential steps using the **qd-buffer** and **qd-descriptor** commands.

NOTE

For FCX devices, when you reset buffer values for the 10 Gbps ports, the buffer values for the rear-panel 10 Gbps and 16 Gbps ports are also reset.

1. Configure the allowable port descriptors. Port descriptors set the limit for the ports. The minimum limit for the port descriptors is 16. The maximum limit of the port descriptors depends on the hardware device. Port descriptor limits of different platforms are listed in the section [“Buffer and descriptor maximum and default allocation values”](#) on page 596. Configure the allowable port descriptors by entering a command similar to the following.

```
Brocade# qd-descriptor 1 2 76
```

Syntax: [no] qd-descriptor <devicenum> <portypeval> <numdescriptors>

The <devicenum> variable refers to the device in the stacking unit. The device number starts from 0.

The <portypeval> variable is 1 for 1 Gbps ports and 2 for 10 Gbps ports.

The <numdescriptors> variable refers to the number of descriptors to allocate.

2. Configure the queue descriptors. The minimum limit for queue descriptors is 16. The system default queue descriptors for different platforms are listed in [“Buffer and descriptor maximum and default allocation values”](#) on page 596. Configure the queue descriptors for the queue by entering a command similar to the following.

```
Brocade# qd-descriptor 1 2 76 2
```

Syntax: [no] qd-descriptor <devicenum> <portypeval> <numdescriptors> <priorityqueue>

The <devicenum> variable refers to the device in the stacking unit. The device number starts from 0.

The <portypeval> variable is 1 for 1 Gbps ports and 2 for 10 Gbps ports.

The <numdescriptors> variable refers to the number of descriptors to allocate.

The *<priorityqueue>* variable refers to the specific queue of the port from 0 through 7.

3. Configure the port buffers. The minimum limit for port buffers is 16. The maximum limit for the port buffer depends on the hardware device. Port buffer limits of different platforms are listed in [“Buffer and descriptor maximum and default allocation values”](#) on page 596. Configure the allowable packet buffers by entering a command similar to the following.

```
Brocade# qd-buffer 1 2 76
```

Syntax: [no] qd-buffer *<devicenum>* *<portypeval>* *<numbuffers>*

The *<devicenum>* variable refers to the device in the stacking unit. The device number starts from 0.

The *<portypeval>* variable is 1 for 1 Gbps ports and 2 for 10 Gbps ports.

The *<numbuffers>* variable refers to the number of buffers to allocate.

4. Configure the queue buffers. The maximum limit of queue buffers depends on the hardware device. Queue buffer limits of different platforms are listed in [“Buffer and descriptor maximum and default allocation values”](#) on page 596. Configure the queue buffers by entering a command similar to the following.

```
Brocade# qd-buffer 1 2 76 2
```

Syntax: [no] qd-buffer *<devicenum>* *<portypeval>* *<numbuffers>* *<priorityqueue>*

The *<devicenum>* variable refers to the device in the stacking unit. The device number starts from 0.

The *<portypeval>* variable is 1 for 1 Gbps ports and 2 for 10 Gbps ports.

The *<numbuffers>* variable refers to the number of buffers to allocate.

The *<priorityqueue>* variable refers to the specific queue of the port from 0 through 7.

NOTE

In FWS devices the global buffer limit is 2016 instead of 2094.

Sample configuration for buffer profile with qd-descriptor and qd-buffer commands on FCX, FWS, and ICX

This sample configuration assumes a four-unit stack with the following topology. Note that there is no packet processor 3 or 7, because stack units 2 and 4 are 24-port devices.

- Stack unit 1, 48 ports - Packet processor numbers 0 and 1
- Stack unit 2, 24 ports - Packet processor number 2
- Stack unit 3, 48 ports - Packet processors 4 and 5
- Stack unit 4, 24 ports - Packet processor number 6

The following commands allocate available buffers to be used by priority 0 queues in the four-unit stack.

```
qd-descriptor 0 1 4095
qd-descriptor 1 1 4095
qd-descriptor 2 1 4095

Configuring user-configurable buffer profiles on FCX and ICX devices

NOTE

The user-configurable buffer profile method is not available on FWS devices.

A buffer profile is a mechanism to arbitrarily allocate the egress buffers and descriptors limits to be applied to a port and its queues. Users can define a limit for a port and its queues by configuring the buffer profiles on the device. Therefore, user-configurable buffer profiles provide a template to allocate egress buffers and descriptors limits to the port and on its queues. This template is then applied to the device.

NOTE

Buffer profiles can be configured for 10 Gbps and 1 Gbps ports, but not for ICX 6610 40 Gbps ports. The 10 Gbps profile will apply to ICX 6430 and 6450 stacking ports, as well as FCX 16 Gbps stacking ports.

Configuring and applying a user-configurable buffer profile is a two-step process.

First, create a user-configurable buffer profile with the **qd-buffer-profile** CLI command. Define a name for the user-configurable buffer profile, assign buffer and descriptor limits at the port level, and then define buffer and descriptor limits per queue of that port.

Second, apply the user-configurable buffer profile you created to the device with the **buffer-profile** CLI command.

Configuring a user-configurable buffer profile

To configure a user-configurable buffer profile, complete the following steps.

1. Create a user-configurable buffer profile. For example, to create a user-configurable buffer profile named `profile1` enter the following command.

```
Brocade(config)# qd-buffer-profile profile1#
```

Syntax: **[no] qd-buffer-profile** *<user-profile-name>*

The *<user-profile-name>* variable specifies the name of the user-configurable buffer profile. The profile name can be up to 64 characters long.

2. Configure the port type for the user-configurable buffer profile.

The buffer profile port type can be configured for 1 Gbps ports, 10 Gbps ports, or for all the ports. The **port-type** option should be in line with the **qd-buffer** legacy command; that is, 1 for 1 Gbps ports, 2 for 10 Gbps ports, 0 for all the ports. The default port type is set to 1 Gbps. To configure a user-configurable profile for 10 Gbps ports, the 10 Gbps port type must be explicitly provided by the **port-type** option. Modifications to buffers and descriptors of a port and its queues take effect dynamically.

When the profile type is configured as all 1 Gbps and 10 Gbps ports, the default buffers and descriptors will be set according to the port type; that is, all 1 Gbps ports use 1 Gbps defaults and 10 Gbps ports use 10 Gbps defaults. If you configure a port and its queue with egress buffer and descriptor limits, then the configured limits are used for both 1 Gbps and 10 Gbps ports.

To configure the port type 1 for the profile named “profile1”, enter the following command at the profile configuration level.

```
Brocade(qd-profile-profile1)# profile-config port-type 1
```

Syntax: **[no] profile-config port-type** 0 | 1 | 2

- 0 – All 1 Gbps and 10 Gbps ports
- 1 – All 1 Gbps ports
- 2 – All 10 Gbps ports

NOTE

The **no** form of the command sets the profile port type to 1 Gbps.

Port type modification resets the profile to its default value. All the port and queue buffers and descriptors will be set to either 1 Gbps or 10 Gbps defaults as per the configuration, which means all the user configurations for the port and its queues will be lost.

NOTE

Port type modifications on an active profile are not allowed.

3. Configure the port buffers. Port buffer sets the maximum buffer limit for the ports. The maximum limit depends on the hardware device. Port buffer limits of different platforms are listed in the section [“Buffer and descriptor maximum and default allocation values”](#) on page 596. To configure the port buffers for the user-configurable buffer profile named “profile1”, enter the following command at the profile configuration level.

```
Brocade(qd-profile-profile1)# profile-config port-buffer 8000
```

Syntax: `profile-config port-buffer <decimal>`

The `<decimal>` variable refers to the number of buffers.

4. Configure the port descriptors. Port descriptors set the maximum descriptor limit for the ports. The maximum limit of port descriptors depends on the hardware device. Port descriptor limits of different platforms are listed in [“Buffer and descriptor maximum and default allocation values”](#) on page 596. To configure the port descriptors for the user-configurable buffer profile named “profile1”, enter the following command at the profile configuration level.

```
Brocade(qd-profile-profile1)# profile-config port-descriptor 8000
```

Syntax: `profile-config port-descriptor <decimal>`

The `<decimal>` variable refers to the number of descriptors.

5. Configure the queue buffers. Queue buffers set the maximum buffer limit for a specified queue. If a queue buffer limit is not set, then the default is used. The system default queue buffers for different platforms are listed in [“Buffer and descriptor maximum and default allocation values”](#) on page 596. To configure the queue buffers for the user-configurable buffer profile named “profile1”, enter the following command at the profile configuration level.

```
Brocade(qd-profile-profile1)# profile-config queue-buffers 2 600
```

Syntax: `profile-config queue-buffers <queue-num> <decimal>`

The `<queue-num>` variable refers to the number of the queue of a port from 0 through 7.

The `<decimal>` variable refers to the number of buffers.

6. Configure the queue descriptors. Queue descriptors set the maximum descriptor limit for the specified queue. If a queue descriptors limit is not set, then the default is used. The system default queue descriptors for different platforms are listed in [“Buffer and descriptor maximum and default allocation values”](#) on page 596. To configure the queue descriptors for the user-configurable buffer profile named “profile1”, enter the following command at the profile configuration level.

```
Brocade(qd-profile-profile1)#Profile-config queue-descriptors 2 600
```

Syntax: `profile-config queue-descriptors <queue-num> <decimal>`

The `<queue-num>` variable refers to the number of the queue of a port from 0 through 7.

The `<decimal>` variable refers to the number of descriptors.

Applying a user-configurable buffer profile on the device

Once configured, a user-configurable buffer profile must be applied on the device. To apply the user-configurable buffer profile named “profile1” to a device, enter the following command.

```
Brocade(config)# buffer-profile port-region 0 qd-buffer-profile profile1
```

Syntax: `[no] buffer-profile port-region <port-region> qd-buffer-profile <user-profile-name>`

The `<port-region>` variable is the device number on which the user-configurable buffer profile is applied.

The `<user-profile-name>` variable is the name of the user-configured profile.

Buffer and descriptor maximum and default allocation values

This section lists the maximum and default buffers and descriptors values of a port and its queues on each hardware platform. The following tables are included:

- [Table 105](#) describes FCX devices.
- [Table 106](#) describes FWS devices.
- [Table 107](#) describes ICX 6610 devices.
- [Table 108](#) describes ICX 6430 devices.
- [Table 109](#) describes ICX 6450 devices.

NOTE

Values in the following tables are for software traffic classes (TCs) or QoS priority (qosp) levels.

TABLE 105 Port buffers and descriptors values on FCX devices

	1 Gbps buffers and descriptors	10 Gbps buffers and descriptors
Port Limit	8096	8096
TC0	512	768
TC1	192	320
TC2	192	320

TC5	192	256	192	256
TC6	192	256	192	256
TC7	192	256	192	256

1. Values are the same for stand-alone and stacking systems.

Configuring values for the ICX 6430

Port buffer and descriptor values in [Table 108](#) are default values for software traffic classes. For the ICX 6430, traffic classes are mapped to shared hardware queues (refer to “[Queues for the ICX 6430 switch](#)” on page 1973. Refer to the following are considerations for configuring your own values and buffer profiles.

- User-defined values have precedence over default values. For example, if default values for TC2, TC3, and TC4 are 96 and you configure 80 for TC3, then the hardware TC1 will be 80 (software TC2, TC3, and TC4 are mapped to hardware TC1).
- The higher user-configured value has precedence. For example, if the software TC2 default value is 96 (which is also the value of TC3 and 4), if you configure 100 for TC2 and 120 for TC3, then the hardware TC1 value will be 120 (software TC2, TC3, and TC4 are mapped to hardware TC1).

Displaying the user-configurable buffer profile configuration on FCX and ICX devices

To display the specified user-configurable buffer profile configuration, use the **show qd-buffer-profile <user-profile-name>** command.

To display all the user-configurable buffer profiles configured on the device, use the **show qd-buffer-profile active-profile** command.

To display all the buffer profiles configured on the device, use the **show qd-buffer-profile all** command.

The following example shows that the user-configurable buffer profile “OneGigProfile” is configured for 1 Gbps ports with the number of buffers and descriptors allocated to each queue. Note that buffers and descriptors displayed in this example are not necessarily default values.

```
Brocade(config)# show qd-buffer-profile OneGigProfile
User Buffer Profile: OneGigProfile      Port-type: 1Gig
Total Buffers = 8096      Total Descriptors = 8096
Per Queue details:      Buffers      Descriptors
Traffic Class 0          50          38
Traffic Class 1          50          38
Traffic Class 2          50          38
Traffic Class 3          50          38
Traffic Class 4          50          38
Traffic Class 5          50          38
Traffic Class 6          132         132
Traffic Class 7          20          20
```

Syntax: **show qd-buffer <user-profile-name> | all**

[Table 110](#) defines the fields in the output of the **show qd-buffer all** command.

TABLE 110 Field definitions for the output of show qd-buffer-profile command

Field	Description
User Buffer Profile	The name of the user-configurable buffer profile
Port-type	The type of the port: 1 Gbps or 10 Gbps or All
Total Buffers	The total number of buffers allocated to the port
Total Descriptors	The total number of descriptors allocated to the port

TABLE 110 Field definitions for the output of show qd-buffer-profile command

Field	Description
Per Queue details	The names of the queues
Buffers	The total number of buffers allocated to the queue
Descriptors	The total number of descriptors allocated to the queue

Configuring buffer sharing on FCX and ICX devices

Network congestion can be caused by various reasons such as port shaping, flow control received on the link due to congestion on the peer, or oversubscription of the egress line rate.

To support priority queuing, FCX and ICX devices support a configurable amount of guaranteed buffers and descriptors per (port, queue) pair. For information about guaranteed buffers and descriptors, refer to [“Configuring buffer profiles”](#) on page 590.

In addition, FCX and ICX devices support configurable shared buffer pools, which help absorb traffic bursts without packet loss. For a given (port, queue) pair, if its buffer usage exceeds the guaranteed limit, it will start using buffers in the sharing pool. The shared buffers are apportioned among the 1 Gbps, 10 Gbps, 16 Gbps, and stacking ports.

Buffer sharing is always enabled. You can configure buffer sharing by changing the buffer sharing level. To configure the buffer sharing level, enter a command similar to the following.

```
Brocade(config)# qd-share-level 2
```

Syntax: `qd-share-level <level>`

The `<level>` variable is the buffer sharing level, which is a decimal value. The range of valid values for FCX is from 1 to 8. The range of valid values for an ICX 6610 is from 2 through 8.

For descriptions of the buffer sharing levels for FCX devices, refer to [“FCX buffer sharing levels”](#) on page 600.

For descriptions of the buffer sharing levels for ICX 6610 devices, refer to [“ICX 6610 buffer sharing levels”](#) on page 600.

For descriptions of the buffer sharing levels for ICX 6430 and 6450 devices, refer to [“ICX 6430 and ICX 6450 buffer sharing levels”](#) on page 601.

FCX buffer sharing levels

The FCX buffer sharing level configures the shared buffers on the device. [Table 111](#) defines the FCX buffer sharing level settings. For information about configuring buffer sharing, refer to [“Configuring buffer sharing on FCX and ICX devices”](#) on page 599.

If you configure buffers at the port or queue level (using **qd** commands or buffer profiles), the buffer sharing level automatically changes to 1. You can change it manually.

TABLE 111 FCX buffer sharing level definitions

Buffer sharing level	Shared buffer limit (in buffers)	Shared buffer total (in kilobytes)
1	256	64
2	1024	250
3	1536	375
4	2048	500
5 (default)	2560	625
6	3072	750
7	3584	875
8	4096	1000

ICX 6610 buffer sharing levels

The ICX 6610 buffer sharing level configures the shared buffers on the device. The ICX 6610 shared buffers are divided into pools. Each of the following pools defines the buffer allocation for a set of traffic class (TC) queues:

- Pool 0 contains TCs 0 and 1.
- Pool 1 contains TCs 2, 3, and 4.
- Pool 2 contains TCs 5 and 6.
- Pool 3 contains TC 7.

For example, the buffers allocated to Pool 0 are shared between TCs 0 and 1. [Table 112](#) defines the ICX 6610 buffer sharing level settings. Note that only the values of Pool 0 change. For information about configuring buffer sharing, refer to [“Configuring buffer sharing on FCX and ICX devices”](#) on page 599.

TABLE 112 ICX 6610 buffer sharing level definitions

Buffer sharing level	Shared buffer limit				Shared buffer total (in kilobytes)	Pool 0 sharing buffers (in kilobytes)
	Pool 0 – TC 0, 1	Pool 1 – TC 2, 3, 4	Pool 2 – TC 5, 6	Pool 3 – TC 7		
1	Not supported					
2	128	128	192	192	250	64
3	256	128	192	192	375	125
4	512	128	192	192	500	250

TABLE 112 ICX 6610 buffer sharing level definitions (Continued)

Buffer sharing level	Shared buffer limit				Shared buffer total (in kilobytes)	Pool 0 sharing buffers (in kilobytes)
	Pool 0 – TC 0, 1	Pool 1 – TC 2, 3, 4	Pool 2 – TC 5, 6	Pool 3 – TC 7		
5 (default)	768	128	192	192	625	375
6	1024	128	192	192	750	500
7	1280	128	192	192	875	625
8	1536	128	192	192	1000	750

ICX 6430 and ICX 6450 buffer sharing levels

The ICX 6430 and 6450 buffer sharing level configures the shared buffers on the device.

[Table 111](#) defines the FCX buffer sharing level settings. For information about configuring buffer sharing, refer to “[Configuring buffer sharing on FCX and ICX devices](#)” on page 599.

If you configure buffers at the port or queue level (using **qd** commands or buffer profiles), the buffer sharing level automatically changes to 1. You can change it manually.

TABLE 113 ICX 6430 and ICX 6450 buffer sharing level definitions

Buffer sharing level	Shared buffer limit (in buffers)	Shared buffer total (in kilobytes)
1	256	64
2 (default)	1024	250
3	1536	375
4	2048	500
5	2560	625
6	3072	750
7	3584	875
8	4096	1000

Displaying buffer sharing information

To display information about buffer sharing, enter the **show qd-share-level** command. Following is an example for an FCX device.

```
Brocade# show qd-share-level
Sharing level: 1-64KB, 2-250KB, 3-375KB, 4-500KB, 5-625KB (default), 6-750KB,
7-875KB, 8-1000KB
Current qdsharing level 5
Device 0 Sharing buffers in use 0
Device 1 Sharing buffers in use 0
Device 1 Sharing buffers in use 0
Device 2 Sharing buffers in use 0
```

Following is an example for ICX 6610 devices.

```
ICX6610-48 Router# show qd-share-level
Sharing level: 1-64KB, 2-250KB, 3-375KB, 4-500KB, 5-625KB (default), 6-750KB,
7-875KB, 8-1000KB
Current qd sharing level 5
Sharing pools to Traffic Class (TC) map:
    Pool 0: TC 0,1  Pool 1: TC 2,3,4  Pool 2: TC 5,6  Pool 3: TC 7
Device 0 Sharing pool 0 buffers in use 0
Device 0 Sharing pool 1 buffers in use 0
Device 0 Sharing pool 2 buffers in use 0
Device 0 Sharing pool 3 buffers in use 0
Device 1 Sharing pool 0 buffers in use 0
Device 1 Sharing pool 1 buffers in use 0
Device 1 Sharing pool 2 buffers in use 0
Device 1 Sharing pool 3 buffers in use 0
Device 2 Sharing pool 0 buffers in use 0
Device 2 Sharing pool 1 buffers in use 0
Device 2 Sharing pool 2 buffers in use 0
Device 2 Sharing pool 3 buffers in use 0
```

Syntax: show qd-share-level

The command output displays the following information:

- Definitions of the buffer sharing levels
- The current buffer sharing level
- Mapping of traffic classes to sharing pools (ICX 6610 devices only)
- Buffer usage information

Removing buffer allocation limits on FCX, FWS, and ICX

You can remove buffer allocation limits on all ports and all traffic classes globally. This permits all available buffers in a port region to be used on a first-come, first-served basis by any of its ports, regardless of priority. This can be done using the following command.

```
Brocade(config)# buffer-sharing-full
```

Syntax: [no] buffer-sharing-full

The command overrides any existing configured queue depth limits and buffer allocation.

ATTENTION

Use the **buffer-sharing-full** command carefully. By entering this command, there is no limit to the number of buffers a port or a specific priority on a port can use. One port could potentially use up all the available buffers of its port region and cause starvation on other ports of the port region.

To prevent traffic loss during temporary network bursts, it is recommended that you use guaranteed (port, queue) buffers allocation or shared buffer allocation to adjust queue depth, rather than enabling the **buffer-sharing-full** command.

NOTE

The **buffer-sharing-full** command can create unpredictable behavior during traffic congestion or a blocking scenario, compromising network stability (by losing control packets), QoS, and stacking.

Buffer profiles for VoIP on FastIron stackable devices

NOTE

Configuring buffer profiles for VoIP traffic is not supported on FastIron X Series devices.

Default buffer settings are currently optimized for 1 GbE-to-1 GbE traffic. Configuring VoIP buffer profiles adds buffer profiles for 1 GbE-to-100 Mbit traffic, simplifying configuration and improving performance.

VoIP profiles allows you to configure a pre-defined set of buffers and descriptors for the priority 0 and 7. These profiles support VoIP traffic that uses priority 7, with 10 Mbps or 100 Mbps uplink ports and 1000 Mbps downlink ports.

NOTE

In previous software versions, you could manually configure buffers and descriptors using **qd** commands. Buffer profiles for VoIP cannot coexist with **qd** commands. You may use buffer profiles for VoIP or **qd** command, but not both at the same time.

Configuring buffer profiles for VoIP

To configure predefined buffers, enter a command similar to the following.

```
Brocade#buffer-profile port-region 0 voip downlink 100 uplink 1000
```

Syntax: [no] buffer-profile port-region <num> voip downlink 100 uplink 1000

NOTE

The port-region num can be either 0 (ports 0/1/1 to 0/1/24) or 1 (ports 0/1/25 to 0/1/48).

NOTE

Only FGS and FLS models support the **buffer-profile port-region <num> voip downlink 100 uplink 1000** command. FCX and ICX models do support this command.

Deleting buffer profiles for VoIP

To delete an existing buffer profile configuration, use the no form of the command.

```
Brocade#no buffer-profile port-region 0 voip downlink 100 uplink 1000
```

Syntax: [no] buffer-profile port-region <num> voip downlink 100 uplink 1000

Remote Fault Notification on 1Gbps fiber connections

NOTE

Remote fault notification (RFN) is only available for 1 Gbps Ethernet Fiber ports. It is not available for 10/100 ports and Gbps Ethernet Copper ports. This feature is not available on ICX 6430 and ICX 6450 devices.

For fiber-optic connections, you can optionally configure a transmit port to notify the receive port on the remote device whenever the transmit port becomes disabled.

When you enable this feature, the transmit port notifies the remote port whenever the fiber cable is either physically disconnected or has failed. When this occurs and the feature is enabled, the device disables the link and turns OFF both LEDs associated with the ports.

By default, RFN is enabled.

You can configure RFN as follows:

- Globally, on the entire device
- On a trunk group
- On an individual interface

Enabling and disabling remote fault notification

RFN is ON by default. To disable RFN, use the following command.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#gig-default neg-off
```

To re-enable RFN, use the following command.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#gig-default auto-gig
```

Syntax: `gig-default neg-off | auto-gig`

For more information about the parameters supported with the **gig-default** command, see [“Changing the Gbps fiber negotiation mode”](#) on page 59.

Link Fault Signaling for 10Gbps Ethernet devices

Link Fault Signaling (LFS) is a physical layer protocol that enables communication on a link between two 10 Gbps Ethernet devices. When configured on a Brocade 10 Gbps Ethernet port, the port can detect and report fault conditions on transmit and receive ports. Brocade recommends enabling LFS on both ends of a link.

LFS is disabled by default on all Brocade FastIron devices.

NOTE

Enable LFS on any device prior to connecting that device with FastIron platforms. FastIron platforms have LFS enabled by default and it cannot be disabled; any connecting device must have LFS currently enabled to ensure interoperability.

When LFS is enabled on an interface, the following Syslog messages are generated when the link goes up or down, or when the TX or RX fiber is removed from one or both sides of the link that has LFS enabled.

```
Interface ethernet1/1, state down - link down
Interface ethernet1/1, state up
```

When a link fault occurs, the Link and Activity LEDs turn OFF.

The Link and Activity LEDs turn ON when there is traffic traversing the link after the fiber is installed.

Enabling Link Fault Signaling

To enable Link Fault Signaling (LFS) between two 10 Gbps Ethernet devices, enter commands such as the following on both ends of the link.

```
Brocade(config)#interface e 1/1
Brocade(config-if-e1000-1/1)#link-fault-signal
```

Syntax: [no] link-fault-signal

Use the **no** form of the command to disable LFS.

LFS is OFF by default.

Viewing the status of LFS-enabled links

The status of an LFS-enabled link is shown in the output of the **show interface** and **show interface brief** commands, as shown in the following examples.

```
Brocade#show interface e 10/1
10GigabitEthernet10/1 is down (remote fault), line protocol is down
  Hardware is 10GigabitEthernet, address is 0012.f227.79d8 (bia 0012.f227.79d8)
  Configured speed 10Gbit, actual unknown, configured duplex fdx, actual unknown
  Member of L2 VLAN ID 1, port is untagged, port state is BLOCKING
  BPDU guard is Disabled, ROOT protect is Disabled
  Link Fault Signaling is Enabled, Link Error Dampening is Disabled
  STP configured to ON, priority is level0
  Flow Control is disabled
  mirror disabled, monitor disabled

some lines omitted for brevity...
```

The bold text in the above output shows that the LFS-enabled link (port 10/1) is down because of an error on the remote port, as indicated by **remote fault**.

Syntax: show interface ethernet <port>

Specify the *port* variable in one of the following formats:

- FSX, FSX 800, and FSX 1600 chassis devices – *slotnum/portnum*
- FESX compact switches – *portnum*

```
Brocade#show interfaces brief
Port  Link      State  Dupl  Speed  Trunk  Tag  Pvid  Pri  MAC              Name
10/1  Err-LFS  None   None   None   None   No   1     0   0012.f227.79d8
```

The bold text in the above output indicates that there is an error on the LFS-enabled link on port 10/1 and the link is down.

Syntax: show interfaces brief

Jumbo frame support

Ethernet traffic moves in units called frames. The maximum size of frames is called the Maximum Transmission Unit (MTU). When a network device receives a frame larger than its MTU, the data is either fragmented or dropped. Historically, Ethernet has a maximum frame size of 1500 bytes, so most devices use 1500 as their default MTU.

Jumbo frames are Ethernet frames with more than 1,500 bytes MTU. Conventionally, jumbo frames can carry up to 9,000 bytes MTU. Brocade FastIron devices support Layer 2 jumbo frames on 10/100, 100/100/1000, and 10GbE ports.

Metro Features

Table 114 lists the individual Brocade FastIron switches and the metro features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 114 Supported metro features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Topology groups	Yes	Yes	Yes	Yes	Yes
Metro Ring Protocol 1 (MRP 1)	Yes	Yes	Yes	Yes	Yes
Metro Ring Protocol 2 (MRP 2)	Yes	Yes	Yes	Yes	Yes
Extended MRP ring IDs from 1 – 1023	Yes	No	Yes	Yes	Yes
Virtual Switch Redundancy Protocol (VSRP)	Yes	Yes	Yes	Yes	Yes
VSRP-Aware security features	Yes	Yes	Yes	Yes	Yes
VSRP and MRP signaling	Yes	Yes	Yes	Yes	Yes
VSRP Fast Start	Yes	Yes	Yes	Yes	Yes
VSRP timer scaling	Yes	Yes	Yes	Yes	Yes

Topology groups

A topology group is a named set of VLANs that share a Layer 2 topology. Topology groups simplify configuration and enhance scalability of Layer 2 protocols by allowing you to run a single instance of a Layer 2 protocol on multiple VLANs.

You can use topology groups with the following Layer 2 protocols:

- STP
- MRP
- VSRP
- 802.1W

Topology groups simplify Layer 2 configuration and provide scalability by enabling you to use the same instance of a Layer 2 protocol for multiple VLANs. For example, if a Brocade device is deployed in a Metro network and provides forwarding for two MRP rings that each contain 128 VLANs, you can configure a topology group for each ring. If a link failure in a ring causes a topology change, the change is applied to all the VLANs in the ring topology group. Without topology groups, you would need to configure a separate ring for each VLAN.

Master VLAN and member VLANs

Each topology group contains a master VLAN and can contain one or more member VLANs and VLAN groups:

- **Master VLAN** – The master VLAN contains the configuration information for the Layer 2 protocol. For example, if you plan to use the topology group for MRP, the topology group master VLAN contains the ring configuration information.
- **Member VLANs** – The member VLANs are additional VLANs that share ports with the master VLAN. The Layer 2 protocol settings for the ports in the master VLAN apply to the same ports in the member VLANs. A change to the master VLAN Layer 2 protocol configuration or Layer 2 topology affects all the member VLANs. Member VLANs do not independently run a Layer 2 protocol.
- **Member VLAN groups** – A VLAN group is a named set of VLANs. The VLANs within a VLAN group have the same ports and use the same values for other VLAN parameters.

When a Layer 2 topology change occurs on a port in the master VLAN, the same change is applied to that port in all the member VLANs that contain the port. For example, if you configure a topology group whose master VLAN contains ports 1/1 and 1/2, a Layer 2 state change on port 1/1 applies to port 1/1 in all the member VLANs that contain that port. However, the state change does not affect port 1/1 in VLANs that are not members of the topology group.

Control ports and free ports

A port that is in a topology group can be a control port or a free port:

- **Control port** – A control port is a port in the master VLAN, and is therefore controlled by the Layer 2 protocol configured in the master VLAN. The same port in all the member VLANs is controlled by the master VLAN Layer 2 protocol. Each member VLAN must contain all of the control ports and can contain additional ports.
- **Free port** – A free port is not controlled by the master VLAN Layer 2 protocol. The master VLAN can contain free ports. (In this case, the Layer 2 protocol is disabled on those ports.) In addition, any ports in the member VLANs that are not also in the master VLAN are free ports.

NOTE

Since free ports are not controlled by the master port Layer 2 protocol, they are assumed to always be in the Forwarding state.

Topology group configuration considerations

- You must configure the master VLAN and member VLANs or member VLAN groups before you configure the topology group.
- You can configure up to 256 topology groups. Each group can control up to 4096 VLANs. A VLAN cannot be controlled by more than one topology group.
- The topology group must contain a master VLAN and can also contain individual member VLANs, VLAN groups, or a combination of individual member VLANs and VLAN groups.
- If you add a new master VLAN to a topology group that already has a master VLAN, the new master VLAN replaces the older master VLAN. All member VLANs and VLAN groups follow the Layer 2 protocol settings of the new master VLAN.

- If you remove the master VLAN (by entering **no master-vlan <vlan-id>**), the software selects the new master VLAN from member VLANs. A new candidate master VLAN will be in configured order to a member VLAN so that the first added member VLAN will be a new candidate master VLAN. Once you save and reload, a member-vlan with the youngest VLAN ID will be the new candidate master. The new master VLAN inherits the Layer 2 protocol settings of the older master VLAN.
- Once you add a VLAN as a member of a topology group, all the Layer 2 protocol information on the VLAN is deleted.

Configuring a topology group

To configure a topology group, enter commands such as the following.

```
Brocade(config)#topology-group 2
Brocade(config-topo-group-2)#master-vlan 2
Brocade(config-topo-group-2)#member-vlan 3
Brocade(config-topo-group-2)#member-vlan 4
Brocade(config-topo-group-2)#member-vlan 5
Brocade(config-topo-group-2)#member-group 2
```

These commands create topology group 2 and add the following:

- Master VLAN 2
- Member VLANs 2, 3, and 4
- Member VLAN group 2

Syntax: **[no] topology-group <group-id>**

The **<group-id>** parameter specifies the topology group ID and can be from 1 – 256.

Syntax: **[no] master-vlan <vlan-id>**

This command adds the master VLAN. The VLAN must already be configured. Make sure all the Layer 2 protocol settings in the VLAN are correct for your configuration before you add the VLAN to the topology group. A topology group can have only one master VLAN.

NOTE

If you remove the master VLAN (by entering **no master-vlan <vlan-id>**), the software selects the new master VLAN from member VLANs. For example, if you remove master VLAN 2 from the example above, the CLI converts member VLAN 3 into the new master VLAN. The new master VLAN inherits the Layer 2 protocol settings of the older master VLAN.

NOTE

If you add a new master VLAN to a topology group that already has a master VLAN, the new master VLAN replaces the older master VLAN. All member VLANs and VLAN groups follow the Layer 2 protocol settings of the new master VLAN.

Syntax: **[no] member-vlan <vlan-id>**

The **<vlan-id>** parameter specifies a VLAN ID. The VLAN must already be configured.

Syntax: **[no] member-group <num>**

The **<num>** specifies a VLAN group ID. The VLAN group must already be configured.

NOTE

Once you add a VLAN or VLAN group as a member of a topology group, all the Layer 2 protocol configuration information for the VLAN or group is deleted. For example, if STP is configured on a VLAN and you add the VLAN to a topology group, the STP configuration is removed from the VLAN. Once you add the VLAN to a topology group, the VLAN uses the Layer 2 protocol settings of the master VLAN.

If you remove a member VLAN or VLAN group from a topology group, you will need to reconfigure the Layer 2 protocol information in the VLAN or VLAN group.

Displaying topology group information

The following sections show how to display STP information and topology group information for VLANs.

Displaying STP information

To display STP information for a VLAN, enter a command such as the following.

```
Brocade#show span vlan 4
VLAN 4 BPDU cam_index is 14344 and the Master DMA Are(HEX) 18 1A
STP instance owned by VLAN 2
```

This example shows STP information for VLAN 4. The line shown in bold type indicates that the VLAN STP configuration is controlled by VLAN 2. This information indicates that VLAN 4 is a member of a topology group and VLAN 2 is the master VLAN in that topology group.

Displaying topology group information

To display topology group information, enter the following command.

```
Brocade#show topology-group

Topology Group 3
=====
master-vlan 2
member-vlan none

Common control ports          L2 protocol
ethernet 1/1                  MRP
ethernet 1/2                  MRP
ethernet 1/5                  VSRP
ethernet 2/22                 VSRP
Per vlan free ports
ethernet 2/3                  Vlan 2
ethernet 2/4                  Vlan 2
ethernet 2/11                 Vlan 2
ethernet 2/12                 Vlan 2
```

Syntax: show topology-group [<group-id>]

This display shows the following information.

TABLE 115 CLI display of topology group information

Field	Description
master-vlan	The master VLAN for the topology group. The settings for STP, MRP, or VSRP on the control ports in the master VLAN apply to all control ports in the member VLANs within the topology group.
member-vlan	The member VLANs in the topology group.
Common control ports	The master VLAN ports that are configured with Layer 2 protocol information. The Layer 2 protocol configuration and state of these ports in the master VLAN applies to the same port numbers in all the member VLANs.
L2 protocol	The Layer 2 protocol configured on the control ports. The Layer 2 protocol can be one of the following: <ul style="list-style-type: none"> • MRP • STP • VSRP
Per vlan free ports	The ports that are not controlled by the Layer 2 protocol information in the master VLAN.

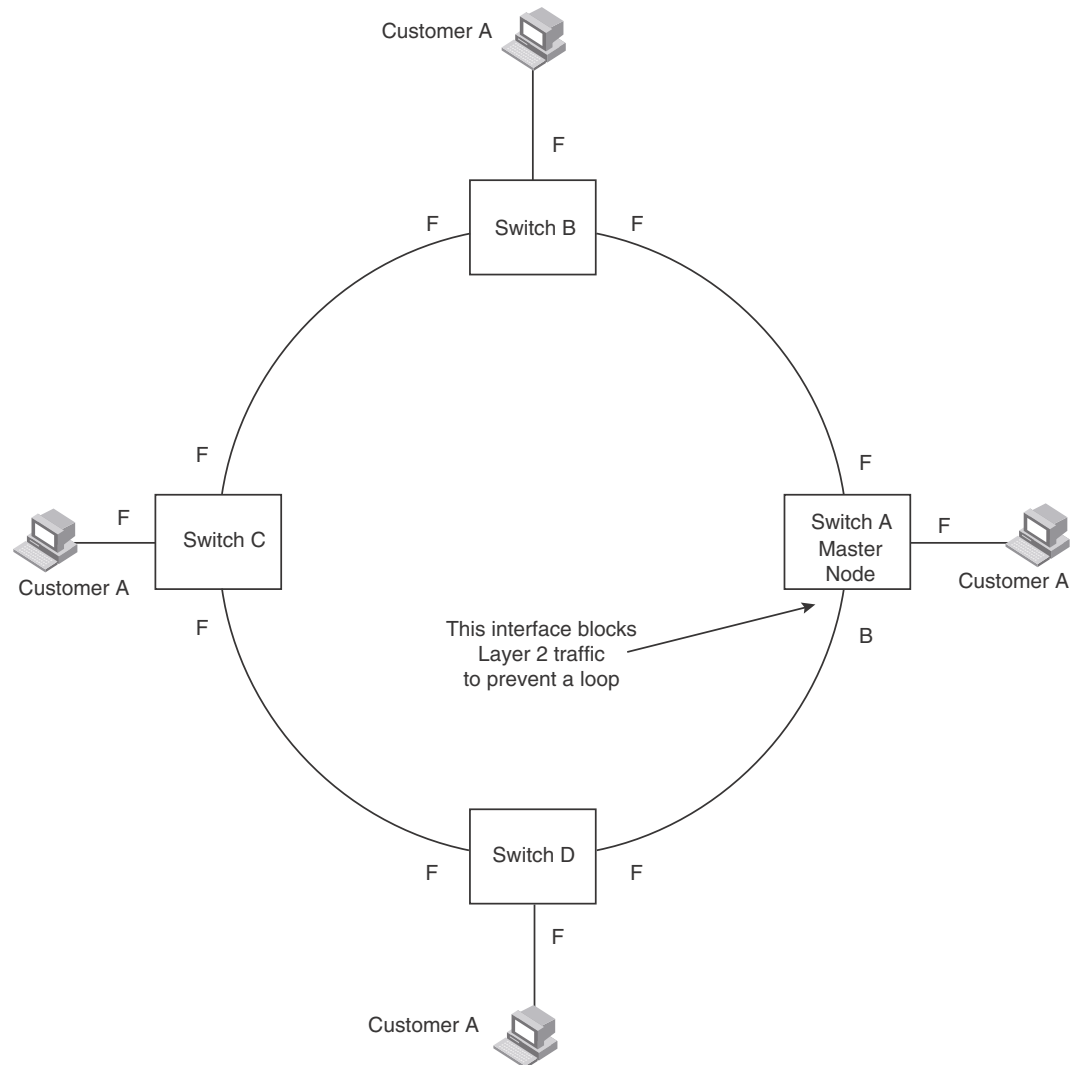

Metro Ring Protocol

Metro Ring Protocol (MRP) is a Brocade proprietary protocol that prevents Layer 2 loops and provides fast reconvergence in Layer 2 ring topologies. It is an alternative to STP and is especially useful in Metropolitan Area Networks (MANs) where using STP has the following drawbacks:

- STP allows a maximum of seven nodes. Metro rings can easily contain more nodes than this.
- STP has a slow reconvergence time, taking many seconds or even minutes. MRP can detect and heal a break in the ring in sub-second time.

Figure 40 shows an example of an MRP metro ring.

FIGURE 40 Metro ring – normal state

The ring in this example consists of four MRP nodes (Brocade switches). Each node has two interfaces with the ring. Each node also is connected to a separate customer network. The nodes forward Layer 2 traffic to and from the customer networks through the ring. The ring interfaces are all in one port-based VLAN. Each customer interface can be in the same VLAN as the ring or in a separate VLAN.

One node is configured as the master node of the MRP ring. One of the two interfaces on the master node is configured as the primary interface; the other is the secondary interface. The primary interface originates Ring Health Packets (RHPs), which are used to monitor the health of the ring. An RHP is forwarded on the ring to the next interface until it reaches the secondary interface of the master node. The secondary interface blocks the packet to prevent a Layer 2 loops.

Metro Ring Protocol configuration notes

- When you configure Metro Ring Protocol (MRP), Brocade recommends that you disable one of the ring interfaces before beginning the ring configuration. Disabling an interface prevents a Layer 2 loop from occurring while you are configuring MRP on the ring nodes. Once MRP is configured and enabled on all the nodes, you can re-enable the interface.
- The above configurations can be configured as MRP masters or MRP members (for different rings).
- Brocade does not recommend configuring more than 15 MRP instances on FCX devices. Also, due to hardware limitations on this platforms, configuring 40 or more MRP instances may cause errors.
- If you configure MRP on a device running Layer 3 software, then restart the device running Layer 2 software, the MRP configuration gets deleted.

MRP rings without shared interfaces (MRP Phase 1)

MRP Phase 1 allows you to configure multiple MRP rings, as shown in [Figure 41](#), but the rings cannot share the same link. For example, you cannot configure ring 1 and ring 2 to each have interfaces 1/1 and 1/2.

Also, when you configure an MRP ring, any node on the ring can be designated as the master node for the ring. A master node can be the master node of more than one ring. (Refer to [Figure 41](#).) Each ring is an independent ring and RHP packets are processed within each ring.

FIGURE 41 Metro ring – multiple rings

In this example, two nodes are each configured with two MRP rings. Any node in a ring can be the master for its ring. A node also can be the master for more than one ring.

MRP rings with shared interfaces (MRP Phase 2)

With MRP Phase 2, MRP rings can be configured to share the same interfaces as long as the interfaces belong to the same VLAN. [Figure 42](#) shows examples of multiple MRP rings that share the same interface.

FIGURE 42 Examples of multiple rings sharing the same interface - MRP Phase 2

Example 1

Example 2

On each node that will participate in the ring, you specify the ring ID and the interfaces that will be used for ring traffic. In a multiple ring configuration, a ring ID determines its priority. The lower the ring ID, the higher the priority of a ring.

A ring ID is also used to identify the interfaces that belong to a ring.

FIGURE 43 Interface IDs and types

For example, in [Figure 43](#), the ID of all interfaces on all nodes on Ring 1 is 1 and all interfaces on all nodes on Ring 2 is 2. Port 1/1 on node S1 and Port 2/2 on S2 have the IDs of 1 and 2 since the interfaces are shared by Rings 1 and 2.

The ring ID is also used to determine an interface priority. Generally, a ring ID is also the ring priority and the priority of all interfaces on that ring. However, if the interface is shared by two or more rings, then the highest priority (lowest ID) becomes the priority of the interface. For example, in [Figure 43](#), all interfaces on Ring 1, except for Port 1/1 on node S1 and Port 2/2 on node S2 have a priority of 1. Likewise, all interfaces on Ring 2, except for Port 1/1 on node S1 and Port 2/2 on node S2 have a priority of 2. Port 1/1 on S1 and Port 2/2 on S2 have a priority of 1 since 1 is the highest priority (lowest ID) of the rings that share the interface.

If a node has interfaces that have different IDs, the interfaces that belong to the ring with the highest priority become regular ports. Those interfaces that do not belong to the ring with the highest priority become tunnel ports. In [Figure 43](#), nodes S1 and S2 have interfaces that belong to Rings 1 and 2. Those interfaces with a priority of 1 are regular ports. The interfaces with a priority of 2 are the tunnel ports since they belong to Ring 2, which has a lower priority than Ring 1.

Selection of master node

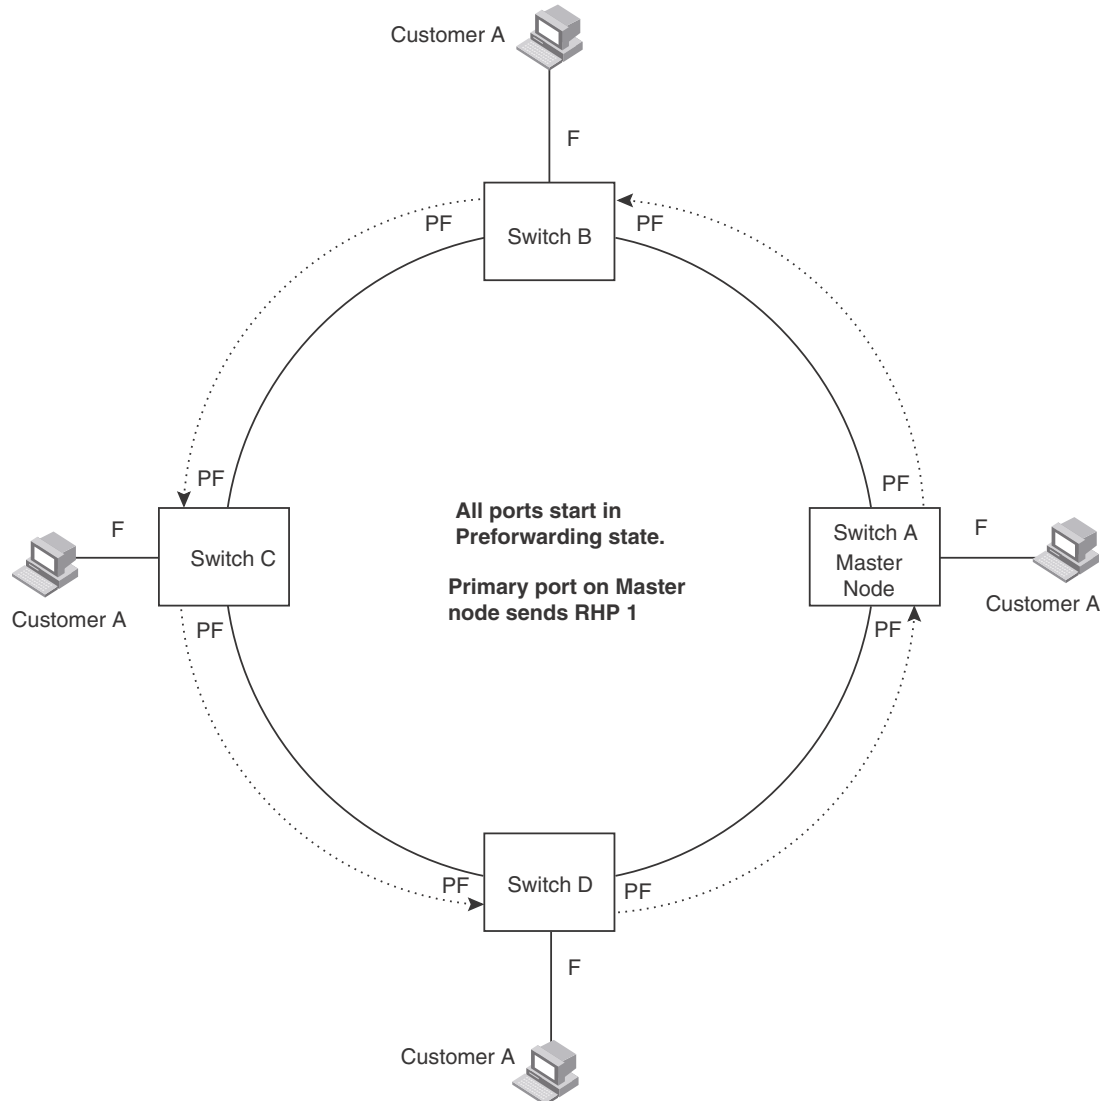

Allowing MRP rings to share interfaces limits the nodes that can be designated as the master node. Any node on an MRP ring that does not have a shared interface can be designated as the ring master node. However, if all nodes on the ring have shared interfaces, nodes that do not have tunnel ports can be designated as the master node of that ring. If none of the nodes meet these criteria, you must change the rings' priorities by reconfiguring the rings' ID.

In [Figure 43](#), any of the nodes on Ring 1, even S1 or S2, can be a master node since none of its interfaces are tunnel ports. However in Ring 2, neither S1 nor S2 can be a master node since these nodes contain tunnel ports.

Ring initialization

The ring shown in [Figure 40](#) shows the port states in a fully initialized ring without any broken links. [Figure 44](#) shows the initial state of the ring, when MRP is first enabled on the ring switches. All ring interfaces on the master node and member nodes begin in the Preforwarding state (PF).

FIGURE 44 Metro ring – initial state

MRP uses Ring Health Packets (RHPs) to monitor the health of the ring. An RHP is an MRP protocol packet. The source address is the MAC address of the master node and the destination MAC address is a protocol address for MRP. The Master node generates RHPs and sends them on the ring. The state of a ring port depends on the RHPs.

RHP processing in MRP Phase 1

A ring interface can have one of the following MRP states:

- **Preforwarding (PF)** – The interface can forward RHPs but cannot forward data. All ring ports begin in this state when you enable MRP.

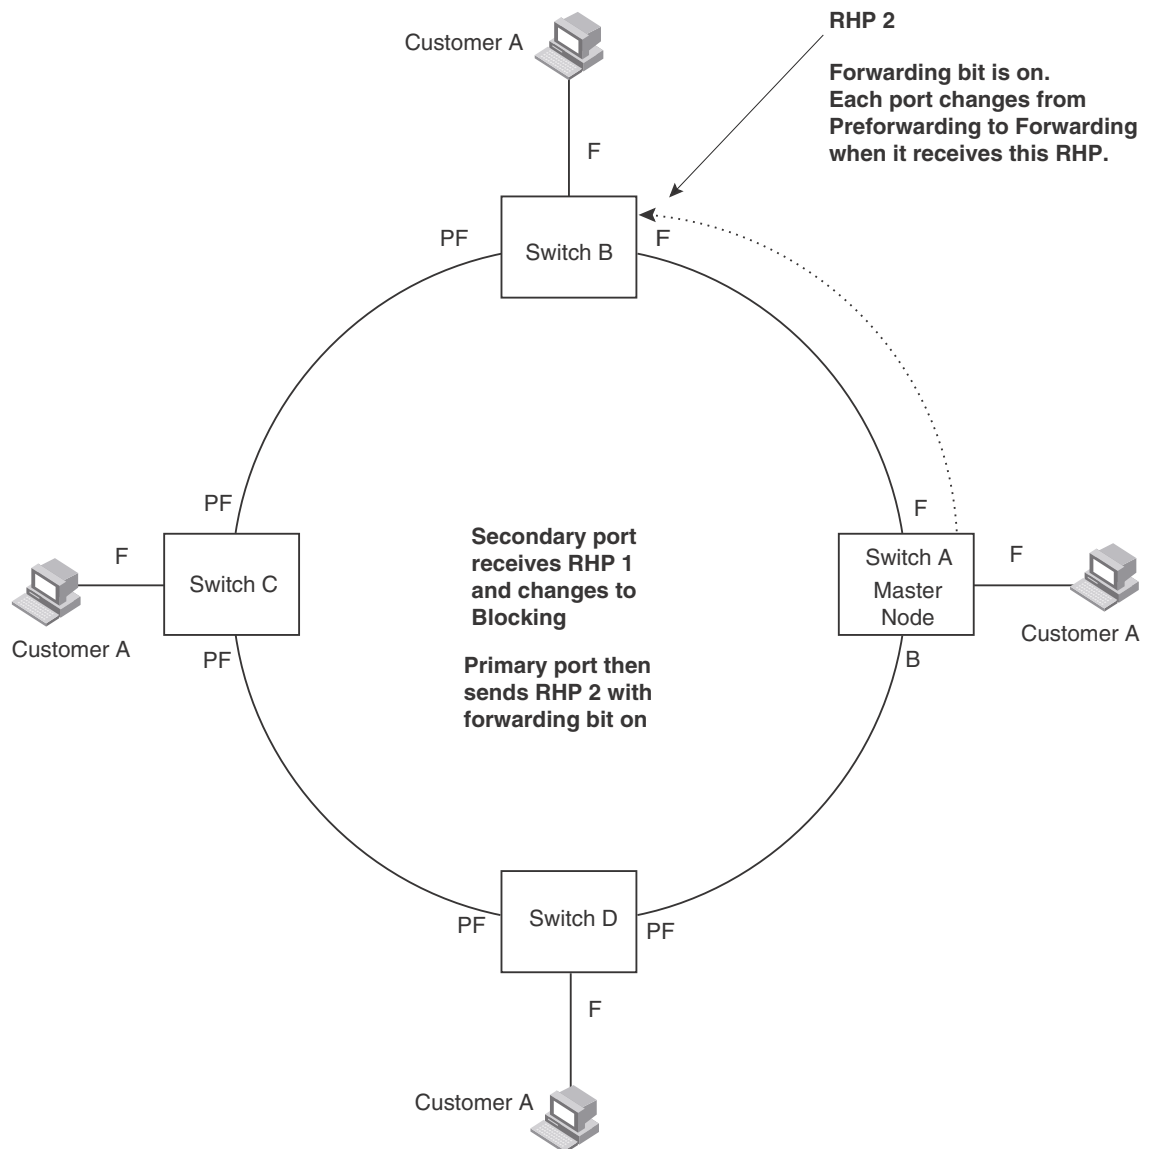

- **Forwarding (F)** – The interface can forward data as well as RHPs. An interface changes from Preforwarding to Forwarding when the port preforwarding time expires. This occurs if the port does not receive an RHP from the Master, or if the forwarding bit in the RHPs received by the port is off. This indicates a break in the ring. The port heals the ring by changing its state to Forwarding. The preforwarding time is the number of milliseconds the port will remain in the Preforwarding state before changing to the Forwarding state, even without receiving an RHP.
- **Blocking (B)** – The interface cannot forward data. Only the secondary interface on the Master node can be Blocking.

When MRP is enabled, all ports begin in the Preforwarding state. The primary interface on the Master node, although it is in the Preforwarding state like the other ports, immediately sends an RHP onto the ring. The secondary port on the Master node listens for the RHP.

- If the secondary port receives the RHP, all links in the ring are up and the port changes its state to Blocking. The primary port then sends another MRP with its forwarding bit set on. As each of the member ports receives the RHP, the ports change their state to Forwarding. Typically, this occurs in sub-second time. The ring very quickly enters the fully initialized state.
- If the secondary port does not receive the RHP by the time the preforwarding time expires, a break has occurred in the ring. The port changes its state to Forwarding. The member ports also change their states from Preforwarding to Forwarding as their preforwarding timers expire. The ring is not intact, but data can still travel among the nodes using the links that are up.

Figure 45 shows an example.

FIGURE 45 Metro ring – from preforwarding to forwarding

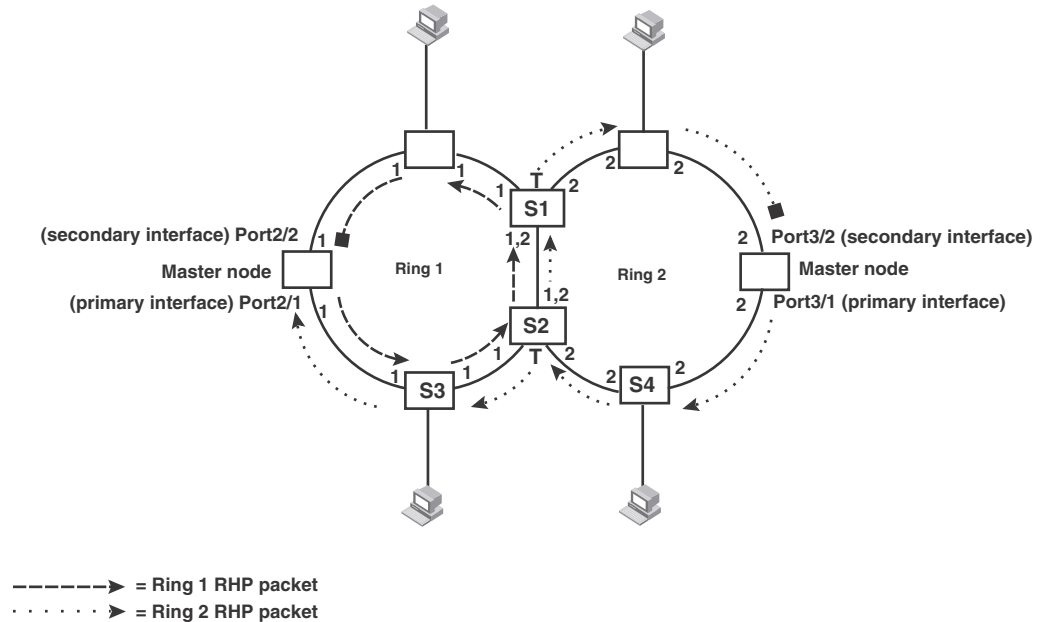

Each RHP also has a sequence number. MRP can use the sequence number to determine the round-trip time for RHPs in the ring. Refer to [“Metro Ring Protocol diagnostics”](#) on page 628.

RHP processing in MRP Phase 2

[Figure 46](#) shows an example of how RHP packets are processed normally in MRP rings with shared interfaces.

FIGURE 46 Flow of RHP packets on MRP rings with shared interfaces

Port 2/1 on Ring 1 master node is the primary interface of the master node. The primary interface forwards an RHP packet on the ring. Since all the interfaces on Ring 1 are regular ports, the RHP packet is forwarded to all the interfaces until it reaches Port 2/2, the secondary interface of the master node. Port 2/2 then blocks the packet to complete the process.

On Ring 2, Port 3/1, is the primary interface of the master node. It sends an RHP packet on the ring. Since all ports on S4 are regular ports, the RHP packet is forwarded on those interfaces. When the packet reaches S2, the receiving interface is a tunnel port. The port compares the packet priority to its priority. Since the packet priority is the same as the tunnel port priority, the packet is forwarded up the link shared by Rings 1 and 2.

When the RHP packet reaches the interface on node S2 shared by Rings 1 and 2, the packet is forwarded since its priority is less than the interface priority. The packet continues to be forwarded to node S1 until it reaches the tunnel port on S1. That tunnel port determines that the RHP packet priority is equal to the port priority and forwards the packet. The RHP packet is forwarded to the remaining interfaces on Ring 2 until it reaches port 3/2, the secondary interface of the master node. Port 3/2 then blocks the packet to prevent a loop.

When the RHP packet from Ring 2 reached S2, it was also forwarded from S2 to S3 on Ring 1 since the port on S2 has a higher priority than the RHP packet. The packets is forwarded around Ring 1 until it reaches port 2/2, Ring 1 the secondary port. The RHP packet is then blocked by that port.

How ring breaks are detected and healed

Figure 47 shows ring interface states following a link break. MRP quickly heals the ring and preserves connectivity among the customer networks.

FIGURE 47 Metro ring – ring break

If a break in the ring occurs, MRP heals the ring by changing the states of some of the ring interfaces:

- **Blocking interface** – The Blocking interface on the Master node has a dead timer. If the dead time expires before the interface receives one of its ring RHPs, the interface changes state to Preforwarding. Once the secondary interface changes state to Preforwarding:
 - If the interface receives an RHP, the interface changes back to the Blocking state and resets the dead timer.
 - If the interface does not receive an RHP for its ring before the Preforwarding time expires, the interface changes to the Forwarding state, as shown in [Figure 47](#).
- **Forwarding interfaces** – Each member interface remains in the Forwarding state.

When the broken link is repaired, the link interfaces come up in the Preforwarding state, which allows RHPs to travel through the restored interfaces and reach the secondary interface on the Master node:

- If an RHP reaches the Master node secondary interface, the ring is intact. The secondary interface changes to Blocking. The Master node sets the forwarding bit on in the next RHP. When the restored interfaces receive this RHP, they immediately change state to Forwarding.
- If an RHP does not reach the Master node secondary interface, the ring is still broken. The Master node does not send an RHP with the forwarding bit on. In this case, the restored interfaces remain in the Preforwarding state until the preforwarding timer expires, then change to the Forwarding state.

If the link between **shared interfaces** breaks ([Figure 48](#)), the secondary interface on Ring 1 master node changes to a preforwarding state. The RHP packet sent by port 3/1 on Ring 2 is forwarded through the interfaces on S4, then to S2. The packet is then forwarded through S2 to S3, but not from S2 to S1 since the link between the two nodes is not available. When the packet reaches Ring 1 master node, the packet is forwarded through the secondary interface since it is currently in a preforwarding state. A secondary interface in preforwarding mode ignores any RHP packet that is not from its ring. The secondary interface changes to blocking mode only when the RHP packet forwarded by its primary interface is returned.

The packet then continues around Ring 1, through the interfaces on S1 to Ring 2 until it reaches Ring 2 master node. Port 3/2, the secondary interface on Ring 2 changes to blocking mode since it received its own packet, then blocks the packet to prevent a loop.

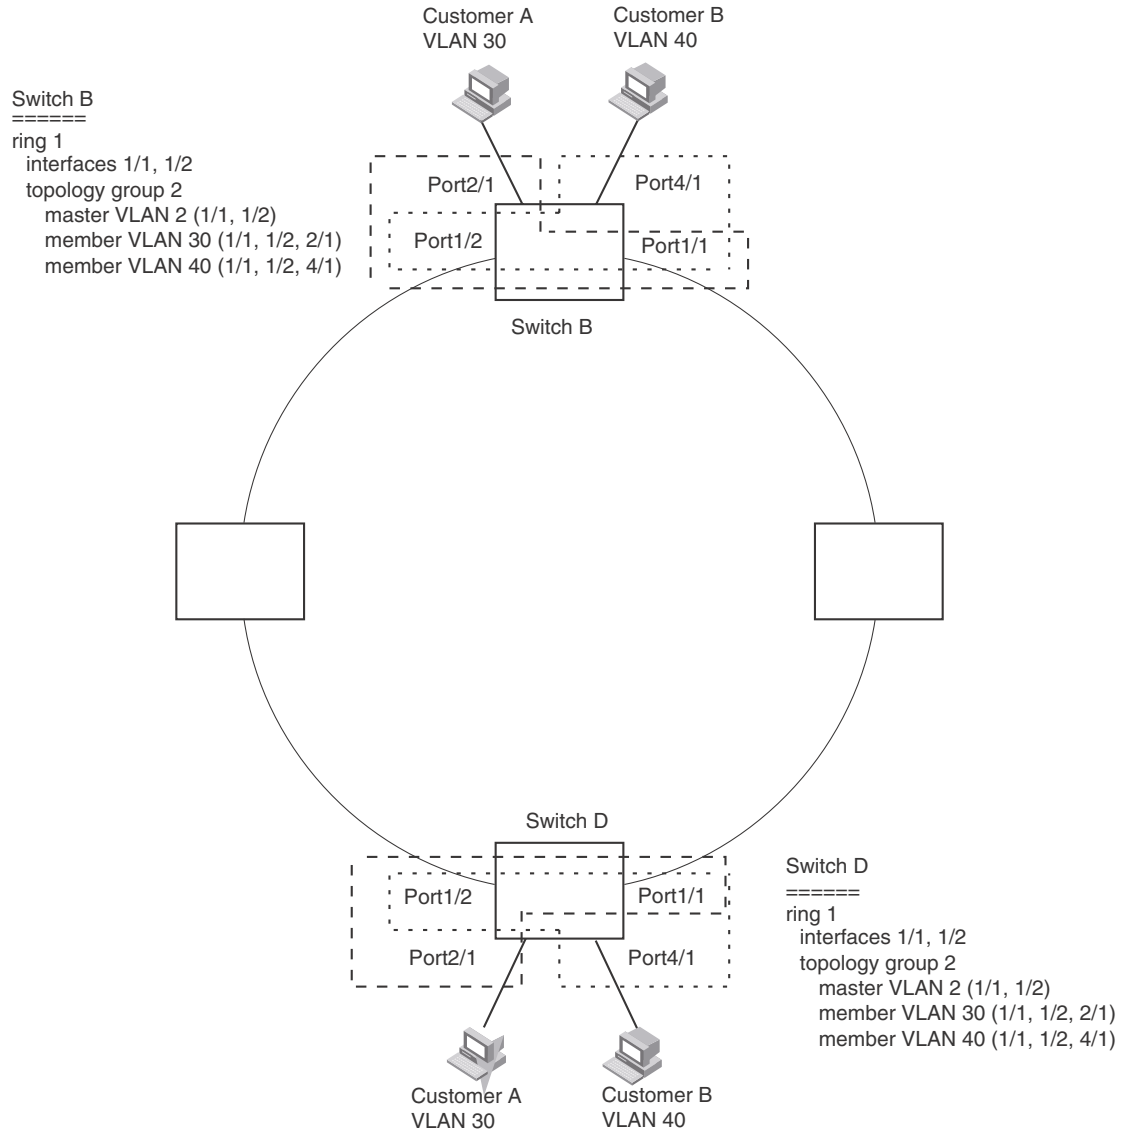

FIGURE 48 Flow of RHP packets when a link for shared interfaces breaks

RHP packets follow this flow until the link is restored; then the RHP packet returns to its normal flow as shown in [Figure 46](#).

Master VLANs and customer VLANs

All the ring ports must be in the same VLAN. Placing the ring ports in the same VLAN provides Layer 2 connectivity for a given customer across the ring. [Figure 49](#) shows an example.

FIGURE 49 Metro ring – ring VLAN and customer VLANs

Notice that each customer has their own VLAN. Customer A has VLAN 30 and Customer B has VLAN 40. Customer A host attached to Switch D can reach the Customer A host attached to Switch B at Layer 2 through the ring. Since Customer A and Customer B are on different VLANs, they will not receive each other traffic.

You can configure MRP separately on each customer VLAN. However, this is impractical if you have many customers. To simplify configuration when you have a lot of customers (and therefore a lot of VLANs), you can use a topology group.

A topology group enables you to control forwarding in multiple VLANs using a single instance of a Layer 2 protocol such as MRP. A topology group contains a master VLAN and member VLANs. The master VLAN contains all the configuration parameters for the Layer 2 protocol (STP, MRP, or VSRP). The member VLANs use the Layer 2 configuration of the master VLAN.

In [Figure 49](#), VLAN 2 is the master VLAN and contains the MRP configuration parameters for ring 1. VLAN 30 and VLAN 40, the customer VLANs, are member VLANs in the topology group. Since a topology group is used, a single instance of MRP provides redundancy and loop prevention for both the customer VLANs.

If you use a topology group:

- The master VLAN must contain the ring interfaces. The ports must be tagged, since they will be shared by multiple VLANs.
- The member VLAN for a customer must contain the two ring interfaces and the interfaces for the customer. Since these interfaces are shared with the master VLAN, they must be tagged. Do not add another customer interfaces to the VLAN.

For more information about topology groups, refer to [“Topology groups”](#) on page 607.

Refer to [“MRP CLI example”](#) on page 631 for the configuration commands required to implement the MRP configuration shown in [Figure 49](#).

Metro Ring Protocol configuration

To configure Metro Ring Protocol (MRP), perform the following tasks. You need to perform the first task on only one of the nodes. Perform the remaining tasks on all the nodes.

NOTE

There are no new commands or parameters to configure MRP with shared interfaces (MRP Phase 2).

- Disable one of the ring interfaces. This prevents a Layer 2 loop from occurring while you are configuring the devices for MRP.
- Add an MRP ring to a port-based VLAN. When you add a ring, the CLI changes to the configuration level for the ring, where you can perform the following tasks.
 - Optionally, specify a name for the ring.
 - On the master node only, enable the device to be the master for the ring. Each ring can have only one master node.
 - Specify the MRP interfaces. Each device has two interfaces to an MRP ring.
 - Optionally, change the hello time and the preforwarding time. These parameters control how quickly failover occurs following a change in the state of a link in the ring.
 - Enable the ring.
- Optionally, add the ring VLAN to a topology group to add more VLANs to the ring. If you use a topology group, make sure you configure MRP on the group master VLAN. Refer to [“Topology groups”](#) on page 607.
- Re-enable the interface you disabled to prevent a Layer 2 loop. Once MRP is enabled, MRP will prevent the Layer 2 loop.
- On FCX devices, when configuring MRP-1 or MRP-2 rings on a VLAN, using the **metro-rings** command in addition to the **metro-ring** command is highly recommended. Since these devices do not support mac-range filtering, the **metro-rings** command greatly reduces the number of FDB entries.

Adding an MRP ring to a VLAN

To add an MRP ring to a VLAN, enter commands such as the following.

NOTE

If you plan to use a topology group to add VLANs to the ring, make sure you configure MRP on the topology group master VLAN.

```
Brocade(config)#vlan 2
Brocade(config-vlan-2)#metro-ring 1
Brocade(config-vlan-2-mrp-1)#name CustomerA
Brocade(config-vlan-2-mrp-1)#master
Brocade(config-vlan-2-mrp-1)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-1)#enable
```

These commands configure an MRP ring on VLAN 2. The ring ID is 1, the ring name is CustomerA, and this node (this Brocade device) is the master for the ring. The ring interfaces are 1/1 and 1/2. Interface 1/1 is the primary interface and 1/2 is the secondary interface. The primary interface will initiate RHPs by default. The ring takes effect in VLAN 2.

```
Brocade(config)#vlan 2
Brocade(config-vlan-2)#metro-ring 1
Brocade(config-vlan-2-mrp-1)#name CustomerA
Brocade(config-vlan-2-mrp-1)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-1)#enable
Brocade(config-vlan-2-mrp-1)#metro-ring 2
Brocade(config-vlan-2-mrp-2)#name CustomerB
Brocade(config-vlan-2-mrp-2)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-2)#enable
```

Syntax: [no] metro-ring <ring id>

The <ring-id> parameter specifies the ring ID. In the FWS, the ring ID can be a value from 1 – 255. Otherwise, the <ring-id> can be from 1 – 1023; ID 256 is reserved for VSRP.

On FWS, FCX, and ICX devices, enter the **metro-rings** in addition to the **metro-ring** command as shown below.

```
Brocade(config)#vlan 2
Brocade(config-vlan-2)#metro-rings 1 2
Brocade(config-vlan-2)#metro-ring 1
Brocade(config-vlan-2-mrp-1)#name CustomerA
Brocade(config-vlan-2-mrp-1)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-1)#enable
Brocade(config-vlan-2-mrp-1)#metro-ring 2
Brocade(config-vlan-2-mrp-2)#name CustomerB
Brocade(config-vlan-2-mrp-2)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-2)#enable
```

Syntax: [no] metro-rings <ring id> <ring id> . . .

The <ring id> variables identify the metro rings you want to configure on the VLAN.

Syntax: [no] name <string>

The <string> parameter specifies a name for the ring. The name is optional, but it can be up to 20 characters long and can include blank spaces. If you use a name that has blank spaces, enclose the name in double quotation marks (for example: "Customer A").

Syntax: [no] master

Configures this node as the master node for the ring. Enter this command only on one node in the ring. The node is a member (non-master) node by default.

Syntax: `[no] ring-interface ethernet <primary-if> ethernet <secondary-if>`

The **ethernet** <primary-if> parameter specifies the primary interface. On the master node, the primary interface is the one that originates RHPs. Ring control traffic and Layer 2 data traffic will flow in the outward direction from this interface by default. On member nodes, the direction of traffic flow depends on the traffic direction selected by the master node. Therefore, on a member node, the order in which you enter the interfaces does not matter.

The **ethernet** <secondary-if> parameter specifies the secondary interface.

NOTE

To take advantage of every interface in a Metro network, you can configure another MRP ring and either configure a different Master node for the ring or reverse the configuration of the primary and secondary interfaces on the Master node. Configuring multiple rings enables you to use all the ports in the ring. The same port can forward traffic one ring while blocking traffic for another ring.

Syntax: `[no] enable`

The **enable** command enables the ring.

Changing the hello and preforwarding times

You also can change the RHP hello time and preforwarding time. To do so, enter commands such as the following.

```
Brocade(config-vlan-2-mrp-1)#hello-time 200
Brocade(config-vlan-2-mrp-1)#preforwarding-time 400
```

These commands change the hello time to 200 ms and change the preforwarding time to 400 ms.

Syntax: `[no] hello-time <ms>`

Syntax: `[no] preforwarding-time <ms>`

The <ms> specifies the number of milliseconds. For the hello time, you can specify from 100 – 1000 (one second). The default hello time is 100 ms. The preforwarding time can be from 200 – 5000 ms, but must be at least twice the value of the hello time and must be a multiple of the hello time. The default preforwarding time is 300 ms. A change to the hello time or preforwarding time takes effect as soon as you enter the command.

Configuration notes for changing the hello and preforwarding times

- The preforwarding time must be at least twice the value of the hello time and must be a multiple of the hello time.
- If UDLD is also enabled on the device, Brocade recommends that you set the MRP preforwarding time slightly higher than the default of 300 ms; for example, to 400 or 500 ms.
- You can use MRP ring diagnostics to determine whether you need to change the hello time and preforwarding time. Refer to [“Metro Ring Protocol diagnostics”](#).

Metro Ring Protocol diagnostics

The Metro Ring Protocol (MRP) diagnostics feature calculates how long it takes for RHP packets to travel through the ring. When you enable MRP diagnostics, the software tracks RHP packets according to their sequence numbers and calculates how long it takes an RHP packet to travel one time through the entire ring. When you display the diagnostics, the CLI shows the average round-trip time for the RHP packets sent since you enabled diagnostics. The calculated results have a granularity of 1 microsecond.

Enabling MRP diagnostics

To enable MRP diagnostics for a ring, enter the following command on the Master node, at the configuration level for the ring.

```
Brocade(config-vlan-2-mrp-1)#diagnostics
```

Syntax: [no] diagnostics

NOTE

This command is valid only on the master node.

Displaying MRP diagnostics

To display MRP diagnostics results, enter the following command on the Master node.

```
Brocade#show metro 1 diag
```

```
Metro Ring 1 - CustomerA
=====
diagnostics results
```

Ring id	Diag state	RHP average time(microsec)	Recommended hello time(ms)	Recommended Prefwing time(ms)
2	enabled	125	100	300

Diag frame sent	Diag frame lost
1230	0

Syntax: show metro <ring-id> diag

This display shows the following information.

TABLE 116 CLI display of MRP ring diagnostic information

Field	Description
Ring id	The ring ID.
Diag state	The state of ring diagnostics.
RHP average time	The average round-trip time for an RHP packet on the ring. The calculated time has a granularity of 1 microsecond.
Recommended hello time	The hello time recommended by the software based on the RHP average round-trip time.
Recommended Prefwing time	The preforwarding time recommended by the software based on the RHP average round-trip time.

TABLE 116 CLI display of MRP ring diagnostic information (Continued)

Field	Description
Diag frame sent	The number of diagnostic RHPs sent for the test.
Diag frame lost	The number of diagnostic RHPs lost during the test.

If the recommended hello time and preforwarding time are different from the actual settings and you want to change them, refer to [“Metro Ring Protocol configuration”](#) on page 625.

Displaying MRP information

You can display the following MRP information:

- Topology group configuration information
- Ring configuration information and statistics

Displaying topology group information

To display topology group information, enter the following command.

Syntax: `show topology-group [<group-id>]`

Refer to [“Displaying topology group information”](#) on page 610 for more information.

Displaying ring information

To display ring information, enter the following command.

```
Brocade#show metro
```

```

Metro Ring 1

```

Syntax: `show metro [<ring-id>]`

This display shows the following information.

TABLE 117 CLI display of MRP ring information

Field	Description
Ring id	The ring ID
State	The state of MRP. The state can be one of the following: <ul style="list-style-type: none"> • enabled – MRP is enabled • disabled – MRP is disabled
Ring role	Whether this node is the master for the ring. The role can be one of the following: <ul style="list-style-type: none"> • master • member
Master vlan	The ID of the master VLAN in the topology group used by this ring. If a topology group is used by MRP, the master VLAN controls the MRP settings for all VLANs in the topology group. NOTE: The topology group ID is 0 if the MRP VLAN is not the master VLAN in a topology group. Using a topology group for MRP configuration is optional.
Topo group	The topology group ID.
Hello time	The interval, in milliseconds, at which the Forwarding port on the ring master node sends Ring Hello Packets (RHPs).
Prefwing time	The number of milliseconds an MRP interface that has entered the Preforwarding state will wait before changing to the Forwarding state. If a member port in the Preforwarding state does not receive an RHP within the Preforwarding time (Prefwing time), the port assumes that a topology change has occurred and changes to the Forwarding state. The secondary port on the Master node changes to Blocking if it receives an RHP, but changes to Forwarding if the port does not receive an RHP before the preforwarding time expires. NOTE: A member node Preforwarding interface also changes from Preforwarding to Forwarding if it receives an RHP whose forwarding bit is on.
Ring interfaces	The device two interfaces with the ring. NOTE: If the interfaces are trunk groups, only the primary ports of the groups are listed.
Interface role	The interface role can be one of the following: <ul style="list-style-type: none"> • primary <ul style="list-style-type: none"> • Master node – The interface generates RHPs. • Member node – The interface forwards RHPs received on the other interface (the secondary interface). • secondary – The interface does not generate RHPs. <ul style="list-style-type: none"> • Master node – The interface listens for RHPs. • Member node – The interface receives RHPs.
Forwarding state	Whether MRP Forwarding is enabled on the interface. The forwarding state can be one of the following: <ul style="list-style-type: none"> • blocking – The interface is blocking Layer 2 data traffic and RHPs • disabled – The interface is down • forwarding – The interface is forwarding Layer 2 data traffic and RHPs • preforwarding – The interface is listening for RHPs but is blocking Layer 2 data traffic

TABLE 117 CLI display of MRP ring information (Continued)

Field	Description
Active interface	The physical interfaces that are sending and receiving RHPs. NOTE: If a port is disabled, its state is shown as “disabled”. NOTE: If an interface is a trunk group, only the primary port of the group is listed.
Interface Type	Shows if the interface is a regular port or a tunnel port.
RHPs sent	The number of RHPs sent on the interface. NOTE: This field applies only to the master node. On non-master nodes, this field contains 0. This is because the RHPs are forwarded in hardware on the non-master nodes.
RHPs rcvd	The number of RHPs received on the interface. NOTE: On most Brocade devices, this field applies only to the master node. On non-master nodes, this field contains 0. This is because the RHPs are forwarded in hardware on the non-master nodes. However, on the FastIron devices, the RHP received counter on non-master MRP nodes increment. This is because, on FastIron devices, the CPU receives a copy of the RHPs forwarded in hardware.
TC RHPs rcvd	The number of Topology Change RHPs received on the interface. A Topology Change RHP indicates that the ring topology has changed.
State changes	The number of MRP interface state changes that have occurred. The state can be one of the states listed in the Forwarding state field.
Interface Type	Shows if the interface is a regular port or a tunnel port.

MRP CLI example

The following examples show the CLI commands required to implement the MRP configuration shown in [Figure 49](#) on page 623.

NOTE

For simplicity, the figure shows the VLANs on only two switches. The CLI examples implement the ring on all four switches.

MRP commands on Switch A (master node)

The following commands configure a VLAN for the ring. The ring VLAN must contain both of the node interfaces with the ring. Add these interfaces as tagged interfaces, since the interfaces also must be in each of the customer VLANs configured on the node.

```
Brocade(config)#vlan 2
Brocade(config-vlan-2)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-2)#metro-ring 1
Brocade(config-vlan-2-mrp-1)#name "Metro A"
Brocade(config-vlan-2-mrp-1)#master
Brocade(config-vlan-2-mrp-1)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-1)#enable
Brocade(config-vlan-2-mrp-1)#exit
Brocade(config-vlan-2)#exit
```

The following commands configure the customer VLANs. The customer VLANs must contain both the ring interfaces as well as the customer interfaces.

```
Brocade(config)#vlan 30
Brocade(config-vlan-30)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-30)#tag ethernet 2/1
Brocade(config-vlan-30)#exit
Brocade(config)#vlan 40
Brocade(config-vlan-40)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-40)#tag ethernet 4/1
Brocade(config-vlan-40)#exit
```

The following commands configure topology group 1 on VLAN 2. The master VLAN is the one that contains the MRP configuration. The member VLANs use the MRP parameters of the master VLAN. The control interfaces (the ones shared by the master VLAN and member VLAN) also share MRP state.

```
Brocade(config)#topology-group 1
Brocade(config-topo-group-1)#master-vlan 2
Brocade(config-topo-group-1)#member-vlan 30
Brocade(config-topo-group-1)#member-vlan 40
```

MRP commands on Switch B

The commands for configuring Switches B, C, and D are similar to the commands for configuring Switch A, with two differences: the nodes are not configured to be the ring master. Omitting the **master** command is required for non-master nodes.

```
Brocade(config)#vlan 2
Brocade(config-vlan-2)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-2)#metro-ring 1
Brocade(config-vlan-2-mrp-1)#name "Metro A"
Brocade(config-vlan-2-mrp-1)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-1)#enable
Brocade(config-vlan-2)#exit
Brocade(config)#vlan 30
Brocade(config-vlan-30)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-30)#tag ethernet 2/1
Brocade(config-vlan-30)#exit
Brocade(config)#vlan 40
Brocade(config-vlan-40)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-40)#tag ethernet 4/1
Brocade(config-vlan-40)#exit
Brocade(config)#topology-group 1
Brocade(config-topo-group-1)#master-vlan 2
Brocade(config-topo-group-1)#member-vlan 30
Brocade(config-topo-group-1)#member-vlan 40
```

MRP commands on Switch C

```
Brocade(config)#vlan 2
Brocade(config-vlan-2)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-2)#metro-ring 1
Brocade(config-vlan-2-mrp-1)#name "Metro A"
Brocade(config-vlan-2-mrp-1)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-1)#enable
Brocade(config-vlan-2)#exit
```

```

Brocade(config)#vlan 30
Brocade(config-vlan-30)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-30)#tag ethernet 2/1
Brocade(config-vlan-30)#exit
Brocade(config)#vlan 40
Brocade(config-vlan-40)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-40)#tag ethernet 4/1
Brocade(config-vlan-40)#exit
Brocade(config)#topology-group 1
Brocade(config-topo-group-1)#master-vlan 2
Brocade(config-topo-group-1)#member-vlan 30
Brocade(config-topo-group-1)#member-vlan 40

```

MRP commands on Switch D

```

Brocade(config)#vlan 2
Brocade(config-vlan-2)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-2)#metro-ring 1
Brocade(config-vlan-2-mrp-1)#name "Metro A"
Brocade(config-vlan-2-mrp-1)#ring-interface ethernet 1/1 ethernet 1/2
Brocade(config-vlan-2-mrp-1)#enable
Brocade(config-vlan-2)#exit
Brocade(config)#vlan 30
Brocade(config-vlan-30)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-30)#tag ethernet 2/1
Brocade(config-vlan-30)#exit
Brocade(config)#vlan 40
Brocade(config-vlan-40)#tag ethernet 1/1 to 1/2
Brocade(config-vlan-40)#tag ethernet 4/1
Brocade(config-vlan-40)#exit
Brocade(config)#topology-group 1
Brocade(config-topo-group-1)#master-vlan 2
Brocade(config-topo-group-1)#member-vlan 30
Brocade(config-topo-group-1)#member-vlan 40

```

VSRP

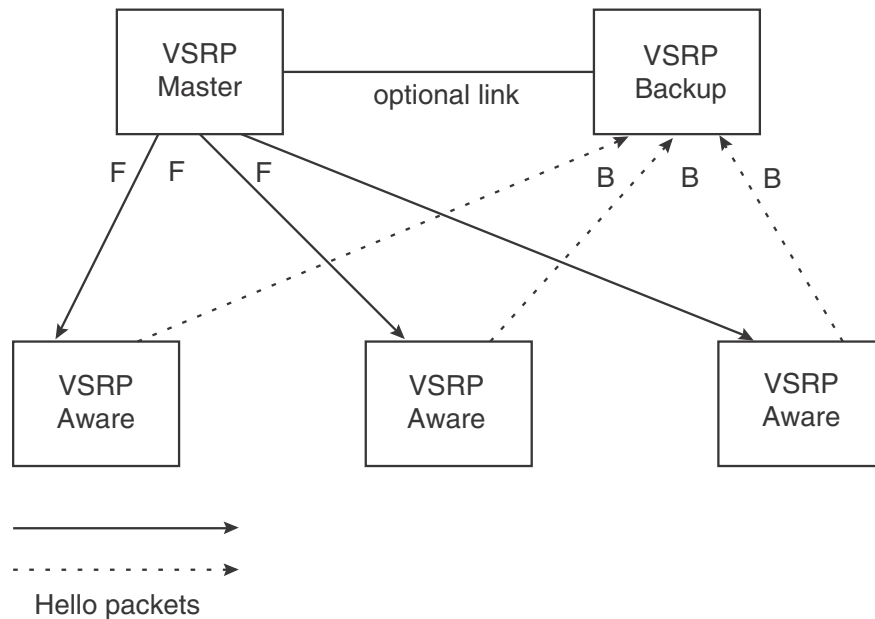

Virtual Switch Redundancy Protocol (VSRP) is a Brocade proprietary protocol that provides redundancy and sub-second failover in Layer 2 and Layer 3 mesh topologies. Based on the Brocade Virtual Router Redundancy Protocol Extended (VRRP-E), VSRP provides one or more backups for a Layer 2 Switch or Layer 3 Switch. If the active Layer 2 Switch or Layer 3 Switch becomes unavailable, one of the backups takes over as the active device and continues forwarding traffic for the network.

The FastIron family of switches support full VSRP as well as **VSRP-awareness**. A Brocade device that is not itself configured for VSRP but is connected to a Brocade device that is configured for VSRP, is **VSRP aware**.

You can use VSRP for Layer 2, Layer 3, or for both layers. On Layer 3 Switches, Layer 2 and Layer 3 share the same VSRP configuration information. On Layer 2 Switches, VSRP applies only to Layer 2.

Figure 50 shows an example of a VSRP configuration.

FIGURE 50 VSRP mesh – redundant paths for Layer 2 and Layer 3 traffic

In this example, two Brocade devices are configured as redundant paths for VRID 1. On each of the devices, a Virtual Router ID (VRID) is configured on a port-based VLAN. Since VSRP is primarily a Layer 2 redundancy protocol, the VRID applies to the entire VLAN. However, you can selectively remove individual ports from the VRID if needed.

Following Master election (described below), one of the Brocade devices becomes the Master for the VRID and sets the state of all the VLAN ports to Forwarding. The other device is a Backup and sets all the ports in its VRID VLAN to Blocking.

If a failover occurs, the Backup becomes the new Master and changes all its VRID ports to the Forwarding state.

Other Brocade devices can use the redundant paths provided by the VSRP devices. In this example, three Brocade devices use the redundant paths. A Brocade device that is not itself configured for VSRP but is connected to a Brocade device that is configured for VSRP, is **VSRP aware**. In this example, the three Brocade devices connected to the VSRP devices are VSRP aware. A Brocade device that is VSRP aware can failover its link to the new Master in sub-second time, by changing the MAC address associated with the redundant path.

When you configure VSRP, make sure each of the non-VSRP Brocade devices connected to the VSRP devices has a separate link to each of the VSRP devices.

VSRP configuration notes and feature limitations

- VSRP and 802.1Q-n-Q tagging are not supported together on the same device.
- VSRP and Super Aggregated VLANs are not supported together on the same device.
- When VSRP or VSRP-aware is configured on a VLAN, the VLAN will support IGMP snooping version 2 only. IGMP version 3 will not be supported on the VLAN.

Layer 2 and Layer 3 redundancy

You can configure VSRP to provide redundancy for Layer 2 only or also for Layer 3:

- **Layer 2 only** – The Layer 2 links are backed up but specific IP addresses are not backed up.
- **Layer 2 and Layer 3** – The Layer 2 links are backed up and a specific IP address is also backed up. Layer 3 VSRP is the same as VRRP-E. However, using VSRP provides redundancy at both layers at the same time.

Layer 2 Switches support Layer 2 VSRP only. Layer 3 Switches support Layer 2 and Layer 3 redundancy. You can configure a Layer 3 Switch for either Layer 2 only or Layer 2 and Layer 3. To configure for Layer 3, specify the IP address you are backing up.

NOTE

If you want to provide Layer 3 redundancy only, disable VSRP and use VRRP-E.

Master election and failover

Each VSRP device advertises its VSRP priority in Hello messages. During Master election, the VSRP device with the highest priority for a given VRID becomes the Master for that VRID. After Master election, the Master sends Hello messages at regular intervals to inform the Backups that the Master is healthy.

If there is a tie for highest VSRP priority, the tie is resolved as follows:

- **Layer 2 Switches** – The Layer 2 Switch with the higher management IP address becomes the Master.
 - Switches with management IP addresses are preferred over switches without management IP addresses.
 - If neither of the switches has a management IP address, then the switch with the higher MAC address becomes the Master. (VSRP compares the MAC addresses of the ports configured for the VRID, not the base MAC addresses of the switches.)
- **Layer 3 Switches** – The Layer 3 Switch whose virtual routing interface has a higher IP address becomes the master.

VSRP failover

Each Backup listens for Hello messages from the Master. The Hello messages indicate that the Master is still available. If the Backups stop receiving Hello messages from the Master, the election process occurs again and the Backup with the highest priority becomes the new Master.

Each Backup waits for a specific period of time, the Dead Interval, to receive a new Hello message from the Master. If the Backup does not receive a Hello message from the Master by the time the Dead Interval expires, the Backup sends a Hello message of its own, which includes the Backup's VSRP priority, to advertise the Backup's intent to become the Master. If there are multiple Backups for the VRID, each Backup sends a Hello message.

When a Backup sends a Hello message announcing its intent to become the Master, the Backup also starts a hold-down timer. During the hold-down time, the Backup listens for a Hello message with a higher priority than its own.

- If the Backup receives a Hello message with a higher priority than its own, the Backup resets its Dead Interval and returns to normal Backup status.

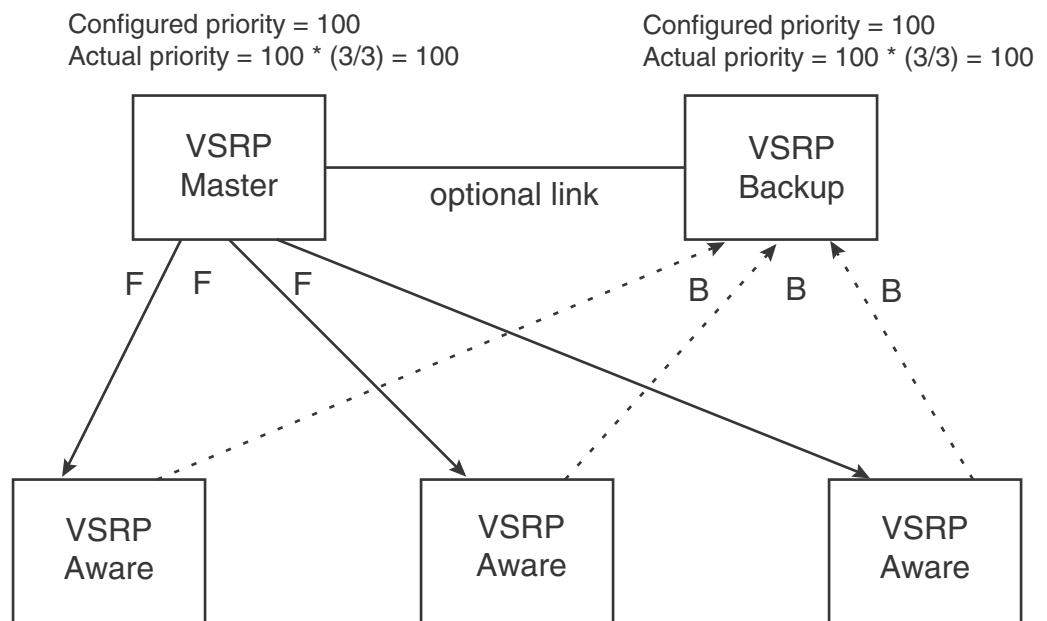

- If the Backup does not receive a Hello message with a higher priority than its own by the time the hold-down timer expires, the Backup becomes the new Master and starts forwarding Layer 2 traffic on all ports.

If you increase the timer scale value, each timer value is divided by the scale value. To achieve sub-second failover times, you can change the scale to a value up to 10. This shortens all the VSRP timers to 10 percent of their configured values.

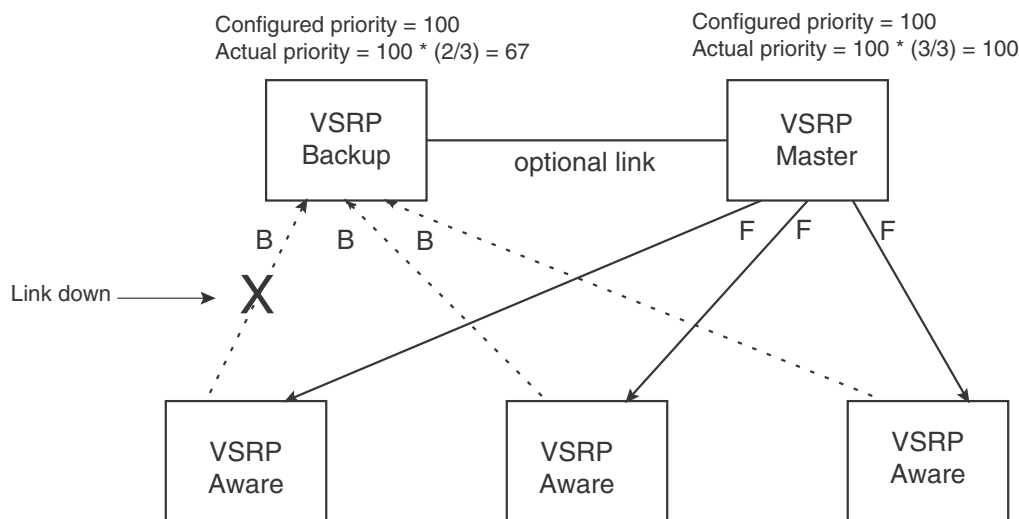

VSRP priority calculation

Each VSRP device has a VSRP priority for each VRID and its VLAN. The VRID is used during Master election for the VRID. By default, a device VSRP priority is the value configured on the device (which is 100 by default). However, to ensure that a Backup with a high number of up ports for a given VRID is elected, the device reduces the priority if a port in the VRID VLAN goes down. For example, if two Backups each have a configured priority of 100, and have three ports in VRID 1 in VLAN 10, each Backup begins with an equal priority, 100. This is shown in [Figure 51](#)

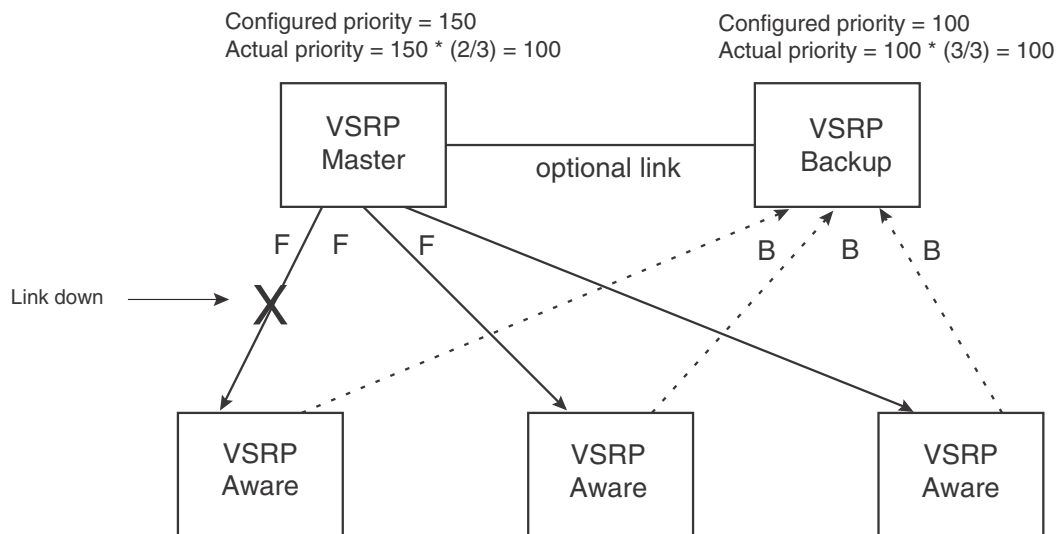

FIGURE 51 VSRP priority

However, if one of the VRID ports goes down on one of the Backups, that Backup priority is reduced. If the Master priority is reduced enough to make the priority lower than a Backup priority, the VRID fails over to the Backup. [Figure 52](#) shows an example.

FIGURE 52 VSRP priority recalculation

You can reduce the sensitivity of a VSRP device to failover by increasing its configured VSRP priority. For example, you can increase the configured priority of the VSRP device on the left in [Figure 52](#) to 150. In this case, failure of a single link does not cause failover. The link failure caused the priority to be reduced to 100, which is still equal to the priority of the other device. This is shown in [Figure 53](#).

FIGURE 53 VSRP priority bias

Track ports

Optionally, you can configure track ports to be included during VSRP priority calculation. In VSRP, a **track port** is a port that is not a member of the VRID VLAN, but whose state is nonetheless considered when the priority is calculated. Typically, a track port represents the exit side of traffic received on the VRID ports. By default, no track ports are configured.

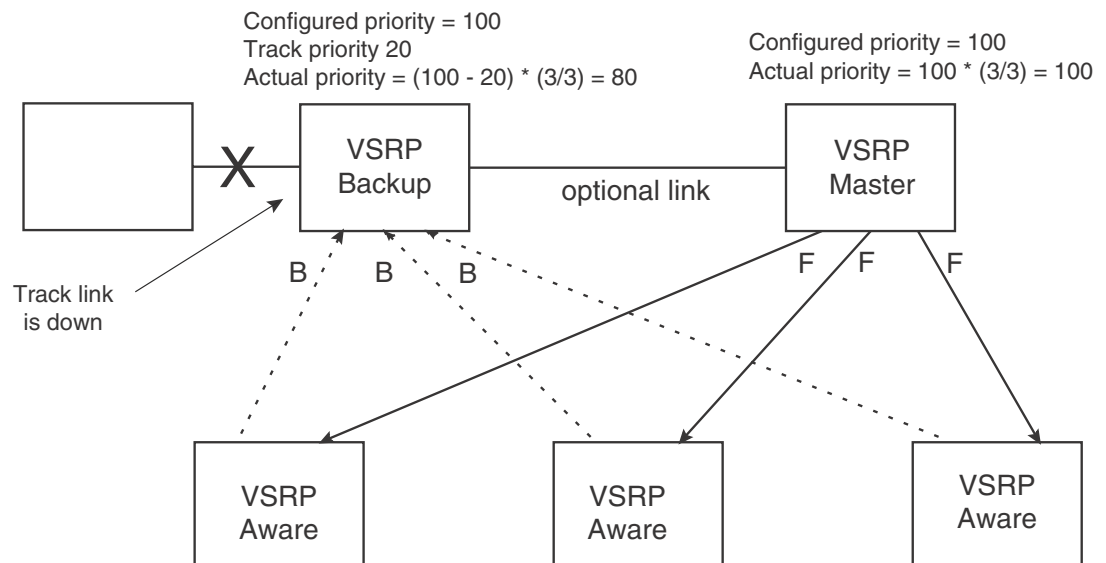

When you configure a track port, you assign a priority value to the port. If the port goes down, VSRP subtracts the track port priority value from the configured VSRP priority. For example, if the you configure a track port with priority 20 and the configured VSRP priority is 100, the software subtracts 20 from 100 if the track port goes down, resulting in a VSRP priority of 80. The new priority value is used when calculating the VSRP priority. [Figure 54](#) shows an example.

FIGURE 54 Track port priority

In [Figure 54](#), the track port is up. Since the port is up, the track priority does not affect the VSRP priority calculation. If the track port goes down, the track priority does affect VSRP priority calculation, as shown in [Figure 55](#).

FIGURE 55 Track port priority subtracted during priority calculation

MAC address failover on VSRP-aware devices

VSRP-aware devices maintain a record of each VRID and its VLAN. When the device has received a Hello message for a VRID in a given VLAN, the device creates a record for that VRID and VLAN and includes the port number in the record. Each subsequent time the device receives a Hello message for the same VRID and VLAN, the device checks the port number:

- If the port number is the same as the port that previously received a Hello message, the VSRP-aware device assumes that the message came from the same VSRP Master that sent the previous message.
- If the port number does not match, the VSRP-aware device assumes that a VSRP failover has occurred to a new Master, and moves the MAC addresses learned on the previous port to the new port.

The VRID records age out if unused. This can occur if the VSRP-aware device becomes disconnected from the Master. The VSRP-aware device will wait for a Hello message for the period of time equal to the following.

$$\text{VRID Age} = \text{Dead Interval} + \text{Hold-down Interval} + (3 \times \text{Hello Interval})$$

The values for these timers are determined by the VSRP device sending the Hello messages. If the Master uses the default timer values, the age time for VRID records on the VSRP-aware devices is as follows.

$$3 + 3 + (3 \times 1) = 9 \text{ seconds}$$

In this case, if the VSRP-aware device does not receive a new Hello message for a VRID in a given VLAN, on any port, the device assumes the connection to the Master is unavailable and removes the VRID record.

VSRP interval timers

The VSRP Hello interval, Dead interval, Backup Hello interval, and Hold-down interval timers are individually configurable. You also can easily change all the timers at the same time while preserving the ratios among their values. To do so, change the timer scale. The **timer scale** is a value used by the software to calculate the timers. The software divides a timer value by the timer scale value. By default, the scale is 1. This means the VSRP timer values are the same as the values in the configuration.

VSRP-aware security features

This feature protects against unauthorized VSRP hello packets by enabling you to configure VSRP-aware security parameters. Without VSRP-aware security, a VSRP-aware device passively learns the authentication method conveyed by the received VSRP hello packet. The VSRP-aware device then stores the authentication method until it ages out with the aware entry.

The VSRP-aware security feature enables you to perform the following:

- Define the specific authentication parameters that a VSRP-aware device will use on a VSRP backup switch. The authentication parameters that you define will not age out.
- Define a list of ports that have authentic VSRP backup switch connections. For ports included in the list, the VSRP-aware switch will process VSRP hello packets using the VSRP-aware security configuration. Conversely, for ports not included in the list, the VSRP-aware switch will not use the VSRP-aware security configuration.

If VSRP hello packets do not meet the acceptance criteria, the VSRP-aware device forwards the packets normally, without any VSRP-aware security processing.

To configure VSRP-Aware Security features, refer to “[Configuring security features on a VSRP-aware device](#)” on page 645.

VSRP parameters

[Table 118](#) lists the VSRP parameters.

TABLE 118 VSRP parameters

Parameter	Description	Default	For more information
Protocol	VSRP state NOTE: On a Layer 3 Switch, you must disable VSRP to use VRRP-E or VRRP.	Enabled	page 643
Virtual Router ID (VRID)	The ID of the virtual switch you are creating by configuring multiple devices as redundant links. You must configure the same VRID on each device that you want to use to back up the links.	None	page 642
Timer scale	The value used by the software to calculate all VSRP timers. Increasing the timer scale value decreases the length of all the VSRP timers equally, without changing the ratio of one timer to another.	1	page 644
Interface parameters			
Authentication type	The type of authentication the VSRP devices use to validate VSRP packets. On Layer 3 Switches, the authentication type must match the authentication type the VRID port uses with other routing protocols such as OSPF. <ul style="list-style-type: none"> No authentication – The interfaces do not use authentication. Simple – The interface uses a simple text-string as a password in packets sent on the interface. If the interface uses simple password authentication, the VRID configured on the interface must use the same authentication type and the same password. NOTE: MD5 is not supported.	No authentication	page 644
VSRP-Aware Security Parameters			
VSRP-Aware Authentication type	The type of authentication the VSRP-aware devices will use on a VSRP backup switch: <ul style="list-style-type: none"> No authentication – The device does not accept incoming packets that have authentication strings. Simple – The device uses a simple text-string as the authentication string for accepting incoming packets. 	Not configured	page 645
VRID parameters			
VSRP device type	Whether the device is a VSRP Backup for the VRID. All VSRP devices for a given VRID are Backups.	Not configured	page 642

TABLE 118 VSRP parameters (Continued)

Parameter	Description	Default	For more information
VSRP ports	The ports in the VRID VLAN that you want to use as VRID interfaces. You can selectively exclude individual ports from VSRP while allowing them to remain in the VLAN.	All ports in the VRID VLAN	page 646
VRID IP address	<p>A gateway address you are backing up. Configuring an IP address provides VRRP-E Layer 3 redundancy in addition to VSRP Layer 2 redundancy.</p> <p>The VRID IP address must be in the same subnet as a real IP address configured on the VSRP interface, but cannot be the same as a real IP address configured on the interface.</p> <p>NOTE: This parameter is valid only on Layer 3 Switches.</p>	None	page 646
Backup priority	<p>A numeric value that determines a Backup preferability for becoming the Master for the VRID. During negotiation, the device with the highest priority becomes the Master.</p> <p>In VSRP, all devices are Backups and have the same priority by default.</p> <p>If two or more Backups are tied with the highest priority, the Backup with the highest IP address becomes the Master for the VRID.</p>	100 for all Backups	page 646
Preference of timer source	<p>When you save a Backup configuration, the software can save the configured VSRP timer values or the VSRP timer values received from the Master.</p> <p>Saving the current timer values instead of the configured ones helps ensure consistent timer usage for all the VRID devices.</p> <p>NOTE: The Backup always gets its timer scale value from the Master.</p>	Configured timer values are saved	page 647
Time-to-Live (TTL)	The maximum number of hops a VSRP Hello packet can traverse before being dropped. You can specify from 1 – 255.	2	page 647
Hello interval	<p>The amount of time between Hello messages from the Master to the Backups for a given VRID.</p> <p>The interval can be from 1 – 84 seconds.</p>	One second	page 648
Dead interval	<p>The amount of time a Backup waits for a Hello message from the Master for the VRID before determining that the Master is no longer active.</p> <p>If the Master does not send a Hello message before the dead interval expires, the Backups negotiate (compare priorities) to select a new Master for the VRID.</p>	Three times the Hello Interval	page 648
Backup Hello state and interval	<p>The amount of time between Hello messages from a Backup to the Master.</p> <p>The message interval can be from 60 – 3600 seconds.</p> <p>You must enable the Backup to send the messages. The messages are disabled by default on Backups. The current Master sends Hello messages by default.</p>	Disabled 60 seconds when enabled	page 648

TABLE 118 VSRP parameters (Continued)

Parameter	Description	Default	For more information
Hold-down interval	The amount of time a Backup that has sent a Hello packet announcing its intent to become Master waits before beginning to forward traffic for the VRID. The hold-down interval prevents Layer 2 loops from occurring during VSRP rapid failover. The interval can from 1 – 84 seconds.	3 seconds	page 649
Track priority	A VSRP priority value assigned to the tracked ports. If a tracked port link goes down, the VRID port VSRP priority is reduced by the amount of the tracked port priority.	5	page 649
Track port	A track port is a port or virtual routing interface that is outside the VRID but whose link state is tracked by the VRID. Typically, the tracked interface represents the other side of VRID traffic flow through the device. If the link for a tracked interface goes down, the VSRP priority of the VRID interface is changed, causing the devices to renegotiate for Master.	None	page 650
Backup preempt mode	Prevents a Backup with a higher VSRP priority from taking control of the VRID from another Backup that has a lower priority but has already assumed control of the VRID.	Enabled	page 650
VRID active state	The active state of the VSRP VRID.	Disabled	page 642
RIP parameters			
Suppression of RIP advertisements	A Layer 3 Switch that is running RIP normally advertises routes to a backed up VRID even when the Layer 3 Switch is not currently the active Layer 3 Switch for the VRID. Suppression of these advertisements helps ensure that other Layer 3 Switches do not receive invalid route paths for the VRID. NOTE: This parameter is valid only on Layer 3 Switches.	Disabled (routes are advertised)	page 650

Configuring basic VSRP parameters

To configure VSRP, perform the following required tasks:

- Configure a port-based VLAN containing the ports for which you want to provide VSRP service.

NOTE

If you already have a port-based VLAN but only want to use VSRP on a sub-set of the VLANs ports, you can selectively remove ports from VSRP service in the VLAN. Refer to [“Removing a port from the VRID VLAN”](#) on page 646.

- Configure a VRID:
 - Specify that the device is a backup. Since VSRP, like VRRP-E, does not have an “owner”, all VSRP devices are backups. The active device for a VRID is elected based on the VRID priority, which is configurable.

- Activate the VRID.

The following example shows a simple VSRP configuration.

```
Brocade(config)#vlan 200
Brocade(config-vlan-200)#tag ethernet 1/1 to 1/8
Brocade(config-vlan-200)#vsrp vrid 1
Brocade(config-vlan-200-vrid-1)#backup
Brocade(config-vlan-200-vrid-1)#activate
```

Syntax: [no] vsrp vrid <num>

The <num> parameter specifies the VRID and can be from 1 – 255.

Syntax: [no] backup [priority <value>] [track-priority <value>]

This command is required. In VSRP, all devices on which a VRID are configured are Backups. The Master is then elected based on the VSRP priority of each device. There is no “owner” device as there is in VRRP.

For information about the command optional parameters, refer to the following:

- [“Changing the backup priority”](#) on page 646
- [“Changing the default track priority setting”](#) on page 649

Syntax: [no] activate

or

Syntax: enable | disable

Configuring optional VSRP parameters

The following sections describe how to configure optional VSRP parameters.

Disabling or re-enabling VSRP

VSRP is enabled by default on Layer 2 Switches and Layer 3 Switches. On a Layer 3 Switch, if you want to use VRRP or VRRP-E for Layer 3 redundancy instead of VSRP, you need to disable VSRP first. To do so, enter the following command at the global CONFIG level.

```
Brocade(config)#no router vsrp
router vsrp is disabled. All vsrp config data will be lost when writing to flash
```

To re-enable the protocol, enter the following command.

```
Brocade(config)#router vsrp
```

Syntax: [no] router vsrp

Since VRRP and VRRP-E do not apply to Layer 2 Switches, there is no need to disable VSRP and there is no command to do so. The protocol is always enabled.

Changing the timer scale

To achieve sub-second failover times, you can shorten the duration of all scale timers for VSRP, VRRP, and VRRP-E by adjusting the timer scale. The **timer scale** is a value used by the software to calculate the timers. By default, the scale value is 1. If you increase the timer scale, each timer value is divided by the scale value. Using the timer scale to adjust timer values enables you to easily change all the timers while preserving the ratios among their values. Here is an example.

Timer	Timer scale	Timer value
Hello interval	1	1 second
	2	0.5 seconds
Dead interval	1	3 seconds
	2	1.5 seconds
Backup Hello interval	1	60 seconds
	2	30 seconds
Hold-down interval	1	3 seconds
	2	1.5 second

NOTE

The Backups always use the value of the timer scale received from the Master, and the value from the Master will be written in the configuration file.

To change the timer scale, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)# scale-timer 2
```

This command changes the scale to 2. All VSRP, VRRP, and VRRP-E timer values will be divided by 2.

Syntax: [no] **scale-timer** <num>

The <num> parameter specifies the multiplier. You can specify a timer scale from 1 – 10.

Configuring authentication

If the interfaces on which you configure the VRID use authentication, the VSRP packets on those interfaces also must use the same authentication. VSRP supports the following authentication types:

- **No authentication** – The interfaces do not use authentication.
- **Simple** – The interfaces use a simple text-string as a password in packets sent on the interface. If the interfaces use simple password authentication, the VRID configured on the interfaces must use the same authentication type and the same password.

To configure a simple password, enter a command such as the following at the VLAN configuration level.

```
Brocade(config-vlan-10)#vsrp auth-type simple-text-auth ourpword
```

This command configures the simple text password “ourpword”.

Syntax: `[no] vsrp auth-type no-auth | simple-text-auth <auth-data>`

The **auth-type no-auth** parameter indicates that the VRID and the interface it is configured on do not use authentication.

The **auth-type simple-text-auth <auth-data>** parameter indicates that the VRID and the interface it is configured on use a simple text password for authentication. The **<auth-data>** value is the password, and can be up to eight characters. If you use this parameter, make sure all interfaces on all the devices supporting this VRID are configured for simple password authentication and use the same password.

Configuring security features on a VSRP-aware device

This section shows how to configure security features on a VSRP-aware device. For an overview of this feature, refer to [“VSRP-aware security features”](#) on page 639.

Specifying an authentication string for VSRP hello packets

The following configuration defines **pri-key** as the authentication string for accepting incoming VSRP hello packets. In this example, the VSRP-aware device will accept all incoming packets that have this authorization string.

```
Brocade(config)#vlan 10
Brocade(config-vlan-10)#vsrp-aware vrid 3 simple-text-auth pri-key
```

Syntax: `vsrp-aware vrid <vrid number> simple text auth <string>`

Specifying no authentication for VSRP hello packets

The following configuration specifies no authentication as the preferred VSRP-aware security method. In this case, the VSRP device will not accept incoming packets that have authentication strings.

```
Brocade(config)#vlan 10
Brocade(config-vlan-10)#vsrp-aware vrid 2 no-auth
```

Syntax: `vsrp-aware vrid <vrid number> no-auth`

The following configuration specifies no authentication for VSRP hello packets received on ports 1/1, 1/2, 1/3, and 1/4 in VRID 4. For these ports, the VSRP device will not accept incoming packets that have authentication strings.

```
Brocade(config)#vlan 10
Brocade(config-vlan-10)#vsrp-aware vrid 4 no-auth port-list ethe 1/1 to 1/4
```

Syntax: `vsrp-aware vrid <vrid number> no-auth port-list <port range>`

<vrid number> is a valid VRID (from 1 to 255).

no-auth specifies no authentication as the preferred VSRP-aware security method. The VSRP device will not accept incoming packets that have authentication strings.

simple-text-auth <string> specifies the authentication string for accepting VSRP hello packets, where **<string>** can be up to 8 characters.

port-list <port range> specifies the range of ports to include in the configuration.

Removing a port from the VRID VLAN

By default, all the ports on which you configure a VRID are interfaces for the VRID. You can remove a port from the VRID while allowing it to remain in the VLAN.

Removing a port is useful in the following cases:

- There is no risk of a loop occurring, such as when the port is attached directly to an end host.
- You plan to use a port in an MRP ring.

To remove a port from a VRID, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#no include-port ethernet 1/2
```

Syntax: [no] include-port ethernet [<slotnum>]/<portnum>

The <slotnum> parameter is required on chassis devices.

The <portnum> parameter specifies the port you are removing from the VRID. The port remains in the VLAN but its forwarding state is not controlled by VSRP. If you are configuring a chassis device, specify the slot number as well as the port number (<slotnum>/<portnum>).

Configuring a VRID IP address

If you are configuring a Layer 3 Switch for VSRP, you can specify an IP address to back up. When you specify an IP address, VSRP provides redundancy for the address. This is useful if you want to back up the gateway address used by hosts attached to the VSRP Backups.

VSRP does not require you to specify an IP address. If you do not specify an address, VSRP provides Layer 2 redundancy. If you do specify an address, VSRP provides Layer 2 and Layer 3 redundancy.

The Layer 3 redundancy support is the same as VRRP-E support. For information, refer to [Chapter 39, “VRRP and VRRP-E”](#).

NOTE

The VRID IP address must be in the same subnet as a real IP address configured on the VSRP interface, but cannot be the same as a real IP address configured on the interface.

NOTE

Failover applies to both Layer 2 and Layer 3.

To specify an IP address to back up, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#ip-address 10.10.10.1
```

Syntax: [no] ip-address <ip-addr>

Changing the backup priority

When you enter the backup command to configure the device as a VSRP Backup for the VRID, you also can change the backup priority and the track priority:

- The backup priority is used for election of the Master. The VSRP Backup with the highest priority value for the VRID is elected as the Master for that VRID. The default priority is 100. If two or more Backups are tied with the highest priority, the Backup with the highest IP address becomes the Master for the VRID.
- The track priority is used with the track port feature. Refer to [“VSRP priority calculation”](#) on page 636 and [“Changing the default track priority setting”](#) on page 649.

To change the backup priority, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#backup priority 75
```

Syntax: [no] backup [priority <value>] [track-priority <value>]

The **priority <value>** parameter specifies the backup priority for this interface and VRID. Specify a value as follows:

- For VRRP, specify a value from 3 – 254. The default is 100.
- For VSRP and VRRP-E, specify a value from 6 – 255. The default is 100.

For a description of the **track-priority <value>** parameter, refer to [“Changing the default track priority setting”](#) on page 649.

Saving the timer values received from the master

The Hello messages sent by a VRID master contain the VRID values for the following VSRP timers:

- Hello interval
- Dead interval
- Backup Hello interval
- Hold-down interval

The Backups always use the value of the timers received from the Master.

To configure a Backup to save the VSRP timer values received from the Master instead of the timer values configured on the Backup, enter the following command. Saving the current timer values instead of the configured ones helps ensure consistent timer usage for all the VRID devices.

```
Brocade(config-vlan-200-vrid-1)#save-current-values
```

Syntax: [no] save-current-values

Changing the TTL setting

A VSRP Hello packet time to live (TTL) specifies how many hops the packet can traverse before being dropped. A hop can be a Layer 3 Switch or a Layer 2 Switch. You can specify from 1 – 255. The default TTL is 2. When a VSRP device (Master or Backup) sends a VSRP Hello packet, the device subtracts one from the TTL. Thus, if the TTL is 2, the device that originates the Hello packet sends it out with a TTL of 1. Each subsequent device that receives the packet also subtracts one from the packet TTL. When the packet has a TTL of 1, the receiving device subtracts 1 and then drops the packet because the TTL is zero.

NOTE

An MRP ring is considered to be a single hop, regardless of the number of nodes in the ring.

To change the TTL for a VRID, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#initial-ttl 5
```

Syntax: [no] initial-ttl <num>

The <num> parameter specifies the TTL and can be from 1 – 255. The default TTL is 2.

Changing the hello interval setting

The Master periodically sends Hello messages to the Backups. To change the Hello interval, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#hello-interval 10
```

Syntax: [no] hello-interval <num>

The <num> parameter specifies the interval and can be from 1 – 84 seconds. The default is 1 second.

NOTE

The default Dead interval is three times the Hello interval plus one-half second. Generally, if you change the Hello interval, you also should change the Dead interval on the Backups.

NOTE

If you change the timer scale, the change affects the actual number of seconds.

Changing the dead interval setting

The Dead interval is the number of seconds a Backup waits for a Hello message from the Master before determining that the Master is dead. The default is 3 seconds. This is three times the default Hello interval.

To change the Dead interval, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#dead-interval 30
```

Syntax: [no] dead-interval <num>

The <num> parameter specifies the interval and can be from 1 – 84 seconds. The default is 3 seconds.

NOTE

If you change the timer scale, the change affects the actual number of seconds.

Changing the backup hello state and interval setting

By default, Backups do not send Hello messages to advertise themselves to the Master. You can enable these messages if desired and also change the message interval.

To enable a Backup to send Hello messages to the Master, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#advertise backup
```

Syntax: [no] advertise backup

When a Backup is enabled to send Hello messages, the Backup sends a Hello message to the Master every 60 seconds by default. You can change the interval to be up to 3600 seconds.

To change the Backup Hello interval, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#backup-hello-interval 180
```

Syntax: [no] **backup-hello-interval** <num>

The <num> parameter specifies the message interval and can be from 60 – 3600 seconds. The default is 60 seconds.

NOTE

If you change the timer scale, the change affects the actual number of seconds.

Changing the hold-down interval setting

The hold-down interval prevents Layer 2 loops from occurring during failover, by delaying the new Master from forwarding traffic long enough to ensure that the failed Master is really unavailable.

To change the Hold-down interval, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#hold-down-interval 4
```

Syntax: [no] **hold-down-interval** <num>

The <num> parameter specifies the hold-down interval and can be from 1 – 84 seconds. The default is 3 seconds.

NOTE

If you change the timer scale, the change affects the actual number of seconds.

Changing the default track priority setting

When you configure a VRID to track the link state of other interfaces, if one of the tracked interface goes down, the software changes the VSRP priority of the VRID interface.

The software reduces the VRID priority by the amount of the priority of the tracked interface that went down. For example, if the VSRP interface priority is 100 and a tracked interface with track priority 60 goes down, the software changes the VSRP interface priority to 40. If another tracked interface goes down, the software reduces the VRID priority again, by the amount of the tracked interface track priority.

The default track priority for all track ports is 5. You can change the default track priority or override the default for an individual track port.

- To change the default track priority, use the **backup priority <value> track-priority <value>** command, described below.
- To override the default track priority for a specific track port, use the **track-port** command. Refer to [“Specifying a track port setting”](#) on page 650.

To change the track priority, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#backup priority 100 track-priority 2
```

Syntax: [no] backup [priority <value>] [track-priority <value>]

Specifying a track port setting

You can configure the VRID on one interface to track the link state of another interface on the device. This capability is useful for tracking the state of the exit interface for the path for which the VRID is providing redundancy. Refer to “[VSRP priority calculation](#)” on page 636.

To configure a VRID to track an interface, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#track-port ethernet 2/4
```

Syntax: [no] track-port ethernet [<slotnum>/]<portnum> | ve <num> [priority <num>]

The **priority <num>** parameter changes the VSRP priority of the interface. If this interface goes down, the VRID VSRP priority is reduced by the amount of the track port priority you specify here.

NOTE

The priority <num> option changes the priority of the specified interface, overriding the default track port priority. To change the default track port priority, use the **backup track-priority <num>** command.

Disabling or re-enabling backup pre-emption setting

By default, a Backup that has a higher priority than another Backup that has become the Master can preempt the Master, and take over the role of Master. If you want to prevent this behavior, disable preemption.

Preemption applies only to Backups and takes effect only when the Master has failed and a Backup has assumed ownership of the VRID. The feature prevents a Backup with a higher priority from taking over as Master from another Backup that has a lower priority but has already become the Master of the VRID.

Preemption is especially useful for preventing flapping in situations where there are multiple Backups and a Backup with a lower priority than another Backup has assumed ownership, because the Backup with the higher priority was unavailable when ownership changed.

If you enable the non-preempt mode (thus disabling the preemption feature) on all the Backups, the Backup that becomes the Master following the disappearance of the Master continues to be the Master. The new Master is not preempted.

To disable preemption on a Backup, enter a command such as the following at the configuration level for the VRID.

```
Brocade(config-vlan-200-vrid-1)#non-preempt-mode
```

Syntax: [no] non-preempt-mode

Suppressing RIP advertisement from backups

Normally, for Layer 3 a VSRP Backup includes route information for a backed up IP address in RIP advertisements. As a result, other Layer 3 Switches receive multiple paths for the backed up interface and might sometimes unsuccessfully use the path to the Backup rather than the path to the Master.

You can prevent the Backups from advertising route information for the backed up interface by enabling suppression of the advertisements.

NOTE

This parameter applies only if you specified an IP address to back up and is valid only on Layer 3 Switches.

To suppress RIP advertisements, enter the following commands.

```
Brocade(config)#router rip
Brocade(config-rip-router)#use-vrrp-path
```

Syntax: [no] use-vrrp-path

VSRP-aware interoperability

The **vsrp-aware tc-vlan-flush** command should be used in network configurations in which the Brocade switch operates as the VSRP-Aware device connecting to a FastIron platforms configured as a VSRP Master.

The command is available at the VLAN level, and is issued per a specific VRID, as shown here for VRID 11.

```
Brocade(config-vlan-10)#vsrp-aware vrid 11 tc-vlan-flush
```

Syntax: vsrp-aware vrid <num> tc-vlan-flush

When this command is enabled, MAC addresses will be flushed at the VLAN level, instead of at the port level. MAC addresses will be flushed for every topology change (TC) received on the VSRP-aware ports.

When you configure the **vsrp-aware tc-vlan-flush** command on a VSRP-aware device, and the device receives VSRP hello packets from the VSRP master, VSRP authentication is automatically configured. However, if the VSRP-aware device does not receive VSRP hello packets from the VSRP master when the **vsrp-aware tc-vlan-flush** command is configured, you must manually configure VSRP authentication. For more information on configuring VSRP authentication, refer to [“Configuring authentication”](#) on page 644.

When this command is enabled, the results of the **show vsrp-aware vlan** command resemble the following.

```
Brocade(config-vlan-10)#vsrp-aware vrid 11 tc-vlan-flush
Brocade(config-vlan-10)#show vsrp aware vlan 10
Aware Port Listing
  VLAN ID VRID Last Port Auth Type      Mac-Flush Age
    10      11 N/A   no-auth Configured Enabled  00:00:00.0
```

Displaying VSRP information

You can display the following VSRP information:

- Configuration information and current parameter values for a VRID or VLAN
- The interfaces on a VSRP-aware device that are active for the VRID

Displaying VRID information

To display VSRP information, enter the following command.

```
Brocade#show vsrp vrid 1
Total number of VSRP routers defined: 2
VLAN 200
auth-type no authentication
VRID 1
  State      Administrative-status  Advertise-backup  Preempt-mode  save-current
  standby    enabled                  disabled          true          false

  Parameter      Configured Current      Unit
  priority        100      80      (100-0)*(4.0/5.0)
  hello-interval    1        1      sec/1
  dead-interval     3        3      sec/1
  hold-interval     3        3      sec/1
  initial-ttl       2        2      hops

  next hello sent in 00:00:00.8
  Member ports:      ethe 1/1 to 1/5
  Operational ports: ethe 1/1 to 1/4
  Forwarding ports:  ethe 1/1 to 1/4
```

Syntax: `show vsrp [vrid <num> | vlan <vlan-id>]`

This display shows the following information when you use the **vrid <num>** or **vlan <vlan-id>** parameter. For information about the display when you use the **aware** parameter, refer to [“Displaying the active interfaces for a VRID”](#) on page 654.

TABLE 119 CLI display of VSRP VRID or VLAN information

Field	Description
Total number of VSRP routers defined	The total number of VRIDs configured on this device.
VLAN	The VLAN on which VSRP is configured.
auth-type	The authentication type in effect on the ports in the VSRP VLAN.
VRID parameters	
VRID	The VRID for which the following information is displayed.
state	<p>This device VSRP state for the VRID. The state can be one of the following:</p> <ul style="list-style-type: none"> initialize – The VRID is not enabled (activated). If the state remains “initialize” after you activate the VRID, make sure that the VRID is also configured on the other routers and that the routers can communicate with each other. <p>NOTE: If the state is “initialize” and the mode is incomplete, make sure you have specified the IP address for the VRID.</p> <ul style="list-style-type: none"> standby – This device is a Backup for the VRID. master – This device is the Master for the VRID.
Administrative-status	<p>The administrative status of the VRID. The administrative status can be one of the following:</p> <ul style="list-style-type: none"> disabled – The VRID is configured on the interface but VSRP or VRRP-E has not been activated on the interface. enabled – VSRP has been activated on the interface.

TABLE 119 CLI display of VSRP VRID or VLAN information (Continued)

Field	Description
Advertise-backup	Whether the device is enabled to send VSRP Hello messages when it is a Backup. This field can have one of the following values: <ul style="list-style-type: none"> disabled – The device does not send Hello messages when it is a Backup. enabled – The device does send Hello messages when it is a Backup.
Preempt-mode	Whether the device can be pre-empted by a device with a higher VSRP priority after this device becomes the Master. This field can have one of the following values: <ul style="list-style-type: none"> disabled – The device cannot be pre-empted. enabled – The device can be pre-empted.
save-current	The source of VSRP timer values preferred when you save the configuration. This field can have one of the following values: <ul style="list-style-type: none"> false – The timer values configured on this device are saved. true – The timer values most recently received from the Master are saved instead of the locally configured values.
NOTE: For the following fields: <ul style="list-style-type: none"> Configured – indicates the parameter value configured on this device. Current – indicates the parameter value received from the Master. Unit – indicates the formula used for calculating the VSRP priority and the timer scales in effect for the VSRP timers. A timer true value is the value listed in the Configured or Current field divided by the scale value. 	
priority	The device preferability for becoming the Master for the VRID. During negotiation, the Backup with the highest priority becomes the Master. If two or more Backups are tied with the highest priority, the Backup interface with the highest IP address becomes the Master for the VRID.
hello-interval	The number of seconds between Hello messages from the Master to the Backups for a given VRID.
dead-interval	The configured value for the dead interval. The dead interval is the number of seconds a Backup waits for a Hello message from the Master for the VRID before determining that the Master is no longer active. If the Master does not send a Hello message before the dead interval expires, the Backups negotiate (compare priorities) to select a new Master for the VRID. NOTE: If the value is 0, then you have not configured this parameter.
hold-interval	The number of seconds a Backup that intends to become the Master will wait before actually beginning to forward Layer 2 traffic for the VRID. If the Backup receives a Hello message with a higher priority than its own before the hold-down interval expires, the Backup remains in the Backup state and does not become the new Master.
initial-ttl	The number of hops a Hello message can traverse after leaving the device before the Hello message is dropped. NOTE: An MRP ring counts as one hop, regardless of the number of nodes in the ring.
next hello sent in	The amount of time until the Master dead interval expires. If the Backup does not receive a Hello message from the Master by the time the interval expires, either the IP address listed for the Master will change to the IP address of the new Master, or this Layer 3 Switch itself will become the Master. NOTE: This field applies only when this device is a Backup.
Member ports	The ports in the VRID.

TABLE 119 CLI display of VSRP VRID or VLAN information (Continued)

Field	Description
Operational ports	The member ports that are currently up.
Forwarding ports	The member ports that are currently in the Forwarding state. Ports that are forwarding on the Master are listed. Ports on the Standby, which are in the Blocking state, are not listed.

Displaying the active interfaces for a VRID

On a VSRP-aware device, you can display VLAN and port information for the connections to the VSRP devices (Master and Backups).

To display the active VRID interfaces, enter the following command on the VSRP-aware device.

```
Brocade#show vsrp aware
Aware port listing
VLAN ID  VRID  Last Port
100      1      3/2
200      2      4/1
```

Syntax: `show vsrp aware`

This display shows the following information when you use the **aware** parameter. For information about the display when you use the **vrid <num>** or **vlan <vlan-id>** parameter, refer to [“Displaying VRID information”](#) on page 652.

TABLE 120 CLI display of VSRP-aware information

Field	Description
VLAN ID	The VLAN that contains the VSRP-aware device connection with the VSRP Master and Backups.
VRID	The VRID.
Last Port	The most recent active port connection to the VRID. This is the port connected to the current Master. If a failover occurs, the VSRP-aware device changes the port to the port connected to the new Master. The VSRP-aware device uses this port to send and receive data through the backed up node.

VSRP fast start

VSRP fast start allows non-Brocade or non-VSRP aware devices that are connected to a Brocade device that is the VSRP Master to quickly switchover to the new Master when a VSRP failover occurs

This feature causes the port on a VSRP Master to restart when a VSRP failover occurs. When the port shuts down at the start of the restart, ports on the non-VSRP aware devices that are connected to the VSRP Master flush the MAC address they have learned for the VSRP master. After a specified time, the port on the previous VSRP Master (which now becomes the Backup) returns back online. Ports on the non-VSRP aware devices switch over to the new Master and learn its MAC address.

Configuring VSRP fast start

The VSRP fast start feature can be enabled on a VSRP-configured Brocade device, either on the VLAN to which the VRID of the VSRP-configured device belongs (globally) or on a port that belongs to the VRID.

To globally configure a VSRP-configured device to shut down its ports when a failover occurs, then restart after five seconds, enter the following command.

```
Brocade(config)#vlan 100
Brocade(config-vlan-100)#vsrp vrid 1
Brocade(config-vlan-100-vrid-1)#restart-ports 5
```

Syntax: [no] restart-ports <seconds>

This command shuts down all the ports that belong to the VLAN when a failover occurs. All the ports will have the specified VRID.

To configure a single port on a VSRP-configured device to shut down when a failover occurs, then restart after a period of time, enter the following command.

```
Brocade(config)#interface ethernet 1/1
Brocade(config-if-e1000-1/1)#restart-vsrp-port 5
```

Syntax: [no] restart-vsrp-port <seconds>

In both commands, the <seconds> parameter instructs the VSRP Master to shut down its port for the specified number of seconds before it starts back up. Enter a value between 1 – 120 seconds. The default is 1 second.

Displaying ports that Have the VSRP fast start feature enabled

The **show vsrp vrid** command shows the ports on which the VSRP fast start feature is enabled.

```
Brocade#show vsrp vrid 100
VLAN 100
  auth-type no authentication
  VRID 100
  =====
  State      Administrative-status  Advertise-backup  Preempt-mode  save-current
  master     enabled                  disabled          true          false
  Parameter  Configured Current      Unit/Formula
  priority   100          50          (100-0)*(2.0/4.0)
  hello-interval 1          1          sec/1
  dead-interval 3          3          sec/1
  hold-interval 3          3          sec/1
  initial-ttl 2          2          hops
  next hello sent in 00:00:00.3
  Member ports:   ethe 2/5 to 2/8
  Operational ports: ethe 2/5 ethe 2/8
  Forwarding ports: ethe 2/5 ethe 2/8
  Restart ports:   2/5(1) 2/6(1) 2/7(1) 2/8(1)
```

The "Restart ports:" line lists the ports that have the VSRP fast start enabled, and the downtime for each port. Refer to [Table 119](#) on page 652 to interpret the remaining information on the display.

VSRP and MRP signaling

A device may connect to an MRP ring through VSRP to provide a redundant path between the device and the MRP ring. VSRP and MRP signaling ensures rapid failover by flushing MAC addresses appropriately. The host on the MRP ring learns the MAC addresses of all devices on the MRP ring and VSRP link. From these MAC addresses, the host creates a MAC database (table), which is used to establish a data path from the host to a VSRP-linked device. [Figure 56](#) below shows two possible data paths from the host to Device 1.

FIGURE 56 Two data paths from host on an MRP ring to a VSRP-linked device

If a VSRP failover from master to backup occurs, VSRP needs to inform MRP of the topology change; otherwise, data from the host continues along the obsolete learned path and never reach the VSRP-linked device, as shown in [Figure 57](#).

FIGURE 57 VSRP on MRP rings that failed over

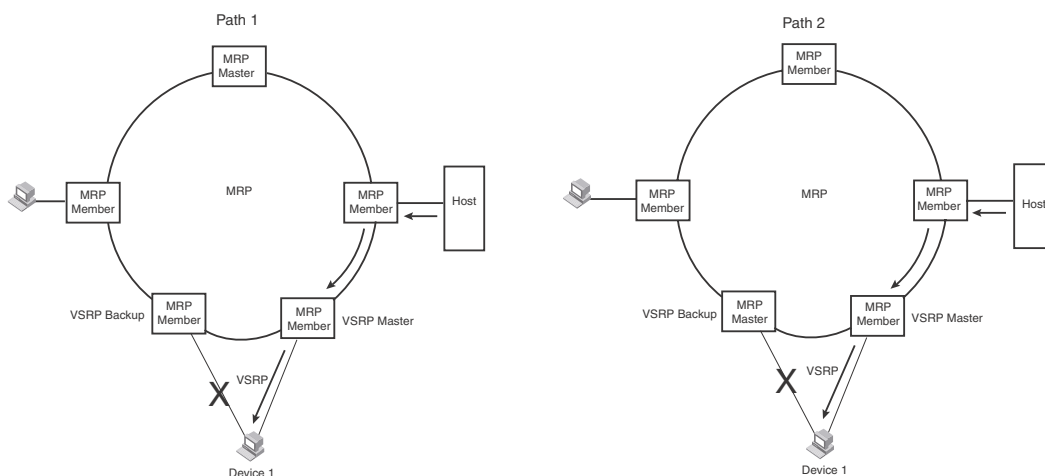

A signaling process for the interaction between VSRP and MRP ensures that MRP is informed of the topology change and achieves convergence rapidly. When a VSRP node fails, a new VSRP master is selected. The new VSRP master finds all MRP instances impacted by the failover. Then each MRP instance does the following:

- The MRP node sends out an MRP PDU with the mac-flush flag set three times on the MRP ring.
- The MRP node that receives this MRP PDU empties all the MAC entries from its interfaces that participate on the MRP ring.
- The MRP node then forwards the MRP PDU with the mac-flush flag set to the next MRP node that is in forwarding state.

The process continues until the Master MRP node secondary (blocking) interface blocks the packet. Once the MAC address entries have been flushed, the MAC table can be rebuilt for the new path from the host to the VSRP-linked device ([Figure 58](#)).

FIGURE 58 New path established

There are no CLI commands used to configure this process.

VSRP

Power over Ethernet

Table 121 lists the individual Brocade FastIron switches and the Power over Ethernet (PoE) features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where noted.

TABLE 121 Supported PoE features

Feature	FESX FSX 800 FSX 1600 PoE interface modules ¹	FWS PoE models only	FCX PoE+ models only	ICX 6610 PoE models only	ICX 6430 ICX 6450 PoE models only
PoE+ (802.3at)	Yes (FSX 800 and FSX 1600 with SX-FI48GPP module only)	No	Yes	Yes	Yes
PoE (802.3af)	Yes	Yes	Yes	Yes	Yes
Detection of PoE power requirements advertised through CDP	Yes	Yes	Yes	Yes	Yes
Maximum power level for a PoE power consuming device	Yes	Yes	Yes	Yes	Yes
Power class for PoE power consuming device	Yes	Yes	Yes	Yes	Yes
Maximum power budget per PoE interface module	Yes	No	No	No	Yes
In-line power priority for a PoE port	Yes	Yes	Yes	Yes	Yes
PoE firmware upgrade via CLI	Yes	No	Yes	Yes	Yes

1. Supported on PoE-enabled interface modules installed in a chassis with PoE power supply.

Power over Ethernet overview

This section provides an overview of the requirements for delivering power over the LAN, as defined by the Institute of Electrical and Electronics Engineers Inc. (IEEE) in the 802.3af (PoE) and 802.3at (PoE+) specifications.

Brocade PoE devices provide Power over Ethernet, compliant with the standards described in the IEEE 802.3af specification for delivering inline power. Brocade PoE+ devices are compliant with both the 802.3af and 802.3at specifications. The 802.3af specification defined the original standard for delivering power over existing network cabling infrastructure, enabling multicast-enabled full streaming audio and video applications for converged services, such as, Voice over IP (VoIP), Wireless Local Area Access (WLAN) points, IP surveillance cameras, and other

IP technology devices. The 802.3at specification expands the standards to support higher power levels for more demanding powered devices, such as video IP phones, pan-tilt-zoom cameras and high-power outdoor antennas for wireless access points. Except where noted, this document will use the term PoE to refer to both PoE and PoE+.

[Table 121](#) lists the FastIron devices and modules that support PoE, PoE+, or both.

PoE technology eliminates the need for an electrical outlet and dedicated UPS near IP powered devices. With power sourcing equipment such as a Brocade FastIron PoE device, power is consolidated and centralized in the wiring closets, improving the reliability and resiliency of the network. Because PoE can provide Power over Ethernet cable, power is continuous, even in the event of a power failure.

Power over Ethernet terms used in this chapter

The following terms are introduced in this chapter:

- Power-sourcing device or Power-sourcing equipment (PSE) - This is the source of the power, or the device that integrates the power onto the network. Power sourcing devices and equipment have embedded PoE technology. The Brocade FastIron PoE device is a power sourcing device.
- IP powered device (PD) or power-consuming device - This is the Ethernet device that requires power and is situated on the end of the cable opposite the power sourcing equipment.

Methods for delivering Power over Ethernet

There are two methods for delivering Power over Ethernet (PoE), as defined in the 802.3af and 802.3at specifications:

- Endspan - Power is supplied through the Ethernet ports on a power sourcing device. With the Endspan solution, power can be carried over the two data pairs (Alternative A) or the two spare pairs (Alternative B).
- Midspan - Power is supplied by an intermediate power sourcing device placed between the switch and the PD. With the Midspan solution, power is carried over the two spare pairs (Alternative B).

With both methods, power is transferred over four conductors, between the two pairs. 802.3af- and 802.3at-compliant PDs are able to accept power from either set of pairs.

Brocade PoE devices use the Endspan method, compliant with the 802.3af and 802.3at standards.

The Endspan and Midspan methods are described in more detail in the following sections.

NOTE

All 802.3af- and 802.3at-compliant power consuming devices are required to support both application methods defined in the 802.3af and 802.3at specification.

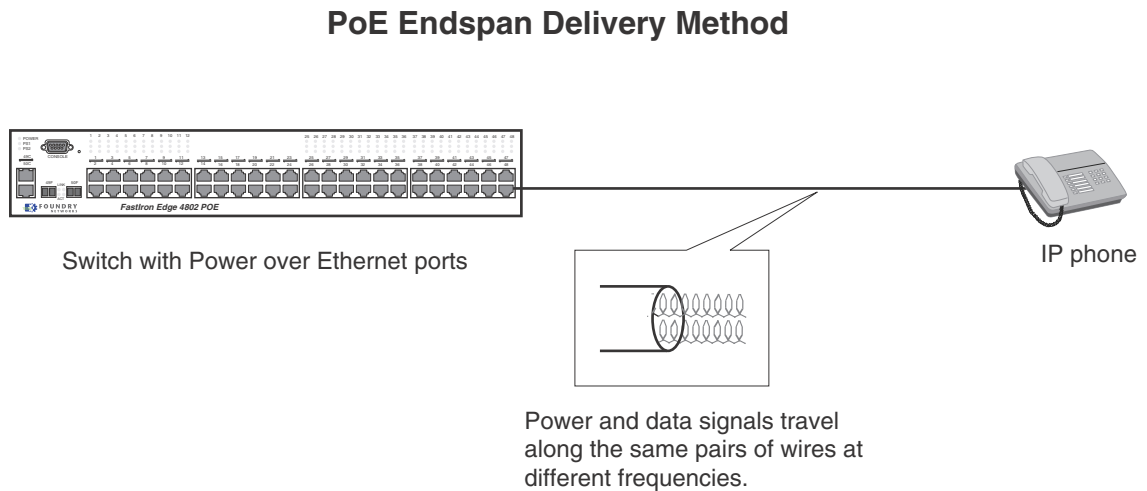

PoE endspan method

The PoE Endspan method uses the Ethernet switch ports on power sourcing equipment, such as a Brocade FastIron PoE switch, which has embedded PoE technology to deliver power over the network.

With the Endspan solution, there are two supported methods of delivering power. In Alternative A, four wires deliver data and power over the network. Specifically, power is carried over the live wire pairs that deliver data, as illustrated in [Figure 59](#). In Alternative B, the four wires of the spare pairs are used to deliver power over the network. Brocade PoE devices support Alternative A.

The Endspan method is illustrated in [Figure 59](#).

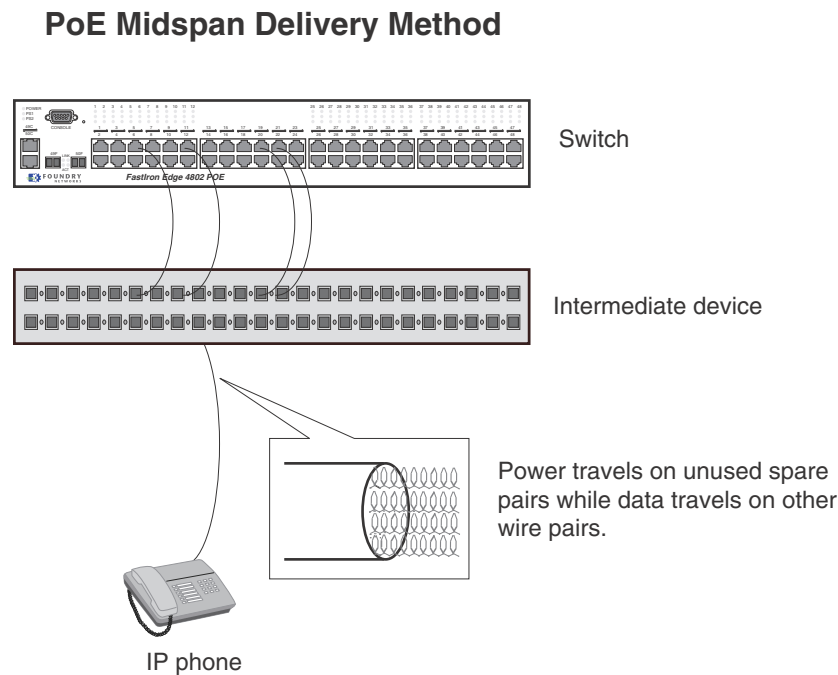

FIGURE 59 PoE Endspan delivery method

PoE midspan method

The PoE Midspan method uses an intermediate device, usually a PD, to inject power into the network. The intermediate device is positioned between the switch and the PD and delivers power over the network using the spare pairs of wires (Alternative B). The intermediate device has multiple channels (typically 6 to 24), and each of the channels has data input and a data-plus-power RJ-45 output connector.

The Midspan method is illustrated in [Figure 60](#).

FIGURE 60 PoE Midspan delivery method

PoE autodiscovery

PoE autodiscovery is a detection mechanism that identifies whether or not an installed device is 802.3af- or 802.3at-compatible. When you plug a device into an Ethernet port that is capable of providing inline power, the autodiscovery mechanism detects whether or not the device requires power and how much power is needed. The autodiscovery mechanism also has a disconnect protection mechanism that shuts down the power once a PD has been disconnected from the network or when a faulty PD has been detected. This feature enables safe installation and prevents high-voltage damage to equipment.

PoE autodiscovery is achieved by periodically transmitting current or test voltages that can detect when a PD is attached to the network. When an 802.3af- or 802.3at-compatible device is plugged into a PoE or PoE+ port, the PD reflects test voltage back to the power sourcing device (the Brocade device), ultimately causing the power to be switched on. Devices not compatible with 802.3af do not reflect test voltage back to the power sourcing device.

Power class

A power class determines the amount of power a PD receives from a PSE. When a valid PD is detected, the Brocade PoE device performs power classification by inducing a specific voltage and measuring the current consumption of the PD. Depending on the measured current, the appropriate class is assigned to the PD. PDs that do not support classification are assigned a class of 0 (zero). [Table 122](#) shows the different power classes and their respective power consumption needs.

TABLE 122 Power classes for PDs

Class	Usage	Power (watts) from Power Sourcing Device	
		Standard PoE	PoE+
0	default	15.4	30
1	optional	4	4
2	optional	7	7
3	optional	15.4	15.4
4	optional	15.4	30

Power specifications

The 802.3af (PoE) standard limits power to 15.4 watts (44 to 50 volts) from the power sourcing device, in compliance with safety standards and existing wiring limitations. Though limited by the 802.3af standard, 15.4 watts of power was ample for most PDs, which consumed an average of 5 to 12 watts of power (IP phones, wireless LAN access points, and network surveillance cameras each consume an average of 3.5 to 9 watts of power). The newer 802.3at (PoE+) standard nearly doubles the power, providing 30 watts (52 or 54 volts) from the power sourcing device.

The PoE power supply provides power to the PoE circuitry block, and ultimately to PoE power-consuming devices. The number of PoE power-consuming devices that one PoE power supply can support depends on the number of watts required by each power-consuming device. Each PoE power supply can provide either 1080 or 2380 watts of power, and each PoE port supports a maximum of either 15.4 or 30 watts of power per power-consuming device. For example, if each PoE power-consuming device attached to a FastIron PoE device consumes 10 watts of power, one 1080 watt power supply will power up to 108 PoE ports. You can install a second PoE power supply for additional PoE power. Power supply specifications are covered in the *Brocade FastIron X Series Chassis Hardware Installation Guide* and in the *Brocade FastIron CX Hardware Installation Guide*.

Dynamic upgrade of PoE power supplies

NOTE

This section applies to the SX 800 and SX 1600 chassis with PoE power supplies.

PoE+ requires higher power levels than standard PoE. In a chassis running software release 07.2.00 or higher, POE power supplies (SX-ACPWR-POE) are upgraded dynamically to 52 or 54 volts, depending on the maximum operating voltage the power supplies are capable of. The preferred voltage mode for PoE+ is 54 volts.

For safety reasons, all PoE power supplies installed in the chassis must operate at the same voltage mode, either 52 volts or 54 volts. The system will select the voltage mode of the power supply with the lowest supported voltage as the voltage mode for all PoE power supplies installed in the chassis. For example, in a FSX 800 chassis with one 52-volt capable PoE power supply and one 54-volt capable PoE power supply, both power supplies will be configured dynamically to operate at 52 volts.

PoE+ voltage selection occurs during each of the following events:

- When the device is powered ON or is rebooted

- When a PoE power supply is installed in the chassis
- When a PoE power supply is removed from the chassis

These events are described in detail in the following sections.

NOTE

A PoE power supply upgrade does not persist beyond a single power cycle. Therefore, an upgrade will occur automatically each time a power supply is re-inserted in the chassis.

You can use the **show inline power detail** command to display detailed information about the PoE power supplies installed in a FastIron PoE device. For more information refer to [“Displaying detailed information about PoE power supplies”](#) on page 678.

CAUTION

The SX-POE-AC-PWR power supply is designed exclusively for use with the Brocade FSX PoE devices. The power supply produces extensive power to support 802.3af and 802.3at applications. Installing the power supply in a device other than the Brocade FSX PoE device will cause extensive damage to your equipment.

Voltage selection during bootup

During bootup, the system will select the voltage mode (either 52 volts or 54 volts) of the power supply with the lowest supported voltage as the voltage mode for all PoE power supplies installed in the chassis. For example, if there is at least one power supply that supports 52 volts maximum, then all power supplies will be configured to operate at 52 volts, even if other supplies are 54 volts-capable. Once the operating voltage is applied, the system will display and log a warning message similar to the following:

```
Brocade(config)#  
Power supply 1 (from left when facing front side) detected.  
Power supply 1 (from left when facing front side) is up.  
WARNING: PoE power supplies in slots 1 are down rev. PoE/PoE+ function will work,  
but output power may be less than 50V under worst case load.
```

If all power supplies are 54 volts-capable, then all power supplies will be configured to operate at 54 volts. In this case, the system will not display or log a warning message.

Voltage selection when a PoE power supply is installed

When a PoE power supply is hotswapped into the chassis, the system will automatically adjust the voltage to match that of the PoE power supply or supplies that are currently installed in the chassis.

The following examples describe how the voltage is selected when a PoE power supply is installed:

- If a 54 volt-capable power supply is installed in a chassis that is operating with 52 volt-capable power supplies, the newly installed power supply will be set to operate at 52 volts.
- If a 54 volt-capable power supply is installed in a chassis that is operating with 54 volt-capable power supplies, the newly installed power supply will be set to operate at 54 volts.

- If a 52 volt-capable power supply is installed in a chassis that is operating with 54 volt-capable power supplies that are actively providing power, the system will reject the newly installed power supply since it cannot safely operate with the 54 volt-capable power supplies. In this case, the 52-volt power supply will be powered OFF and an error message similar to the following will display on the console.

```
Brocade(config)#
Power supply 1 (from left when facing front side) detected.
Power supply 1 (from left when facing front side) is up.
Shutting down power supply in slot 1 because it is not compatible with the
existing PoE power supplies. Please remove and replace.
```

When the system is next reloaded, the power supply voltage will be selected as described in the section [“Voltage selection during bootup”](#) on page 664.

- If a 52 volt-capable power supply is installed in a chassis that is operating with 54 volt-capable power supplies that are *not* actively providing power, the system will configure the power supplies to operate at 52 volts. In this case, the newly installed 52-volt power supply will *not* be powered OFF and a message similar to the following will display on the console.

NOTE: Automatically downgraded all PoE power supplies to 52V.

Voltage selection when a PoE power supply is removed

If a 52 volt PoE power supply is removed from the chassis, the system will survey the remaining power supplies to determine if they are 54 volts-capable. If the remaining supplies are 54 volts-capable and the system is not currently providing power to any PDs, then the software will upgrade the voltage of all supplies to 54 volts. The system will display and log a message similar to the following:

NOTE: Automatically upgraded all PoE power supplies to 54V.

However, if the system is currently providing power to one or more PDs, the system will not upgrade the voltage level. When the system is next reloaded, the power supply voltage will be selected as described in the section [“Voltage selection during bootup”](#) on page 664.

Power over Ethernet cabling requirements

The 802.3af and 802.3at standards currently support PoE and PoE+ on 10/100/1000-Mbps Ethernet ports operating over standard Category 5 unshielded twisted pair (UTP) cable or better. If your network uses cabling categories less than Category 5, you cannot implement PoE without first upgrading your cables to Category 5 UTP cable or better.

Supported powered devices

Brocade PoE devices support a wide range of IP powered devices including the following:

- Voice over IP (VoIP) phones
- Wireless LAN access points
- IP surveillance cameras

The following sections briefly describe these IP powered devices.

VoIP

Voice over IP (VoIP) is the convergence of traditional telephony networks with data networks, utilizing the existing data network infrastructure as the transport system for both services. Traditionally, voice is transported on a network that uses circuit-switching technology, whereas data networks are built on packet-switching technology. To achieve this convergence, technology has been developed to take a voice signal, which originates as an analog signal, and transport it within a digital medium. This is done by devices, such as VoIP telephones, which receive the originating tones and place them in UDP packets, the size and frequency of which is dependant on the coding / decoding (CODEC) technology that has been implemented in the VoIP telephone or device. The VoIP control packets use the TCP/IP format.

IP surveillance cameras

IP surveillance technology provides digital streaming of video over Ethernet, providing real-time, remote access to video feeds from cameras.

The main benefit of using IP surveillance cameras on the network is that you can view surveillance images from any computer on the network. If you have access to the Internet, you can securely connect from anywhere in the world to view a chosen facility or even a single camera from your surveillance system. By using a Virtual Private Network (VPN) or the company intranet, you can manage password-protected access to images from the surveillance system. Similar to secure payment over the Internet, images and information are kept secure and can be viewed only by approved personnel.

Installing PoE firmware

NOTE

The PoE firmware upgrade feature is not supported on FWS devices.

PoE firmware is stored in the PoE controller of the FastIron switch. You can install PoE firmware from the TFTP server on a FastIron switch with the CLI command. To do so, you should have a valid firmware image on the TFTP server.

NOTE

You can install PoE firmware only on one switch at a time. Therefore, to install PoE firmware on a stacking unit, you need to install it individually on every switch of the stack.

NOTE

The CLI syntax to install PoE firmware is different on FSX and FCX platforms.

FSX platform

To install PoE firmware on a FSX platform, enter a command such as the following.

```
Brocade#inline power install-firmware module 1 tftp 10.120.54.161
fsx_poe_07400.fw
```

Syntax: `inline power install-firmware module <slot> tftp <ip-address> <filename>`

Slot refers to the slot of the PoE module.

ip-address refers to the IP address of the TFTP server.

Filename refers to the name of the file, including the pathname.

FCX and ICX platforms

To install PoE firmware on FCX and ICX platforms, enter a command such as the following.

```
Brocade#inline power install-firmware stack-unit 1 tftp 10.120.54.161
fcx_poeplus_07400.fw
```

Syntax: `inline power install-firmware stack-unit <unit-number> tftp <ip-address> <filename>`

Stack-unit refers to the unit-id of the switch. If the switch is not a part of the stack, the unit number will be the default value. The default value for stack-unit is 1.

ip-address refers to the IP address of the tftp server.

Filename refers to the name of the file, including the pathname.

If you want to install firmware on a stack, you need to install firmware on one switch at a time with the above command.

Image file types

This section lists the PoE firmware file types supported and the procedure to install them on the FCX, ICX, and FSX devices.

TABLE 123 PoE Firmware files

Product	PoE Firmware ¹
FESX FSX 800 FSX 1600	fsx_poe_07400.fw
FSX 800 with SX-FI648PP module FSX 1600 with SX-FI648PP module	fsx_poeplus_07400.fw
FCX ICX 6610	fcx_poeplus_07400.fw
ICX 6430 ICX 6450	icx64XX_poeplus_07400.fw

1. The firmware files are specific to these devices only and are not interchangeable. For example, you cannot load FCX PoE firmware on a FSX device, and vice versa.

Installing PoE firmware

1. Place the PoE firmware on a TFTP server to which the Brocade device has access.
2. Copy the PoE firmware from the TFTP server into the switch. To do so, enter a command such as the following.

```
Brocade#inline power install-firmware module 1 tftp 10.120.54.161
fsx_poe_07400.fw
```

The process of PoE installation begins. You should see output similar to the following.

```
PoE Info: Loading firmware from TFTP file fsx_poe_07400.fw.....
```

```
PoE Info: Firmware in PoE module(s) in slot 1 will be installed now.
```

```
PoE Warning: Upgrading firmware in slot 1....DO NOT HOTSWAP OR POWER DOWN THE
MODULE.
```

```
PoE Info: FW Download on slot 1 module 1...(re)sending download command...
PoE Info: FW Download on slot 1 module 1...TPE response received.

1 in slot 1.
PoE Info: Programming Brocade defaults. Step 3: Writing user byte 0xf0 on
module 1 in slot 1.
PoE Info: Programming Brocade defaults. Step 4: Saving settings on module 1 in
slot 1.
PoE Info: Programming Brocade defaults on module 1 in slot 1.....completed.
```

NOTE

If you are attempting to transfer a file using TFTP but have received an error message, refer to [“Diagnostic error codes and remedies for TFTP transfers”](#) on page 93.

PoE and CPU utilization

Depending on the number of PoE-configured ports that have powered power devices, there may be a slight and noticeable increase of up to 15 percent in CPU utilization. In typical scenarios, this is normal behavior for PoE and does not affect the functionality of other features on the switch.

Enabling and disabling Power over Ethernet

To enable a port to receive inline power for power consuming devices, enter commands such as the following.

```
Brocade#configure terminal
Brocade(config)# interface ethernet 1/1
Brocade(config-if-e1000-1/1)# inline power
```

After entering the above commands, the console displays the following message.

```
Brocade(config-if-e1000-1/1)#PoE Info: Power enabled on port 1/1.
```

Syntax: [no] inline power

Use the **no** form of the command to disable the port from receiving inline power.

NOTE

Inline power should not be configured between two switches as it may cause unexpected behavior.

NOTE

FastIron PoE and PoE+ devices can automatically detect whether or not a power consuming device is 802.3af- or 802.3at-compliant.

Disabling support for PoE legacy power-consuming devices

Brocade PoE devices automatically support most legacy power consuming devices (devices not compliant with 802.3af 802.3at), as well as all 802.3af- and 802.3at-compliant devices. If desired, you can disable and re-enable support for legacy PoE power consuming devices on a global basis (on the entire device) or on individual slots (chassis devices only). When you disable legacy support, 802.3af- and 802.3at-compliant devices are not affected.

To disable support for legacy power consuming devices on a non-stackable device, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)# no legacy-inline-power
```

To disable support for legacy power consuming devices on a stackable device, enter the following command at the stack unit CONFIG level of the CLI.

```
Brocade(config-unit-2)# no legacy-inline-power
```

On chassis devices, you can disable support for legacy power consuming devices per slot. To disable legacy support on all ports in slot 2, enter the following command at the global CONFIG level of the CLI.

```
Brocade(config)# no legacy-inline-power 2
```

NOTE

The **no legacy-inline-power** command does not require a software reload if it is entered prior to connecting the PDs. If the command is entered after the PDs are connected, the configuration must be saved (**write memory**) and the software reloaded after the change is placed into effect.

Syntax: [no] legacy-inline-power [<slotnum>]

To re-enable support for legacy power consuming devices after it has been disabled, enter the **legacy-inline-power** command (without the **no** parameter).

The `<slotnum>` variable is required on chassis devices when disabling or re-enabling legacy support on a slot.

Use the **show run** command to view whether support for PoE legacy power consuming devices is enabled or disabled.

Enabling the detection of PoE power requirements advertised through CDP

Many power consuming devices, such as Cisco VoIP phones and other vendors' devices, use the Cisco Discovery Protocol (CDP) to advertise their power requirements to power sourcing devices, such as Brocade PoE devices. Brocade power sourcing equipment is compatible with Cisco and other vendors' power consuming devices; they can detect and process power requirements for these devices automatically.

NOTE

If you configure a port with a maximum power level or a power class for a power consuming device, the power level or power class will take precedence over the CDP power requirement. Therefore, if you want the device to adhere to the CDP power requirement, do not configure a power level or power class on the port.

Command syntax for PoE power requirements

To enable the Brocade device to detect CDP power requirements, enter the following commands.

```
Brocade# configure terminal
Brocade(config)# cdp run
```

Syntax: `[no] cdp run`

Use the **no** form of the command to disable the detection of CDP power requirements.

Setting the maximum power level for a PoE power-consuming device

When PoE is enabled on a port to which a power consuming device or PD is attached, by default, a Brocade PoE device will supply 15.4 watts of power at the RJ-45 jack, minus any power loss through the cables. A PoE+ device will supply either 15.4 or 30 watts of power (depending on the type of PD connected to the port), minus any power loss through the cables. For example, a PoE port with a default maximum power level of 15.4 watts will receive a maximum of 12.95 watts of power after 2.45 watts of power loss through the cable. This is compliant with the IEEE 802.3af and 802.3at specifications for delivering inline power. Devices that are configured to receive less PoE power, for example, 4.0 watts of power, will experience a lower rate of power loss through the cable.

If desired, you can manually configure the maximum amount of power that the Brocade PoE device will supply at the RJ-45 jack.

Setting power levels configuration note

Consider the following when enabling this feature:

- There are two ways to configure the power level for a PoE or PoE+ power consuming device. The first method is discussed in this section. The other method is provided in the section [“Setting the power class for a PoE power- consuming device”](#) on page 672. For each PoE port, you can configure either a maximum power level or a power class. You cannot configure both. You can, however, configure a maximum power level on one port and a power class on another port.
- The Brocade PoE or PoE+ device will adjust the power on a port only if there are available power resources. If power resources are not available, the following message will display on the console and in the Syslog:

```
PoE: Failed power allocation of 30000 mwatts on port 1/1/21. Will retry when  
more power budget.
```

Configuring power levels command syntax

To configure the maximum power level for a power consuming device, enter commands such as the following.

```
Brocade#configure terminal  
Brocade(config)# interface ethernet 1/1  
Brocade(config-if-e1000-1/1)# inline power power-limit 14000
```

These commands enable inline power on interface ethernet 1 in slot 1 and set the PoE power level to 14,000 milliwatts (14 watts).

Syntax: `inline power power-limit <power level>`

The `<power level>` variable is the maximum power level in number of milliwatts. The following values are supported:

- PoE – Enter a value from 1000 through 15,400. The default is 15,400.
- PoE+ – Enter a value from 1000 through 30,000. The default is 30,000.

NOTE

Do not configure a power level higher than 15,400 for standard PoE PDs, which support a maximum of 15,400 milliwatts. Setting the power level higher than 15,400 could damage the PD.

For information about resetting the maximum power level, refer to [“Resetting PoE parameters”](#) on page 675.

Setting the power class for a PoE power- consuming device

A power class specifies the maximum amount of power that a Brocade PoE or PoE+ device will supply to a power consuming device. [Table 124](#) shows the different power classes and their respective maximum power allocations.

TABLE 124 Power classes for PDs

Class	Usage	Power (watts) from Power Sourcing Device	
		Standard PoE	PoE+
0	default	15.4	30
1	optional	4	4
2	optional	7	7
3	optional	15.4	15.4
4	optional	15.4	30

Setting the power class configuration notes

Consider the following points when setting the power class for a PoE power-consuming device.

- The power class sets the maximum power level for a power consuming device. Alternatively, you can set the maximum power level as instructed in the section [“Setting the maximum power level for a PoE power- consuming device”](#) on page 670. For each PoE port, you can configure either a power class or a maximum power level. You cannot configure both. You can, however, configure a power level on one port and a power class on another port.
- The power class includes any power loss through the cables. For example, a PoE port with a power class of 3 (15.4 watts) will receive a maximum of 12.95 watts of power after 2.45 watts of power loss through the cable. This is compliant with the IEEE 802.3af and 802.3at specifications for delivering inline power. Devices that are configured to receive less PoE power, for example, class 1 devices (4.0 watts), will experience a lower rate of power loss through the cable.
- The Brocade PoE or PoE+ device will adjust the power on a port only if there are available power resources. If power resources are not available, the following message will display on the console and in the Syslog:

```
PoE: Failed power allocation of 30000 mwatts on port 1/1/21. Will retry when
more power budget.
```

Setting the power class command syntax

To configure the power class for a PoE power consuming device, enter commands such as the following.

```
Brocade# configure terminal
Brocade(config)# interface ethernet 1/1
Brocade(config-if-e1000-1/1)# inline power power-by-class 2
```

These commands enable inline power on interface ethernet 1 in slot 1 and set the power class to 2.

Syntax: `inline power power-by-class <class value>`

The *<class value>* variable is the power class. Enter a value between 0 and 4. The default is 0.

[Table 124](#) shows the different power classes and their respective maximum power allocations.

NOTE

Do not configure a class value of 4 on a PoE+ port on which a standard PoE PD is connected. Standard PoE PDs support a maximum of 15.4 watts. Setting the power class value to 4 (30 watts) could damage the PD.

For information about resetting the power class, refer to [“Resetting PoE parameters”](#) on page 675.

Setting the power budget for a PoE interface module

By default, each PoE and PoE+ interface module has a maximum power budget of 65535 watts. If desired, you can change the amount of power allocated to each PoE and PoE+ interface module installed in the chassis. To do so, enter a command such as the following.

```
Brocade(config)# inline power budget 150000 module 7
```

This command allocates 150000 milliwatts (150 watts) to the PoE interface module in slot 7. The command takes effect immediately. The results are displayed in the “power budget” column in the **show inline power detail** output. The configuration (`inline power budget 150000 module 7`) is displayed in the **show running-config** output.

Syntax: `inline power budget <num> module <slot>`

The *<num>* variable is the number of milliwatts to allocate to the module. Enter a value from 0 through 65535000.

The *<slot>* variable specifies the where the PoE or PoE+ module resides in the chassis.

Setting the inline power priority for a PoE port

Each PoE power supply can provide either 1080 or 2380 watts of power, and each PoE port receives a maximum of 15.4 watts of power per PoE power-consuming device, or a maximum of 30 watts of power per PoE+ power-consuming device, minus any power loss through the cable. The power capacity of one or two PoE power supplies is shared among all PoE power consuming devices attached to the FastIron PoE device.

In a configuration where PoE power consuming devices collectively have a greater demand for power than the PoE power supply or supplies can provide, the FastIron PoE device must place the PoE ports that it cannot power in *standby* or *denied* mode (waiting for power) until the available power increases. The available power increases when one or more PoE ports are powered down, or, if applicable, when an additional PoE power supply is installed in the FastIron PoE device.

When PoE ports are in *standby* or *denied* mode (waiting for power) and the FastIron PoE device receives additional power resources, by default, the device will allocate newly available power to the standby ports in priority order, with the highest priority ports first, followed by the next highest priority ports, and so on. Within a given priority, standby ports are considered in ascending order, by

slot number then by port number, provided enough power is available for the ports. For example, PoE port 1/11 should receive power before PoE port 2/1. However, if PoE port 1/11 needs 12 watts of power and PoE port 2/1 needs 10 watts of power, and 11 watts of power become available on the device, the FastIron PoE device will allocate the power to port 2/1 because it does not have sufficient power for port 1/11.

You can configure an *inline power priority* on PoE ports, whereby ports with a higher inline power priority will take precedence over ports with a low inline power priority. For example, if a new PoE port comes online and the port is configured with a high priority, if necessary (if power is already fully allocated to power consuming devices), the FastIron PoE device will remove power from a PoE port or ports that have a lower priority and allocate the power to the PoE port that has the higher value.

Ports that are configured with the same inline power priority are given precedence based on the slot number and port number in ascending order, provided enough power is available for the port. For example, if both PoE port 1/2 and PoE port 2/1 have a high inline power priority value, PoE port 1/2 will receive power before PoE port 2/1. However, if PoE port 1/2 needs 12 watts of power and PoE port 2/1 needs 10 watts of power, and 11 watts of power become available on the device, the FastIron PoE device will allocate the power to PoE port 2/1 because it does not have sufficient power for port 1/2. By default, all ports are configured with a low inline power priority.

Command syntax for setting the inline power priority for a PoE port

To configure an inline power priority for a PoE port on a FastIron PoE device, enter commands such as the following.

```
Brocade#configure terminal
Brocade(config)# interface ethernet 1/1
Brocade(config-if-e1000-1/1)# inline power priority 2
```

These commands enable inline power on interface ethernet 1 in slot 1 and set the inline power priority level to high.

Syntax: [no] **inline power priority** <priority num>

The **priority** <priority num> parameter is the inline power priority number. The default is 3 (low priority). You can specify one of the following values:

- 3 – Low priority
- 2 – High priority
- 1 – Critical priority

Use the **inline power** command (without a priority number) to reset a port priority to the default (low) priority.

Use the **no inline power** command to disable the port from receiving inline power.

For information about resetting the inline power priority, refer to [“Resetting PoE parameters”](#) on page 675.

To view the inline power priority for all PoE ports, issue the **show inline power** command at the Privileged EXEC level of the CLI. Refer to [“Displaying PoE operational status”](#) on page 675.

Resetting PoE parameters

NOTE

Resetting PoE parameters applies to the FastIron X Series PoE chassis.

You can override or reset PoE port parameters including power priority, power class, and maximum power level. To do so, you must specify each PoE parameter in the CLI command line. This section provides some CLI examples.

Example 1—Changing a PoE port power priority from high to low

To change a PoE port power priority from high to low (the default value) and keep the current maximum configured power level of 3000, enter commands such as the following.

```
Brocade# configure terminal
Brocade(config)# interface ethernet 1/1
Brocade(config-if-e1000-1/1)# inline power priority 3 power-limit 3000
```

You must specify both the inline power priority and the maximum power level (**power-limit** command), even though you are keeping the current configured maximum power level at 3000. If you do not specify the maximum power level, the device will apply the default value. Also, you must specify the inline power priority before specifying the power limit.

Example 2—Changing a port power class from 2 to 3

To change a port power class from 2 (7 watts maximum) to 3 (15.4 watts maximum) and keep the current configured power priority of 2, enter commands such as the following.

```
Brocade#configure terminal
Brocade(config)# interface ethernet 1/1
Brocade(config-if-e1000-1/1)# inline power priority 2 power-by-class 3
```

You must specify both the power class and the inline power priority, even though you are not changing the power priority. If you do not specify the power priority, the device will apply the default value of 3 (low priority). Also, you must specify the inline power priority before specifying the power class.

Displaying Power over Ethernet information

This section lists the CLI commands for viewing PoE information.

Displaying PoE operational status

The **show inline power** command displays operational information about Power over Ethernet.

You can view the PoE operational status for the entire device, for a specific PoE module only, or for a specific interface only. In addition, you can use the **show inline power detail** command to display in-depth information about PoE power supplies.

The following shows an example of the **show inline power** display output on a Brocade PoE device.

Displaying Power over Ethernet information

Brocade#show inline power

Grand Total 1846673 2127400

Syntax: show inline power [<port>]

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Table 125 provides definitions for the **show inline power** command.

TABLE 125 Field definitions for the **show inline power** command

Column	Definition
Power Capacity	The total PoE power supply capacity and the amount of available power (current free) for PoE power consuming devices. Both values are shown in milliwatts.
Power Allocations	The number of times the FSX fulfilled PoE requests for power.
Port	The slot number and port number.
Admin State	Specifies whether or not Power over Ethernet has been enabled on the port. This value can be one of the following: <ul style="list-style-type: none"> On – The inline power command was issued on the port. Off – The inline power command has not been issued on the port.
Oper State	Shows the status of inline power on the port. This value can be one of the following: <ul style="list-style-type: none"> On – The PoE power supply is delivering inline power to the PD. Off – The PoE power supply is not delivering inline power to the PD. Denied – The port is in standby mode (waiting for power) because the FSX does not currently have enough available power for the port. <p>NOTE: When you enable a port using the CLI, it may take 12 or more seconds before the operational state of that port is displayed correctly in the show inline power output.</p>
Power Consumed	The number of current, actual milliwatts that the PD is consuming.
Power Allocated	The number of milliwatts allocated to the port. This value is either the default or configured maximum power level, or the power class that was automatically detected by the device.
PD Type	The type of PD connected to the port. This value can be one of the following: <ul style="list-style-type: none"> 802.3at – The PD connected to this port is 802.3at-compliant. 802.3af – The PD connected to this port is 802.3af-compliant. Legacy – The PD connected to this port is a legacy product (not 802.3af-compliant). N/A – Power over Ethernet is configured on this port, and one of the following is true: <ul style="list-style-type: none"> The device connected to this port is a non-powered device. No device is connected to this port. The port is in <i>standby</i> or <i>denied</i> mode (waiting for power).
PD Class	Determines the maximum amount of power a PD receives. Table 124 shows the different power classes and their respective maximum power allocations. This field can also be “Unknown”, meaning the device attached to the port cannot advertise its power class. <p>NOTE: If an 802.3at PD with a class 4 value is connected, the Brocade FastIron switch will not be able to do the power negotiation since these switches cannot handle the 802.3at LLDP.</p>
Pri	The port <i>in-line power priority</i> , which determines the order in which the port will receive power while in <i>standby</i> mode (waiting for power). Ports with a higher priority will receive power before ports with a low priority. This value can be one of the following: <ul style="list-style-type: none"> 3 – Low priority 2 – High priority 1 – Critical priority

TABLE 125 Field definitions for the show inline power command (Continued)

Column	Definition
Fault/Error	<p>If applicable, this is the fault or error that occurred on the port. This value can be one of the following:</p> <ul style="list-style-type: none"> critical temperature – The PoE chip temperature limit rose above the safe operating level, thereby powering down the port. detection failed - discharged capacitor – The port failed capacitor detection (legacy PD detection) because of a discharged capacitor. This can occur when connecting a non-PD on the port. detection failed - out of range capacitor – The port failed capacitor detection (legacy PD detection) because of an out-of-range capacitor value. This can occur when connecting a non-PD on the port. internal h/w fault – A hardware problem has hindered port operation. lack of power – The port has shut down due to lack of power. main supply voltage high – The voltage was higher than the maximum voltage limit, thereby tripping the port. main supply voltage low – The voltage was lower than the minimum voltage limit, thereby tripping the port. overload state – The PD consumes more power than the maximum limit configured on the port, based on the default configuration, user configuration, or CDP configuration. over temperature – The port temperature rose above the temperature limit, thereby powering down the port. PD DC fault – A succession of underload and overload states, or a PD DC/DC fault, caused the port to shutdown. short circuit – A short circuit was detected on the port delivering power. underload state – The PD consumes less power than the minimum limit specified in the 802.3af standard. voltage applied from ext src – The port failed capacitor detection (legacy PD detection) because the voltage applied to the port was from an external source.
Total	The total power in milliwatts being <i>consumed</i> by all PDs connected to the Interface module, and the total power in milliwatts <i>allocated</i> to all PDs connected to the Interface module.
Grand Total	The total number of current, actual milliwatts being <i>consumed</i> by all PDs connected to the FastIron PoE device, and the total number of milliwatts <i>allocated</i> to all PDs connected to the FastIron PoE device.

Displaying detailed information about PoE power supplies

The **show inline power detail** command displays detailed operational information about the PoE power supplies in Brocade PoE switches. The command output differs on FCX POE+ switches compared to FastIron X Series switches.

The following is an example of the **show inline power detail** command output on an FCX POE+ switch.

```

Brocade#FCX#show inline power detail

Slot	#Ports Pri: 1	#Ports Pri: 2	#Ports Pri: 3	Power Consumption	Power Allocation	Power Budget
3	0	0	48	513.90 W	739.200 W	65535.0 W
4	0	0	48	1346.497 W	1440.0 W	65535.0 W
6	0	0	24	0.0 W	0.0 W	65535.0 W
7	0	0	48	43.72 W	61.600 W	65535.0 W
8	0	0	24	0.0 W	0.0 W	65535.0 W
Total:0	0	0	192	1902.659 W	2240.800 W	327675.0 W

Syntax: show inline power detail

[Table 126](#) provides definitions for the statistics displayed in the **show inline power detail** command.

TABLE 126 Field definitions for the **show inline power detail** command

Column	Definition
Power supply data	
PoE+ Max Operating Voltage	This field is applicable to FastIron PoE+ chassis devices only. It displays the maximum operating voltage supported by the PoE power supply. Possible values are: <ul style="list-style-type: none"> 52 V 54 V
Model Number	The manufacturing part number of the PoE power supply. Possible values are: <ul style="list-style-type: none"> 32016000 32007000
Serial Number	The serial number of the PoE power supply, for example, AA100730213.
Firmware Ver	The PoE power supply firmware version.
Test Date	The PoE power supply firmware test date in the format mm/dd/yyyy.
H/W Status	The PoE power supply hardware status code. This field is used by Brocade Technical Support for troubleshooting.
Max Curr	The PoE power supply maximum current capacity.
Voltage	The PoE power supply current input voltage.
Capacity	The PoE power supply total power capacity (in watts).
PoE Capacity	The PoE power supply PoE power capacity (in watts).
Consumption	The total number of watts consumed by PoE power consuming devices and PoE modules in the system, plus any internal or cable power loss. <p>NOTE: Under the lower total inline power consumption level by Powered Devices (PDs) on FastIron SX devices, the power consumption displayed by the power supply units (PSUs) is inaccurately displayed as lower than the actual power consumption of the PSUs due to the sensitivity limitations of power supply measurements.</p>
General PoE data	
Slot	The Interface module / slot number.

TABLE 126 Field definitions for the **show inline power detail** command (Continued)

Column	Definition
Firmware Version	The Interface module / slot number firmware version.
Cumulative port state data	
NOTE: When you enable a port using the CLI, it may take 12 or more seconds before the operational state of that port is displayed correctly in the show inline power output.	
Slot	The Interface module / slot number.
#Ports Admin-On	The number of ports on the Interface module on which the inline power command was issued.
#Ports Admin-Off	The number of ports on the Interface module on which the inline power command was not issued.
#Ports Oper-On	The number of ports on the Interface module that are receiving inline power from the PoE power supply.
#Ports Oper-Off	The number of ports on the Interface module that are not receiving inline power from the PoE power supply.
#Ports Off-Denied	The number of ports on the Interface module that were denied power because of insufficient power.
#Ports Off-No-PD	The number of ports on the Interface module to which no PDs are connected.
#Ports Off-Fault	The number of ports on the Interface module that are not receiving power because of a subscription overload.
Total	The totals for all of the fields in the Cumulative Port State Data report.
Cumulative port power data	
Slot	The Interface module / slot number.
#Ports Pri: 1	The number of PoE ports on the Interface module that have a PoE port priority of 1.
#Ports Pri: 2	The number of PoE ports on the Interface module that have a PoE port priority of 2.
#Ports Pri: 3	The number of PoE ports on the Interface module that have a PoE port priority of 3.
Power Consumption	The total number of watts consumed by PoE power consuming devices, plus any cable loss.
Power Allocation	The number of watts allocated to the Interface module PoE ports. This value is the sum of the ports' default or configured maximum power levels, or power classes automatically detected by the FastIron PoE device.
Power Budget	The power budget allocated to the slot. The default value is 65535 watts. Any other value indicates that the power budget was configured using the CLI command inline power budget .
Total	The totals for all of the fields in the Cumulative Port Power Data report.

Displaying Power over Ethernet information

UDLD and Protected Link Groups

Table 127 lists the individual Brocade FastIron switches and the Uni-Directional Link Detection (UDLD) and protected link group features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 127 Supported UDLD and protected link group features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Uni-directional Link Detection (UDLD) (Link keepalive)	Yes	Yes	Yes	Yes	Yes
UDLD on tagged ports	Yes	Yes	Yes	Yes	Yes
Protected link groups	Yes	Yes	Yes	Yes	Yes

UDLD overview

Uni-Directional Link Detection (UDLD) monitors a link between two Brocade devices and brings the ports on both ends of the link down if the link goes down at any point between the two devices. This feature is useful for links that are individual ports and for trunk links. Figure 61 shows an example.

FIGURE 61 UDLD example

When link keepalive is enabled, the feature brings down the FastIron ports connected to the failed link.

Normally, a Brocade device load balances traffic across the ports in a trunk group. In this example, each Brocade device load balances traffic across two ports. Without the UDLD feature, a link failure on a link that is not directly attached to one of the Brocade devices is undetected by the Brocade devices. As a result, the Brocade devices continue to send traffic on the ports connected to the failed link.

When UDLD is enabled on the trunk ports on each Brocade device, the devices detect the failed link, disable the ports connected to the failed link, and use the remaining ports in the trunk group to forward the traffic.

Ports enabled for UDLD exchange proprietary health-check packets once every second (the keepalive interval). If a port does not receive a health-check packet from the port at the other end of the link within the keepalive interval, the port waits for two more intervals. If the port still does not receive a health-check packet after waiting for three intervals, the port concludes that the link has failed and takes the port down.

UDLD for tagged ports

The default implementation of UDLD sends the packets untagged, even across tagged ports. If the untagged UDLD packet is received by a third-party switch, that switch may reject the packet. As a result, UDLD may be limited only to Brocade devices, since UDLD may not function on third-party switches.

To solve this issue, you can configure ports to send out UDLD control packets that are tagged with a specific VLAN ID. This feature also enables third party switches to receive the control packets that are tagged with the specified VLAN. For tagged operation, all of the following conditions must be met:

- A VLAN is specified when UDLD is configured
- The port belongs to the configured VLAN as tagged member
- All the devices across the UDLD link are in the same VLAN

For configuration details, refer to [“Enabling UDLD for tagged ports”](#) on page 687.

Configuration notes and feature limitations for UDLD

- UDLD is supported only on Ethernet ports.
- UDLD can be enabled on only one VLAN for tagged port.
- To configure UDLD on a trunk group, you must enable and configure the feature on each port of the group individually. Configuring UDLD on a trunk group primary port enables the feature on that port only.
- When UDLD is enabled on a trunk port, trunk threshold is not supported.
- Dynamic trunking is not supported. If you want to configure a trunk group that contains ports on which UDLD is enabled, you must remove the UDLD configuration from the ports. After you create the trunk group, you can re-add the UDLD configuration.
- If MRP is also enabled on the device, Brocade recommends that you set the MRP preforwarding time slightly higher than the default of 300 ms; for example, to 400 or 500 ms. Refer to [“Changing the hello and preforwarding times”](#) on page 627.

Enabling UDLD

NOTE

This section shows how to configure UDLD for untagged control packets. To configure UDLD for tagged control packets, refer to [“Enabling UDLD for tagged ports”](#).

To enable UDLD on a port, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#link-keepalive ethernet 0/1/1
```

To enable the feature on a trunk group, enter commands such as the following.

```
Brocade(config)#link-keepalive ethernet 0/1/1 ethernet 0/1/2
Brocade(config)#link-keepalive ethernet 0/1/3 ethernet 0/1/4
```

Syntax: [no] link-keepalive ethernet <port> [to <port> | ethernet <port>]

This command is not supported if you downgrade the device to FCX 6.0 or FSX5.1. In this case, use the following command to configure multiple ports:

Syntax: [no] link-keepalive ethernet <port> [ethernet <port>]

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Enabling UDLD for tagged ports

To enable ports to receive and send UDLD control packets tagged with a specific VLAN ID, enter commands such as the following.

```
Brocade(config)#link-keepalive ethernet 1/18 vlan 22
```

This command enables UDLD on port 1/18 and allows UDLD control packet tagged with VLAN 22 to be received and sent on port 1/18.

Syntax: [no] link-keepalive ethernet <port> [vlan <vlan-ID>]

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

For the <vlan-ID> variable, enter the ID of the VLAN that the UDLD control packets can contain to be received and sent on the port. If a VLAN ID is not specified, then UDLD control packets are sent out of the port as untagged packets.

NOTE

You must configure the same VLANs that will be used for UDLD on all devices across the network; otherwise, the UDLD link cannot be maintained.

Changing the Keepalive interval

By default, ports enabled for UDLD send a link health-check packet once every 500 ms. You can change the interval to a value from 1 – 60, where 1 is 100 ms, 2 is 200 ms, and so on. To change the interval, enter a command such as the following.

```
Brocade(config)#link-keepalive interval 3
```

Syntax: [no] link-keepalive interval <num>

The <num> parameter specifies how often the ports send a UDLD packet. You can specify from 1 – 60, in 100 ms increments. The default is 5 (500 ms).

Changing the Keepalive retries

By default, a port waits one second to receive a health-check reply packet from the port at the other end of the link. If the port does not receive a reply, the port tries four more times by sending up to four more health-check packets. If the port still does not receive a reply after the maximum number of retries, the port goes down.

You can change the maximum number of keepalive attempts to a value from 3 – 64. To change the maximum number of attempts, enter a command such as the following.

```
Brocade(config)#link-keepalive retries 4
```

Syntax: [no] link-keepalive retries <num>

The <num> parameter specifies the maximum number of times the port will try the health check. You can specify a value from 3 – 64. The default is 7.

Displaying UDLD information

This section describes the commands used to display information about a UDLD configuration.

Displaying information for all ports

To display UDLD information for all ports, enter the following command.

```
Brocade#show link-keepalive
Total link-keepalive enabled ports: 4
Keepalive Retries: 3      Keepalive Interval: 1 Sec.
```

Port	Physical Link	Logical Link	State	Link-vlan
4/1	up	up	FORWARDING	3
4/2	up	up	FORWARDING	
4/3	down	down	DISABLED	
4/4	up	down	DISABLED	

Syntax: show link-keepalive

TABLE 128 CLI display of UDLD information

Field	Description
Total link-keepalive enabled ports	The total number of ports on which UDLD is enabled.
Keepalive Retries	The number of times a port will attempt the health check before concluding that the link is down.

TABLE 128 CLI display of UDLD information (Continued)

Field	Description
Keepalive Interval	The number of seconds between health check packets.
Port	The port number.
Physical Link	The state of the physical link. This is the link between the Brocade port and the directly connected device.
Logical Link	The state of the logical link. This is the state of the link between this Brocade port and the Brocade port on the other end of the link.
State	The traffic state of the port.
Link-vlan	The ID of the tagged VLAN in the UDLD packet.

If a port is disabled by UDLD, the change also is indicated in the output of the **show interfaces brief** command. An example is given below.

```
Brocade#show interfaces brief
```

Port	Link	State	Dupl	Speed	Trunk	Tag	Priori	MAC	Name
1/1	Up	LK-DISABLE	None	None	None	No	level0	00e0.52a9.bb00	
1/2	Down	None	None	None	None	No	level0	00e0.52a9.bb01	
1/3	Down	None	None	None	None	No	level0	00e0.52a9.bb02	
1/4	Down	None	None	None	None	No	level0	00e0.52a9.bb03	

If the port was already down before you enabled UDLD for the port, the port state is listed as None.

Syntax: **show interfaces brief**

Displaying information for a single port

To display detailed UDLD information for a specific port, enter a command such as the following.

```
Brocade#show link-keepalive ethernet 4/1
```

Current State	: up	Remote MAC Addr	: 00e0.52d2.5100
Local Port	: 4/1	Remote Port	: 2/1
Local System ID	: e0927400	Remote System ID	: e0d25100
Packets sent	: 254	Packets received	: 255
Transitions	: 1	Link-vlan	: 100
Port blocking	: No	BM disabled	: No

Syntax: **show link-keepalive [ethernet [<slotnum>]/<portnum>]**

TABLE 129 CLI display of detailed UDLD information

Field	Description
Current State	The state of the logical link. This is the link between this Brocade port and the Brocade port on the other end of the link.
Remote MAC Addr	The MAC address of the port or device at the remote end of the logical link.
Local Port	The port number on this Brocade device.
Remote Port	The port number on the Brocade device at the remote end of the link.

TABLE 129 CLI display of detailed UDLD information (Continued)

Field	Description
Local System ID	A unique value that identifies this Brocade device. The ID can be used by Brocade technical support for troubleshooting.
Remote System ID	A unique value that identifies the Brocade device at the remote end of the link.
Packets sent	The number of UDLD health-check packets sent on this port.
Packets received	The number of UDLD health-check packets received on this port.
Transitions	The number of times the logical link state has changed between up and down.
Port blocking	Information used by Brocade technical support for troubleshooting.
Link-vlan	The ID of the tagged VLAN in the UDLD packet.
BM disabled	Information used by Brocade technical support for troubleshooting.

The **show interface ethernet** command also displays the UDLD state for an individual port. In addition, the line protocol state listed in the first line will say “down” if UDLD has brought the port down. An example is given below.

```
Brocade#show interface ethernet 1/1
FastEthernet1/1 is down, line protocol is down, link keepalive is enabled
  Hardware is FastEthernet, address is 00e0.52a9.bbca (bia 00e0.52a9.bbca)
  Configured speed auto, actual unknown, configured duplex fdx, actual unknown
  Member of L2 VLAN ID 1, port is untagged, port state is DISABLED
  STP configured to ON, priority is level0, flow control enabled
  mirror disabled, monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  300 second output rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 input errors, 0 CRC, 0 frame, 0 ignored
  0 runts, 0 giants, DMA received 0 packets
  19 packets output, 1216 bytes, 0 underruns
  Transmitted 0 broadcasts, 19 multicasts, 0 unicasts
  0 output errors, 0 collisions, DMA transmitted 19 packets
```

In this example, the port has been brought down by UDLD. Notice that in addition to the information in the first line, the port state on the fourth line of the display is listed as DISABLED.

Clearing UDLD statistics

To clear UDLD statistics, enter the following command.

```
Brocade#clear link-keepalive statistics
```

Syntax: clear link-keepalive statistics

This command clears the Packets sent, Packets received, and Transitions counters in the **show link keepalive ethernet** [*<slotnum>/<portnum>*] display.

Protected link groups

A protected link group minimizes disruption to the network by protecting critical links from loss of data and power. In a protected link group, one port in the group acts as the primary or active link, and the other ports act as secondary or standby links. The active link carries the traffic. If the active link goes down, one of the standby links takes over.

During normal operation, the active port in a protected link group is enabled and the standby ports are logically disabled. If the active port fails, the Brocade device immediately enables one of the standby ports, and switches traffic to the standby port. The standby port becomes the new, active port.

About active ports

When you create a protected link group, you can optionally specify which port in the protected link group is the active port. If you do not explicitly configure an active port, the Brocade device dynamically assigns one. A dynamic active port is the first port in the protected link group that comes up (usually the lowest numbered port in the group).

Static and dynamic active ports operate as follows:

- A static active port (an active port that you explicitly configured) pre-empt other ports in the protected link group. So, if a static active link comes back up after a failure, the Brocade device will revert to this link as the active link.
- A dynamic active port (an active port assigned by the software) is non-pre-emptive. Therefore, if a dynamic active link comes back up after a failure, the Brocade device does not revert to this link, but continues carrying traffic on the current active link.

Using UDLD with protected link groups

You can use UDLD with protected link groups to detect uni-directional link failures and to improve the speed at which the device detects a failure in the link. Use UDLD and protected link groups simultaneously when the FastIron X Series device is connected to a device with slower link detection times.

NOTE

When UDLD and protected links are configured on a port and the link goes down, protected links will not come up after UDLD becomes “healthy” again without first physically disabling then re-enabling the link.

UDLD with protected link groups configuration notes

- You can configure a maximum of 32 protected link groups.
- There is no restriction on the number of ports in a protected link group.
- Each port can belong to one protected link group at a time.
- On FastIron X Series devices, there is no restriction on the type of ports in a protected link group. FastIron X Series devices support protected link groups consisting of 10-GbE ports, Gbps fiber ports, 10/100/1000 copper ports, and 10/100 ports, or any combination thereof.

- FastIron WS and Brocade FCX Series devices support protected link groups consisting of Gbps fiber ports, 10/100/1000 copper ports, and 10/100 ports, or any combination thereof. These devices do not support protected link groups on 10-GbE ports.
- This feature is supported with tagged and untagged ports.
- This feature is supported with trunk ports.
- The protected link groups feature is not supported with LACP.
- There is no restriction on the properties of ports in a protected link group. For example, member ports can be in the same VLAN or in different VLANs.
- When two switches are connected together with links in a protected link group, and the ports connecting the switches together are part of a protected link group, you must configure two connecting ports (one port on each switch) as active ports of the protected link group. The following example illustrates this scenario.

The configuration for the above illustration is as follows.

Switch 1

```
Brocade(config)# protected-link-group 1 e 1/3 e 1/6
Brocade(config)# protected-link-group 1 active-port 1/3
```

Switch 2

```
Brocade(config)# protected-link-group 1 e 1/12 e 1/15
Brocade(config)# protected-link-group 1 active-port 1/12
```

Creating a protected link group and assigning an active port

Follow the steps given below to create a protected link group.

1. Specify the member ports in the protected link group. Enter a command such as the following.

```
Brocade(config)#protected-link-group 10 e 1 to 4
```

2. Optionally specify which port will be the active port for the protected link group. Enter a command such as the following.

```
Brocade(config)#protected-link-group 10 active-port 1
```

NOTE

If you do not explicitly configure an active port, the Brocade device automatically assigns one as the first port in the protected link group to come up.

These commands configure port e1 as the active port and ports e2 – e4 as standby ports. If port 1 goes down, the Brocade device enables the first available standby port, and switches the traffic to that port. Since the above configuration consists of a statically configured active port, the active port pre-empt's other ports in the protected link group. Refer to [“About active ports”](#) on page 691.

Syntax: `[no] protected-link-group <group-ID> ethernet <port> to <port>`

The `<group-ID>` parameter specifies the protected link group number. Enter a number from 1 – 32.

Each `ethernet <port> to <port>` specifies the ports in the protected link group. Specify the `port` variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – `stack-unit/slotnum/portnum`
- FSX 800 and FSX 1600 chassis devices – `slotnum/portnum`
- ICX devices – `slotnum/portnum`
- FESX compact switches – `portnum`

[no] protected-link-group <group-ID> active-port ethernet <port>

The `<group-ID>` parameter specifies the protected link group number. Enter a number from 1 – 32.

The `active-port ethernet <port>` defines the active port. Specify the `port` variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – `stack-unit/slotnum/portnum`
- FSX 800 and FSX 1600 chassis devices – `slotnum/portnum`
- ICX devices – `slotnum/portnum`
- FESX compact switches – `portnum`

Viewing information about protected link groups

You can use the following **show** commands to view information about protected link groups:

- **show protected-link-group**
- **show interface brief**
- **show interface**

The following shows example output for the **show protected-link-group** command.

```
Brocade#show protected-link-group
Group ID: 1
Member Port(s): ethe 1 to 7
Configured Active Port: 7
Current Active Port: 7
Standby Port(s): ethe 5
Total Number of Protected Link Groups: 1
```

Syntax: `show protected-link-group [<group-ID>]`

TABLE 130 CLI display of protected link group information

Field	Description
Group ID	The ID number of the protected link group.
Member Port(s)	The ports that are members of the protected link group.
Configured Active Port	The statically configured active port. If you do not statically configure an active port, this value will be "None".
Current Active Port	The current active port for the protected link group. If all member ports are down, this value will be "None".
Standby Port(s)	The member ports that are on standby.

The **show interface brief** command also displays information about protected link groups.

Example

```
Brocade#show int brief e 3 to 4
Port  Link    State    Dupl Speed Trunk Tag Priori MAC          Name
3     Up      Inactive Full Auto  None  Yes level0 0012.f2a8.7140
4     Up      Forward  Full 1G   None  Yes level0 0012.f2a8.7140
```

In the above output, the **State** of port 3 is **Inactive**, which means port 3 is an inactive port in a protected link group. For active ports in a protected link group, the **State** will be Active.

Syntax: **show interface brief ethernet** <port>

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

The **show interface** command also displays information about protected link groups.

```
Brocade#show int e 3
GigabitEthernet3 is up, line protocol is up, link keepalive is enabled
  Hardware is GigabitEthernet, address is 0012.f2a8.7140 (bia 0012.f2a8.7142)
  Configured speed auto, actual 1Gbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual MDIX
  Member of 3 L2 VLANs, port is tagged, port state is protected-link-inactive
  BPDU guard is Disabled, ROOT protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0
  ....
  some lines omitted for brevity
```

In the above output, the port state is **protected-link-inactive** which means port 3 is an inactive port in a protected link group.

Syntax: **show interface ethernet** <port>

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*

- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Trunk Groups and Dynamic Link Aggregation

Table 131 lists the individual Brocade FastIron switches and the trunk groups and dynamic link aggregation features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 131 Supported trunk group and dynamic link aggregation features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Trunk groups	Yes	Yes	Yes	Yes	Yes
Trunk threshold for static trunk groups	Yes	Yes	Yes	Yes	Yes
Flexible trunk group membership	Yes	Yes	Yes	Yes	Yes
Option to include Layer 2 in trunk hash calculation	No	Yes	Yes	Yes	Yes
802.3ad link aggregation (dynamic trunk groups)	Yes	Yes	Yes	Yes	Yes
Link Aggregation Control Protocol (LACP)	Yes	Yes	Yes	Yes	Yes
Single link LACP	Yes	Yes	Yes	Yes	Yes
Single link static trunk	Yes	Yes	Yes	Yes	Yes
Singleton LACP trunk	Yes	Yes	Yes	Yes	Yes

Trunk group overview

The trunk group feature allows you to manually configure multiple high-speed load-sharing links between two Brocade Layer 2 switches or Layer 3 switches or between a Brocade Layer 2 switch and Layer 3 switch and a server.

In addition to enabling load sharing of traffic, trunk groups provide redundant, alternate paths for traffic if any of the segments fail.

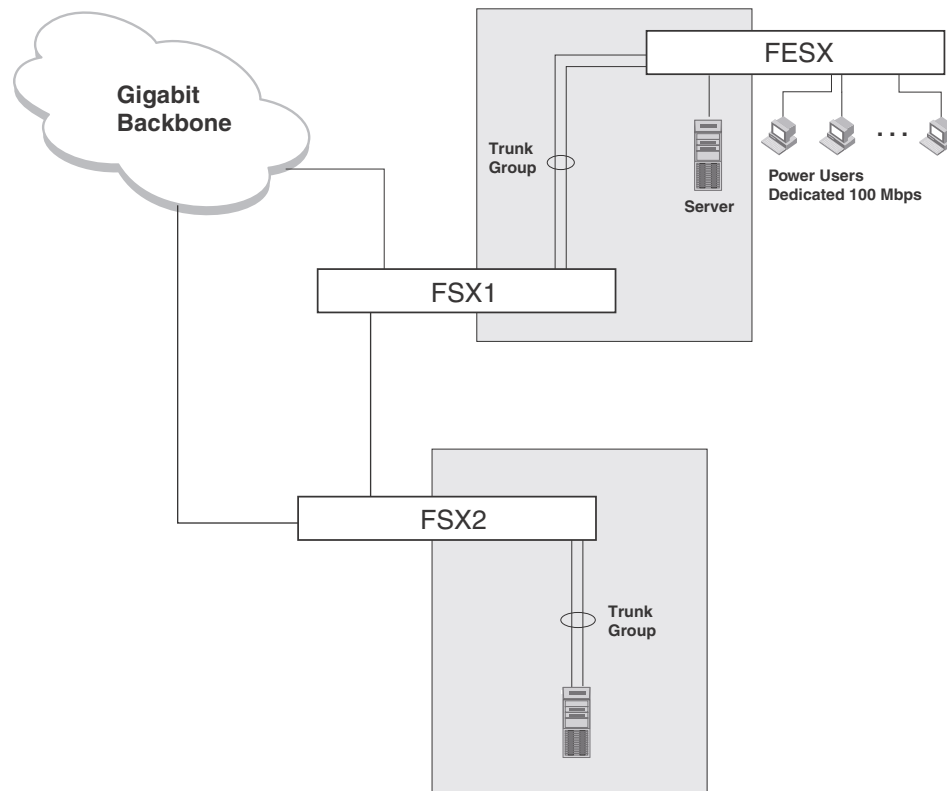

Trunk groups are manually configured aggregate links containing multiple ports. 802.3ad link aggregation is a protocol that dynamically creates and manages trunk groups.

NOTE

You can use both types of trunking on the same device. However, you can use only one type of trunking for a given port. For example, you can configure port 1/1 as a member of a static trunk group or you can enable 802.3ad link aggregation on the port, but you cannot do both.

Figure 62 shows an example of a configuration that uses trunk groups.

FIGURE 62 Trunk group application within a FastIron network

NOTE

The ports in a trunk group make a single logical link. Therefore, all the ports in a trunk group must be connected to the same device at the other end.

Trunk group connectivity to a server

To support termination of a trunk group, the server must have multiple network interface cards (NICs) or either a dual or quad interface card installed. The trunk server is designated as a server with multiple adapters or a single adapter with multiple ports that share the same MAC address and IP address.

[Figure 63](#) shows an example of a trunk group between a server and a Brocade device.

FIGURE 63 Trunk group between a server and a Brocade compact Layer 2 switch or Layer 3 switch

Trunk group rules

Table 132 lists the maximum number of trunk groups you can configure on a Brocade device and the valid number of ports in a trunk group. The table applies to static and LACP trunk ports.

TABLE 132 Trunk group support

Model	Maximum number of trunk groups		Valid number of ports in a group
	Static	LACP	
FCX624 FCX648	124	64	2, 3, 4, 5, 6, 7, or 8
FESX624	31	31	2, 3, 4, 5, 6, 7, or 8
FESX648	31	31	2, 3, 4, 5, 6, 7, or 8
FSX 800 FSX 1600	31	31	First Generation IPv4 devices: 2, 3, or 4 Second Generation IPv6 devices: 2, 3, 4, 5, 6, 7, or 8
	255	64	Third Generation devices: 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, or 12
FWS624	13	13	2, 3, 4, 5, 6, 7, or 8
FWS648	25	25	2, 3, 4, 5, 6, 7, or 8
ICX 6430	29	29	2, 3, 4, 5, 6, 7, or 8
ICX 6450	124	64	
ICX 6610	124	64	

NOTE

On FastIron X Series devices, multi-slot trunk groups are supported on 1 GbE and 10 GbE ports. The valid number of slots in a multi-slot trunk group is as follows: First Generation IPv4 devices - 2, 3, or 4 ports; Second Generation IPv6 devices - 2, 3, 4, 5, 6, 7, or 8 ports; Third-generation devices - 2 to 12 ports.

- Legacy ports and 48 Gbps copper ports cannot be members of the same trunk group in hardware configurations such as the following:

- 48-port 10/100/1000 Mbps (RJ45) Ethernet PoE interface module (SX-FI48GPP) and IPv4/IPv6 interface modules or management modules with user ports.
- Combination of different generations of ports cannot be members of the same trunk group under the following hardware configurations:
 - 24-port fiber and copper Ethernet PoE/Fiber interfaces (SX-FI24GPP, SX-FI24GF) and IPv4/IPv6 interface modules or management modules with user ports
 - 2-port 10G and 8-port 10G interfaces (SX-FI8XG, SX-FI2XG) and the IPv4/IPv6 interface modules or management modules with user ports
- The FastIron SX chassis supports up to 12 ports per trunk (both static and LACP) and a maximum of 255 trunk groups only when the following interface modules are installed in the chassis:
 - SX-FI48GPP—48-port 10/100/1000 Mbps Ethernet PoE interface module
 - SX-FI24GPP—24-port Gigabit Ethernet copper interface module
 - SX-FI24HF—24-port Gigabit Ethernet fiber interface module
 - SX-FI2XG—2-port 10 Gigabit Ethernet interface module
 - SX-FI8XG—8-port 10 Gigabit Ethernet interface module
- Cross module trunking between different generation cards is not recommended when the SX chassis is populated with multiple generation cards (First, second and third). Cross module trunking is only supported between the same generation SX cards.
- You cannot configure a port as a member of a trunk group if 802.3ad link aggregation is enabled on the port.
- Unlike the FES and other Brocade devices, trunk groups on devices listed in [Table 132](#) are not classified as switch trunk groups or server trunk groups.
- Trunking is supported on 10-GbE ports.
- You cannot combine 1-Gbps and 10-Gbps ports in the same trunk group.
- For FastIron WS devices, mixed speed static and dynamic (LACP) trunks are not allowed and if configured will not come up. In these devices, the first four ports are 1 Gbps, the remaining ports are 10/100 Mbps. With both static and LACP trunking, all members of the trunk should be either the 1 Gbps ports or the 10/100 Mbps ports.
- Port assignment on a module need not be consecutive. The port range can contain gaps. For example, you can configure ports 1, 3, and 4 (excluding 2). Refer to [“Support for flexible trunk group membership”](#) on page 704.
- Although the FastIron devices have port ranges, they do not apply to trunk groups.
- You can select any port to be the primary port of the trunk group.
- Make sure the device on the other end of the trunk link can support the same number of ports in the link. For example, if you configure a 3-port trunk group on the FESX and the other end is a different type of switch, make sure the other switch can support a 3-port trunk group.
- All the ports must be connected to the same device at the other end.
- All trunk group member properties must match the lead port of the trunk group with respect to the following parameters:
 - Port tag type (untagged or tagged port)
 - Statically configured port speed and duplex
 - QoS priority

To change port parameters, you must change them on the primary port. The software automatically applies the changes to the other ports in the trunk group.

Configuration notes for FastIron devices in an IronStack

In a Brocade IronStack system, a trunk group may have port members distributed across multiple stack units. Both static and dynamic trunking are supported.

NOTE

Cascaded trunks between stack units are supported on Brocade ICX devices only.

To configure trunk groups for FastIron devices in an IronStack, use the CLI syntax in [“CLI syntax for configuring consecutive ports in a trunk group”](#) on page 707.

The following notes apply to FastIron stackable devices that are part of an IronStack:

- If a stack unit fails or is removed from the stack, its static trunk configuration becomes a reserved configuration on the Active Controller. Any remaining ports of the static trunk in the IronStack continue to function.
- When a new stack unit is added to an IronStack, the new unit receives running configuration and trunk-related information, including a list of ports that are up and are members of a trunk, from the Active Controller.
- Before merging two IronStack devices, make sure that there are no static trunks configured between them. This can result in self-looped ports.
- When an IronStack device with static trunks partitions into multiple IronStacks, loops and forwarding errors may occur. In these cases, user intervention is required to remove the loops.
- 10 Gbps links support up to eight ports in a trunk for stackable units.

Trunk group configuration examples

[Figure 64](#) shows some examples of valid 2-port trunk group links between devices. The trunk groups in this example are switch trunk groups between two Brocade devices. Ports in a valid 2-port trunk group on one device are connected to two ports in a valid 2-port trunk group on another device. The same rules apply to 3-port trunk groups, 4-port trunk groups, and so on.

FIGURE 64 Examples of 2-port and 3-port trunk groups

Figure 65 shows examples of two chassis devices connected by multi-slot trunk groups.

FIGURE 65 Examples of multi-slot trunk groups

Figure 66 shows two IronStacks connected by multi-slot trunk groups.

FIGURE 66 Two IronStacks connected by multi-slot trunk groups

Support for flexible trunk group membership

FastIron devices support flexible trunk group membership, which eliminates the requirement for port membership to be consecutive, and allows the trunking of ports on non-consecutive interfaces. For example, you can configure ports e 2/4, 2/6, and 2/7 (excluding e 2/5) together on a module as a trunk group. This feature is supported on static and LACP trunk ports, as well as 1-GbE and 10-GbE ports. Flexible trunk ports follow the same rules as listed in “[Trunk group rules](#)” on page 699.

NOTE

For FCX devices only, flexible trunk group membership is supported from Web Management, but not from SNMP. For all other FastIron devices, this feature is *not* supported from Web Management or SNMP.

For configuration details, refer to [“CLI syntax for configuring non-consecutive ports in a trunk group”](#) on page 708.

Trunk group load sharing

Brocade devices load-share across the ports in the trunk group. The method used for the load sharing depends on the device type and traffic type (Layer 2 or Layer 3).

NOTE

Layer 2 and Layer 3 AppleTalk traffic is not load-balanced. Layer 3 routed IP or IPX traffic also is not load balanced. These traffic types will however still be forwarded on the trunk ports.

Support for IPv6 when sharing traffic across a trunk group

Brocade devices that support IPv6 take the IPv6 address for a packet into account when sharing traffic across a trunk group. The load sharing is performed in the same way it is for IPv4 addresses; that is, trunk types with a traffic load that is shared based on IPv4 address information can now use IPv6 addresses to make the load sharing decision.

Load sharing occurs as described in [Table 133](#) or [Table 134](#).

Load balancing for unknown unicast, multicast, and broadcast traffic

Brocade devices load balance unknown unicast, multicast, and broadcast traffic based on the source port and VLAN ID and not on any source or destination information in the packet.

For example, when the switch receives unknown unicast, multicast, and broadcast packets, and the packets are from the same source port, the packets are forwarded to the same port of the trunk group. Conversely, when the switch receives unknown unicast, multicast, and broadcast packets, and the packets are from different source ports, the packets are load balanced across all the ports of the trunk group.

Note that this does not apply to known unicast traffic, which is always load balanced across all the ports of a trunk group based on the traffic's Layer 2 and Layer 3 source and destination parameters.

How trunk load sharing works

The load balancing method for bridged traffic varies depending on the traffic type. Load balancing for routed traffic is always based on the source and destination IP addresses and protocol field (not applicable for FastIron stackable devices).

[Table 133](#) and [Table 134](#) show how the different Brocade devices load balance traffic.

NOTE

[Table 133](#) and [Table 134](#) do not include unknown unicast, multicast, and broadcast traffic. Refer to [“Load balancing for unknown unicast, multicast, and broadcast traffic”](#).

[Table 133](#) shows how the FastIron X Series devices load balance traffic across the ports in a trunk group.

TABLE 133 Trunk group load sharing on FastIron X Series devices

Traffic type	Load balancing method
Layer 2 Bridged non-IP	Source and destination MAC addresses
Layer 2 Bridged TCP/UDP	Source and destination MAC addresses, source and destination IP addresses, and source and destination TCP/UDP ports
Layer 2 Bridged IP (non-TCP/UDP)	Source and destination MAC addresses, and source and destination IP addresses
Layer 3 Routed traffic	Source and destination IP addresses and protocol field

[Table 134](#) describes how the FastIron stackable devices load balance traffic.

TABLE 134 Trunk group load sharing on FastIron stackable devices

Traffic type	Load balancing method
Layer 2 Bridged Non-IP	Source and destination MAC addresses
Layer 2 Bridged IPv4 TCP/UDP	Source and destination IP addresses, and source and destination TCP/UDP ports
Layer 2 Bridged IPv4 Non-TCP/UDP	Source and destination IP addresses
Layer 2 Bridged IPv6 TCP/UDP	Source and destination IP addresses, source and destination TCP and UDP ports, and flow label
Layer 2 Bridged IPv6 Non-TCP/UDP	Source and destination TCP and UDP ports, and flow label
Layer 3 Routed traffic	Source and destination IP addresses and protocol field

Adding Layer 2 information to trunk hash output

NOTE

Adding Layer 2 information to trunk hash output is *not* supported on FastIron X Series devices.

FastIron stackable devices support the option to include Layer 2 information in the trunk hash calculation for IP packets. Use the following CLI command.

```
Brocade(config)# trunk hash-options include-layer2
```

The **trunk hash-options include-layer2** command adds Layer 2 information (text in bold) to the following load-balancing parameters:

- Non-IP: Source and destination MAC addresses
- IPv4 TCP/UDP: Source and destination IP addresses, and source and destination TCP/UDP ports, **Source MAC, Destination MAC**
- IPv4 Non-TCP/UDP: Source and destination IP addresses, **Source MAC, Destination MAC**
- IPv6 TCP/UDP: Source and destination IP addresses, source and destination TCP and UDP ports, and flow label, **Source MAC, Destination MAC**
- IPv6 Non-TCP/UDP: Source and destination TCP and UDP ports, and flow label, **Source MAC, Destination MAC**

Syntax: [no] trunk hash-options include-layer2

Configuring a trunk group

1. Disconnect the cables from those ports on both systems that will be connected by the trunk group. Do not configure the trunk groups with the cables connected.

NOTE

If you connect the cables before configuring the trunk groups and rebooting, the traffic on the ports can create a spanning tree loop.

2. Configure the trunk group on one of the two Layer 2 switches or Layer 3 switches involved in the configuration.

NOTE

Downtime is incurred when adding a new port to a trunk group. It is suggested that you schedule the addition of ports to a trunk group to minimize downtime and its impact to the production network.

3. Save the configuration changes to the startup-config file.
4. Dynamically place the new trunk configuration into effect by entering the **trunk deploy** command at the global CONFIG level of the CLI.
5. If the device at the other end of the trunk group is another Layer 2 switch or Layer 3 switch, repeat steps 2 through 4 for the other device.
6. When the trunk groups on both devices are operational, reconnect the cables to those ports that are now configured as trunk groups, starting with the first port (lead port) of each trunk group.
7. To verify the link is operational, use the **show trunk** command.

CLI syntax for configuring consecutive ports in a trunk group

This section describes the CLI syntax for configuring consecutive ports in a trunk group. To configure non-consecutive ports, refer to [“CLI syntax for configuring non-consecutive ports in a trunk group”](#) on page 708. Configuration examples are shown in later sections of this chapter.

To configure a trunk group consisting of two groups of two ports each, enter commands such as the following.

```
Brocade(config)#trunk ethernet 1/1 to 1/2 ethernet 3/3 to 3/4
Trunk will be created in next trunk deploy
Brocade(config)#write memory
Brocade(config)#trunk deploy
```

Syntax: [no] trunk ethernet <primary-port> to <port> [ethernet <primary-port> to <port>]

Syntax: trunk deploy

Each **ethernet** parameter introduces a port group.

The *<primary-port>* variable specifies the primary port. Notice that each port group must begin with a primary port. The primary port of the first port group specified (which must be the group with the lower port numbers) becomes the primary port for the entire trunk group.

Specify the *<primary-port>* and *<port>* variables in one of the following formats:

- FWS and FCX stackable switches – *<stack-unit/slotnum/portnum>*
- FSX 800 and FSX 1600 chassis devices – *<slotnum/portnum>*
- ICX devices = *<slotnum/portnum>*
- FESX compact switches – *<portnum>*

You can list all of the ports individually, use the keyword **to** to specify ranges of ports, or use a combination of both.

CLI syntax for configuring non-consecutive ports in a trunk group

This section describes the CLI syntax for configuring non-consecutive ports in a trunk group. Configuration examples are shown in later sections of this chapter.

To configure a 4-port trunk with non-consecutive ports on a FastIron chassis device, enter a command such as the following.

```
Brocade(config)#trunk ethernet 1/7 ethernet 1/9 ethernet 1/11 ethernet 1/21
```

This creates a 4-port trunk group with the following members.

members 1/7, 1/9, 1/11, and 1/21.

To configure a 4-port trunk with non-consecutive ports on a FastIron stackable device, enter a command such as the following.

```
Brocade(config)#trunk ethernet 1/1/7 ethernet 1/1/9 ethernet 1/1/11 ethernet 1/1/21
```

This creates a 4-port trunk group with the following members.

members 1/1/7, 1/1/9, 1/1/11, and 1/1/21.

Syntax: [no] trunk ethernet *<port>* ethernet *<port>* | to ethernet *<port>*...

The *port* variable specifies an individual port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can enter the **ethernet port** parameter multiple times to specify a list.

The **to** keyword indicates that you are specifying a range of ports. Specify the lower port number in the range first, then **to**, then the higher port number in the range.

Example 1: Configuring the trunk groups

To configure the trunk groups shown in [Figure 62](#), enter the following commands. Notice that the commands are entered on multiple devices.

To configure the trunk group link between FSX1 and the FESX, enter the following commands.

NOTE

The text shown in *italics* in the following CLI example shows messages echoed to the screen in answer to the CLI commands entered.

```
Brocade(config)#trunk e 1/5 to 1/8
Trunk will be created in next trunk deploy
Brocade(config)#write memory
Brocade(config)#trunk deploy
```

To configure the trunk group link between FSX2 and the server, enter the following commands.

```
Brocade(config)#trunk e 1/2 to 1/4
Trunk will be created in next trunk deploy
Brocade(config)#write memory
Brocade(config)#trunk deploy
```

You then configure the trunk group on the FESX.

```
Brocade(config)#trunk ethernet 17 to 18
Trunk will be created in next trunk deploy
Brocade(config)#write memory
Brocade(config)#trunk deploy
```

NOTE

The **trunk deploy** command dynamically places trunk configuration changes into effect, without a software reload.

Example 2: Configuring a trunk group that spans two Ethernet modules in a chassis device

This section shows how to configure a trunk group that spans two modules in a chassis device.

Multi-slot trunk groups are supported on 1-GbE ports, 10-GbE ports, as well as on static and LACP trunk ports. For multi-slot trunk group rules, refer to [Table 136](#) on page 723.

To configure a trunk group consisting of two groups of ports, 1/1 to 1/2 on module 1 and 4/5 to 4/6 on module 4, enter the following commands.

```
Brocade(config)#trunk ethernet 1/1 to 1/2 ethernet 4/5 to 4/6
Trunk will be created in next trunk deploy
Brocade(config)#write memory
Brocade(config)#trunk deploy
```

NOTE

The **trunk deploy** command dynamically places trunk configuration changes into effect, without a software reload.

NOTE

If you disable a module that is part of a multi-slot trunk group, the corresponding trunk ports will go down, but the remaining ports in the trunk will remain up and running. However, when you re-enable the module, all of the trunk ports will go down and then come back up. In other words, trunk ports are redeployed when a module is re-enabled.

Example 3: Configuring a multi-slot trunk group with one port per module

You can select one port per module in a multi-slot trunk group. This feature is supported on 1-GbE and 10-GbE ports, as well as on static and LACP trunk ports. For multi-slot trunk group rules, refer to [Table 136](#) on page 723.

To configure a 2-port multi-slot trunk group consisting of port 1/1 on module 1 and port 2/1 on module 2, enter the following commands.

```
Brocade(config)#trunk ethernet 1/1 to 1/1 ethernet 2/1 to 2/1
Trunk will be created in next trunk deploy
Brocade(config)#write memory
Brocade(config)#trunk deploy
```

NOTE

The **trunk deploy** command dynamically places trunk configuration changes into effect, without a software reload.

NOTE

If you disable a module that is part of a multi-slot trunk group, the corresponding trunk ports will remain up and running. However, when you re-enable the module, all of the trunk ports will go down and then come back up. In other words, trunk ports are redeployed when a module is re-enabled.

Example 4: Configuring a trunk group of 10 Gbps Ethernet ports

You can configure 10 Gbps Ethernet ports together in a trunk group.

To configure a trunk group containing two 10 Gbps Ethernet ports, enter commands such as the following.

```
Brocade(config)#trunk ethernet 1/1 to 2/1
Brocade(config-trunk-1/1-2/1)# write memory
Brocade(config-trunk-1/1-2/1)# exit
Brocade(config)#trunk deploy
```

The commands configure a trunk group consisting of 10 Gbps Ethernet ports 1/1 and 2/1, and then deploy the trunk group. The trunk configuration does not take effect until you deploy it.

Example 5: Configuring a static trunk group for devices in an IronStack

The following example shows how to configure a static trunk group for units in an IronStack, and the result of the configured trunk group in the **show trunk** output.

```
4 Router(config)#sh trunk
Configured trunks:
Trunk ID: 1
Hw Trunk ID: 1
Ports_Configured: 2
Primary Port Monitored: Individually
Ports  PortName Port_Status Monitor Rx_Mirr Tx_Mirr Monitor_Dir
1/1/1  none     enable    off    N/A     N/A     N/A
1/1/2  none     enable    on     1/1/15 1/1/15  both
Operational trunks:
Trunk ID: 1
Hw Trunk ID: 1
Duplex: Full
Speed: 1G
Tag: No
Priority: level0
Active Ports: 2
Ports  Link_Status port_state
1/1/1  active      Forward
1/1/2  active      Forward
```

Additional trunking options

The following trunking options can be performed on ports in deployed trunks. These options are supported on static trunk ports. Except where noted, these options are also supported on dynamic (LACP) trunk ports on all Brocade FastIron devices.

- Naming a trunk port
- Disabling or re-enabling a trunk port
- Deleting a static trunk group (applies to static trunks only)
- Specifying the minimum number of ports in a trunk group (applies to static trunks only)
- Monitoring a trunk port
- Configuring outbound rate shaping on a trunk port
- Enabling sFlow forwarding on an individual port in a trunk
- Setting the sFlow sampling rate on an individual port in a trunk

NOTE

Depending on the operational state of LACP-enabled ports, at any time these ports may join a trunk group, change trunk group membership, exit a trunk group, or possibly never join a trunk group. Therefore, before configuring trunking options on LACP-enabled ports (for example, naming the port, disabling the port, and so on), verify the actual trunk group port membership using the **show trunk** command. To view the status of LACP, use the **show link-aggregate** command.

Naming a trunk port

Naming a trunk port is supported on individual ports of a static trunk group.

To name an individual port in a trunk group, enter a command such as the following at the trunk group configuration level.

```
Brocade(config)#trunk e 4/1 to 4/4
Brocade(config-trunk-4/1-4/4)#port-name customer1 ethernet 4/2
```

This command assigns the name “customer1” to port 4/2 in the trunk group consisting of ports 4/1 to 4/4.

Syntax: [no] **port-name** <ASCII string> **ethernet** <port>

The <ASCII string> variable specifies the port name. The name can be up to 49 characters long.

The <port> variable is a valid port in the trunk group.

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Disabling or re-enabling a trunk port

NOTE

When you enable or disable auto-negotiated combination ports on FESX devices, the ports may flap for a few seconds before the link is up.

Disabling or re-enabling trunk ports is supported on individual ports of a static trunk group.

You can disable or re-enable individual ports in a trunk group. To disable an individual port in a trunk group, enter commands such as the following at the trunk group configuration level.

```
Brocade(config)#trunk e 4/1 to 4/4
Brocade(config-trunk-4/1-4/4)#config-trunk-ind
Brocade(config-trunk-4/1-4/4)#disable ethernet 4/2
```

Syntax: [no] **config-trunk-ind**

Syntax: [no] **disable ethernet** <port>

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

The **config-trunk-ind** command enables configuration of individual ports in the trunk group. If you do not use this command, the **disable** and **enable** commands will be valid only for the primary port in the trunk group and will disable or enable all ports in the trunk group. You need to enter the **config-trunk-ind** command only once in a trunk group. After you enter the command, all applicable port configuration commands apply to individual ports only.

NOTE

If you enter **no config-trunk-ind**, all port configuration commands are removed from the individual ports and the configuration of the primary port is applied to all the ports. Also, once you enter the **no config-trunk-ind** command, the **enable**, **disable**, and **monitor** commands are valid only on the primary port and apply to the entire trunk group.

To enable an individual port in a trunk group, enter commands such as the following at the trunk group configuration level.

```
Brocade(config-trunk-4/1-4/4)#config-trunk-ind
Brocade(config-trunk-4/1-4/4)#enable ethernet 4/2
```

Syntax: **enable ethernet** <port>

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Disabling or re-enabling a range or list of trunk ports

The **disable port-name** command disables the port. The states of other ports in the trunk group are not affected.

If you have configured a name for the trunk port, you can specify the port name, as shown in the following example.

```
Brocade(config-trunk-4/1-4/4)#config-trunk-ind
Brocade(config-trunk-4/1-4/4)#disable port-name customer1
```

Syntax: **disable port-name** <portname>

To disable a range of ports in a trunk group, enter commands such as the following.

```
Brocade(config)#trunk ethernet 2/1 to 2/4
Brocade(config-trunk-2/1-2/4)#config-trunk-ind
Brocade(config-trunk-2/1-2/4)#disable ethernet 2/3 to 2/4
```

This command disables ports 2/3 and 2/4 in trunk group 2/1 to 2/4.

To disable a list of ports, enter a command such as the following.

```
Brocade(config-trunk-2/1-2/4)#disable ethernet 2/1 ethernet 2/3 ethernet 2/4
```

This command disables ports 2/1, 2/3, and 2/4 in the trunk group.

You can specify a range and a list on the same command line. For example, to re-enable some trunk ports, enter a command such as the following.

```
Brocade(config-trunk-2/1-2/4)#enable ethernet 2/1 to 2/2 ethernet 2/4
```

Syntax: [no] disable ethernet <port> to <port> | ethernet <port>

Syntax: [no] enable ethernet <port> to <port> | ethernet <port>

The <port> variable specifies an individual port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can enter the **ethernet** <port> parameter multiple times to specify a list.

The **to** keyword indicates that you are specifying a range. Specify the lower port number in the range first, then **to**, then the higher port number in the range.

Deleting a static trunk group

Use the **no trunk ethernet** command to delete a static trunk group.

NOTE

To delete an LACP trunk group, use the **no link-aggregate active | passive** command.

To delete a trunk group, use the **no** form of the command you used to create the trunk group. For example, to remove one of the trunk groups configured in the previous examples, enter the following command.

```
Brocade(config)#no trunk ethernet 1/1 to 1/2 ethernet 3/3 to 3/4
```

Syntax: no trunk ethernet <port> to <port> [ethernet <port> to <port>]...

The *port* variable specifies an individual port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

You can enter the **ethernet** *port* parameter multiple times to specify a list.

The **to** keyword indicates that you are specifying a range of ports. Specify the lower port number in the range first, then **to**, then the higher port number in the range.

Specifying the minimum number of ports in a static trunk group

You can configure Brocade devices to disable all of the ports in a trunk group when the number of active member ports drops below a specified threshold value. For example, if a trunk group has four ports, and the threshold for the trunk group is three, then the trunk group is disabled if the number of available ports in the trunk group drops below three. If the trunk group is disabled, then traffic is forwarded over a different link or trunk group.

For example, the following commands establish a trunk group consisting of four ports, and then establish a threshold for this trunk group of three ports.

```
Brocade(config)#trunk e 3/31 to 3/34
Brocade(config-trunk-3/31-3/34)#threshold 3
```

In this example, if the number of active ports drops below three, then all the ports in the trunk group are disabled.

Syntax: [no] **threshold** <number>

The <number> variable specifies a threshold number from 2 (default) up to the number of ports in a trunk group. The total number of threshold ports must be greater than 1.

NOTE

When using the **no threshold** command, it is not necessary to enter a number.

Configuration notes for specifying ports in a static trunk group

- Specifying ports in a trunk group is supported on static trunk groups only. It is not supported on LACP trunk groups.
- When unidirectional link detection (UDLD) is enabled on a trunk port, the trunk threshold is not supported.
- The **disable module** command can be used to disable the ports on a module. However, on 10 Gbps modules, the **disable module** command does not cause the remote connection to be dropped. If a trunk group consists of 10 Gbps ports, and you use the **disable module** command to disable ports in the trunk group, which then causes the number of active ports in the trunk group to drop below the threshold value, the trunk group is not disabled.
- If you establish a threshold for a trunk used in conjunction with Metro Ring Protocol (MRP) on 10 Gbps interfaces, then you must also enable Link Fault Signaling (LFS).
- If you specify a threshold for a trunk group, the other end of the trunk group must also have the same threshold configuration.

Monitoring a trunk port

You can monitor the traffic on an individual port of a static trunk group. For configuration details, refer to [“Monitoring an individual trunk port”](#) on page 930.

Configuring outbound rate shaping for a trunk port

You can configure the maximum rate at which outbound traffic is sent out on a static trunk port. For configuration details, refer to [“Configuring outbound rate shaping for a trunk port”](#) on page 1953.

Enabling sFlow forwarding on a trunk port

You can enable sFlow forwarding on individual ports of a static trunk group. For configuration details, refer to [“Enabling sFlow forwarding on individual trunk ports”](#) on page 546.

Setting the sFlow sampling rate on a trunk port

You can configure an individual trunk port to use a different sampling rate than the global default sampling rate. This feature is supported on static trunk ports. For configuration details, refer to [“Changing the sampling rate for a trunk port”](#) on page 544.

Displaying trunk group configuration information

To display configuration information for the trunk groups, use the **show trunk** command. This command displays information for configured trunk groups and operational trunk groups. A configured trunk group is one that has been configured in the software but has not been placed into operation by a reset or reboot. An operational trunk group is one that has been placed into operation by a reset or reboot.

Enter the following command at any CLI level.

Syntax: **show trunk** [**ethernet** <port> **to** <port>]

The **ethernet** parameter introduces a port or port group.

The <port> variable specifies an individual port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

The **to** keyword indicates that you are specifying a range of ports. Specify the lower port number in the range first, then **to**, then the higher port number in the range.

NOTE

The **show trunk** command does not display any form of trunk when links are up.

[Table 135](#) describes the information displayed by the **show trunk** command.

TABLE 135 CLI trunk group information

Field	Description
Trunk ID	The trunk group number. The software numbers the groups in the display to make the display easy to use.
HW Trunk ID	The trunk ID.
Duplex	<p>The mode of the port, which can be one of the following:</p> <ul style="list-style-type: none"> • None – The link on the primary trunk port is down. • Full – The primary port is running in full-duplex. • Half – The primary port is running in half-duplex. <p>NOTE: This field and the following fields apply only to operational trunk groups.</p>
Speed	<p>The speed set for the port. The value can be one of the following:</p> <ul style="list-style-type: none"> • None – The link on the primary trunk port is down. • 10 – The port speed is 10 Mbps. • 100 – The port speed is 100 Mbps. • 1 Gbps – The port speed is 1000 Mbps.

TABLE 135 CLI trunk group information (Continued)

Field	Description
Tag	Indicates whether the ports have 802.1Q VLAN tagging. The value can be Yes or No.
Priority	Indicates the Quality of Service (QoS) priority of the ports. The priority can be a value from 0 through 7.
Active Ports	The number of ports in the trunk group that are currently active.
Ports	The ports in the trunk group.
Link_Status	The link status of each port in the trunk group.
LACP_Status	<p>Displays the status of the aggregate links, which could be one of the following states:</p> <ul style="list-style-type: none"> • Ready - The port is functioning normally in the trunk group and is able to transmit and receive LACP packets. • Expired - The time has expired (as determined by timeout values) and the port has shut down because the port on the other side of the link has stopped transmitting packets. • Down - The port physical link is down. <p>For more information about this feature, refer to the section “Displaying and determining the status of aggregate links” on page 731.</p>
Load Sharing	The number of traffic flows currently being load balanced on the trunk ports. All traffic exchanged within the flow is forwarded on the same trunk port. For information about trunk load sharing, refer to “Trunk group load sharing” on page 705.

Viewing the first and last ports in a trunk group

Output for many of the **show** commands will show the first and last port in a trunk as FirstPort-LastPort, if the ports are consecutive, and FirstPort*LastPort if the ports are not consecutive. This output is shown in the following **show mac** command, which displays the first and last ports.

```
Brocade#show mac
Total active entries from all ports = 1
MAC-Address Port Type Index
0007.e910.c201 1/1/7*1/1/21 Dynamic 2920
```

For a trunk group with members 1/1/7 to 1/1/9, the output from the **show mac** command resembles the following.

```
Brocade#show mac
Total active entries from all ports = 1
MAC-Address Port Type Index
0007.e910.c201 1/1/7-1/1/9 Dynamic 2920
```

Dynamic link aggregation

Brocade software supports the IEEE 802.3ad standard for link aggregation. This standard describes the Link Aggregation Control Protocol (LACP), a mechanism for allowing ports on both sides of a redundant link to form a trunk link (aggregate link), without the need for manual configuration of the ports into trunk groups.

When you enable link aggregation on a group of Brocade ports, the Brocade ports can negotiate with the ports at the remote ends of the links to establish trunk groups.

The link aggregation feature automates trunk configuration but can coexist with the Brocade trunk group feature. Link aggregation parameters do not interfere with trunk group parameters.

NOTE

Use the link aggregation feature only if the device at the other end of the link you want to aggregate also supports IEEE 802.3ad link aggregation. Otherwise, you must manually configure the trunk links.

Link aggregation support is disabled by default. You can enable the feature on an individual port basis, in active or passive mode:

- **Active mode** – When you enable a port for active link aggregation, the Brocade port can exchange standard LACP Data Unit (LACPDU) messages to negotiate trunk group configuration with the port on the other side of the link. In addition, the Brocade port actively sends LACPDU messages on the link to search for a link aggregation partner at the other end of the link, and can initiate an LACPDU exchange to negotiate link aggregation parameters with an appropriately configured remote port.
- **Passive mode** – When you enable a port for passive link aggregation, the Brocade port can exchange LACPDU messages with the port at the remote end of the link, but the Brocade port cannot search for a link aggregation port or initiate negotiation of an aggregate link. Thus, the port at the remote end of the link must initiate the LACPDU exchange.

NOTE

Brocade recommends that you disable or remove the cables from the ports you plan to enable for dynamic link aggregation. Doing so prevents the possibility that LACP will use a partial configuration to talk to the other side of a link. A partial configuration does not cause errors, but does sometimes require LACP to be disabled and re-enabled on both sides of the link to ensure that a full configuration is used. It is easier to disable a port or remove its cable first. This applies both for active link aggregation and passive link aggregation.

The following rules apply to units in an IronStack:

- With LACP trunk configurations, the LACP system ID is the MAC address of the Active Controller. If the LACP system ID changes, the entire trunk flaps and an STP reconvergence occurs.
- Link aggregation can be used to form multi-slot aggregate links on stack units, but the link aggregation keys must match for the port groups on each stack unit. For example, to configure an aggregate link containing ports 1/1/1 through 1/1/4, and 3/1/5 through 3/1/8, you must change the link aggregation key on one or both port groups so that the key is the same for all eight ports. Refer to [“IronStack LACP trunk group configuration example”](#).

IronStack LACP trunk group configuration example

To configure a trunk group consisting of two groups of two ports each on an IronStack, enter commands similar to the following.

```
Brocade(config)#interface ethernet 1/1/1 to 1/1/4
Brocade(config-mif-1/1/1-1/1/4)#link-aggregate off
Brocade(config-mif-1/1/1-1/1/4)#link-aggregate configure key 10000
Brocade(config-mif-1/1/1-1/1/4)#link-aggregate active
Brocade(config-mif-1/1/1-1/1/4)#interface ethernet 3/1/5 to 3/1/8
Brocade(config-mif-3/1/5-3/1/8)#link-aggregate off
Brocade(config-mif-3/1/5-3/1/8)#link-aggregate configure key 10000
Brocade(config-mif-3/1/5-3/1/8)#link-aggregate active
```

This command sequence changes the key for ports 1/1/1 through 1/1/4 and 3/1/5 through 3/1/8 to 10000. Because all ports in an aggregate link must have the same key, this example forms a multi-slot aggregate link for ports 1/1/1 through 1/1/4 and 3/1/5 through 3/1/8.

Examples of valid LACP trunk groups

Brocade ports follow the same configuration rules for dynamically created aggregate links as they do for statically configured trunk groups. Refer to [“Trunk group rules”](#) on page 699 and [“Trunk group load sharing”](#) on page 705.

[Figure 67](#) shows some examples of valid aggregate links.

FIGURE 67 Examples of valid aggregate links

Brocade ports enabled for link aggregation follow the same rules as ports configured for trunk groups.

The examples assume that link aggregation is enabled on all of the links between the Brocade device on the left and the device on the right (which can be either a Brocade device or another vendor device). The ports that are members of aggregate links in the examples are following the configuration rules for trunk links on Brocade devices.

The Brocade rules apply to a Brocade device even if the device at the other end is from another vendor and uses different rules. Refer to [“Trunk group rules”](#) on page 699.

Configuration notes and limitations for configuring IronStack LACP trunk groups

This section lists the configuration considerations and limitations for dynamic link aggregation.

FastIron stackable devices

The following notes and feature limitations apply to the FastIron WS and Brocade FCX Series devices:

- The dynamic link aggregation (802.3ad) implementation allows any number of ports up to eight to be aggregated into a link.
- The default key assigned to an aggregate link is based on the port type (1 Gbps port or 10 Gbps port). The device assigns different keys to 10 Gbps ports than to 1 Gbps ports so that ports with different physical capabilities will not be able to form a trunk.

NOTE

The trunks that will be formed by link aggregation will strictly adhere to the static trunking rules on the stackable devices. Be careful in selecting keys if you are manually configuring link aggregation keys. Make sure that the possible trunks that you expect to be formed conform to the static trunking rules.

- When you enable link aggregation (LACP) on a group of Brocade ports, you must also assign a unique key (other than the default key) to all of the ports in the aggregate link.

FastIron stackable devices in an IronStack

- If a stack unit fails, or is removed from the stack, its LACP configuration becomes a reserved configuration on the Active Controller. Any remaining ports of the dynamic trunk in the IronStack continue to function.
- Merging two IronStacks with a dynamic trunk configured between them results in self-looped ports, which are detected and corrected by the Spanning Tree Protocol (STP).
- When an IronStack with dynamic trunks partitions into multiple IronStacks, the protocol will take care of splitting the dynamic trunk in the partner. No user intervention is required.

FastIron X Series devices

The following notes and feature limitations apply to the FastIron X Series devices:

- You cannot use 802.3ad link aggregation on a port configured as a member of a static trunk group.
- The dynamic link aggregation (802.3ad) implementation on FastIron X Series devices allows different numbers of ports to be aggregated in a link, depending on the IP version (IPv6 or IPv4) and the software version running on the device. For details, refer to [Table 132](#) on page 699.
- The default key assigned to an aggregate link is based on the port type (1 Gbps port or 10 Gbps port). The Brocade device assigns different keys to 10 Gbps ports than to 1 Gbps ports so that ports with different physical capabilities will not be able to form a trunk.

NOTE

The trunks that will be formed by link aggregation will strictly adhere to the static trunking rules on the Brocade device. Be careful in selecting keys if you are manually configuring link aggregation keys. Make sure that the possible trunks that you expect to be formed conform to the static trunking rules.

- When the FastIron X Series device dynamically adds or changes a trunk group, the **show trunk** command displays the trunk as both configured and active. However, the **show running-config** or **write terminal** command does not contain a trunk command defining the new or changed trunk group.
- If the FastIron X Series device places a port into a trunk group as a secondary port, all configuration information except information related to link aggregation is removed from the port. For example, if port 1/3 has an IP interface, and the link aggregation feature places port 1/3 into a trunk group consisting of ports 1/1 through 1/4, the IP interface is removed from the port.
- If the FastIron X Series device (Layer 3) is running OSPF or BGP4, the device causes these protocols to reset when a dynamic link change occurs. The reset includes ending and restarting neighbor sessions with OSPF and BGP4 peers, and clearing and relearning dynamic route entries and forwarding cache entries. Although the reset causes a brief interruption, the protocols automatically resume normal operation.
- You can enable link aggregation on 802.1Q tagged ports (ports that belong to more than one port-based VLAN), as well as on untagged ports.

Adaptation to trunk disappearance

The Brocade device will tear down an aggregate link if the device at the other end of the link reboots or brings all the links down. Tearing the aggregate link down prevents a mismatch if the other device has a different trunk configuration following the reboot or re-establishment of the links. Once the other device recovers, dynamic link aggregation can renegotiate the link without a mismatch.

Flexible trunk eligibility

The criteria for trunk port eligibility in an aggregate link are flexible. A range of ports can contain down ports and remain eligible to become an aggregate link.

By default, the device places the ports into 2-port groups, consisting of an odd-numbered port and the next even-numbered port. For example, ports 1/1 and 1/2 are a 2-port group, as are ports 1/3 and 1/4, 9/1 and 9/2, and so on. If either of the ports in a 2-port group is up, the device considers both ports to be eligible to be in an aggregate link.

Figure 68 shows an example of 2-port groups in a range of four ports on which link aggregation is enabled. Based on the states of the ports, some or all of them will be eligible to be used in an aggregate link.

FIGURE 68 2-port groups used to determine aggregation eligibility

Table 136 shows examples of the ports from Figure 68 that will be eligible for an aggregate link based on individual port states.

TABLE 136 Port eligibility for link aggregation

	Port group 1		Port group 2		Trunk eligibility
	1/1	1/2	1/3	1/4	
Link State	Up	Up	Up	Up	4-port 1/1 – 1/4
	Up	Up	Up	Down	4-port 1/1 – 1/4
	Up	Down	Up	Down	4-port 1/1 – 1/4
	Up	Up	Down	Up	4-port 1/1 – 1/4
	Down	Down	Down	Up	2-port 1/3 – 1/4
	Up	Down	Down	Down	2-port 1/1 – 1/2

As shown in [Table 136](#), all or a subset of the ports within a port range will be eligible for formation into an aggregate link based on port states. Notice that the sets of ports that are eligible for the aggregate link must be valid static trunk configurations.

Enabling dynamic link aggregation

By default, link aggregation is disabled on all ports. To enable link aggregation on a set of ports, enter commands such as the following at the Interface configuration level of the CLI.

NOTE

Configuration commands for link aggregation differ depending on whether you are using the default link aggregation key automatically assigned by the software, or if you are assigning a different, unique key. For more information about keys, refer to [“Key”](#) on page 726.

Using the default key assigned by the software

```
Brocade(config)#interface ethernet 1/1
Brocade(config-if-e1000-1/1)#link-aggregate active
Brocade(config)#interface ethernet 1/2
Brocade(config-if-e1000-1/2)#link-aggregate active
```

The commands in this example enable the active mode of link aggregation on ports 1/1 and 1/2. The ports can send and receive LACPDU messages. Note that these ports will use the default key, because one has not been explicitly configured.

NOTE

In conformance with the 802.3ad specification, the default key assigned to an aggregate link is based on the port type (1 Gbps port or 10 Gbps port). The Brocade device assigns different keys to 10 Gbps ports than to 1 Gbps ports so that ports with different physical capabilities will not be able to form a trunk.

Assigning a unique key

```
Brocade(config)#interface ethernet 1/1
Brocade(config-if-e1000-1/1)#link-aggregate configure key 10000
Brocade(config-if-e1000-1/1)#link-aggregate active
Brocade(config)#interface ethernet 1/2
Brocade(config-if-e1000-1/2)#link-aggregate configure key 10000
Brocade(config-if-e1000-1/2)#link-aggregate active
```

The commands in this example assign the key 10000 and enable the active mode of link aggregation on ports 1/1 and 1/2. The ports can send and receive LACPDU messages.

NOTE

As shown in the example, when configuring a key, you must assign the key prior to enabling link aggregation.

The following commands enable passive link aggregation on ports 1/5 through 1/8.

```
Brocade(config)#interface ethernet 1/5 to 1/8
Brocade(config-mif-1/5-1/8)#link-aggregate passive
```

The commands in this example enable the passive mode of link aggregation on ports 1/5 through 1/8. These ports wait for the other end of the link to contact them. After this occurs, the ports can send and receive LACPDU messages.

To disable link aggregation on a port, enter a command such as the following.

```
Brocade(config-if-e1000-1/8)#link-aggregate off
```

Syntax: [no] link-aggregate active | passive | off

Syntax: [no] link-aggregate configure [system-priority <num>] | [port-priority <num>] | [key <num>]

NOTE

For more information about keys, including details about the **link-aggregate** and **link-aggregate configure** commands, refer to [“Key”](#) on page 726.

How changing the VLAN membership of a port affects trunk groups and dynamic keys

When you change a port VLAN membership and the port is currently a member of a trunk group, the following changes occur to the trunk group:

- The Brocade device tears down the existing trunk group.
- All ports in the trunk group get a new key.
- The new key group aggregates into a new trunk group.

When you change a port VLAN membership, and the port is not a member of a trunk group, the following changes occur:

- The port gets a new key depending on changes to the port VLAN tag type, as follows:
 - Tagged to Tagged VLAN – The primary port of the trunk group gets a new key.
 - Tagged to Untagged VLAN – The port gets the default key for untagged ports.
 - Untagged to Tagged VLAN – If the Brocade device finds a port with matching port properties, the port gets that port key. If it does not find one, the port gets a new key.
 - Untagged to Untagged VLAN – The port gets a new key depending on whether it is in the default VLAN. If there is a trunk group associated with the key, it is not affected.
- All other ports keep their existing keys.
- The new key groups try to aggregate into trunk groups.

Additional trunking options for LACP trunk ports

Additional trunking options are supported on individual ports that are part of an 802.3ad aggregate link. Refer to [“Additional trunking options”](#) on page 711.

Link aggregation parameters

You can change the settings on individual ports for the following link aggregation parameters:

- System priority
- Port priority
- Timeout
- Key

System priority

The system priority parameter specifies the link aggregation priority on the Brocade device relative to the devices at the other ends of the links on which link aggregation is enabled. A higher value indicates a lower priority. You can specify a priority from 0 through 65535. The default is 1.

NOTE

If you are connecting the Brocade device to another vendor device and the link aggregation feature is not working, set the system priority on the Brocade device to a lower priority (a higher priority value). In some cases, this change allows the link aggregation feature to operate successfully between the two devices.

Port priority

The port priority parameter determines the active and standby links. When a group of ports is negotiating with a group of ports on another device to establish a trunk group, the Brocade port with the highest priority becomes the default active port. The other ports (with lower priorities) become standby ports in the trunk group. You can specify a priority from 0 through 65535. A higher value indicates a lower priority. The default is 1.

NOTE

The primary port in the port group becomes the default active port. The primary port is the lowest-numbered port in a valid trunk port group.

Timeout

You can specify a timeout mode, which determines how fast ports are removed from a trunk. Refer to [“Configuring link aggregation parameters”](#) on page 729 for more information.

Key

Every port that is link aggregation-enabled has a key. The key identifies the group of potential trunk ports to which the port belongs. Ports with the same key are called a key group and are eligible to be in the same trunk group.

When you enable link aggregation on an untagged port, the software assigns a default key to the port. For tagged ports, you must manually configure link aggregation keys. Refer to [“Configuring keys for ports with link aggregation enabled”](#) on page 729.

All ports within an aggregate link must have the same key. However, if the device has ports that are connected to two different devices, and the port groups allow the ports to form into separate aggregate links with the two devices, then each group of ports can have the same key while belonging to separate aggregate links with different devices. [Figure 69](#) on page 727 shows an example.

FIGURE 69 Ports with the same key in different aggregate links

Notice that the keys between one device and another do not need to match. The only requirement for key matching is that all the ports within an aggregate link on a given device must have the same key.

Devices that support multi-slot trunk groups can form multi-slot aggregate links using link aggregation. However, the link aggregation keys for the groups of ports on each module must match. For example, if you want to allow link aggregation to form an aggregate link containing ports 1/1 through 1/4 and 3/5 through 3/8, you must change the link aggregation key on one or both groups of ports so that the key is the same on all eight ports. [Figure 70](#) on page 728 shows an example of a multi-slot aggregate link.

FIGURE 70 Multi-slot aggregate link

System ID: aaaa.bbbb.cccc

Ports 1/1 - 1/4: Key 0

Ports 3/5 - 3/8: Key 0

By default, the device ports are divided into 4-port groups. The software dynamically assigns a unique key to each 4-port group. If you need to divide a 4-port group into two 2-port groups, change the key in one of the groups so that the two 2-port groups have different keys. For example, if you plan to use ports 1/1 and 1/2 in VLAN 1, and ports 1/3 and 1/4 in VLAN 2, change the key for ports 1/3 and 1/4.

Viewing keys for tagged ports

To display link aggregation information, including the key for a specific port, enter a command such as the following at any level of the CLI.

```
Brocade#show link-aggregate ethernet 1/1
System ID: 00e0.52a9.bb00
Port  [Sys P] [Port P] [ Key ] [Act][Tio][Agg][Syn][Col][Dis][Def][Exp]
1/1      0      0      0   No  L   No  No  No  No  No  No
```

The command in this example shows the key and other link aggregation information for port 1/1.

To display link aggregation information, including the key for all ports on which link aggregation is enabled, enter the following command at any level of the CLI.

```

Brocade#show link-aggregate
System ID: 0004.8055.b200
Long timeout: 90, default: 90
Short timeout: 3, default: 3
Port  [Sys P] [Port P] [ Key ] [Act][Tio][Agg][Syn][Col][Dis][Def][Exp][Ope]
1/1      1      1    10000  Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
1/2      1      1    10000  Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
2/1      1      1    10000  Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
2/2      1      1    10000  Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
4/1      1      1     480   Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
4/2      1      1     480   Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
4/3      1      1     480   Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
4/4      1      1     480   Yes  S   Agg  Syn  Col  Dis  Def  No  Dwn
4/17     1      1     481   Yes  S   Agg  Syn  Col  Dis  Def  No  Ope
4/18     1      1     481   Yes  S   Agg  Syn  Col  Dis  Def  No  Ope
4/19     1      1     481   Yes  S   Agg  Syn  Col  Dis  Def  No  Ope
4/20     1      1     481   Yes  S   Agg  Syn  Col  Dis  Def  No  Ope

```

Syntax: `show link-aggregate [ethernet <port>]`

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

Configuring link aggregation parameters

You can configure one or more parameters on the same command line, and in any order.

NOTE

For key configuration only, configuration commands differ depending on whether or not link aggregation is enabled on the ports.

Configuring a port group key if link aggregation is disabled

Use the following command sequence to change the key for ports that do not have link aggregation enabled, and for all other link aggregation parameters (for example, system priority, port priority).

For example, to change the software-assigned key for a port group to another value, enter commands similar to the following.

```

Brocade(config)#interface ethernet 1/1 to 1/4
Brocade(config-mif-1/1-1/4)#link-aggregate configure key 10000
Brocade(config-mif-1/1-1/4)#interface ethernet 3/5 to 3/8
Brocade(config-mif-3/5-3/8)#link-aggregate configure key 10000

```

Configuring keys for ports with link aggregation enabled

As shown in the following command sequence, to change the key on ports that already have link aggregation enabled, you must first turn off link aggregation, configure the new key, and then re-enable link aggregation.

```
Brocade(config)#interface ethernet 1/1 to 1/4
Brocade(config-mif-1/1-1/4)#link-aggregate off
Brocade(config-mif-1/1-1/4)#link-aggregate configure key 10000
Brocade(config-mif-1/1-1/4)#link-aggregate active
Brocade(config-mif-1/1-1/4)#interface ethernet 3/5 to 3/8
Brocade(config-mif-3/5-3/8)#link-aggregate off
Brocade(config-mif-3/5-3/8)#link-aggregate configure key 10000
Brocade(config-mif-3/5-3/8)#link-aggregate active
```

These commands change the key for ports 1/1 through 1/4 and 3/5 through 3/8 to 10000. Because all ports in an aggregate link must have the same key, the command in this example enables ports 1/1 through 1/4 and 3/5 through 3/8 to form a multi-slot aggregate link.

Syntax: [no] link-aggregate configure [system-priority <num>] | [port-priority <num>] | [key <num>]

The **system-priority** <num> parameter specifies the Brocade device link aggregation priority. A higher value indicates a lower priority. You can specify a priority from 0 through 65535. The default is 1.

The **port-priority** <num> parameter specifies an individual port priority within the port group. A higher value indicates a lower priority. You can specify a priority from 0 through 65535. The default is 1.

The **key** <num> parameter identifies the group of ports that are eligible to be aggregated into a trunk group. The software automatically assigns a key to each group of ports. The software assigns the keys in ascending numerical order, beginning with 0. You can change a port group key to a value from 10000 through 65535.

Configuring port timeout

You can control the time it takes to remove ports from a trunk with link aggregation enabled by configuring the link aggregated port with a “short” timeout mode. Once a port is configured with a timeout mode, it will remain in that timeout mode whether it is up or down or whether it is part of a trunk.

All ports in a trunk should have the same timeout mode, which is checked when link aggregation is enabled on ports.

To configure a port with a short timeout mode, enter a command such as the following.

```
Brocade(config)#interface ethernet8/1
Brocade(config-if-e1000-8/1)#link-aggregate configure timeout short
```

Syntax: [no] link-aggregate configure timeout [short]

If the timeout mode is not configured for a port and link aggregation is enabled, the port starts with a short timeout mode. Once a trunk is formed, the timeout mode is changed to the long timeout mode. The value for “long” and “short” is displayed in the output for the **show link-aggregate** command.

NOTE

LACP short timeout mode is not supported on FESX combination copper ports. If these ports are configured with a short timeout mode, the ports will flap and will not be aggregated into a trunk group.

Displaying and determining the status of aggregate links

The **show link-aggregate** command provides the ability to view the status of dynamic links. You can determine the status of ports that are members of an aggregate link, and whether LACP messages are being transmitted between the ports.

The following section provides details about the events that can affect the status of ports in an aggregate link and the status of LACP messages exchanged between the ports. Later sections provide instructions for viewing these status reports.

Events that affect the status of ports in an aggregate link

Brocade devices can block traffic on a port or shut down a port that is part of a trunk group or aggregate link when a port joins a trunk group and the port on the other end of the link shuts down or stops transmitting LACP packets. Depending on the timeout value set on the port, the link aggregation information expires. If this occurs, the Brocade device shuts down the port and notifies all the upper layer protocols that the port is down.

Brocade devices can also block traffic on a port that is initially configured with link aggregation. The port is blocked until it joins a trunk group. In this case, traffic is blocked, but the port is still operational.

A port remains blocked until one of the following events occurs:

- Both ports in the aggregate link have the same key.
- LACP brings the port back up.
- The port joins a trunk group.

Displaying link aggregation and port status information

Use the **show link-aggregate** command to determine the operational status of ports associated with aggregate links.

To display the link aggregation information for a specific port, enter a command such as the following at any level of the CLI.

```
Brocade#show link-aggregate ethernet 1/1
System ID: 00e0.52a9.bb00
Port  [Sys P] [Port P] [ Key ] [Act][Tio][Agg][Syn][Col][Dis][Def][Exp] [Ope]
1/1      0      0      0   No   L   No   No   No   No   No   No   Ope
```

The command in this example shows the link aggregation information for port 1/1.

To display the link aggregation information for all ports on which link aggregation is enabled, enter the following command at any level of the CLI.

Displaying and determining the status of aggregate links

```
Brocade#show link-aggregate
System ID: 00e0.52a9.bb00
Long timeout: 120, default: 120 Short timeout: 3, default: 3
Port  [Sys P] [Port P] [Key] [Act][Tio][Agg][Syn][Col][Dis][Def][Exp][Ope]
1/1      1      1      0   No   L   Agg  Syn  No   No   Def  Exp  Ope
1/2      1      1      0   No   L   Agg  Syn  No   No   Def  Exp  Ina
1/3      1      1      0   No   L   Agg  Syn  No   No   Def  Exp  Ina
1/4      1      1      0   No   L   Agg  Syn  No   No   Def  Exp  Blo
1/5      1      1      1   No   L   Agg  No   No   No   Def  Exp  Ope
1/6      1      1      1   No   L   Agg  No   No   No   Def  Exp  Ope
1/7      1      1      1   No   L   Agg  No   No   No   Def  Exp  Dwn
1/8      1      1      1   No   L   Agg  No   No   No   Def  Exp  Dwn
```

Syntax: `show link-aggregate [ethernet <port>]`

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

NOTE

Ports that are configured as part of an aggregate link must also have the same key. For more information about assigning keys, refer to [“Key”](#) on page 726.

The `show link-aggregate` command shows the following information.

TABLE 137 Description of show link-aggregate command output

Field	Description
System ID	Lists the base MAC address of the device. This is also the MAC address of port 1 (or 1/1).
Short timeout	The short timeout value on the FSX.
Long timeout	The long timeout value on the FSX.
Port	Lists the port number.
Sys P	Lists the system priority configured for this port.
Port P	Lists the port link aggregation priority.
Key	Lists the link aggregation key. This column displays “singleton” if the port is configured with a single instance of LACP. (Refer to “Single instance LACP configuration” on page 734 for more details.)
Act	Indicates the link aggregation mode, which can be one of the following: <ul style="list-style-type: none">• No – The mode is passive or link aggregation is disabled (off) on the port. If link aggregation is enabled (and the mode is passive), the port can send and receive LACPDU messages to participate in negotiation of an aggregate link initiated by another port, but cannot search for a link aggregation port or initiate negotiation of an aggregate link.• Yes – The mode is active. The port can send and receive LACPDU messages.

TABLE 137 Description of show link-aggregate command output (Continued)

Field	Description
Tio	<p>Indicates the timeout value of the port. The timeout value can be one of the following:</p> <ul style="list-style-type: none"> • L – Long. The trunk group has already been formed and the port is therefore using a longer message timeout for the LACPDU messages exchanged with the remote port. Typically, these messages are used as confirmation of the health of the aggregate link. • S – Short. The port has just started the LACPDU message exchange process with the port at the other end of the link. The S timeout value also can mean that the link aggregation information received from the remote port has expired and the ports are starting a new information exchange.
Agg	<p>Indicates the link aggregation state of the port. The state can be one of the following:</p> <ul style="list-style-type: none"> • Agg – Link aggregation is enabled on the port. • No – Link aggregation is disabled on the port.
Syn	<p>Indicates the synchronization state of the port. The state can be one of the following:</p> <ul style="list-style-type: none"> • No – The port is out of sync with the remote port. The port does not understand the status of the LACPDU process and is not prepared to enter a trunk link. • Syn – The port is in sync with the remote port. The port understands the status of the LACPDU message exchange process, and therefore knows the trunk group to which it belongs, the link aggregation state of the remote port, and so on.
Col	<p>Indicates the collection state of the port, which determines whether the port is ready to send traffic over the trunk link:</p> <ul style="list-style-type: none"> • Col – The port is ready to send traffic over the trunk link. • No – The port is not ready to send traffic over the trunk link.
Dis	<p>Indicates the distribution state of the port, which determines whether the port is ready to receive traffic over the trunk link:</p> <ul style="list-style-type: none"> • Dis – The port is ready to receive traffic over the trunk link. • No – The port is not ready to receive traffic over the trunk link.
Def	<p>Indicates whether the port is using default link aggregation values. The port uses default values if it has not received link aggregation information through LACP from the port at the remote end of the link. This field can have one of the following values:</p> <ul style="list-style-type: none"> • Def – The port has not received link aggregation values from the port at the other end of the link and is therefore using its default link aggregation LACP settings. • No – The port has received link aggregation information from the port at the other end of the link and is using the settings negotiated with that port.
Exp	<p>Indicates whether the negotiated link aggregation settings have expired. The settings expire if the port does not receive an LACPDU message from the port at the other end of the link before the message timer expires. This field can have one of the following values:</p> <ul style="list-style-type: none"> • Exp – The link aggregation settings this port negotiated with the port at the other end of the link have expired. The port is now using its default link aggregation settings. • No – The link aggregation values that this port negotiated with the port at the other end of the link have not expired, so the port is still using the negotiated settings.
Ope	<ul style="list-style-type: none"> • Ope (operational) - The port is operating normally. • Ina (inactive) - The port is inactive because the port on the other side of the link is down or has stopped transmitting LACP packets. • Blo (blocked) - The port is blocked because the adjacent port is not configured with link aggregation or because it is not able to join a trunk group. To unblock the port and bring it to an operational state, enable link aggregation on the adjacent port and ensure that the ports have the same key.

Displaying link aggregation and port status information for FastIron stackable devices

To display link aggregation information for devices in an IronStack, enter the **show link-aggregate** command. The output for an Ironstack resembles the following.

```
Brocade(config)#show link-aggregate
System ID: 0012.f2e5.a200
Long timeout: 120, default: 120
Short timeout: 3, default: 3
Port [Sys P] [Port P] [ Key ] [Act][Tio][Agg][Syn][Col][Dis][Def][Exp][Ope]
1/1/1 1          1      13000 Yes  L   Agg  Syn  Col  Dis  No   No   Ope
2/1/1 1          1      13000 Yes  L   Agg  Syn  Col  Dis  No   No   Ope
3/1/1 1          1      13000 Yes  L   Agg  Syn  Col  Dis  No   No   Ope
4/1/1 1          1      13000 Yes  L   Agg  Syn  Col  Dis  No   No   Ope
```

Displaying LACP status information

Use the **show trunk** command to determine the status of LACP. Refer to [“Displaying trunk group configuration information”](#) on page 716.

Clearing the negotiated aggregate links table

When a group of ports negotiates a trunk group configuration, the software stores the negotiated configuration in a table. You can clear the negotiated link aggregation configurations from the software. When you clear the information, the software does not remove link aggregation parameter settings you have configured. Only the configuration information negotiated using LACP is removed.

NOTE

The software automatically updates the link aggregation configuration based on LACPDU messages. However, clearing the link aggregation information can be useful if you are troubleshooting a configuration.

To clear the link aggregation information, enter the following command at the Privileged EXEC level of the CLI.

```
Brocade#clear link-aggregate
```

Syntax: clear link-aggregate

Single instance LACP configuration

A single instance of link aggregation (or single link LACP) can be used for unidirectional link detection. Single link LACP is based on 802.3ad LACP, but allows you to form an aggregated link with only one Ethernet port. It is the preferred method for detecting unidirectional links across multi-vendor devices, instead of unidirectional link detection (UDLD), because it is based on a standard rather than on a proprietary solution.

Configuration notes for single link LACP

- Single link LACP is supported on 1-GbE and 10-GbE ports, as well as across modules.
- Single link LACP is not supported on static trunk ports.
- Single link LACP is not intended for the creation of trunk groups.
- The single link LACP timer is always short (3 seconds) and is not configurable. PDUs are sent out every three seconds.
- Single link LACP is not supported on ports that have unidirectional link detection (UDLD) configured.

CLI syntax for single link LACP

To form a single link LACP, the port on both sides of the link must have LACP enabled. You can then define a single link LACP at the interface level of the device by entering the following commands.

```
Brocade(config)#interface ethernet 8/1
Brocade(config-if-e1000-8/1)#link-aggregate configure singleton
Link-aggregation active
```

Syntax: [no] link-aggregate configure

When single link LACP is configured, the **show link-aggregate** command displays the following information.

```
Brocade#show link-aggregate
System ID: 00e0.5200.0118
Long timeout: 120, default: 120 Short timeout: 3, default: 3
Port  [Sys P] [Port P] [ Key ] [Act][Tio][Agg][Syn][Col][Dis][Def][Exp][Ope]
2/1      1      1      1   Yes  S   Agg  Syn  No   No   Def  Exp  Ina
2/2      1      1      1   Yes  S   Agg  Syn  No   No   Def  Exp  Ina
2/3      1      1  singleton Yes  S   Agg  Syn  No   No   Def  Exp  Ina
2/4      1      1  singleton Yes  S   Agg  Syn  No   No   Def  Exp  Dwn
```

If the **singleton** keyword is configured on the port, the “Key” column displays “singleton”. Refer to [“Description of show link-aggregate command output”](#) on page 732 to interpret the information on the displayed output.

Also, when ports are logically brought up or down while the **singleton** keyword is configured on the port, the following syslog messages are generated.

```
Logical link on interface ethernet <slot#/port#> is up.
Logical link on interface ethernet <slot#/port#> is down.
```

Single instance LACP configuration

VLANs

[Table 138](#) lists the individual Brocade FastIron switches and the virtual LAN (VLAN) features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 138 Supported VLAN features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
VLAN Support	Yes	Yes	Yes	Yes	Yes
4096 maximum VLANs	Yes	Yes	Yes	Yes	Yes
802.1Q with tagging	Yes	Yes	Yes	Yes	Yes
802.1ad (Q-in-Q) tagging	Yes	Yes	Yes	Yes	Yes
802.1ad (Q-in-Q) tag profiles	No	Yes	Yes	Yes	Yes
Dual-mode VLANs	Yes	Yes	Yes	Yes	Yes
Port-based VLANs	Yes	Yes	Yes	Yes	Yes
Uplink Ports Within a Port-Based VLAN	Yes	Yes	Yes	Yes	Yes
Protocol VLANs (AppleTalk, IPv4, dynamic IPv6, and IPX)	Yes	Yes	Yes	Yes	Yes
Layer 3 Subnet VLANs (Appletalk, IP subnet network, and IPX)	Yes	Yes	Yes	Yes	Yes
VLAN groups	Yes	Yes	Yes	Yes	Yes
Multi-range VLANs	Yes	Yes	Yes	Yes	Yes
Private VLANs (PVLANS)	Yes	Yes	Yes	Yes	Yes ICX 6450 uses hardware forwarding, while ICX 6430 uses software forwarding.
Super Aggregated VLANs	Yes	Yes	Yes	Yes	Yes
VLAN Q-in-Q Tagging (tag-type 8100 over 8100 encapsulation)	Yes	Yes	Yes	Yes	Yes

VLAN overview

The following sections provide details about the VLAN types and features supported on the FastIron family of switches.

Types of VLANs

This section describes the VLAN types supported on Brocade devices.

VLAN support on FastIron devices

You can configure the following types of VLANs on FastIron devices:

- **Layer 2 port-based VLAN** – a set of physical ports that share a common, exclusive Layer 2 broadcast domain
- **Layer 3 protocol VLANs** – a subset of ports within a port-based VLAN that share a common, exclusive broadcast domain for Layer 3 broadcasts of the specified protocol type
- **IP subnet VLANs** – a subset of ports in a port-based VLAN that share a common, exclusive subnet broadcast domain for a specified IP subnet
- **IPv6 VLANs** – a subset of ports in a port-based VLAN that share a common, exclusive network broadcast domain for IPv6 packets
- **IPX network VLANs** – a subset of ports in a port-based VLAN that share a common, exclusive network broadcast domain for a specified IPX network
- **AppleTalk cable VLANs** – a subset of ports in a port-based-based VLAN that share a common, exclusive network broadcast domain for a specified AppleTalk cable range

When a FastIron device receives a packet on a port that is a member of a VLAN, the device forwards the packet based on the following VLAN hierarchy:

- If the port belongs to an IP subnet VLAN, IPX network VLAN, or AppleTalk cable VLAN and the packet belongs to the corresponding IP subnet, IPX network, or AppleTalk cable range, the device forwards the packet to all the ports within that VLAN.
- If the packet is a Layer 3 packet but cannot be forwarded as described above, but the port is a member of a Layer 3 protocol VLAN for the packet protocol, the device forwards the packet on all the Layer 3 protocol VLAN ports.
- If the packet cannot be forwarded based on either of the VLAN membership types listed above, but the packet can be forwarded at Layer 2, the device forwards the packet on all the ports within the receiving port port-based VLAN.

Protocol VLANs differ from IP subnet, IPX network, and AppleTalk VLANs in an important way. Protocol VLANs accept any broadcast of the specified protocol type. An IP subnet, IPX network, or AppleTalk VLAN accepts only broadcasts for the specified IP subnet, IPX network, or AppleTalk cable range.

NOTE

Protocol VLANs are different from IP subnet, IPX network, and AppleTalk cable VLANs. A port-based VLAN cannot contain both an IP subnet, IPX network, or AppleTalk cable VLAN and a protocol VLAN for the same protocol. For example, a port-based VLAN cannot contain both an IP protocol VLAN and an IP subnet VLAN.

Layer 2 port-based VLANs

On all Brocade devices, you can configure port-based VLANs. A port-based VLAN is a subset of ports on a Brocade device that constitutes a Layer 2 broadcast domain.

By default, all the ports on a Brocade device are members of the default VLAN. Thus, all the ports on the device constitute a single Layer 2 broadcast domain. When you configure a port-based VLAN, the device automatically removes the ports you add to the VLAN from the default VLAN.

You can configure multiple port-based VLANs. You can configure up to 4094 port-based VLANs on a Layer 2 switch or Layer 3 switch. On both device types, valid VLAN IDs are 1 – 4095. You can configure up to the maximum number of VLANs within that ID range.

NOTE

VLAN IDs 4087, 4090, and 4093 are reserved for Brocade internal use only. VLAN 4094 is reserved for use by Single STP. Also, if you are running an earlier release, VLAN IDs 4091 and 4092 may be reserved for Brocade internal use only. If you want to use VLANs 4091 and 4092 as configurable VLANs, you can assign them to different VLAN IDs. For more information, refer to [“Assigning different VLAN IDs to reserved VLANs 4091 and 4092”](#) on page 767.

Each port-based VLAN can contain either tagged or untagged ports. A port cannot be a member of more than one port-based VLAN unless the port is tagged. **802.1Q tagging** allows the port to add a four-byte tag field, which contains the VLAN ID, to each packet sent on the port. You also can configure port-based VLANs that span multiple devices by tagging the ports within the VLAN. The tag enables each device that receives the packet to determine the VLAN the packet belongs to. 802.1Q tagging applies only to Layer 2 VLANs, not to Layer 3 VLANs.

Because each port-based VLAN is a separate Layer 2 broadcast domain, by default each VLAN runs a separate instance of the Spanning Tree Protocol (STP).

Layer 2 traffic is bridged within a port-based VLAN and Layer 2 broadcasts are sent to all the ports within the VLAN.

[Figure 71](#) shows an example of a Brocade device on which a Layer 2 port-based VLAN has been configured.

FIGURE 71 Brocade device containing user-defined Layer 2 port-based VLAN

DEFAULT-VLAN
VLAN ID = 1
Layer 2 Port-based VLAN

User-configured port-based VLAN

When you add a port-based VLAN, the device removes all the ports in the new VLAN from DEFAULT-VLAN.

Configuring port-based VLANs

Port-based VLANs allow you to provide separate spanning tree protocol (STP) domains or broadcast domains on a port-by-port basis.

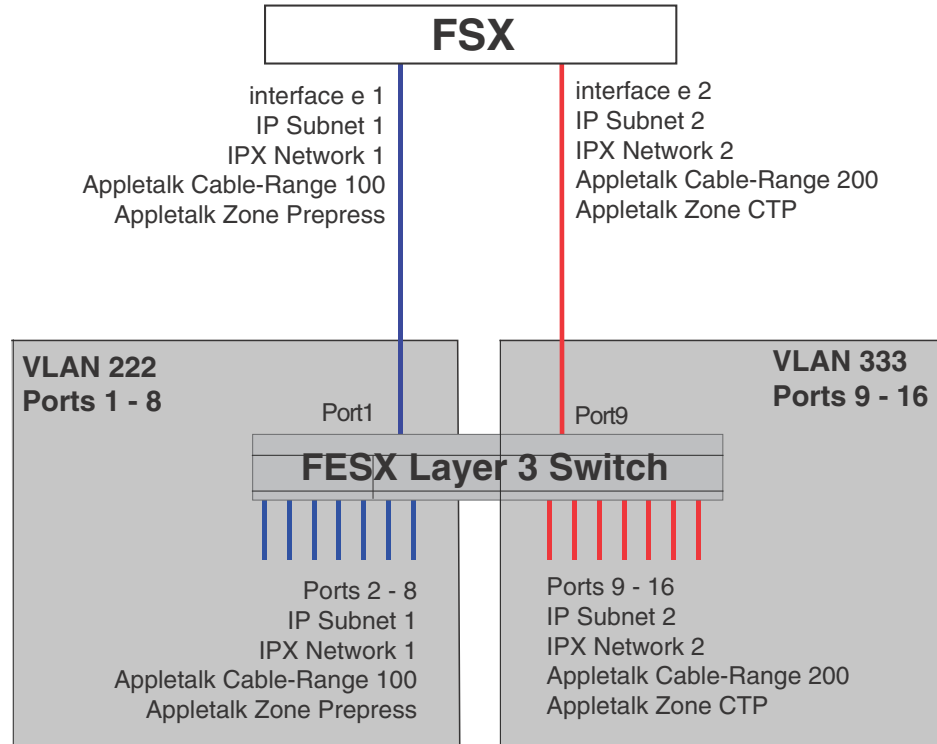

This section describes how to perform the following tasks for port-based VLANs using the CLI:

- Create a VLAN
- Delete a VLAN
- Modify a VLAN
- Change a VLAN priority
- Enable or disable STP on the VLAN

Example 1—Simple port-based VLAN configuration

[Figure 72](#) shows a simple port-based VLAN configuration using a single Brocade Layer 2 switch. All ports within each VLAN are untagged. One untagged port within each VLAN is used to connect the Layer 2 switch to a Layer 3 switch (in this example, a FSX) for Layer 3 connectivity between the two port-based VLANs.

FIGURE 72 Port-based VLANs 222 and 333

To create the two port-based VLANs shown in [Figure 72](#), enter the following commands.

```
Brocade(config)# vlan 222 by port
Brocade(config-vlan-222)# untagged ethernet 1 to 8
Brocade(config-vlan-222)# vlan 333 by port
Brocade(config-vlan-333)# untagged ethernet 9 to 16
```

Syntax: `vlan <vlan-id> by port`

Syntax: `untagged ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum> | ethernet [<slotnum>/]<portnum>]`

Example 2—More complex port-based VLAN configuration

Figure 73 shows a more complex port-based VLAN configuration using multiple Layer 2 switches and IEEE 802.1Q VLAN tagging. The backbone link connecting the three Layer 2 switches is tagged. One untagged port within each port-based VLAN on FESX-A connects each separate network wide Layer 2 broadcast domain to the router for Layer 3 forwarding between broadcast domains. The STP priority is configured to force FESX-A to be the root bridge for VLANs RED and BLUE. The STP priority on FESX-B is configured so that FESX-B is the root bridge for VLANs GREEN and BROWN.

FIGURE 73 More complex port-based VLAN

To configure the Port-based VLANs on the FESX Layer 2 switches in Figure 73, use the following method.

Configuring port-based VLANs on FESX-A

Enter the following commands to configure FESX-A.

```
Brocade> enable
Brocade# configure terminal
Brocade(config)# hostname FESX-A
Brocade-A(config)# vlan 2 name BROWN
Brocade-A(config-vlan-2)# untagged ethernet 1 to 4 ethernet 17
Brocade-A(config-vlan-2)# tagged ethernet 25 to 26
Brocade-A(config-vlan-2)# spanning-tree
Brocade-A(config-vlan-2)# vlan 3 name GREEN
Brocade-A(config-vlan-3)# untagged ethernet 5 to 8 ethernet 18
Brocade-A(config-vlan-3)# tagged ethernet 25 to 26
Brocade-A(config-vlan-3)# spanning-tree
Brocade-A(config-vlan-3)# vlan 4 name BLUE
```

```

Brocade-A(config-vlan-4)# untagged ethernet 9 to 12 ethernet 19
Brocade-A(config-vlan-4)# tagged ethernet 25 to 26
Brocade-A(config-vlan-4)# spanning-tree
Brocade-A(config-vlan-4)# spanning-tree priority 500
Brocade-A(config-vlan-4)# vlan 5 name RED
Brocade-A(config-vlan-5)# untagged ethernet 13 to 16 ethernet 20
Brocade-A(config-vlan-5)# tagged ethernet 25 to 26
Brocade-A(config-vlan-5)# spanning-tree
Brocade-A(config-vlan-5)# spanning-tree priority 500
Brocade-A(config-vlan-5)# end
Brocade-A# write memory

```

Configuring port-based VLANs on FESX-B

Enter the following commands to configure FESX-B.

```

Brocade> en
Brocade# configure terminal
Brocade(config)# hostname FESX-B
Brocade-B(config)# vlan 2 name BROWN
Brocade-B(config-vlan-2)# untagged ethernet 1 to 4
Brocade-B(config-vlan-2)# tagged ethernet 25 to 26
Brocade-B(config-vlan-2)# spanning-tree
Brocade-B(config-vlan-2)# spanning-tree priority 500
Brocade-B(config-vlan-2)# vlan 3 name GREEN
Brocade-B(config-vlan-3)# untagged ethernet 5 to 8
Brocade-B(config-vlan-3)# tagged ethernet 25 to 26
Brocade-B(config-vlan-3)# spanning-tree
Brocade-B(config-vlan-3)# spanning-tree priority 500
Brocade-B(config-vlan-3)# vlan 4 name BLUE
Brocade-B(config-vlan-4)# untagged ethernet 9 to 12
Brocade-B(config-vlan-4)# tagged ethernet 25 to 26
Brocade-B(config-vlan-4)# vlan 5 name RED
Brocade-B(config-vlan-5)# untagged ethernet 13 to 16
Brocade-B(config-vlan-5)# tagged ethernet 25 to 26
Brocade-B(config-vlan-5)# end
Brocade-B# write memory

```

Configuring port-based VLANs on FESX-C

Enter the following commands to configure FESX-C.

```

Brocade> en
Brocade# configure terminal
Brocade(config)# hostname FESX-C
Brocade-C(config)# vlan 2 name BROWN
Brocade-C(config-vlan-2)# untagged ethernet 1 to 4
Brocade-C(config-vlan-2)# tagged ethernet 25 to 26
Brocade-C(config-vlan-2)# vlan 3 name GREEN
Brocade-C(config-vlan-3)# untagged ethernet 5 to 8
Brocade-C(config-vlan-3)# tagged ethernet 25 to 26
Brocade-C(config-vlan-3)# vlan 4 name BLUE
Brocade-C(config-vlan-4)# untagged ethernet 9 to 12
Brocade-C(config-vlan-4)# tagged ethernet 25 to 26
Brocade-C(config-vlan-4)# vlan 5 name RED
Brocade-C(config-vlan-5)# untagged ethernet 13 to 16
Brocade-C(config-vlan-5)# tagged ethernet 25 to 26
Brocade-C(config-vlan-5)# end
Brocade-C# write memory

```

Syntax: `vlan <vlan-id> by port`

Syntax: `untagged ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum> | ethernet [<slotnum>/]<portnum>]`

Syntax: `tagged ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum> | ethernet [<slotnum>/]<portnum>]`

Syntax: `[no] spanning-tree`

Syntax: `spanning-tree [ethernet [<slotnum>/]<portnum> path-cost <value> priority <value>] forward-delay <value> hello-time <value> maximum-age <time> priority <value>`

Modifying a port-based VLAN

You can make the following modifications to a port-based VLAN:

- Add or delete a VLAN port.
- Enable or disable STP.

Removing a port-based VLAN

Suppose you want to remove VLAN 5 from the example in [Figure 73](#). To do so, use the following procedure.

1. Access the global CONFIG level of the CLI on FESX-A by entering the following commands.

```
Brocade-A> enable
No password has been assigned yet...
Brocade-A# configure terminal
Brocade-A(config)#
```

2. Enter the following command.

```
Brocade-A(config)# no vlan 5
Brocade-A(config)#
```

3. Enter the following commands to exit the CONFIG level and save the configuration to the system-config file on flash memory.

```
Brocade-A(config)#
Brocade-A(config)# end
Brocade-A# write memory
Brocade-A#
```

4. Repeat steps 1 – 3 on FESX-B.

Syntax: `no vlan <vlan-id> by port`

Removing a port from a VLAN

Suppose you want to remove port 11 from VLAN 4 on FESX-A shown in [Figure 73](#). To do so, use the following procedure.

1. Access the global CONFIG level of the CLI on FESX-A by entering the following command.

```
Brocade-A> enable
No password has been assigned yet...
Brocade-A# configure terminal
Brocade-A(config)#
```

2. Access the level of the CLI for configuring port-based VLAN 4 by entering the following command.

```
Brocade-A(config)#
Brocade-A(config)# vlan 4
Brocade-A(config-vlan-4)#
```

3. Enter the following commands.

```
Brocade-A(config-vlan-4)#
Brocade-A(config-vlan-4)# no untagged ethernet 11
deleted port ethe 11 from port-vlan 4.
Brocade-A(config-vlan-4)#
```

4. Enter the following commands to exit the VLAN CONFIG mode and save the configuration to the system-config file on flash memory.

```
Brocade-A(config-vlan-4)#
Brocade-A(config-vlan-4)# end
Brocade-A# write memory
```

You can remove all the ports from a port-based VLAN without losing the rest of the VLAN configuration. However, you cannot configure an IP address on a virtual routing interface unless the VLAN contains ports. If the VLAN has a virtual routing interface, the virtual routing interface IP address is deleted when the ports associated with the interface are deleted. The rest of the VLAN configuration is retained.

Multi-range VLAN

The multi-range VLAN feature allows users to use a single command to create and configure multiple VLANs. These VLANs can be continuous, for example from 2 to 7 or discontinuous, for example, 2 4 7.

NOTE

The maximum number of VLANs you can create or configure with a single command is 64.

Creating a multi-range VLAN

To create more than one VLAN with a single command, you can specify the VLAN number and range.

Syntax: **[no] vlan <num> to <num>**

The <num> parameter specifies the VLAN ID.

To create a continuous range of VLANs, enter command such as the following.

```
Brocade(config)#vlan 2 to 7
Brocade(config-mvlan-2-7)#
```

Syntax: **[no] vlan <num> to <num>**

To create discontinuous VLANs, enter command such as the following.

```
Brocade(config)#vlan 2 4 7
Brocade(config-mvlan-2*7)#exit
```

Syntax: **[no] vlan <num> <num> <num>**

You can also create continuous and discontinuous VLANs. To create continuous and discontinuous VLANs, enter command such as the following.

```
Brocade(config)#vlan 2 to 7 20 25
Brocade(config-mvlan-2*25)#
```

Syntax: [no] vlan <num> to <num> <num>

Deleting a multi-range VLAN

You can also delete multiple VLANs with a single command.

To delete a continuous range of VLANs, enter command such as the following.

```
Brocade(config)#no vlan 2 to 7
```

Syntax: [no] vlan <num> to <num>

To delete discontinuous VLANs, enter command such as the following.

```
Brocade(config)#no vlan 2 4 7
```

Syntax: [no] vlan <num> <num> <num>

You can also delete continuous and discontinuous VLANs. To delete continuous and discontinuous VLANs, enter command such as the following.

```
Brocade(config)#no vlan 2 to 7 20 25
```

Syntax: [no] vlan <num> to <num> <num>

If a single multi-range VLAN command contains more than 64 VLANs, the CLI does not add the VLAN IDs but instead displays an error message. An example is given below.

```
Brocade(config)#vlan 100 to 356
ERROR -can't have more than 64 vlans at a time in a multi-range vlan command
```

Configuring a multi-range VLAN

You can configure multiple VLANs with a single command from the multi-range VLAN configuration level. For example, if you want to add tagged ethernet port 1/1/1 in the VLAN 16 17 20 21 22 23 24, enter the following commands.

```
Brocade(config)#vlan 16 17 20 to 24
Brocade(config-mvlan-16*24)#tag e 1/1/1
Brocade(config-mvlan-16*24)#
```

The first command will take you to the multi-range VLAN configuration mode. The second command will add tagged ethernet port 1/1/1 in the specified VLANs, VLAN 16 17 20 21 22 23 and 24.

The following VLAN parameters can be configured with the specified VLAN range.

Command	Explanation
atalk-protocol	Set AppleTalk protocol VLAN
clear	Clear table/statistics/keys
decnet-protocol	Set decnet protocol VLAN
end	End Configuration level and goto Privileged level
exit	Exit current level
ip-protocol	Set IP protocol VLAN
ipv6-protocol	Set IPv6 protocol VLAN
ipx-protocol	Set IPX protocol VLAN
mac-vlan-permit	Define port to be used for MAC Based VLAN
monitor	Monitor Ingress Traffic on this VLAN(Enable VLAN Mirroring)
multicast	IGMP snooping on this VLAN
netbios-protocol	Set netbios protocol VLAN
no	Undo/disable commands
other-protocol	Set other protocol VLAN
quit	Exit to User level
show	Show system information
spanning-tree	Set spanning tree for this VLAN
static-mac-address	Configure static MAC for this VLAN
tagged	802.1Q tagged port
uplink-switch	Define uplink ports and enable uplink switching
vsrp	Configure VSRP
vsrp-aware	Configure VSRP Aware parameters
write	Write running configuration to flash or terminal

NOTE

In FSX and FESX platforms, the **mac-vlan-permit** command is not available in the multi-range vlan configuration mode.

The VLAN parameters configured for the VLAN range are written in the configuration file of the individual VLANs. These VLAN parameters can also be removed or modified from the individual VLANs. In the following example, as the first step, create VLANs 16 17 20 21 22 23 24. Further, as the second step, add Ethernet port 1/1/1 in all the VLANs. As the third step, enabled 802.1w spanning tree on all these VLANs.

```
Brocade(config)#vlan 16 17 20 to 24
Brocade(config-mvlan-16*24)#tag e 1/1/1
Brocade(config-mvlan-16*24)#
Added tagged port(s) ethe 1/1/1 to port-vlan16.
Added tagged port(s) ethe 1/1/1 to port-vlan 17.
Added tagged port(s) ethe 1/1/1 to port-vlan 20.
Added tagged port(s) ethe 1/1/1 to port-vlan 21.
```

```

Added tagged port(s) ethe 1/1/1 to port-vlan 22.
Added tagged port(s) ethe 1/1/1 to port-vlan 23.
Added tagged port(s) ethe 1/1/1 to port-vlan 24.
Brocade(config-mvlan-16*24)#span 802-1w

```

The Ethernet port e 1/1/1 and spanning tree 802.1w is added to the database of each VLAN separately. You can verify the configuration with the show **running-config** command. See the example below.

```

Brocade(config-mvlan-16*24)#show run
Current configuration:
!
!

```

output omitted

```

!
!
vlan 1 name DEFAULT-VLAN by port
!
vlan 16 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 17 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 20 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 21 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 22 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 23 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 24 by port
tagged ethe 1/1/1
spanning-tree 802-1w

!
!

```

output omitted

```

!
!

```

Now you can modify any one or some of the VLANs. See the example below.

In the following example, disable the spanning tree 802.1w on VLANs 22,23 and 24, And, verify with show **running-config** output that the spanning tree 802.1w is disabled on specified VLANs, VLAN 22, 23 and 24 and not on the VLANs 16, 17, 20 and 21.

```
Brocade(config)#vlan 22 to 24
Brocade(config-mvlan-22-24)#no span 8
Brocade(config-mvlan-22-24)#exit
```

```
Brocade(config)#show run
Current configuration:
```

output omitted

```
!
!
vlan 1 name DEFAULT-VLAN by port
!
vlan 16 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 17 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 20 by port
tagged ethe 1/1/1
spanning-tree 802-1w
!
vlan 21 by port
tagged ethe 1/1/1
spanning-tree 802-1w

vlan 22 by port
tagged ethe 1/1/1
!
vlan 23 by port
tagged ethe 1/1/1
!
vlan 24 by port
tagged ethe 1/1/1
```

output omitted

Multi-range VLAN show commands

This section describes the show commands for multi-range VLAN parameters.

In the multi-range VLAN mode, some of the Show commands are also available. The output of the Show commands in multi-range VLAN mode displays the information related to the specific VLANs only. See the example below.

In the following example, the first command will change the interface configuration level to the multi-range VLAN mode for the VLANs 4, 5 and 6. In the multi-range VLAN mode, enter the command *show 802.1w*. The output will display the information of STP for VLANs 4, 5 and 6

```
Brocade(config)#vlan 4 to 6
```

VLAN overview

```
Brocade(config-mvlan-4-6)#show 802-1w

```

The following **show** parameters can be viewed for the specified VLAN range from the multi-range VLAN configuration mode. The output of these commands displays information about the specified VLANs only.

TABLE 139 VLAN show parameters

Command	Definition
802-1w	Rapid Spanning tree IEEE 802.1w status
mac-address	MAC address table
span	Spanning tree status
vlan	VLAN status
vsrp	Show VSRP commands

Layer 3 protocol-based VLANs

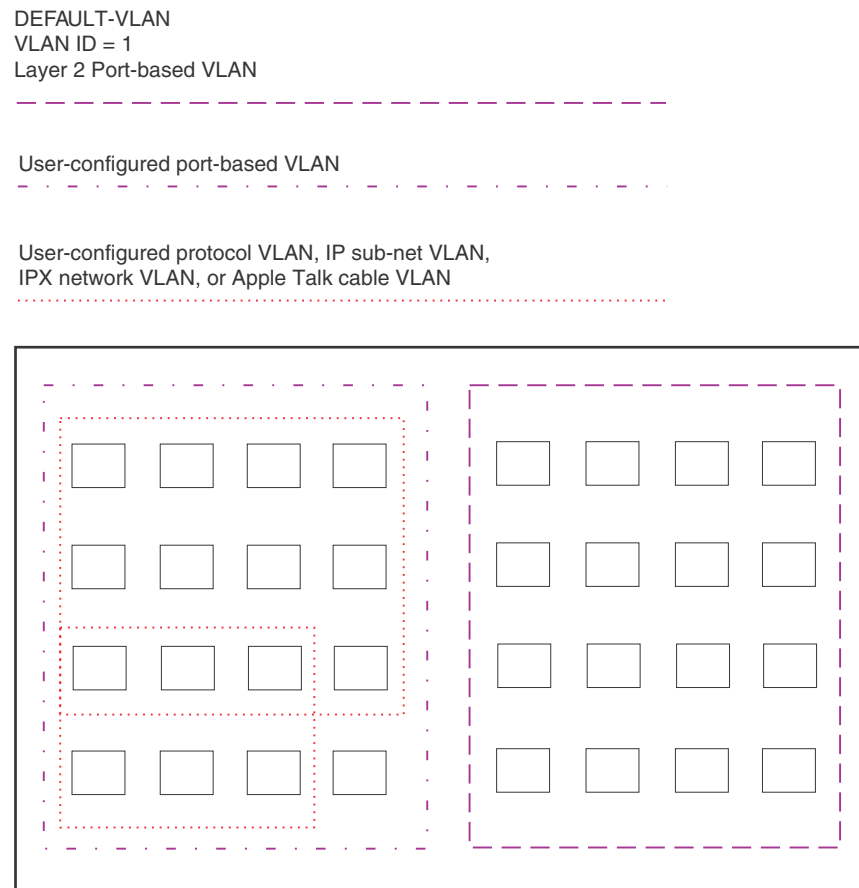

If you want some or all of the ports within a port-based VLAN to be organized according to Layer 3 protocol, you must configure a Layer 3 protocol-based VLAN within the port-based VLAN.

You can configure each of the following types of protocol-based VLAN within a port-based VLAN. All the ports in the Layer 3 VLAN must be in the same Layer 2 VLAN.

Layer 3 protocol-based VLANs are as follows:

- **AppleTalk** – The device sends AppleTalk broadcasts to all ports within the AppleTalk protocol VLAN.
- **IP** – The device sends IP broadcasts to all ports within the IP protocol VLAN.
- **IPv6** – The device sends IPv6 broadcasts to all ports within the IPv6 protocol VLAN.
- **IPX** – The device sends IPX broadcasts to all ports within the IPX protocol VLAN.
- **DECnet** – The device sends DECnet broadcasts to all ports within the DECnet protocol VLAN.
- **NetBIOS** – The device sends NetBIOS broadcasts to all ports within the NetBIOS protocol VLAN.
- **Other** – The device sends broadcasts for all protocol types other than those listed above to all ports within the VLAN.

Figure 74 shows an example of Layer 3 protocol VLANs configured within a Layer 2 port-based VLAN.

FIGURE 74 Layer 3 protocol VLANs within a Layer 2 port-based VLAN

You can add Layer 3 protocol VLANs or IP sub-net, IPX network, and AppleTalk cable VLANs to port-based VLANs.

Layer 3 VLANs cannot span Layer 2 port-based VLANs.

However, Layer 3 VLANs can overlap within a Layer 2 port-based VLAN.

Integrated Switch Routing (ISR)

The Brocade ***Integrated Switch Routing (ISR)*** feature enables VLANs configured on Layer 3 switches to route Layer 3 traffic from one protocol VLAN or IP subnet, IPX network, or AppleTalk cable VLAN to another. Normally, to route traffic from one IP subnet, IPX network, or AppleTalk cable VLAN to another, you would need to forward the traffic to an external router. The VLANs provide Layer 3 broadcast domains for these protocols but do not in themselves provide routing services for these protocols. This is true even if the source and destination IP subnets, IPX networks, or AppleTalk cable ranges are on the same device.

ISR eliminates the need for an external router by allowing you to route between VLANs using virtual routing interfaces (vifs). A **virtual routing interface** is a logical port on which you can configure Layer 3 routing parameters. You configure a separate virtual routing interface on each VLAN that you want to be able to route from or to. For example, if you configure two IP subnet VLANs on a Layer 3 switch, you can configure a virtual routing interface on each VLAN, then configure IP routing parameters for the subnets. Thus, the Layer 3 switch forwards IP subnet broadcasts within each VLAN at Layer 2 but routes Layer 3 traffic between the VLANs using the virtual routing interfaces.

NOTE

The Layer 3 switch uses the lowest MAC address on the device (the MAC address of port 1 or 1/1) as the MAC address for all ports within all virtual routing interfaces you configure on the device.

The routing parameters and the syntax for configuring them are the same as when you configure a physical interface for routing. The logical interface allows the Layer 3 switch to internally route traffic between the protocol-based VLANs without using physical interfaces.

All the ports within a protocol-based VLAN must be in the same port-based VLAN. The protocol-based VLAN cannot have ports in multiple port-based VLANs, unless the ports in the port-based VLAN to which you add the protocol-based VLAN are 802.1Q tagged.

You can configure multiple protocol-based VLANs within the same port-based VLAN. In addition, a port within a port-based VLAN can belong to multiple protocol-based VLANs of the same type or different types. For example, if you have a port-based VLAN that contains ports 1 – 10, you can configure port 5 as a member of an AppleTalk protocol VLAN, an IP protocol VLAN, and an IPX protocol VLAN, and so on.

IP subnet, IPX network, and AppleTalk cable VLANs

The protocol-based VLANs described in the previous section provide separate protocol broadcast domains for specific protocols. For IP, IPX, and AppleTalk, you can provide more granular broadcast control by instead creating the following types of VLAN:

- **IP subnet VLAN** – An IP subnet broadcast domain for a specific IP subnet.
- **IPX network VLAN** – An IPX network broadcast domain for a specific IPX network.
- **AppleTalk cable VLAN** – An AppleTalk broadcast domain for a specific cable range.

You can configure these types of VLANs on Layer 3 switches only. The Layer 3 switch sends broadcasts for the IP subnet, IPX network, or AppleTalk cable range to all ports within the IP subnet, IPX network, or AppleTalk cable VLAN at Layer 2.

The Layer 3 switch routes packets between VLANs at Layer 3. To configure an IP subnet, IPX network, or AppleTalk cable VLAN to route, you must add a virtual routing interface to the VLAN, then configure the appropriate routing parameters on the virtual routing interface.

NOTE

The Layer 3 switch routes packets between VLANs of the same protocol. The Layer 3 switch cannot route from one protocol to another.

NOTE
IP subnet VLANs are not the same thing as IP protocol VLANs. An IP protocol VLAN sends all IP broadcasts on the ports within the IP protocol VLAN. An IP subnet VLAN sends only the IP subnet broadcasts for the subnet of the VLAN. You cannot configure an IP protocol VLAN and an IP subnet VLAN within the same port-based VLAN.

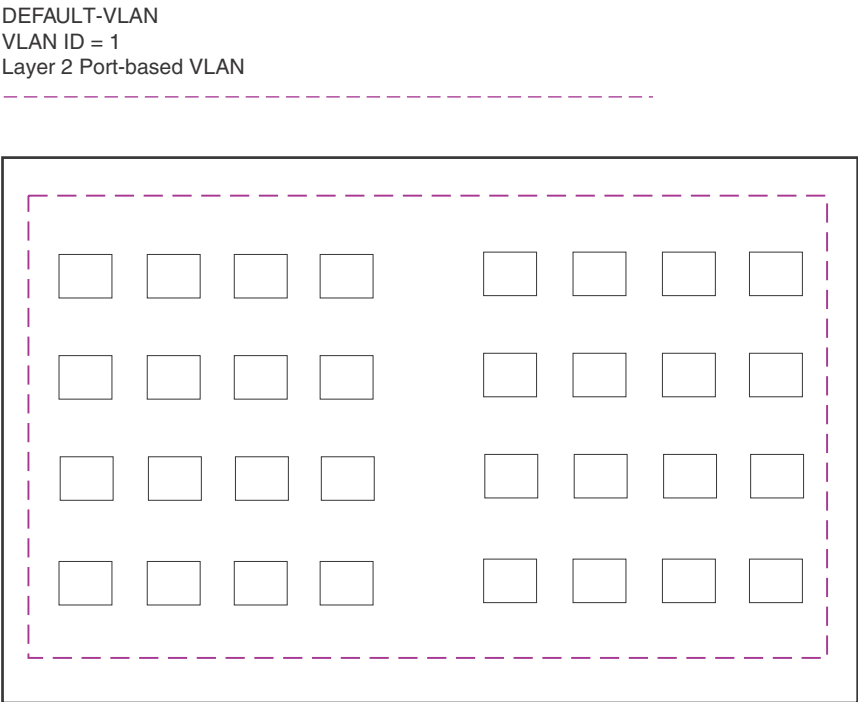

This note also applies to IPX protocol VLANs and IPX network VLANs, and to AppleTalk protocol VLANs and AppleTalk cable VLANs.

Default VLAN

By default, all the ports on a FastIron device are in a single port-based VLAN. This VLAN is called the DEFAULT-VLAN and is VLAN number 1. FastIron devices do not contain any protocol VLANs or IP subnet, IPX network, or AppleTalk cable VLANs by default.

Figure 75 shows an example of the default Layer 2 port-based VLAN.

FIGURE 75 Default Layer 2 port-based VLAN

By default, all ports belong to a single port-based VLAN, DEFAULT-VLAN. Thus, all ports belong to a single Layer 2 broadcast domain.

When you configure a port-based VLAN, one of the configuration items you provide is the ports that are in the VLAN. When you configure the VLAN, the Brocade device automatically removes the ports that you place in the VLAN from DEFAULT-VLAN. By removing the ports from the default VLAN, the Brocade device ensures that each port resides in only one Layer 2 broadcast domain.

NOTE

Information for the default VLAN is available only after you define another VLAN.

Some network configurations may require that a port be able to reside in two or more Layer 2 broadcast domains (port-based VLANs). In this case, you can enable a port to reside in multiple port-based VLANs by tagging the port. Refer to the following section.

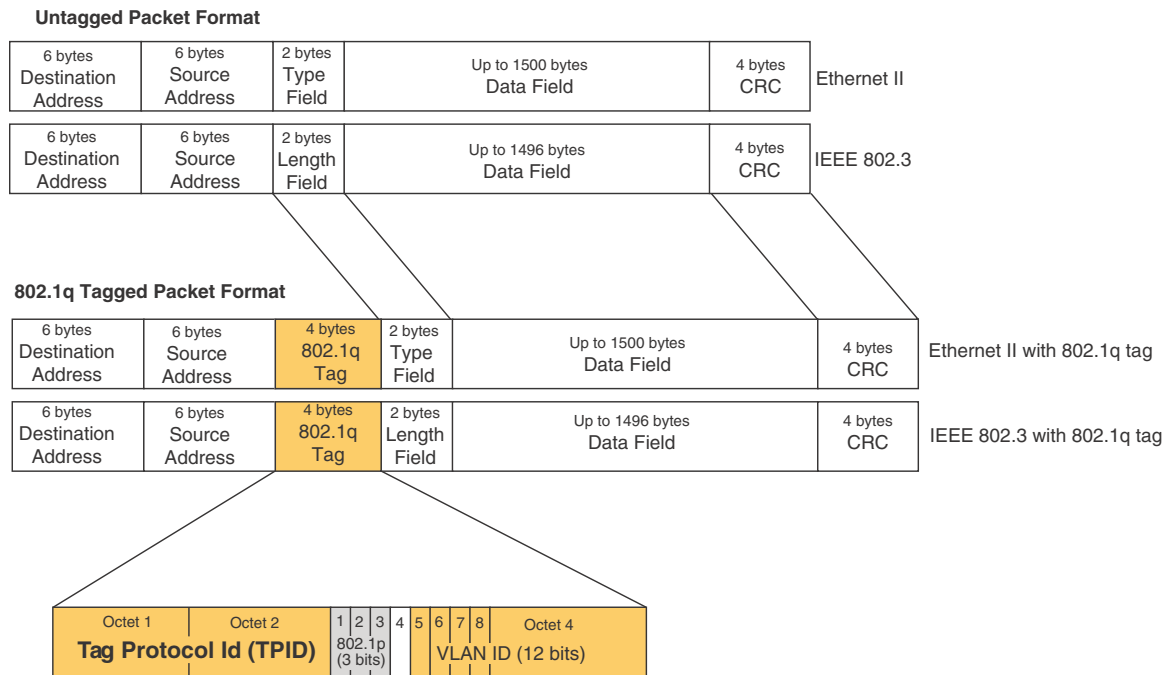

If your network requires that you use VLAN ID 1 for a user-configured VLAN, you can reassign the default VLAN to another valid VLAN ID. Refer to [“Assigning a different VLAN ID to the default VLAN”](#) on page 766.

802.1Q tagging

802.1Q tagging is an IEEE standard that allows a networking device to add information to a Layer 2 packet in order to identify the VLAN membership of the packet. Brocade devices tag a packet by adding a four-byte tag to the packet. The tag contains the tag value, which identifies the data as a tag, and also contains the VLAN ID of the VLAN from which the packet is sent.

- The default tag value is 8100 (hexadecimal). This value comes from the 802.1Q specification. You can change this tag value on a global basis on Brocade devices if needed to be compatible with other vendors' equipment.
- The VLAN ID is determined by the VLAN on which the packet is being forwarded.

[Figure 76](#) shows the format of packets with and without the 802.1Q tag. The tag format is vendor-specific. To use the tag for VLANs configured across multiple devices, make sure all the devices support the same tag format.

FIGURE 76 Packet containing a Brocade 802.1Q VLAN tag

If you configure a VLAN that spans multiple devices, you need to use tagging only if a port connecting one of the devices to the other is a member of more than one port-based VLAN. If a port connecting one device to the other is a member of only a single port-based VLAN, tagging is not required.

If you use tagging on multiple devices, each device must be configured for tagging and must use the same tag value. In addition, the implementation of tagging must be compatible on the devices. The tagging on all Brocade devices is compatible with other Brocade devices.

Figure 77 shows an example of two devices that have the same Layer 2 port-based VLANs configured across them. Notice that only one of the VLANs requires tagging.

FIGURE 77 VLANs configured across multiple devices

Support for 802.1ad (Q-in-Q) tagging

Brocade devices provide finer granularity for configuring 802.1Q tagging, enabling you to configure 802.1Q tag-types on a group of ports, thereby enabling the creation of two identical 802.1Q tags (802.1ad tagging) on a single device. This enhancement improves SAV interoperability between Brocade devices and other vendors' devices that support the 802.1Q tag-types, but are not very flexible with the tag-types they accept.

- FastIron X Series devices support one value for **tag-type**, which is defined at the global level.
- FastIron WS and Brocade FCX Series devices support one value for **tag-type**, which is defined at the global level, and one value for **tag-profile**, which is defined at the global and interface level of the CLI.

802.1ad tagging for FastIron WS and Brocade FCX Series devices

The following enhancements allow the FastIron WS and Brocade FCX Series devices, including those in an IronStack, to use Q-in-Q and SAV, by allowing the changing of a tag profile for ports:

- In addition to the default tag type 0x8100, you can now configure one additional global tag profile with a number from 0xffff.
- Tag profiles on a single port, or a group of ports can be configured to point to the global tag profile.

For example applications and configuration details, refer to [“802.1ad tagging configuration”](#) on page 804.

To configure a global tag profile, enter the following command in the configuration mode.

```
Brocade(config)# tag-profile 9500
```

Syntax: [no] tag-profile <tag-no>

<tag-no> - the number of the tag, can be 0x8100 (default), or 0xffff

To direct individual ports or on a range of ports to this tag profile, enter commands similar to the following.

```
Brocade(config)# interface ethernet 1/1/1
Brocade(config-if-e1000-1/1/1)# tag-profile enable
Brocade(config-mif-1/1/1,1/2/1)# tag-profile enable
```

Spanning Tree Protocol (STP)

The default state of STP depends on the device type:

- STP is disabled by default on Brocade Layer 3 switches.
- STP is enabled by default on Brocade Layer 2 switches.

Also by default, each port-based VLAN has a separate instance of STP. Thus, when STP is globally enabled, each port-based VLAN on the device runs a separate spanning tree.

You can enable or disable STP on the following levels:

- **Globally** – Affects all ports on the device.

NOTE

If you configure a port-based VLAN on the device, the VLAN has the same STP state as the default STP state on the device. Thus, on Layer 2 switches, new VLANs have STP enabled by default. On Layer 3 switches, new VLANs have STP disabled by default. You can enable or disable STP in each VLAN separately. In addition, you can enable or disable STP on individual ports.

- **Port-based VLAN** – Affects all ports within the specified port-based VLAN.

STP is a Layer 2 protocol. Thus, you cannot enable or disable STP for individual protocol VLANs or for IP subnet, IPX network, or AppleTalk cable VLANs. The STP state of a port-based VLAN containing these other types of VLANs determines the STP state for all the Layer 2 broadcasts within the port-based VLAN. This is true even though Layer 3 protocol broadcasts are sent on Layer 2 within the VLAN.

It is possible that STP will block one or more ports in a protocol VLAN that uses a virtual routing interface to route to other VLANs. For IP protocol and IP subnet VLANs, even though some of the physical ports of the virtual routing interface are blocked, the virtual routing interface can still route so long as at least one port in the virtual routing interface protocol VLAN is not blocked by STP.

If you enable Single STP (SSTP) on the device, the ports in all VLANs on which STP is enabled become members of a single spanning tree. The ports in VLANs on which STP is disabled are excluded from the single spanning tree.

For more information, refer to [Chapter 27, “Spanning Tree Protocol”](#).

Virtual routing interfaces

A virtual routing interface is a logical routing interface that Brocade Layer 3 switches use to route Layer 3 protocol traffic between protocol VLANs.

Brocade devices send Layer 3 traffic at Layer 2 within a protocol VLAN. However, Layer 3 traffic from one protocol VLAN to another must be routed.

If you want the device to be able to send Layer 3 traffic from one protocol VLAN to another, you must configure a virtual routing interface on each protocol VLAN, then configure routing parameters on the virtual routing interfaces. For example, to enable a Layer 3 switch to route IP traffic from one IP subnet VLAN to another, you must configure a virtual routing interface on each IP subnet VLAN, then configure the appropriate IP routing parameters on each of the virtual routing interfaces.

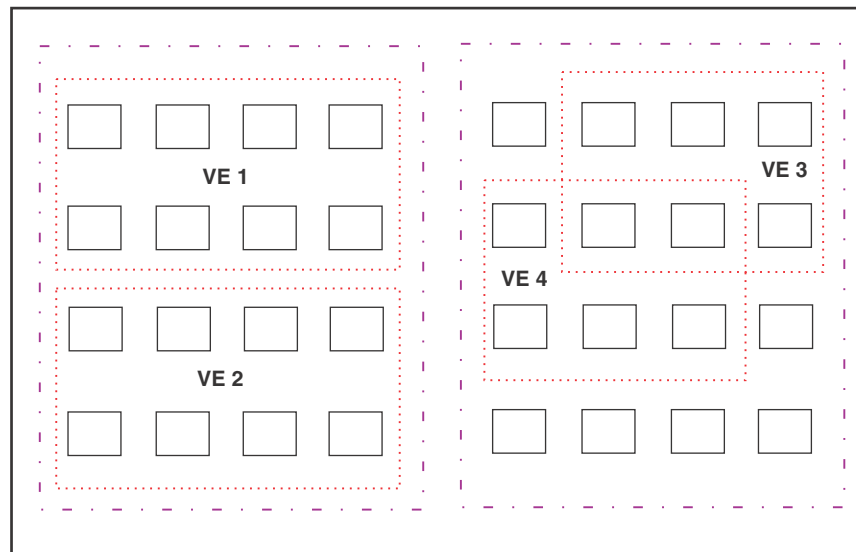

[Figure 78](#) shows an example of Layer 3 protocol VLANs that use virtual routing interfaces for routing.

FIGURE 78 Use virtual routing interfaces for routing between Layer 3 protocol VLANs

User-configured port-based VLAN

User-configured protocol VLAN, IP sub-net VLAN,
IPX network VLAN, or AppleTalk cable VLAN

VE = virtual interface
("VE" stands for "Virtual Ethernet")

Layer 2 and Layer 3 traffic within a VLAN
is bridged at Layer 2.

Layer 3 traffic between protocol VLANs
is routed using virtual interfaces (VE).
To route to one another, each protocol
VLAN must have a virtual interface.

VLAN and virtual routing interface groups

Brocade FastIron devices support the configuration of VLAN groups. To simplify configuration, you can configure VLAN groups and virtual routing interface groups. When you create a VLAN group, the VLAN parameters you configure for the group apply to all the VLANs within the group. Additionally, you can easily associate the same IP subnet interface with all the VLANs in a group by configuring a virtual routing interface group with the same ID as the VLAN group.

For configuration information, refer to [“VLAN groups and virtual routing interface group”](#) on page 791.

Dynamic, static, and excluded port membership

When you add ports to a protocol VLAN, IP subnet VLAN, IPX network VLAN, or AppleTalk cable VLAN, you can add them dynamically or statically:

- Dynamic ports
- Static ports

You also can explicitly exclude ports.

Dynamic ports

Dynamic ports are added to a VLAN when you create the VLAN. However, if a dynamically added port does not receive any traffic for the VLAN protocol within ten minutes, the port is removed from the VLAN. However, the port remains a candidate for port membership. Thus, if the port receives traffic for the VLAN protocol, the device adds the port back to the VLAN.

After the port is added back to the VLAN, the port can remain an active member of the VLAN up to 20 minutes without receiving traffic for the VLAN protocol. If the port ages out, it remains a candidate for VLAN membership and is added back to the VLAN when the VLAN receives protocol traffic. At this point, the port can remain in the VLAN up to 20 minutes without receiving traffic for the VLAN protocol, and so on.

Unless you explicitly add a port statically or exclude a port, the port is a dynamic port and thus can be an active member of the VLAN, depending on the traffic it receives.

NOTE

You cannot configure dynamic ports in an AppleTalk cable VLAN. The ports in an AppleTalk cable VLAN must be static. However, ports in an AppleTalk protocol VLAN can be dynamic or static.

[Figure 79](#) shows an example of a VLAN with dynamic ports. Dynamic ports not only join and leave the VLAN according to traffic, but also allow some broadcast packets of the specific protocol to “leak” through the VLAN. Refer to [“Broadcast leaks”](#) on page 763.

FIGURE 79 VLAN with dynamic ports—all ports are active when you create the VLAN

A = active port

C = candidate port

When you add ports dynamically, all the ports are added when you add the VLAN.

SUBNET Ports in a new protocol VLAN that do not receive traffic for the VLAN protocol age out after 10 minutes and become candidate ports. [Figure 80](#) shows what happens if a candidate port receives traffic for the VLAN protocol.

FIGURE 80 VLAN with dynamic ports—candidate ports become active again if they receive protocol traffic

Ports that time out remain candidates for membership in the VLAN and become active again if they receive traffic for the VLAN's protocol, IP sub-net, IPX network, or AppleTalk cable range.

When a candidate port rejoins a VLAN, the timeout for that port becomes 20 minutes. Thus, the port remains an active member of the VLAN even if it does not receive traffic for 20 minutes. After that, the port becomes a candidate port again.

Static ports

Static ports are permanent members of the protocol VLAN. The ports remain active members of the VLAN regardless of whether the ports receive traffic for the VLAN protocol. You must explicitly identify the port as a static port when you add it to the VLAN. Otherwise, the port is dynamic and is subject to aging out.

Excluded ports

If you want to prevent a port in a port-based VLAN from ever becoming a member of a protocol, IP subnet, IPX network, or AppleTalk cable VLAN configured in the port-based VLAN, you can explicitly exclude the port. You exclude the port when you configure the protocol, IP subnet, IPX network, or AppleTalk cable VLAN.

Excluded ports do not leak broadcast packets. Refer to [“Broadcast leaks”](#) on page 763.

Broadcast leaks

A dynamic port becomes a member of a Layer 3 protocol VLAN when traffic from the VLAN's protocol is received on the port. After this point, the port remains an active member of the protocol VLAN, unless the port does not receive traffic from the VLAN's protocol for 20 minutes. If the port does not receive traffic for the VLAN's protocol for 20 minutes, the port ages out and is no longer an active member of the VLAN.

To enable a host that has been silent for awhile to send and receive packets, the dynamic ports that are currently members of the Layer 3 protocol VLAN "leak" Layer 3 broadcast packets to the ports that have aged out. When a host connected to one of the aged out ports responds to a leaked broadcast, the port is added to the protocol VLAN again.

To "leak" Layer 3 broadcast traffic, an active port sends 1/8th of the Layer 3 broadcast traffic to the inactive (aged out) ports.

Static ports do not age out and do not leak broadcast packets.

Super aggregated VLANs

Brocade FastIron devices support Super Aggregated VLANs. You can aggregate multiple VLANs within another VLAN. This feature allows you to construct Layer 2 paths and channels. This feature is particularly useful for Virtual Private Network (VPN) applications in which you need to provide a private, dedicated Ethernet connection for an individual client to transparently reach its subnet across multiple networks.

For an application example and configuration information, refer to [“Super-aggregated VLAN configuration”](#) on page 796.

Trunk group ports and VLAN membership

A trunk group is a set of physical ports that are configured to act as a single physical interface. Each trunk group port configuration is based on the configuration of the lead port, which is the lowest numbered port in the group.

If you add a trunk group lead port to a VLAN, all of the ports in the trunk group become members of that VLAN.

Summary of VLAN configuration rules

A hierarchy of VLANs exists between the Layer 2 and Layer 3 protocol-based VLANs:

- Port-based VLANs are at the lowest level of the hierarchy.
- Layer 3 protocol-based VLANs, IP, IPv6, IPX, AppleTalk, Decnet, and NetBIOS are at the middle level of the hierarchy.
- IP subnet, IPX network, and AppleTalk cable VLANs are at the top of the hierarchy.

NOTE

You cannot have a protocol-based VLAN and a subnet or network VLAN of the same protocol type in the same port-based VLAN. For example, you can have an IPX protocol VLAN and IP subnet VLAN in the same port-based VLAN, but you cannot have an IP protocol VLAN and an IP subnet VLAN in the same port-based VLAN, nor can you have an IPX protocol VLAN and an IPX network VLAN in the same port-based VLAN.

As a Brocade device receives packets, the VLAN classification starts from the highest level VLAN first. Therefore, if an interface is configured as a member of both a port-based VLAN and an IP protocol VLAN, IP packets coming into the interface are classified as members of the IP protocol VLAN because that VLAN is higher in the VLAN hierarchy.

Multiple VLAN membership rules

- A port can belong to multiple, unique, overlapping Layer 3 protocol-based VLANs without VLAN tagging.
- A port can belong to multiple, overlapping Layer 2 port-based VLANs only if the port is a tagged port. Packets sent out of a tagged port use an 802.1Q-tagged frame.
- When both port and protocol-based VLANs are configured on a given device, all protocol VLANs must be strictly contained within a port-based VLAN. A protocol VLAN cannot include ports from multiple port-based VLANs. This rule is required to ensure that port-based VLANs remain loop-free Layer 2 broadcast domains.
- IP protocol VLANs and IP subnet VLANs cannot operate concurrently on the system or within the same port-based VLAN.
- IPX protocol VLANs and IPX network VLANs cannot operate concurrently on the system or within the same port-based VLAN.
- If you first configure IP and IPX protocol VLANs before deciding to partition the network by IP subnet and IPX network VLANs, then you need to delete those VLANs before creating the IP subnet and IPX network VLANs.
- One of each type of protocol VLAN is configurable within each port-based VLAN on the Layer 2 switch.
- Multiple IP subnet and IPX network VLANs are configurable within each port-based VLAN on the Layer 2 switch.
- Removing a configured port-based VLAN from a Brocade Layer 2 switch or Layer 3 switch automatically removes any protocol-based VLAN, IP subnet VLAN, AppleTalk cable VLAN, or IPX network VLAN, or any Virtual Ethernet router interfaces defined within the Port-based VLAN.

Routing between VLANs

Brocade Layer 3 switches can locally route IP, IPX, and Appletalk between VLANs defined within a single router. All other routable protocols or protocol VLANs (for example, DecNet) must be routed by another external router capable of routing the protocol.

Virtual routing interfaces (Layer 2 switches only)

You need to configure virtual routing interfaces if an IP, IPX, or Appletalk protocol VLAN, IP subnet VLAN, AppleTalk cable VLAN, or IPX network VLAN needs to route protocols to another port-based VLAN on the same router. A virtual routing interface can be associated with the ports in only a single port-based VLAN. Virtual router interfaces must be defined at the highest level of the VLAN hierarchy.

If you do not need to further partition the port-based VLAN by defining separate Layer 3 VLANs, you can define a single virtual routing interface at the port-based VLAN level and enable IP, IPX, and Appletalk routing on a single virtual routing interface.

Some configurations may require simultaneous switching and routing of the same single protocol across different sets of ports on the same router. When IP, IPX, or Appletalk routing is enabled on a Brocade Layer 3 switch, you can route these protocols on specific interfaces while bridging them on other interfaces. In this scenario, you can create two separate backbones for the same protocol, one bridged and one routed.

To bridge IP, IPX, or Appletalk at the same time these protocols are being routed, you need to configure an IP protocol, IP subnet, IPX protocol, IPX network, or Appletalk protocol VLAN and not assign a virtual routing interface to the VLAN. Packets for these protocols are bridged or switched at Layer 2 across ports on the router that are included in the Layer 3 VLAN. If these VLANs are built within port-based VLANs, they can be tagged across a single set of backbone fibers to create separate Layer 2 switched and Layer 3 routed backbones for the same protocol on a single physical backbone.

Routing between VLANs using virtual routing interfaces (Layer 3 switches only)

Brocade calls the ability to route between VLANs with virtual routing interfaces ***Integrated Switch Routing (ISR)***. There are some important concepts to understand before designing an ISR backbone.

Virtual router interfaces can be defined on port-based, IP protocol, IP subnet, IPX protocol, IPX network, AppleTalk protocol, and AppleTalk cable VLANs.

To create any type of VLAN on a Brocade Layer 3 switch, Layer 2 forwarding must be enabled. When Layer 2 forwarding is enabled, the Layer 3 switch becomes a Switch on all ports for all non-routable protocols.

If the router interfaces for IP, IPX, or AppleTalk are configured on physical ports, then routing occurs independent of the Spanning Tree Protocol (STP). However, if the router interfaces are defined for any type VLAN, they are virtual routing interfaces and are subject to the rules of STP.

If your backbone consists of virtual routing interfaces all within the same STP domain, it is a bridged backbone, not a routed one. This means that the set of backbone interfaces that are blocked by STP will be blocked for routed protocols as well. The routed protocols will be able to cross these paths only when the STP state of the link is FORWARDING. This problem is easily avoided by proper network design.

When designing an ISR network, pay attention to your use of virtual routing interfaces and the spanning-tree domain. If Layer 2 switching of your routed protocols (IP, IPX, AppleTalk) is not required across the backbone, then the use of virtual routing interfaces can be limited to edge switch ports within each router. Full backbone routing can be achieved by configuring routing on each physical interface that connects to the backbone. Routing is independent of STP when configured on a physical interface.

If your ISR design requires that you switch IP, IPX, or Appletalk at Layer 2 while simultaneously routing the same protocols over a single backbone, then create multiple port-based VLANs and use VLAN tagging on the backbone links to separate your Layer 2 switched and Layer 3 routed networks.

There is a separate STP domain for each port-based VLAN. Routing occurs independently across port-based VLANs or STP domains. You can define each end of each backbone link as a separate tagged port-based VLAN. Routing will occur independently across the port-based VLANs. Because each port-based VLAN STP domain is a single point-to-point backbone connection, you are guaranteed to never have an STP loop. STP will never block the virtual router interfaces within the tagged port-based VLAN, and you will have a fully routed backbone.

Dynamic port assignment (Layer 2 switches and Layer 3 switches)

All Switch ports are dynamically assigned to any Layer 3 VLAN on Brocade Layer 2 switches and any non-routable VLAN on Brocade Layer 3 switches. To maintain explicit control of the VLAN, you can explicitly exclude ports when configuring any Layer 3 VLAN on a Brocade Layer 2 switch or any non-routable Layer 3 VLAN on a Brocade Layer 3 switch.

If you do not want the ports to have dynamic membership, you can add them statically. This eliminates the need to explicitly exclude the ports that you do not want to participate in a particular Layer 3 VLAN.

Assigning a different VLAN ID to the default VLAN

When you enable port-based VLANs, all ports in the system are added to the default VLAN. By default, the default VLAN ID is "VLAN 1". The default VLAN is not configurable. If you want to use the VLAN ID "VLAN 1" as a configurable VLAN, you can assign a different VLAN ID to the default VLAN.

To reassign the default VLAN to a different VLAN ID, enter the following command.

```
Brocade(config)# default-vlan-id 4095
```

Syntax: [no] default-vlan-d <vlan-id>

You must specify a valid VLAN ID that is not already in use. For example, if you have already defined VLAN 10, do not try to use "10" as the new VLAN ID for the default VLAN. Valid VLAN IDs are numbers from 1 – 4095.

NOTE

does not change the properties of the default VLAN. Changing the name allows you to use the VLAN ID “1” as a configurable VLAN.

Assigning different VLAN IDs to reserved VLANs 4091 and 4092

If you want to use VLANs 4091 and 4092 as configurable VLANs, you can assign them to different VLAN IDs.

For example, to reassign reserved VLAN 4091 to VLAN 10, enter the following commands.

```
Brocade(config)# reserved-vlan-map vlan 4091 new-vlan 10
Reload required. Please write memory and then reload or power cycle.
Brocade(config)# write mem
Brocade(config)# exit
Brocade# reload
```

NOTE

You must save the configuration (write mem) and reload the software to place the change into effect.

The above configuration changes the VLAN ID of 4091 to 10. After saving the configuration and reloading the software, you can configure VLAN 4091 as you would any other VLAN.

Syntax: [no] reserved-vlan-map vlan 4091 | 4092 new-vlan <vlan-id>

For <vlan-id>, enter a valid VLAN ID that is not already in use. For example, if you have already defined VLAN 20, do not try to use “20 as the new VLAN ID. Valid VLAN IDs are numbers from 1 – 4090, 4093, and 4095. VLAN ID 4094 is reserved for use by the Single Spanning Tree feature.

Viewing reassigned VLAN IDs for reserved VLANs 4091 and 4092

To view the assigned VLAN IDs for reserved VLANs 4091 and 4092, use the **show reserved-vlan-map** command. The reassigned VLAN IDs also display in the output of the **show running-config** and **show config** commands.

The following shows example output for the **show reserved-vlan-map** command.

```
Brocade # show reserved-vlan-map
```

Reserved Purpose	Default	Re-assign	Current
CPU VLAN	4091	10	10
All Ports VLAN	4092	33	33

Syntax: show reserved-vlan-map

The following table defines the fields in the output of the **show reserved-vlan-map** command.

TABLE 140 Output of the **show reserved-vlan-map** command

Field	Description
Reserved Purpose	Describes for what the VLAN is reserved. Note that the description is for Brocade internal VLAN management.
Default	The default VLAN ID of the reserved VLAN.
Re-assign	The VLAN ID to which the reserved VLAN was reassigned. ¹
Current	The current VLAN ID for the reserved VLAN. ¹

1. If you reassign a reserved VLAN without saving the configuration and reloading the software, the reassigned VLAN ID will display in the **Re-assign** column. However, the previously configured or default VLAN ID will display in the **Current** column until the configuration is saved and the device reloaded.

Assigning trunk group ports

When a “lead” trunk group port is assigned to a VLAN, all other members of the trunk group are automatically added to that VLAN. A lead port is the first port of a trunk group port range; for example, “1” in 1 – 4 or “5” in 5 – 8.

Refer to [“Trunk group rules”](#) on page 699 for more information.

Enable spanning tree on a VLAN

The spanning tree bridge and port parameters are configurable using one CLI command set at the Global Configuration Level of each Port-based VLAN. Suppose you want to enable the IEEE 802.1D STP across VLAN 3. To do so, use the following method.

NOTE

When port-based VLANs are not operating on the system, STP is set on a system-wide level at the global CONFIG level of the CLI.

1. Access the global CONFIG level of the CLI on FESX-A by entering the following commands.

```
Brocade-A> enable
No password has been assigned yet...
Brocade-A# configure terminal
Brocade-A(config)#
```

2. Access the level of the CLI for configuring port-based VLAN 3 by entering the following command.

```
Brocade-A(config)#
Brocade-A(config)# vlan 3
Brocade-A(config-vlan-3)#
```

3. From VLAN 3 configuration level of the CLI, enter the following command to enable STP on all tagged and untagged ports associated with VLAN 3.

```
Brocade-B(config-vlan-3)#
Brocade-B(config-vlan-3)# spanning-tree
Brocade-B(config-vlan-3)#
```

4. Enter the following commands to exit the VLAN CONFIG mode and save the configuration to the system-config file on flash memory.

```
Brocade-B(config-vlan-3)#
Brocade-B(config-vlan-3)# end
Brocade-B# write memory
Brocade-B#
```

5. Repeat steps 1 – 4 on FESX-B.

NOTE

You do not need to configure values for the STP parameters. All parameters have default values as noted below. Additionally, all values will be globally applied to all ports on the system or on the port-based VLAN for which they are defined.

To configure a specific path-cost or priority value for a given port, enter those values using the key words in the brackets [] shown in the syntax summary below. If you do not want to specify values for any given port, this portion of the command is not required.

Syntax: `vlan <vlan-id> by port`

Syntax: `[no] spanning-tree`

Syntax: `spanning-tree [ethernet [<slotnum>/]<portnum> path-cost <value> priority <value>]
forward-delay <value> hello-time <value> maximum-age <time> priority <value>`

Bridge STP parameters (applied to all ports within a VLAN):

- Forward Delay – the period of time a bridge will wait (the listen and learn period) before forwarding data packets. Possible values: 4 – 30 seconds. Default is 15.
- Maximum Age – the interval a bridge will wait for receipt of a hello packet before initiating a topology change. Possible values: 6 – 40 seconds. Default is 20.
- Hello Time – the interval of time between each configuration BPDU sent by the root bridge. Possible values: 1 – 10 seconds. Default is 2.
- Priority – a parameter used to identify the root bridge in a network. The bridge with the lowest value has the highest priority and is the root. Possible values: 1 – 65,535. Default is 32,678.

Port parameters (applied to a specified port within a VLAN):

- Path Cost – a parameter used to assign a higher or lower path cost to a port. Possible values: 1 – 65535. Default is (1000/Port Speed) for Half-Duplex ports and is (1000/Port Speed)/2 for Full-Duplex ports.
- Priority – value determines when a port will be rerouted in relation to other ports. Possible values: 0 – 255. Default is 128.

Configuring IP subnet, IPX network and protocol-based VLANs

Protocol-based VLANs provide the ability to define separate broadcast domains for several unique Layer 3 protocols within a single Layer 2 broadcast domain. Some applications for this feature might include security between departments with unique protocol requirements. This feature enables you to limit the amount of broadcast traffic end-stations, servers, and routers need to accept.

IP subnet, IPX network, and protocol-based VLAN configuration example

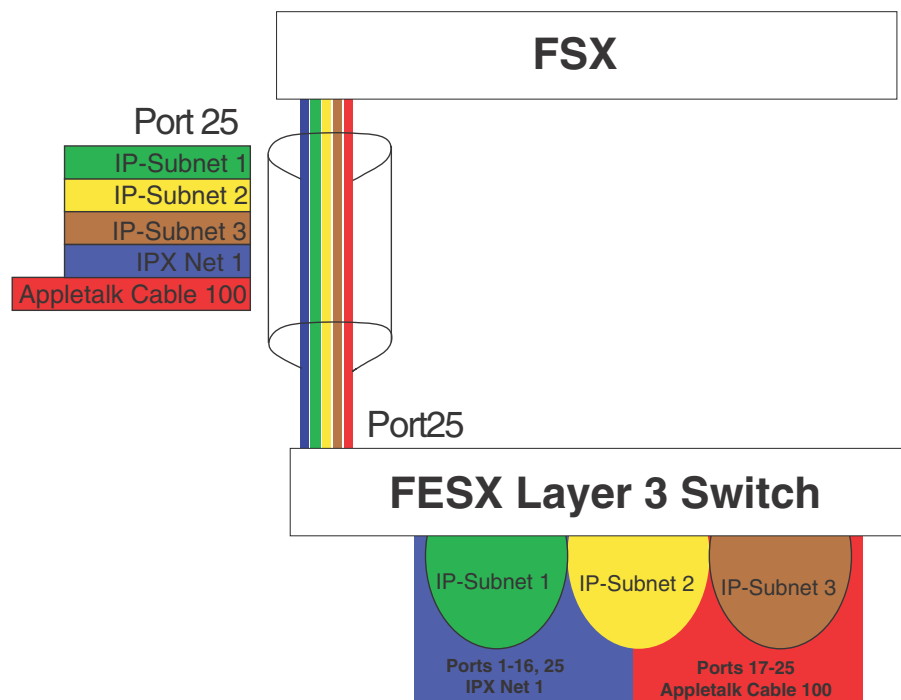

Suppose you want to create five separate Layer 3 broadcast domains within a single Layer 2 STP broadcast domain:

- Three broadcast domains, one for each of three separate IP subnets
- One for IPX Network 1
- One for the Appletalk protocol

Also suppose you want a single router interface to be present within all of these separate broadcast domains, without using IEEE 802.1Q VLAN tagging or any proprietary form of VLAN tagging.

Figure 81 shows this configuration.

FIGURE 81 Protocol-based (Layer 3) VLANs

To configure the VLANs shown in [Figure 81](#), use the following procedure.

1. To permanently assign ports 1 – 8 and port 25 to IP subnet VLAN 1.1.1.0, enter the following commands.

```
Brocade(config-vlan-2)# ip-subnet 1.1.1.0/24 name Green
Brocade(config-vlan-ip-subnet)# no dynamic
Brocade(config-vlan-ip-subnet)# static ethernet 1 to 8 ethernet 25
```

2. To permanently assign ports 9 – 16 and port 25 to IP subnet VLAN 1.1.2.0, enter the following commands.

```
Brocade(config-vlan-3)# ip-subnet 1.1.2.0/24 name Yellow
Brocade(config-vlan-ip-subnet)# no dynamic
Brocade(config-vlan-ip-subnet)# static ethernet 9 to 16 ethernet 25
```

3. To permanently assign ports 17 – 25 to IP subnet VLAN 1.1.3.0, enter the following commands.

```
Brocade(config-vlan-4)# ip-subnet 1.1.3.0/24 name Brown
Brocade(config-vlan-ip-subnet)# no dynamic
Brocade(config-vlan-ip-subnet)# static ethernet 17 to 25
```

4. To permanently assign ports 1 – 12 and port 25 to IPX network 1 VLAN, enter the following commands.

```
Brocade(config-ip-subnet)# ipx-network 1 ethernet_802.3 name Blue
Brocade(config-ipx-network)# no dynamic
Brocade(config-ipx-network)# static ethernet 1 to 12 ethernet 25
Brocade(config-ipx-network)#
```

5. To permanently assign ports 12 – 25 to Appletalk VLAN, enter the following commands.

```
Brocade(config-ipx-proto)# atalk-proto name Red
Brocade(config-atalc-proto)# no dynamic
Brocade(config-atalc-proto)# static ethernet 13 to 25
Brocade(config-atalc-proto)# end
Brocade# write memory
Brocade#
```

Syntax: `ip-subnet <ip-addr> <ip-mask> [name <string>]`

Syntax: `ipx-network <ipx-network-number> <frame-encapsulation-type> netbios-allow | netbios-disallow [name <string>]`

Syntax: `ip-proto | ipx-proto | atalk-proto | decnet-proto | netbios-proto | other-proto static | exclude | dynamic ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum>] [name <string>]`

IP subnet, IPX network, and protocol-based VLANs within port-based VLANs

If you plan to use port-based VLANs in conjunction with protocol-based VLANs, you must create the port-based VLANs first. Once you create a port-based VLAN, then you can assign Layer 3 protocol VLANs within the boundaries of the port-based VLAN. Generally, you create port-based VLANs to allow multiple separate STP domains.

Example

Suppose you need to provide three separate STP domains across an enterprise campus backbone. The first STP domain (VLAN 2) requires a set of ports at each Layer 2 switch location to be statically mapped to IP only. No other protocols can enter the switches on this set of ports.

A second set of ports within STP domain VLAN 2 will be restricted to only IPX traffic. The IP and IPX protocol VLANs will overlap on Port 1 of FESX-A to support both protocols on the same router interface. The IP subnets and IPX network that span the two protocol VLANs will be determined by the FastIron router configuration. The IP and IPX Protocol VLANs ensure that only the ports included in the each Layer 3 protocol VLAN will see traffic from the FastIron router.

The second STP domain (VLAN 3) requires that half the ports in the domain are dedicated to IP subnet 1.1.1.0/24 and the other ports are dedicated to IPX network 1. Similar to VLAN 2, Port 9 from VLAN 3 will be used to carry this IP subnet and IPX network to the FastIron router. No other protocols will be allowed to enter the network on VLAN 3. Also, no IP packets with a source address on subnet 1.1.1.0/24 or IPX packets with a source address on network 1 will be allowed to enter the switches on VLAN 3.

There is no need to segment Layer 3 broadcast domains within the STP broadcast domain (VLAN 4). The FastIron router will dictate the IP subnets and IPX network that are on VLAN 4. There are no Layer 3 protocol restrictions on VLAN 4; however, the FastIron router is configured to only forward IP and IPX between STP domains.

FIGURE 82 More protocol-based VLANs

To configure the Layer 3 VLANs on the FESX Layer 2 switches in [Figure 82](#), use the following procedure.

Configuring Layer 3 VLANs on FESX-A

Enter the following commands to configure FESX-A.

1. Create port-based VLAN 2 and assign the untagged and tagged ports that will participate in this VLAN.

```
Brocade-A >en
Brocade-A# config t
Brocade-A(config)# vlan 2 name IP_IPX_Protocol
Brocade-A(config-vlan-2)# untagged e1 to 8
Brocade-A(config-vlan-2)# tagged e25 to 26
```

2. Enable STP and set the priority to force FESX-A to be the root bridge for VLAN 2.

```
Brocade-A(config-vlan-2)# spanning-tree
Brocade-A(config-vlan-2)# spanning-tree priority 500
Brocade-A(config-vlan-2)#
```

3. Create the IP and IPX protocol-based VLANs and statically assign the ports within VLAN 2 that will be associated with each protocol-based VLAN.

```
Brocade-A(config-vlan-2)# ip-proto name Red
Brocade-A(config-vlan-ip-proto)# no dynamic
Brocade-A(config-vlan-ip-proto)# static e1 to 4 e25 to 26
Brocade-A(config-vlan-ip-proto)# exclude e5 to 8
Brocade-A(config-vlan-ip-proto)# ipx-proto name Blue
Brocade-A(config-vlan-ipx-proto)# no dynamic
Brocade-A(config-vlan-ipx-proto)# static e1 e5 to 8 e25 to 26
Brocade-A(config-vlan-ipx-proto)# exclude e2 to 4
```

4. To prevent machines with non-IP protocols from getting into the IP portion of VLAN 2, create another Layer 3 protocol VLAN to exclude all other protocols from the ports that contains the IP-protocol VLAN. To do so, enter the following commands.

```
Brocade-A(config-vlan-ipx-PROTO)# other-PROTO name Block_OTHER_PROTO
Brocade-A(config-vlan-OTHER-PROTO)# no dynamic
Brocade-A(config-vlan-OTHER-PROTO)# exclude e1 to 8
Brocade-A(config-vlan-OTHER-PROTO)#
```

5. Create port-based VLAN 3. Note that FESX-B will be the root for this STP domain, so you do not need to adjust the STP priority.

```
Brocade-A(config-vlan-OTHER-PROTO)# vlan 3 name IP-Sub_IPX-Net_Vlans
Brocade-A(config-vlan-3)# untagged e9 to 16
Brocade-A(config-vlan-3)# tagged e25 to 26
Brocade-A(config-vlan-3)# spanning-tree
Brocade-A(config-vlan-3)#
```

6. Create IP subnet VLAN 1.1.1.0/24, IPX network 1, and other-protocol VLANs

```
Brocade-A(config-vlan-3)# ip-subnet 1.1.1.0/24 name Green
Brocade-A(config-vlan-ip-subnet)# no dynamic
Brocade-A(config-vlan-ip-subnet)# static e9 to 12 e25 to 26
Brocade-A(config-vlan-ip-subnet)# exclude e13 to 16
Brocade-A(config-vlan-ip-subnet)# ipx-net 1 ethernet_802.3 name Brown
Brocade-A(config-vlan-ipx-network)# no dynamic
Brocade-A(config-vlan-ipx-network)# static e9 e13 to 16 e25 to 26
Brocade-A(config-vlan-ipx-network)# exclude e10 to 12
Brocade-A(config-vlan-ipx-network)# other-PROTO name Block_OTHER_PROTO
Brocade-A(config-vlan-OTHER-PROTO)# no dynamic
Brocade-A(config-vlan-OTHER-PROTO)# exclude e9 to 16
Brocade-A(config-vlan-OTHER-PROTO)#
```

7. Configure the last port-based VLAN 4. You need to set the STP priority for this VLAN because FESX-A will be the root bridge for this VLAN. Because you do not need to partition this STP domain into multiple Layer 3 broadcast domains, this is the only configuration required for VLAN 4.

```
Brocade-A(config-vlan-OTHER-PROTO)# vlan 4 name Purple_ALL-Protocols
Brocade-A(config-vlan-4)# untagged e17 to 24
Brocade-A(config-vlan-4)# tagged e25 to 26
Brocade-A(config-vlan-4)# spanning-tree
Brocade-A(config-vlan-4)# spanning-tree priority 500
Brocade-A(config-vlan-4)#
```

Configuring Layer 3 VLANs on FESX-B

Enter the following commands to configure FESX-B.

```
Brocade# config t
Brocade(config)# host Brocade-B
Brocade-B(config)#vlan 2 name IP_IPX_Protocol
Brocade-B(config-vlan-2)# untagged e1 to 8
Brocade-B(config-vlan-2)# tagged e25 to 26
Brocade-B(config-vlan-2)# spanning-tree
Brocade-B(config-vlan-2)# ip-PROTO name Red
Brocade-B(config-vlan-ip-PROTO)# # no dynamic
Brocade-B(config-vlan-ip-PROTO)# static e1 to 4 e25 to 26
Brocade-B(config-vlan-ip-PROTO)# exclude e5 to 8
Brocade-B(config-vlan-ip-PROTO)# ipx-PROTO name Blue
Brocade-B(config-vlan-ipx-PROTO)# no dynamic
```

```

Brocade-B(config-vlan-ipx-PROTO)# static e5 to 8 e25 to 26
Brocade-B(config-vlan-ipx-PROTO)# exclude e1 to 4
Brocade-B(config-vlan-other-PROTO)# vlan 3 name IP-Sub_IPX-Net_VLANS
Brocade-B(config-vlan-3)# untagged e9 to 16
Brocade-B(config-vlan-3)# tagged e25 to 26
Brocade-B(config-vlan-3)# spanning-tree
Brocade-B(config-vlan-3)# spanning-tree priority 500
Brocade-B(config-vlan-3)# ip-sub 1.1.1.0/24 name Green
Brocade-B(config-vlan-ip-subnet)# no dynamic
Brocade-B(config-vlan-ip-subnet)# static e9 to 12 e25 to 26
Brocade-B(config-vlan-ip-subnet)# exclude e13 to 16
Brocade-B(config-vlan-ip-subnet)# ipx-net 1 ethernet_802.3 name Brown
Brocade-B(config-vlan-ipx-network)# no dynamic
Brocade-B(config-vlan-ipx-network)# static e13 to 16 e25 to 26
Brocade-B(config-vlan-ipx-network)# exclude e9 to 12
Brocade-B(config-vlan-ipx-network)# vlan 4 name Purple_ALL-Protocols
Brocade-B(config-vlan-4)# untagged e17 to 24
Brocade-B(config-vlan-4)# tagged e25 to 26
Brocade-B(config-vlan-4)# spanning-tree

```

Configuring Layer 3 VLANs on FESX-C

Enter the following commands to configure FESX-C.

```

Brocade# config t
Brocade(config)# host Brocade-C

```

IPv6 protocol VLAN configuration

You can configure a protocol-based VLAN as a broadcast domain for IPv6 traffic. When the Layer 3 switch receives an IPv6 multicast packet (a packet with 06 in the version field and 0xFF as the beginning of the destination address), the Layer 3 switch forwards the packet to all other ports.

NOTE

The Layer 3 switch forwards all IPv6 multicast packets to all ports except the port that received the packet, and does not distinguish among subnet directed multicasts.

You can add the VLAN ports as static ports or dynamic ports. A static port is always an active member of the VLAN. Dynamic ports within any protocol VLAN age out after 10 minutes if no member protocol traffic is received on a port within the VLAN. The aged out port, however, remains as a candidate dynamic port for that VLAN. The port becomes active in the VLAN again if member protocol traffic is received on that port.

Once a port is re-activated, the aging out period for the port is reset to 20 minutes. Each time a member protocol packet is received by a candidate dynamic port (aged out port) the port becomes active again and the aging out period is reset for 20 minutes.

NOTE

You can disable VLAN membership aging of dynamically added ports. Refer to [“Disabling membership aging of dynamic VLAN ports”](#) on page 783).

To configure an IPv6 VLAN, enter commands such as the following.

```
Brocade(config)# vlan 2
Brocade(config-vlan-2)# untagged ethernet 1/1 to 1/8
Brocade(config-vlan-2)# ipv6-proto name V6
Brocade(config-ipv6-subnet)# static ethernet 1/1 to 1/6
Brocade(config-ipv6-subnet)# dynamic
```

The first two commands configure a port-based VLAN and add ports 1/1 – 1/8 to the VLAN. The remaining commands configure an IPv6 VLAN within the port-based VLAN. The **static** command adds ports 1/1 – 1/6 as static ports, which do not age out. The **dynamic** command adds the remaining ports, 1/7 – 1/8, as dynamic ports. These ports are subject to aging as described above.

Syntax: [no] ipv6-proto [name <string>]

Routing between VLANs using virtual routing interfaces (Layer 3 switches only)

Brocade Layer 3 switches offer the ability to create a virtual routing interface within a Layer 2 STP port-based VLAN or within each Layer 3 protocol, IP subnet, or IPX network VLAN. This combination of multiple Layer 2 or Layer 3 broadcast domains, or both, and virtual routing interfaces are the basis for Brocade's very powerful Integrated Switch Routing (ISR) technology. ISR is very flexible and can solve many networking problems. The following example is meant to provide ideas by demonstrating some of the concepts of ISR.

Example

Suppose you want to move routing out to each of three buildings in a network. Remember that the only protocols present on VLAN 2 and VLAN 3 are IP and IPX. Therefore, you can eliminate tagged ports 25 and 26 from both VLAN 2 and VLAN 3 and create new tagged port-based VLANs to support separate IP subnets and IPX networks for each backbone link.

You also need to create unique IP subnets and IPX networks within VLAN 2 and VLAN 3 at each building. This will create a fully routed IP and IPX backbone for VLAN 2 and VLAN 3. However, VLAN 4 has no protocol restrictions across the backbone. In fact there are requirements for NetBIOS and DecNet to be bridged among the three building locations. The IP subnet and IPX network that exists within VLAN 4 must remain a flat Layer 2 switched STP domain. You enable routing for IP and IPX on a virtual routing interface only on FESX-A. This will provide the flat IP and IPX segment with connectivity to the rest of the network. Within VLAN 4 IP and IPX will follow the STP topology. All other IP subnets and IPX networks will be fully routed and have use of all paths at all times during normal operation.

Figure 83 shows the configuration described above.

FIGURE 83 Routing between protocol-based VLANs

To configure the Layer 3 VLANs and virtual routing interfaces on the FESX Layer 3 switch in Figure 83, use the following procedure.

Configuring Layer 3 VLANs and virtual routing interfaces on the FESX-A

Enter the following commands to configure FESX-A. The following commands enable OSPF or RIP routing.

```
Brocade>en
No password has been assigned yet...
Brocade# configure terminal
Brocade(config)# hostname FESX-A
Brocade-A(config)# router ospf
Brocade-A(config-ospf-router)# area 0.0.0.0 normal
Please save configuration to flash and reboot.
Brocade-A(config-ospf-router)#
```

The following commands create the port-based VLAN 2. In the previous example, an external FESX defined the router interfaces for VLAN 2. With ISR, routing for VLAN 2 is done locally within each FESX. Therefore, there are two ways you can solve this problem. One way is to create a unique IP subnet and IPX network VLAN, each with its own virtual routing interface and unique IP or IPX address within VLAN 2 on each FESX. In this example, this is the configuration used for VLAN 3. The second way is to split VLAN 2 into two separate port-based VLANs and create a virtual router interface within each port-based VLAN. Later in this example, this second option is used to create a port-based VLAN 8 to show that there are multiple ways to accomplish the same task with ISR.

You also need to create the Other-Protocol VLAN within port-based VLAN 2 and 8 to prevent unwanted protocols from being Layer 2 switched within port-based VLAN 2 or 8. Note that the only port-based VLAN that requires STP in this example is VLAN 4. You will need to configure the rest of the network to prevent the need to run STP.

```
Brocade-A(config-ospf-router)# vlan 2 name IP-Subnet_1.1.2.0/24
Brocade-A(config-vlan-2)# untagged ethernet 1 to 4
Brocade-A(config-vlan-2)# no spanning-tree
Brocade-A(config-vlan-2)# router-interface ve1
Brocade-A(config-vlan-2)# other-proto name block_other_protocols
Brocade-A(config-vlan-other-proto)# no dynamic
Brocade-A(config-vlan-other-proto)# exclude ethernet 1 to 4
```

Once you have defined the port-based VLAN and created the virtual routing interface, you need to configure the virtual routing interface just as you would configure a physical interface.

```
Brocade-A(config-vlan-other-proto)# interface ve1
Brocade-A(config-vif-1)# ip address 1.1.2.1/24
Brocade-A(config-vif-1)# ip ospf area 0.0.0.0
```

Do the same thing for VLAN 8.

```
Brocade-A(config-vif-1)# vlan 8 name IPX_Network2
Brocade-A(config-vlan-8)# untagged ethernet 5 to 8
Brocade-A(config-vlan-8)# no spanning-tree
Brocade-A(config-vlan-8)# router-interface ve 2
Brocade-A(config-vlan-8)# ipx-network 2 ethernet_802.3
Brocade-A(config-vlan-8)# other-proto name block-other-protocols
Brocade-A(config-vlan-other-proto)# no dynamic
Brocade-A(config-vlan-other-proto)# exclude ethernet 5 to 8
Brocade-A(config-vlan-other-proto)# interface ve2
Brocade-A(config-vif-1)# ip address 1.1.2.2/24
Brocade-A(config-vif-1)# ip ospf area 0.0.0.0
```

The next thing you need to do is create VLAN 3. This is very similar to the previous example with the addition of virtual routing interfaces to the IP subnet and IPX network VLANs. Also there is no need to exclude ports from the IP subnet and IPX network VLANs on the router.

```
Brocade-A(config-vif-2)# vlan 3 name IP_Sub_&_IPX_Net_VLAN
Brocade-A(config-vlan-3)# untagged ethernet 9 to 16
Brocade-A(config-vlan-3)# no spanning-tree
Brocade-A(config-vlan-3)# ip-subnet 1.1.1.0/24
Brocade-A(config-vlan-ip-subnet)# static ethernet 9 to 12
Brocade-A(config-vlan-ip-subnet)# router-interface ve3
Brocade-A(config-vlan-ip-subnet)# ipx-network 1 ethernet_802.3
Brocade-A(config-vlan-ipx-network)# static ethernet 13 to 16
Brocade-A(config-vlan-ipx-network)# router-interface ve4
Brocade-A(config-vlan-ipx-network)# other-proto name block-other-protocols
Brocade-A(config-vlan-other-proto)# exclude ethernet 9 to 16
Brocade-A(config-vlan-other-proto)# no dynamic
Brocade-A(config-vlan-other-proto)# interface ve 3
Brocade-A(config-vif-3)# ip addr 1.1.1.1/24
Brocade-A(config-vif-3)# ip ospf area 0.0.0.0
```

Now configure VLAN 4. Remember this is a flat segment that, in the previous example, obtained its IP default gateway and IPX router services from an external FESX. In this example, FESX-A will provide the routing services for VLAN 4. You also want to configure the STP priority for VLAN 4 to make FESX-A the root bridge for this VLAN.

```
Brocade-A(config-vif-4)# vlan 4 name Bridged_ALL_Protocols
Brocade-A(config-vlan-4)# untagged ethernet 17 to 24
Brocade-A(config-vlan-4)# tagged ethernet 25 to 26
Brocade-A(config-vlan-4)# spanning-tree
Brocade-A(config-vlan-4)# spanning-tree priority 500
Brocade-A(config-vlan-4)# ipx network 3 ethernet_802.3
Brocade-A(config-vlan-ipx-network)# exit
Brocade-A(config-vlan-4)# router-interface ve5
Brocade-A(config-vlan-4)# interface ve5
Brocade-A(config-vif-5)# ip address 1.1.3.1/24
Brocade-A(config-vif-5)# ip ospf area 0.0.0.0
```

It is time to configure a separate port-based VLAN for each of the routed backbone ports (Ethernet 25 and 26).

If you do not create a separate tagged port-based VLAN for each point-to-point backbone link, you need to include tagged interfaces for Ethernet 25 and 26 within VLANs 2, 3, and 8. This type of configuration makes the entire backbone a single STP domain for each VLAN 2, 3, and 8. This is the configuration used in the example in [“Configuring IP subnet, IPX network and protocol-based VLANs”](#) on page 770. In this scenario, the virtual routing interfaces within port-based VLANs 2, 3, and 8 will be accessible using only one path through the network. The path that is blocked by STP is not available to the routing protocols until it is in the STP FORWARDING state.

```
Brocade-A(config-vif-5)# vlan 5 name Rtr_BB_to_Bldg.2
Brocade-A(config-vlan-5)# tagged ethernet 25
Brocade-A(config-vlan-5)# no spanning-tree
Brocade-A(config-vlan-5)# router-interface ve6
Brocade-A(config-vlan-5)# vlan 6 name Rtr_BB_to_Bldg.3
Brocade-A(config-vlan-6)# tagged ethernet 26
Brocade-A(config-vlan-6)# no spanning-tree
Brocade-A(config-vlan-6)# ipx-network 4 ethernet_802.3
```

```
Brocade-A(config-vlan-ipx-network)# exit
Brocade-A(config-vlan-6)# router-interface ve7
Brocade-A(config-vlan-6)# interface ve6
Brocade-A(config-vif-6)# ip addr 1.1.4.1/24
Brocade-A(config-vif-6)# ip ospf area 0.0.0.0
Brocade-A(config-vif-6)# interface ve7
Brocade-A(config-vif-7)# ip addr 1.1.5.1/24
Brocade-A(config-vif-7)# ip ospf area 0.0.0.0
Brocade-A(config-vif-7)#
```

This completes the configuration for FESX-A. The configuration for FESX-B and C is very similar except for a few issues which are as follows:

- IP subnets and IPX networks configured on FESX-B and FESX-C must be unique across the entire network, except for the backbone port-based VLANs 5, 6, and 7 where the subnet is the same but the IP address must change.
- There is no need to change the default priority of STP within VLAN 4.
- There is no need to include a virtual router interface within VLAN 4.
- The backbone VLAN between FESX-B and FESX-C must be the same at both ends and requires a new VLAN ID. The VLAN ID for this port-based VLAN is VLAN 7.

Configuring Layer 3 VLANs and virtual routing interfaces for FESX-B

Enter the following commands to configure FESX-B.

```
Brocade> en
No password has been assigned yet...
Brocade# config t
Brocade(config)# hostname FESX-B
Brocade-B(config)# router ospf
Brocade-B(config-ospf-router)# area 0.0.0.0 normal
Brocade-B(config-ospf-router)# vlan 2 name IP-Subnet_1.1.6.0/24
Brocade-B(config-vlan-2)# untagged ethernet 1 to 4
Brocade-B(config-vlan-2)# no spanning-tree
Brocade-B(config-vlan-2)# router-interface ve1
Brocade-B(config-vlan-2)# other-proto name block-other-protocols
Brocade-B(config-vlan-other-proto)# no dynamic
Brocade-B(config-vlan-other-proto)# exclude ethernet 1 to 4
Brocade-B(config-vlan-other-proto)# interface ve1
Brocade-B(config-vif-1)# ip addr 1.1.6.1/24
Brocade-B(config-vif-1)# ip ospf area 0.0.0.0
Brocade-B(config-vif-1)# vlan 8 name IPX_Network6
Brocade-B(config-vlan-8)# untagged ethernet 5 to 8
Brocade-B(config-vlan-8)# no span
Brocade-B(config-vlan-8)# router-interface ve2
Brocade-B(config-vlan-8)# ipx-net 6 ethernet_802.3
Brocade-B(config-vlan-ipx-network)# exit
Brocade-B(config-vlan-8)# other-proto name block-other-protocols
Brocade-B(config-vlan-other-proto)# no dynamic
Brocade-B(config-vlan-other-proto)# exclude ethernet 5 to 8
Brocade-B(config-vlan-other-proto)# interface ve2
Brocade-B(config-vif-2)# vlan 3 name IP_Sub_&_IPX_Net_VLAN
Brocade-B(config-vlan-3)# untagged ethernet 9 to 16
Brocade-B(config-vlan-3)# no spanning-tree
Brocade-B(config-vlan-3)# ip-subnet 1.1.7.0/24
Brocade-B(config-vlan-ip-subnet)# static ethernet 9 to 12
Brocade-B(config-vlan-ip-subnet)# router-interface ve3
```

Routing between VLANs using virtual routing interfaces (Layer 3 switches only)

```
Brocade-B(config-vlan-ip-subnet)# ipx-network 7 ethernet_802.3
Brocade-B(config-vlan-ipx-network)# static ethernet 13 to 16
Brocade-B(config-vlan-ipx-network)# router-interface ve4
Brocade-B(config-vlan-ipx-network)# other-proto name block-other-protocols
Brocade-B(config-vlan-other-proto)# exclude ethernet 9 to 16
Brocade-B(config-vlan-other-proto)# no dynamic
Brocade-B(config-vlan-other-proto)# interface ve 3
Brocade-B(config-vif-3)# ip addr 1.1.7.1/24
Brocade-B(config-vif-3)# ip ospf area 0.0.0.0
Brocade-B(config-vif-3)# interface ve4
Brocade-B(config-vif-4)# vlan 4 name Bridged_ALL_Protocols
Brocade-B(config-vlan-4)# untagged ethernet 17 to 24
Brocade-B(config-vlan-4)# tagged ethernet 25 to 26
Brocade-B(config-vlan-4)# spanning-tree
Brocade-B(config-vlan-4)# ipx-network 4 ethernet_802.3
Brocade-B(config-vlan-ipx-network)# exit
Brocade-B(config-vlan-4)# vlan 5 name Rtr_BB_to_Bldg.1
Brocade-B(config-vlan-5)# tagged ethernet 25
Brocade-B(config-vlan-5)# no spanning-tree
Brocade-B(config-vlan-5)# router-interface ve5
Brocade-B(config-vlan-5)# vlan 7 name Rtr_BB_to_Bldg.3
Brocade-B(config-vlan-7)# tagged ethernet 26
Brocade-B(config-vlan-7)# no spanning-tree
Brocade-B(config-vlan-7)# router-interface ve6
Brocade-B(config-vlan-7)# interface ve5
Brocade-B(config-vif-5)# ip addr 1.1.4.2/24
Brocade-B(config-vif-5)# ip ospf area 0.0.0.0
Brocade-B(config-vif-5)# interface ve6
Brocade-B(config-vif-6)# ip addr 1.1.8.1/24
Brocade-B(config-vif-6)# ip ospf area 0.0.0.0
Brocade-B(config-vif-6)#
```

Configuring Layer 3 VLANs and virtual routing interfaces for FESX-C

Enter the following commands to configure FESX-C.

```
Brocade> en
No password has been assigned yet...
Brocade# config t
Brocade(config)# hostname FESX-C
Brocade-C(config)# router ospf
Brocade-C(config-ospf-router)# area 0.0.0.0 normal
Brocade-C(config-ospf-router)# vlan 2 name IP-Subnet_1.1.9.0/24
Brocade-C(config-vlan-2)# untagged ethernet 1 to 4
Brocade-C(config-vlan-2)# no spanning-tree

Brocade-C(config-vif-6)# ip ospf area 0.0.0.0
Brocade-C(config-vif-6)#

```

Configuring protocol VLANs with dynamic ports

The configuration examples for protocol VLANs in the sections above show how to configure the VLANs using static ports. You also can configure the following types of protocol VLANs with dynamic ports:

- AppleTalk protocol
- IP protocol
- IPX protocol

- IP subnet
- IPX network

NOTE

The software does not support dynamically adding ports to AppleTalk cable VLANs. Conceptually, an AppleTalk cable VLAN consists of a single network cable, connected to a single port. Therefore, dynamic addition and removal of ports is not applicable.

NOTE

You cannot route to or from protocol VLANs with dynamically added ports.

Aging of dynamic ports

When you add the ports to the VLAN, the software automatically adds them all to the VLAN. However, dynamically added ports age out. If the age time for a dynamic port expires, the software removes the port from the VLAN. If that port receives traffic for the IP subnet or IPX network, the software adds the port to the VLAN again and starts the aging timer over. Each time the port receives traffic for the VLAN's IP subnet or IPX network, the aging timer starts over.

NOTE

You can disable VLAN membership aging of dynamically added ports. Refer to [“Disabling membership aging of dynamic VLAN ports”](#) on page 783).

Dynamic ports within any protocol VLAN age out after 10 minutes, if no member protocol traffic is received on a port within the VLAN. The aged out port, however, remains as a candidate dynamic port for that VLAN. The port becomes active in the VLAN again if member protocol traffic is received on that port.

Once a port is re-activated, the aging out period for the port is reset to 20 minutes. Each time a member protocol packet is received by a candidate dynamic port (aged out port) the port becomes active again and the aging out period is reset for 20 minutes.

Disabling membership aging of dynamic VLAN ports

You can disable VLAN membership aging of ports that are dynamically assigned to protocol or subnet-based VLANs. This feature resolves the connectivity issue that may occur in certain configurations when protocol or subnet VLANs are configured with dynamic port membership.

NOTE

This issue does not occur with statically assigned VLAN memberships. Thus, enable this feature only if your configuration includes dynamically assigned VLAN memberships for protocol or subnet VLANs.

To enable this feature, enter commands such as the following.

```
Brocade(config)# vlan 10 by port
Brocade(config-vlan-10)# interface ethernet 1/1 to 1/5
Brocade(config-vlan-10)# ip-proto name IP_Prot_VLAN
Brocade(config-vlan-ip-proto)# no-dynamic-aging
Brocade(config-vlan-ip-proto)# write memory
```

These commands create an IP protocol VLAN and disable the VLAN membership aging of ports that are dynamically assigned to the protocol VLAN.

Syntax: [no] no-dynamic-aging

Enter the **no** form of the command to disable this feature after it has been enabled.

By default, VLAN membership of dynamically assigned ports will age out after a period of time if no packets belonging to that protocol or subnet VLAN are received by the CPU.

The output of the **show running-config** command indicates if the no-dynamic-aging feature is enabled for a specific protocol or subnet VLAN.

Configuration guidelines for membership aging of dynamic VLAN ports

- You cannot dynamically add a port to a protocol VLAN if the port has any routing configuration parameters. For example, the port cannot have a virtual routing interface, IP subnet address, IPX network address, or AppleTalk network address configured on it.
- Once you dynamically add a port to a protocol VLAN, you cannot configure routing parameters on the port.
- Dynamic VLAN ports are not required or supported on AppleTalk cable VLANs.
- When protocol VLANs with dynamic ports are configured, the output of the **show running-config** command in the Router image will show the “dynamic” keyword. In the Switch image, the keyword is not shown in the output of the **show running-config** command.

NOTE

In the Switch image, all the ports are dynamic ports by-default, so the **dynamic** command does not appear in the **show running-config** command output. If you configure the **no dynamic** command, it will appear in the output of the **show running-config** command. Similarly in Router image, no ports are dynamic by-default, so the **no dynamic** command does not appear in the output of the **show running-config** command. If you configure the **dynamic** command, it will appear in the output of the **show running-config** command.

Configuring an IP, IPX, or AppleTalk Protocol VLAN with Dynamic Ports

To configure an IP, IPX, or AppleTalk protocol VLAN with dynamic ports, use the following method.

To configure port-based VLAN 10, then configure an IP protocol VLAN within the port-based VLAN with dynamic ports, enter the following commands such as the following.

```
Brocade(config)# vlan 10 by port
Brocade(config-vlan-10)# untagged ethernet 1/1 to 1/6
added untagged port ethe 1/1 to 1/6 to port-vlan 30.
Brocade(config-vlan-10)# ip-proto name IP_Prot_VLAN
Brocade(config-vlan-ip-proto)# dynamic
Brocade(config)# write memory
```

Syntax: **vlan** <vlan-id> **name** <string> [**by port**]

Syntax: **untagged ethernet** [<slotnum>/]<portnum> **to** [<slotnum>/]<portnum>

or

Syntax: **untagged ethernet** [<slotnum>/]<portnum> **ethernet** [<slotnum>/]<portnum>

NOTE

Use the first **untagged** command for adding a range of ports. Use the second command for adding separate ports (not in a range).

Syntax: **ip-proto** [**name** <string>]

Syntax: **ipx-proto** [**name** <string>]

Syntax: **appletalk-cable-vlan** <num> [**name** <string>]

Syntax: **dynamic**

The procedure is similar for IPX and AppleTalk protocol VLANs. Enter **ipx-proto** or **atalk-proto** instead of **ip-proto**.

Configuring an IP subnet VLAN with dynamic ports

To configure port-based VLAN 10, then configure an IP subnet VLAN within the port-based VLAN with dynamic ports, enter commands such as the following.

```
Brocade(config)# vlan 10 name IP_VLAN by port
Brocade(config-vlan-10)# untagged ethernet 1/1 to 1/6
added untagged port ethe 1/1 to 1/6 to port-vlan 10.
Brocade(config-vlan-10)# ip-subnet 1.1.1.0/24 name Mktg-LAN
Brocade(config-vlan-ip-subnet)# dynamic
Brocade(config)# write memory
```

These commands create a port-based VLAN on chassis ports 1/1 – 1/6 named “Mktg-LAN”, configure an IP subnet VLAN within the port-based VLAN, and then add ports from the port-based VLAN dynamically.

Syntax: **vlan** <vlan-id> **name** <string> [**by port**]

Syntax: **untagged ethernet** [<slotnum>/]<portnum> **to** [<slotnum>/]<portnum>

or

Syntax: **untagged ethernet** [<slotnum>/]<portnum> **ethernet** [<slotnum>/]<portnum>

NOTE

Use the first **untagged** command for adding a range of ports. Use the second command for adding separate ports (not in a range).

Syntax: **ip-subnet** <ip-addr> <ip-mask> [**name** <string>]

or

Syntax: **ip-subnet** <ip-addr>/<mask-bits> [**name** <string>]

Syntax: **dynamic**

Configuring an IPX network VLAN with dynamic ports

To configure port-based VLAN 20, then configure an IPX network VLAN within the port-based VLAN with dynamic ports, enter commands such as the following.

Configuring protocol VLANs with dynamic ports

```
Brocade(config)# vlan 20 name IPX_VLAN by port
Brocade(config-vlan-10)# untagged ethernet 2/1 to 2/6
added untagged port ethe 2/1 to 2/6 to port-vlan 20.
Brocade(config-vlan-10)# ipx-network abcd ethernet_ii name Eng-LAN
Brocade(config-vlan-ipx-network)# dynamic
Brocade(config)# write memory
```

These commands create a port-based VLAN on chassis ports 2/1 – 2/6 named “Eng-LAN”, configure an IPX network VLAN within the port-based VLAN, and then add ports from the port-based VLAN dynamically.

Syntax: `vlan <vlan-id> name <string> [by port]`

Syntax: `untagged ethernet [<slotnum>/]<portnum> to [<slotnum>/]<portnum>`

or

Syntax: `untagged ethernet [<slotnum>/]<portnum> ethernet [<slotnum>/]<portnum>`

NOTE

Use the first **untagged** command for adding a range of ports. Use the second command for adding separate ports (not in a range).

Syntax: `ipx-network <network-addr> ethernet_ii | ethernet_802.2 | ethernet_802.3 | ethernet_snap [name <string>]`

Syntax: `dynamic`

Configuring uplink ports within a port-based VLAN

You can configure a subset of the ports in a port-based VLAN as uplink ports. When you configure uplink ports in a port-based VLAN, the device sends all broadcast and unknown-unicast traffic from a port in the VLAN to the uplink ports, but not to other ports within the VLAN. Thus, the uplink ports provide tighter broadcast control within the VLAN.

This uplink port feature behaves the same as the private VLAN (PVLAN) feature, but with the ability to support tagged ports. This feature also supports two PVLAN modes: the Primary ports (uplink ports) and Isolated ports (host ports).

For example, if two ports within a port-based VLAN are Gbps ports attached to the network and the other ports are 10/100 ports attached to clients, you can configure the two ports attached to the network as uplink ports. In this configuration, broadcast and unknown-unicast traffic in the VLAN does not go to all ports. The traffic goes only to the uplink ports. The clients on the network do not receive broadcast and unknown-unicast traffic from other ports, including other clients.

Configuration considerations for uplink ports within a port-based VLAN

- When this feature is enabled, flooded traffic (unknown unicast, unregistered multicast, and broadcast traffic) is software forwarded.
- This feature should not be enabled with protocol VLANs or PVLANS in the same VLAN.

Configuration syntax for uplink ports within a port-based VLAN

To configure a port-based VLAN containing uplink ports, enter commands such as the following.

```
Brocade(config)# vlan 10 by port
Brocade(config-vlan-10)# untagged ethernet 1/1 to 1/24
Brocade(config-vlan-10)# untagged ethernet 2/1 to 2/2
Brocade(config-vlan-10)# uplink-switch ethernet 2/1 to 2/2
```

Syntax: `[no] uplink-switch ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum> | ethernet [<slotnum>/]<portnum>]`

In this example, 24 ports on a 10/100 module and two Gbps ports on a Gbps module are added to port-based VLAN 10. The two Gbps ports are then configured as uplink ports.

IP subnet address on multiple port-based VLAN configuration

For a Brocade device to route between port-based VLANs, you must add a virtual routing interface to each VLAN. Generally, you also configure a unique IP subnet address on each virtual routing interface. For example, if you have three port-based VLANs, you add a virtual routing interface to each VLAN, then add a separate IP subnet address to each virtual routing interface. The IP address on each of the virtual routing interfaces must be in a separate subnet. The Brocade device routes Layer 3 traffic between the subnets using the subnet addresses.

NOTE

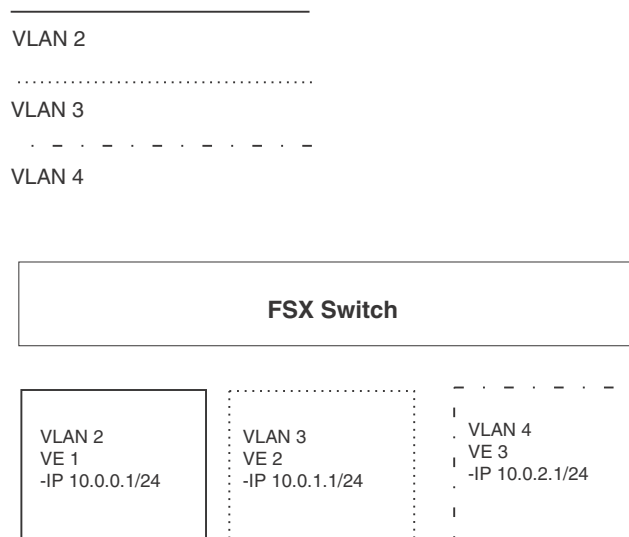

This feature applies only to Layer 3 switches.

NOTE

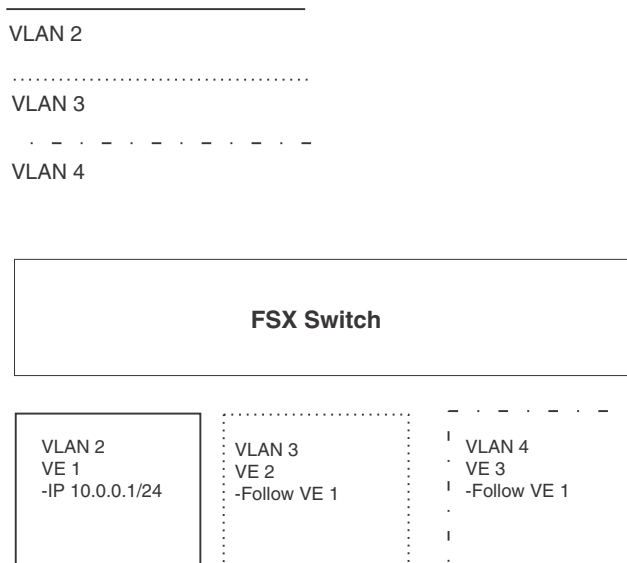

Before using the method described in this section, refer to [“VLAN groups and virtual routing interface group”](#) on page 791. You might be able to achieve the results you want using the methods in that section instead.

[Figure 84](#) shows an example of this type of configuration.

FIGURE 84 Multiple port-based VLANs with separate protocol addresses

As shown in this example, each VLAN has a separate IP subnet address. If you need to conserve IP subnet addresses, you can configure multiple VLANs with the same IP subnet address, as shown in [Figure 85](#).

FIGURE 85 Multiple port-based VLANs with the same protocol address

Each VLAN still requires a separate virtual routing interface. However, all three VLANs now use the same IP subnet address.

In addition to conserving IP subnet addresses, this feature allows containment of Layer 2 broadcasts to segments within an IP subnet. For ISP environments where the same IP subnet is allocated to different customers, placing each customer in a separate VLAN allows all customers to share the IP subnet address, while at the same time isolating them from one another Layer 2 broadcasts.

NOTE

You can provide redundancy to an IP subnet address that contains multiple VLANs using a pair of Brocade Layer 3 switches configured for Brocade VRRP (Virtual Router Redundancy Protocol).

The Brocade device performs proxy Address Resolution Protocol (ARP) for hosts that want to send IP traffic to hosts in other VLANs that are sharing the same IP subnet address. If the source and destination hosts are in the same VLAN, the Brocade device does not need to use ARP:

- If a host attached to one VLAN sends an ARP message for the MAC address of a host in one of the other VLANs using the same IP subnet address, the Brocade device performs a proxy ARP on behalf of the other host. The Brocade device then replies to the ARP by sending the virtual routing interface MAC address. The Brocade device uses the same MAC address for all virtual routing interfaces.

When the host that sent the ARP then sends a unicast packet addressed to the virtual routing interface MAC address, the device switches the packet on Layer 3 to the destination host on the VLAN.

NOTE

If the Brocade device ARP table does not contain the requested host, the Brocade device forwards the ARP request on Layer 2 to the same VLAN as the one that received the ARP request. Then the device sends an ARP for the destination to the other VLANs that are using the same IP subnet address.

- If the destination is in the same VLAN as the source, the Brocade device does not need to perform a proxy ARP.

To configure multiple VLANs to use the same IP subnet address:

- Configure each VLAN, including adding tagged or untagged ports.
- Configure a separate virtual routing interface for each VLAN, but do not add an IP subnet address to more than one of the virtual routing interfaces.
- Configure the virtual routing interfaces that do not have the IP subnet address to “follow” the virtual routing interface that does have the address.

To configure the VLANs shown in [Figure 85](#), you could enter the following commands.

```
Brocade(config)# vlan 1 by port
Brocade(config-vlan-1)# untagged ethernet 1/1
Brocade(config-vlan-1)# tagged ethernet 1/8
Brocade(config-vlan-1)# router-interface ve 1
```

Syntax: `router-interface ve <number>`

The commands above configure port-based VLAN 1. The VLAN has one untagged port (1/1) and a tagged port (1/8). In this example, all three VLANs contain port 1/8 so the port must be tagged to allow the port to be in multiple VLANs. You can configure VLANs to share a Layer 3 protocol interface regardless of tagging. A combination of tagged and untagged ports is shown in this example to demonstrate that sharing the interface does not change other VLAN features.

Notice that each VLAN still requires a unique virtual routing interface.

The following commands configure port-based VLANs 2 and 3.

```
Brocade(config-vlan-1)# vlan 2 by port
Brocade(config-vlan-2)# untagged ethernet 1/2
Brocade(config-vlan-2)# tagged ethernet 1/8
Brocade(config-vlan-2)# router-interface ve 2
Brocade(config-vlan-2)# vlan 3 by port
Brocade(config-vlan-3)# untagged ethernet 1/5 to 1/6
Brocade(config-vlan-3)# tagged ethernet 1/8
Brocade(config-vlan-3)# router-interface ve 3
```

The following commands configure an IP subnet address on virtual routing interface 1.

```
Brocade(config-vlan-3)# interface ve 1
Brocade(config-vif-1)# ip address 10.0.0.1/24
```

The following commands configure virtual routing interfaces 2 and 3 to “follow” the IP subnet address configured on virtual routing interface 1.

```
Brocade(config-vif-1)# interface ve 2
Brocade(config-vif-2)# ip follow ve 1
Brocade(config-vif-2)# interface ve 3
Brocade(config-vif-3)# ip follow ve 1
```

NOTE

Because virtual routing interfaces 2 and 3 do not have their own IP subnet addresses but instead are “following” virtual routing interface a IP address, you still can configure an IPX or AppleTalk interface on virtual routing interfaces 2 and 3.

VLAN groups and virtual routing interface group

To simplify configuration when you have many VLANs with the same configuration, you can configure VLAN groups and virtual routing interface groups.

NOTE

VLAN groups are supported on Layer 3 switches and Layer 2 switches. Virtual routing interface groups are supported only on Layer 3 switches.

When you create a VLAN group, the VLAN parameters you configure for the group apply to all the VLANs within the group. Additionally, you can easily associate the same IP subnet interface with all the VLANs in a group by configuring a virtual routing interface group with the same ID as the VLAN group.

- The VLAN group feature allows you to create multiple port-based VLANs with identical port members. Because the member ports are shared by all the VLANs within the group, you must add the ports as tagged ports. This feature not only simplifies VLAN configuration but also allows you to have a large number of identically configured VLANs in a startup-config file on the device flash memory module. Normally, a startup-config file with a large number of VLANs might not fit on the flash memory module. By grouping the identically configured VLANs, you can conserve space in the startup-config file so that it fits on the flash memory module.
- The virtual routing interface group feature is useful when you want to configure the same IP subnet address on all the port-based VLANs within a VLAN group. You can configure a virtual routing interface group only after you configure a VLAN group with the same ID. The virtual routing interface group automatically applies to the VLANs in the VLAN group that has the same ID and cannot be applied to other VLAN groups or to individual VLANs.

You can create up to 32 VLAN groups and 32 virtual routing interface groups. A virtual routing interface group always applies only to the VLANs in the VLAN group with the same ID.

NOTE

Depending on the size of the VLAN ID range you want to use for the VLAN group, you might need to allocate additional memory for VLANs. On Layer 3 switches, if you allocate additional memory for VLANs, you also need to allocate the same amount of memory for virtual routing interfaces. This is true regardless of whether you use the virtual routing interface groups. To allocate additional memory, refer to [“Allocating memory for more VLANs or virtual routing interfaces”](#) on page 795.

Configuring a VLAN group

To configure a VLAN group, enter commands such as the following.

```
Brocade(config)# vlan-group 1 vlan 2 to 257
Brocade(config-vlan-group-1)# tagged 1/1 to 1/2
```

The first command in this example begins configuration for VLAN group 1, and assigns VLANs 2 through 257 to the group. The second command adds ports 1/1 and 1/2 as tagged ports. Because all the VLANs in the group share the ports, you must add the ports as tagged ports.

Syntax: `vlan-group <num> vlan <vlan-id> to <vlan-id>`

Syntax: `tagged ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum>] | ethernet [<slotnum>/]<portnum>]`

The `vlan-group <num>` parameter specifies the VLAN group ID and can be from 1 – 32. The `vlan <vlan-id> to <vlan-id>` parameters specify a contiguous range (a range with no gaps) of individual VLAN IDs. Specify the low VLAN ID first and the high VLAN ID second. The command adds all of the specified VLANs to the VLAN group.

You can add up to 256 VLANs with the command at one time. To add more than 256 VLANs, enter separate commands. For example, to configure VLAN group 1 and add 512 VLANs to the group, enter the following commands.

```
Brocade(config)# vlan-group 1 vlan 2 to 257
Brocade(config-vlan-group-1)# add-vlan 258 to 513
```

NOTE

The device memory must be configured to contain at least the number of VLANs you specify for the higher end of the range. For example, if you specify 2048 as the VLAN ID at the high end of the range, you first must increase the memory allocation for VLANs to 2048 or higher. Additionally, on Layer 3 switches, if you allocate additional memory for VLANs, you also need to allocate the same amount of memory for virtual routing interfaces, before you configure the VLAN groups. This is true regardless of whether you use the virtual routing interface groups. The memory allocation is required because the VLAN groups and virtual routing interface groups have a one-to-one mapping. Refer to [“Allocating memory for more VLANs or virtual routing interfaces”](#) on page 795.

If a VLAN within the range you specify is already configured, or if the range contains more than 256 VLANs, the CLI does not add the group but instead displays an error message.

```
Brocade(config)#vlan-group 1 vlan 2 to 1000
VLAN group 1 is too big. Only 256 vlans are allowed at a time
```

In this case, create the group by specifying a valid contiguous range. Then add more VLANs to the group after the CLI changes to the configuration level for the group. See the following example.

```
Brocade(config)#vlan-group 2 vlan 1000 to 1250
Brocade(config-vlan-group-2)#add-vlan 1251 to 1500
Brocade(config-vlan-group-2)#add-vlan 1501 to 1750
Brocade(config-vlan-group-2)#add-vlan 1751 to 2000
```

You can add or remove individual VLANs or VLAN ranges from the VLAN group at configuration level. For example, if you want to add VLANs 1001 and 1002 to VLAN group 1 and remove VLANs 900 through 1000, enter the following commands.

```
Brocade(config-vlan-group-1)# add-vlan 1001 to 1002
Brocade(config-vlan-group-1)# remove-vlan 900 to 1000
```

Syntax: `add-vlan <vlan-id> [to <vlan-id>]`

Syntax: `remove-vlan <vlan-id> [to <vlan-id>]`

The `<vlan-id> to <vlan-id>` parameters specify a contiguous range (a range with no gaps) of individual VLAN IDs. Specify the low VLAN ID first and the high VLAN ID second. You can add or remove up to 256 VLANs at a time. To add or remove more than 256 VLANs, do so using separate commands. For example, to remove 512 VLANs from VLAN group 1, enter the following commands.

```
Brocade(config-vlan-group-1)# remove-vlan 400 to 654
Brocade(config-vlan-group-1)# remove-vlan 655 to 910
```

Displaying information about VLAN groups

To display VLAN group configuration information, use the **show vlan-group** command.

```
Brocade# show vlan-group
vlan-group 1 vlan 2 to 20
  tagged ethe 1/1 to 1/2
!
vlan-group 2 vlan 21 to 40
  tagged ethe 1/1 to 1/2
!
```

Syntax: **show vlan-group** [`<group-id>`]

The `<group-id>` specifies a VLAN group. If you do not use this parameter, the configuration information for all the configured VLAN groups is displayed.

Configuring a virtual routing interface group

A virtual routing interface group allows you to associate the same IP subnet interface with multiple port-based VLANs. For example, if you associate a virtual routing interface group with a VLAN group, all the VLANs in the group have the IP interface of the virtual routing interface group.

Configuration notes and feature limitations for virtual routing interface group

- When you configure a virtual routing interface group, all members of the group have the same IP subnet address. This feature is useful in collocation environments where the device has many IP addresses and you want to conserve the IP address space.
- The **group-router-interface** command creates router interfaces for each VLAN in the VLAN group by using the VLAN IDs of each of the VLANs as the corresponding virtual interface number. Therefore, if a VLAN group contains VLAN IDs greater than the maximum virtual interface number allowed, the **group-router-interface** command will be rejected.

CLI syntax for virtual routing interface group

To configure a virtual routing interface group, enter commands such as the following.

```
Brocade(config)# vlan-group 1
Brocade(config-vlan-group-1)# group-router-interface
Brocade(config-vlan-group-1)# exit
Brocade(config)# interface group-ve 1
Brocade(config-vif-group-1)# ip address 10.10.10.1/24
```

These commands enable VLAN group 1 to have a group virtual routing interface, then configure virtual routing interface group 1. The software always associates a virtual routing interface group only with the VLAN group that has the same ID. In this example, the VLAN group ID is 1, so the corresponding virtual routing interface group also must have ID 1.

Syntax: `group-router-interface`

Syntax: `interface group-ve <num>`

Syntax: `[no] ip address <ip-addr> <ip-mask> [secondary]`

or

Syntax: `[no] ip address <ip-addr>/<mask-bits> [secondary]`

The **router-interface-group** command enables a VLAN group to use a virtual routing interface group. Enter this command at the configuration level for the VLAN group. This command configures the VLAN group to use the virtual routing interface group that has the same ID as the VLAN group. You can enter this command when you configure the VLAN group for the first time or later, after you have added tagged ports to the VLAN and so on.

The `<num>` parameter in the **interface group-ve <num>** command specifies the ID of the VLAN group with which you want to associate this virtual routing interface group. The VLAN group must already be configured and enabled to use a virtual routing interface group. The software automatically associates the virtual routing interface group with the VLAN group that has the same ID. You can associate a virtual routing interface group only with the VLAN group that has the same ID.

NOTE

IPv6 is not supported with **group-ve**.

NOTE

FCX devices do not support ACLs with **group-ve**.

NOTE

FastIron devices support **group-ve** with OSPF, VRRP v2 and VRRP-E v2 protocols only.

The syntax and usage for the **ip address** command is the same as when you use the command at the interface level to add an IP interface.

Displaying the VLAN group and virtual routing interface group information

To verify configuration of VLAN groups and virtual routing interface groups, display the running-config file. If you have saved the configuration to the startup-config file, you also can verify the configuration by displaying the startup-config file. The following example shows the running-config information for the VLAN group and virtual routing interface group configured in the previous examples. The information appears in the same way in the startup-config file.

```
Brocade# show running-config
```

```
lines not related to the VLAN group omitted...
```

```
vlan-group 1 vlan 2 to 20
  add-vlan 1001 to 1002
  tagged ethe 1/1 to 1/2
```

```
router-interface-group

lines not related to the virtual routing interface group omitted...

interface group-ve 1
 ip address 10.10.10.1 255.255.255.0
```

NOTE

If you have enabled display of subnet masks in CIDR notation, the IP address information is shown as follows: 10.10.10.1/24.

Allocating memory for more VLANs or virtual routing interfaces

Brocade Layer 2 and Layer 3 Switches support up to 4095 VLANs. In addition, Layer 3 switches support up to 512 virtual routing interfaces.

The number of VLANs and virtual routing interfaces supported on your product depends on the device and, for Chassis devices, the amount of DRAM on the management module. [Table 141](#) lists the default and configurable maximum numbers of VLANs and virtual routing interfaces for Layer 2 and Layer 3 switches. Unless otherwise noted, the values apply to both types of switches.

TABLE 141 VLAN and virtual routing interface support

VLANs		Virtual routing interfaces	
Default maximum	Configurable maximum	Default maximum	Configurable maximum
64	4094	255	512

NOTE

If many of your VLANs will have an identical configuration, you might want to configure VLAN groups and virtual routing interface groups after you increase the system capacity for VLANs and virtual routing interfaces. Refer to [“VLAN groups and virtual routing interface group”](#) on page 791.

Increasing the number of VLANs you can configure

NOTE

Although you can specify up to 4095 VLANs, you can configure only 4094 VLANs. VLAN ID 4094 is reserved for use by the Single Spanning Tree feature.

To increase the maximum number of VLANs you can configure, enter commands such as the following at the global CONFIG level of the CLI.

```
Brocade(config)# system-max vlan 2048
Brocade(config)# write memory
Brocade(config)# end
Brocade# reload
```

Syntax: `system-max vlan <num>`

The `<num>` parameter indicates the maximum number of VLANs. The range of valid values depends on the device you are configuring. Refer to [Table 141](#).

Increasing the number of virtual routing interfaces you can configure

To increase the maximum number of virtual routing interfaces you can configure, enter commands such as the following at the global CONFIG level of the CLI.

```
Brocade(config)# system-max virtual-interface 512
Brocade(config)# write memory
Brocade(config)# end
Brocade# reload
```

Syntax: `system-max virtual-interface <num>`

The <num> parameter indicates the maximum number of virtual routing interfaces. The range of valid values depends on the device you are configuring. Refer to [Table 141](#).

Super-aggregated VLAN configuration

You can aggregate multiple VLANs within another VLAN. This feature allows you to construct Layer 2 paths and channels. This feature is particularly useful for Virtual Private Network (VPN) applications in which you need to provide a private, dedicated Ethernet connection for an individual client to transparently reach its subnet across multiple networks.

Conceptually, the paths and channels are similar to Asynchronous Transfer Mode (ATM) paths and channels. A path contains multiple channels, each of which is a dedicated circuit between two end points. The two devices at the end points of the channel appear to each other to be directly attached. The network that connects them is transparent to the two devices.

You can aggregate up to 4094 VLANs within another VLAN. This provides a total VLAN capacity on one Brocade device of 16,760,836 channels ($4094 * 4094$).

The devices connected through the channel are not visible to devices in other channels. Therefore, each client has a private link to the other side of the channel.

The feature allows point-to-point and point-to-multipoint connections.

[Figure 86](#) shows a conceptual picture of the service that aggregated VLANs provide. Aggregated VLANs provide a path for multiple client channels. The channels do not receive traffic from other channels. Thus, each channel is a private link.

FIGURE 86 Conceptual model of the super aggregated VLAN application

Each client connected to the edge device is in its own port-based VLAN, which is like an ATM channel. All the clients' VLANs are aggregated by the edge device into a single VLAN for connection to the core. The single VLAN that aggregates the clients' VLANs is like an ATM path.

The device that aggregates the VLANs forwards the aggregated VLAN traffic through the core. The core can consist of multiple devices that forward the aggregated VLAN traffic. The edge device at the other end of the core separates the aggregated VLANs into the individual client VLANs before forwarding the traffic. The edge devices forward the individual client traffic to the clients. For the clients' perspective, the channel is a direct point-to-point link.

Figure 87 shows an example application that uses aggregated VLANs. This configuration includes the client connections shown in Figure 86.

FIGURE 87 Example of a super aggregated VLAN application

In this example, a collocation service provides private channels for multiple clients. Although the same devices are used for all the clients, the VLANs ensure that each client receives its own Layer 2 broadcast domain, separate from the broadcast domains of other clients. For example, client 1 cannot ping client 5.

The clients at each end of a channel appear to each other to be directly connected and thus can be on the same subnet and use network services that require connection to the same subnet. In this example, client 1 is in subnet 192.168.1.0/24 and so is the device at the other end of client 1 channel.

Because each VLAN configured on the core devices is an aggregate of multiple client VLANs, the aggregated VLANs greatly increase the number of clients a core device can accommodate.

This example shows a single link between the core devices. However, you can use a trunk group to add link-level redundancy.

Configuration notes for aggregated VLANs

- This feature is not supported on the 48-port 10/100/1000 Mbps (RJ45) Ethernet POE interface module (SX-FI48GPP).
- Super Aggregated VLANs and VSRP are not supported together on the same device.

Configuring aggregated VLANs

To configure aggregated VLANs, perform the following tasks:

- On each edge device, configure a separate port-based VLAN for each client connected to the edge device. In each client VLAN:
 - Add the port connected to the client as an untagged port.
 - Add the port connected to the core device (the device that will aggregate the VLANs) as a tagged port. This port must be tagged because all the client VLANs share the port as an uplink to the core device.
- On each core device:
 - Enable VLAN aggregation. This support allows the core device to add an additional tag to each Ethernet frame that contains a VLAN packet from the edge device. The additional tag identifies the aggregate VLAN (the path). However, the additional tag can cause the frame to be longer than the maximum supported frame size. The larger frame support allows Ethernet frames up to 1530 bytes long.
 - For FWS devices, the frame size is limited to 1522, not 1530, bytes. To allow frames larger than 1522, you must enable jumbo frames. To globally enable jumbo support, enter commands such as the following.

```
Brocade(config)# jumbo
Brocade(config)# write memory
Brocade(config)# end
Brocade# reload
```

NOTE

Enable the VLAN aggregation option only on the core devices.

- Configure a VLAN tag type (tag ID) that is different than the tag type used on the edge devices. If you use the default tag type (8100) on the edge devices, set the tag type on the core devices to another value, such as 9100. The tag type must be the same on all the core devices. The edge devices also must have the same tag type but the type must be different from the tag type on the core devices.

NOTE

You can enable the Spanning Tree Protocol (STP) on the edge devices or the core devices, but not both. If you enable STP on the edge devices and the core devices, STP will prevent client traffic from travelling through the core to the other side.

Configuring aggregated VLANs on an edge device

To configure the aggregated VLANs on device A in [Figure 87](#) on page 798, enter the following commands.

```
Brocade(config)# vlan 101 by port
Brocade(config-vlan-101)# tagged ethernet 2/1
Brocade(config-vlan-101)# untagged ethernet 1/1
Brocade(config-vlan-101)# exit
Brocade(config)# vlan 102 by port
Brocade(config-vlan-102)# tagged ethernet 2/1
Brocade(config-vlan-102)# untagged ethernet 1/2
Brocade(config-vlan-102)# exit
Brocade(config)# vlan 103 by port
Brocade(config-vlan-103)# tagged ethernet 2/1
Brocade(config-vlan-103)# untagged ethernet 1/3
Brocade(config-vlan-103)# exit
Brocade(config)# vlan 104 by port
Brocade(config-vlan-104)# tagged ethernet 2/1
Brocade(config-vlan-104)# untagged ethernet 1/4
Brocade(config-vlan-104)# exit
Brocade(config)# vlan 105 by port
Brocade(config-vlan-105)# tagged ethernet 2/1
Brocade(config-vlan-105)# untagged ethernet 1/5
Brocade(config-vlan-105)# exit
Brocade(config)# write memory
```

Syntax: [no] vlan <vlan-id> [by port]

Syntax: [no] tagged ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum> | ethernet [<slotnum>/]<portnum>]

Syntax: [no] untagged ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum> | ethernet [<slotnum>/]<portnum>]

Use the **tagged** command to add the port that the device uses for the uplink to the core device. Use the **untagged** command to add the ports connected to the individual clients.

Configuring aggregated VLANs on a core device

To configure the aggregated VLANs on device C in [Figure 87](#) on page 798, enter the following commands.

```
Brocade(config)# tag-type 9100
Brocade(config)# aggregated-vlan
Brocade(config)# vlan 101 by port
Brocade(config-vlan-101)# tagged ethernet 4/1
Brocade(config-vlan-101)# untagged ethernet 3/1
Brocade(config-vlan-101)# exit
Brocade(config)# vlan 102 by port
Brocade(config-vlan-102)# tagged ethernet 4/1
Brocade(config-vlan-102)# untagged ethernet 3/2
Brocade(config-vlan-102)# exit
Brocade(config)# write memory
```

Syntax: [no] tag-type <num>

Syntax: [no] aggregated-vlan

The `<num>` parameter specifies the tag type can be a hexadecimal value from 0 – ffff. The default is 8100.

Verifying the aggregated VLAN configuration

You can verify the VLAN, VLAN aggregation option, and tag configuration by viewing the running-config. To display the running-config, enter the **show running-config** command from any CLI prompt. After you save the configuration changes to the startup-config, you also can display the settings in that file by entering the **show configuration** command from any CLI prompt.

Complete CLI examples for aggregated VLANs

The following sections show all the Aggregated VLAN configuration commands on the devices in [Figure 87](#) on page 798.

NOTE

In these examples, the configurations of the edge devices (A, B, E, and F) are identical. The configurations of the core devices (C and D) also are identical. The aggregated VLAN configurations of the edge and core devices on one side must be symmetrical (in fact, a mirror image) to the configurations of the devices on the other side. For simplicity, the example in [Figure 87](#) on page 798 is symmetrical in terms of the port numbers. This allows the configurations for both sides of the link to be the same. If your configuration does not use symmetrically arranged port numbers, the configurations should not be identical but must use the correct port numbers.

Commands for configuring aggregated VLANs on device A

```
BrocadeA(config)# vlan 101 by port
BrocadeA(config-vlan-101)# tagged ethernet 2/1
BrocadeA(config-vlan-101)# untagged ethernet 1/1
BrocadeA(config-vlan-101)# exit
BrocadeA(config)# vlan 102 by port
BrocadeA(config-vlan-102)# tagged ethernet 2/1
BrocadeA(config-vlan-102)# untagged ethernet 1/2
BrocadeA(config-vlan-102)# exit
BrocadeA(config)# vlan 103 by port
BrocadeA(config-vlan-103)# tagged ethernet 2/1
BrocadeA(config-vlan-103)# untagged ethernet 1/3
BrocadeA(config-vlan-103)# exit
BrocadeA(config)# vlan 104 by port
BrocadeA(config-vlan-104)# tagged ethernet 2/1
BrocadeA(config-vlan-104)# untagged ethernet 1/4
BrocadeA(config-vlan-104)# exit
BrocadeA(config)# vlan 105 by port
BrocadeA(config-vlan-105)# tagged ethernet 2/1
BrocadeA(config-vlan-105)# untagged ethernet 1/5
BrocadeA(config-vlan-105)# exit
vA(config)# write memory
```

Commands for configuring aggregated VLANs on device B

The commands for configuring device B are identical to the commands for configuring device A. Notice that you can use the same channel VLAN numbers on each device. The devices that aggregate the VLANs into a path can distinguish between the identically named channel VLANs based on the ID of the path VLAN.

```
BrocadeB(config)# vlan 101 by port
BrocadeB(config-vlan-101)# tagged ethernet 2/1
BrocadeB(config-vlan-101)# untagged ethernet 1/1
BrocadeB(config-vlan-101)# exit
BrocadeB(config)# vlan 102 by port
BrocadeB(config-vlan-102)# tagged ethernet 2/1
BrocadeB(config-vlan-102)# untagged ethernet 1/2
BrocadeB(config-vlan-102)# exit
BrocadeB(config)# vlan 103 by port
BrocadeB(config-vlan-103)# tagged ethernet 2/1
BrocadeB(config-vlan-103)# untagged ethernet 1/3
BrocadeB(config-vlan-103)# exit
BrocadeB(config)# vlan 104 by port
BrocadeB(config-vlan-104)# tagged ethernet 2/1
BrocadeB(config-vlan-104)# untagged ethernet 1/4
BrocadeB(config-vlan-104)# exit
BrocadeB(config)# vlan 105 by port
BrocadeB(config-vlan-105)# tagged ethernet 2/1
BrocadeB(config-vlan-105)# untagged ethernet 1/5
BrocadeB(config-vlan-105)# exit
BrocadeB(config)# write memory
```

Commands for configuring aggregated VLANs on device C

Because device C is aggregating channel VLANs from devices A and B into a single path, you need to change the tag type and enable VLAN aggregation.

```
BrocadeC(config)# tag-type 9100
BrocadeC(config)# aggregated-vlan
BrocadeC(config)# vlan 101 by port
BrocadeC(config-vlan-101)# tagged ethernet 4/1
BrocadeC(config-vlan-101)# untagged ethernet 3/1
BrocadeC(config-vlan-101)# exit
BrocadeC(config)# vlan 102 by port
BrocadeC(config-vlan-102)# tagged ethernet 4/1
BrocadeC(config-vlan-102)# untagged ethernet 3/2
BrocadeC(config-vlan-102)# exit
BrocadeC(config)# write memory
```

Commands for configuring aggregated VLANs on device D

Device D is at the other end of path and separates the channels back into individual VLANs. The tag type must be the same as tag type configured on the other core device (Device C). In addition, VLAN aggregation also must be enabled.

```
BrocadeD(config)# tag-type 9100
BrocadeD(config)# aggregated-vlan
BrocadeD(config)# vlan 101 by port
BrocadeD(config-vlan-101)# tagged ethernet 4/1
BrocadeD(config-vlan-101)# untagged ethernet 3/1
BrocadeD(config-vlan-101)# exit
```

```

BrocadeD(config)# vlan 102 by port
BrocadeD(config-vlan-102)# tagged ethernet 4/1
BrocadeD(config-vlan-102)# untagged ethernet 3/2
BrocadeD(config-vlan-102)# exit
BrocadeD(config)# write memory

```

Commands for configuring aggregated VLANs on device E

Because the configuration in [Figure 87](#) on page 798 is symmetrical, the commands for configuring device E are identical to the commands for configuring device A.

```

BrocadeE(config)# vlan 101 by port
BrocadeE(config-vlan-101)# tagged ethernet 2/1
BrocadeE(config-vlan-101)# untagged ethernet 1/1
BrocadeE(config-vlan-101)# exit
BrocadeE(config)# vlan 102 by port
BrocadeE(config-vlan-102)# tagged ethernet 2/1
BrocadeE(config-vlan-102)# untagged ethernet 1/2
BrocadeE(config-vlan-102)# exit
BrocadeE(config)# vlan 103 by port
BrocadeE(config-vlan-103)# tagged ethernet 2/1
BrocadeE(config-vlan-103)# untagged ethernet 1/3
BrocadeE(config-vlan-103)# exit
BrocadeE(config)# vlan 104 by port
BrocadeE(config-vlan-104)# tagged ethernet 2/1
BrocadeE(config-vlan-104)# untagged ethernet 1/4
BrocadeE(config-vlan-104)# exit
BrocadeE(config)# vlan 105 by port
BrocadeE(config-vlan-105)# tagged ethernet 2/1
BrocadeE(config-vlan-105)# untagged ethernet 1/5
BrocadeE(config-vlan-105)# exit
BrocadeE(config)# write memory

```

Commands for configuring aggregated VLANs on device F

The commands for configuring device F are identical to the commands for configuring device E. In this example, Because the port numbers on each side of the configuration in [Figure 87](#) on page 798 are symmetrical, the configuration of device F is also identical to the configuration of device A and device B.

```

BrocadeF(config)# vlan 101 by port
BrocadeF(config-vlan-101)# tagged ethernet 2/1
BrocadeF(config-vlan-101)# untagged ethernet 1/1
BrocadeF(config-vlan-101)# exit
BrocadeF(config)# vlan 102 by port
BrocadeF(config-vlan-102)# tagged ethernet 2/1
BrocadeF(config-vlan-102)# untagged ethernet 1/2
BrocadeF(config-vlan-102)# exit
BrocadeF(config)# vlan 103 by port
BrocadeF(config-vlan-103)# tagged ethernet 2/1
BrocadeF(config-vlan-103)# untagged ethernet 1/3
BrocadeF(config-vlan-103)# exit
BrocadeF(config)# vlan 104 by port
BrocadeF(config-vlan-104)# tagged ethernet 2/1
BrocadeF(config-vlan-104)# untagged ethernet 1/4
BrocadeF(config-vlan-104)# exit
BrocadeF(config)# vlan 105 by port

```

```

BrocadeF(config-vlan-105)# tagged ethernet 2/1
BrocadeF(config-vlan-105)# untagged ethernet 1/5
BrocadeF(config-vlan-105)# exit
BrocadeF(config)# write memory

```

802.1ad tagging configuration

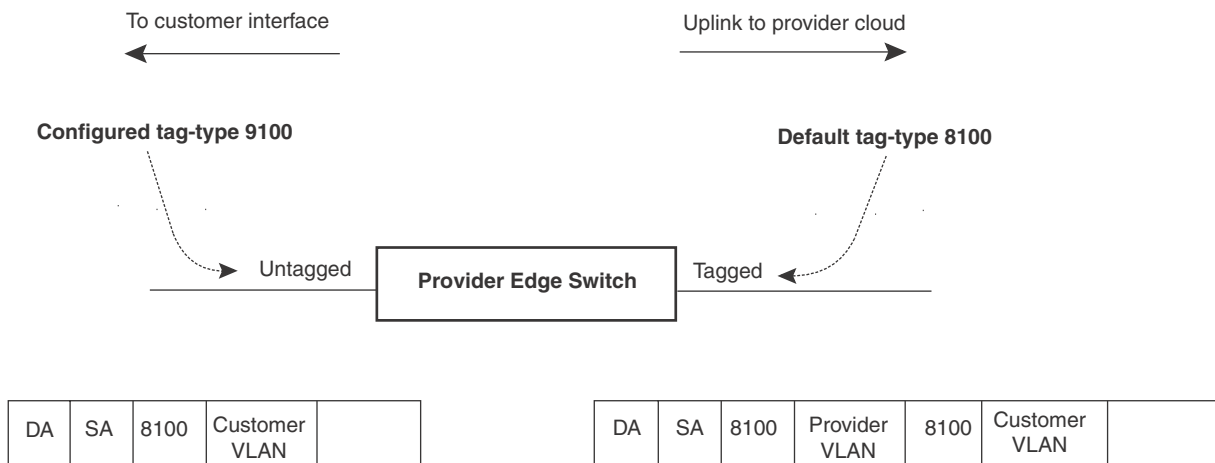

802.1ad tagging provides finer granularity for configuring 802.1Q tagging, enabling you to configure 802.1Q tag-types on a group of ports. This feature allows you to create two identical 802.1Q tags (802.1ad tagging) on a single device. This enhancement improves SAV interoperability between Brocade devices and other vendors' devices that support the 802.1Q tag-types, but are not very flexible with the tag-types they accept.

NOTE

Brocade devices treat a double-tagged Ethernet frame as a Layer 2 only frame. The packets are not inspected for Layer 3 and Layer 4 information, and operations are not performed on the packet utilizing Layer 3 or Layer 4 information.

Figure 88 shows an example application with 802.1ad tagging.

FIGURE 88 802.1ad configuration example

In Figure 88, the untagged ports (to customer interfaces) accept frames that have any 802.1Q tag other than the configured tag-type 9100. These packets are considered untagged on this incoming port and are re-tagged when they are sent out of the uplink towards the provider. The 802.1Q tag-type on the uplink port is 8100, so the Brocade device will switch the frames to the uplink device with an additional 8100 tag, thereby supporting devices that only support this method of VLAN tagging.

Configuration rules for 802.1ad tagging

- Because the uplink (to the provider cloud) and the edge link (to the customer port) must have different 802.1Q tags, make sure the uplink and edge link are in different port regions. Refer to [“About port regions”](#) on page 556 for a list of valid port regions.
- On devices that support port regions, if you configure a port with an 802.1Q tag-type, the Brocade device automatically applies the 802.1Q tag-type to all ports within the same port region. Likewise, if you remove the 802.1Q tag-type from a port, the Brocade device automatically removes the 802.1Q tag-type from all ports within the same port region.
- Q-in-Q and SAV are not supported on the following :
 - 48-port 10/100/1000 Mbps (RJ45) Ethernet POE interface module (SX-FI48GPP)
 - 2-port 10-Gigabit Ethernet interface module (SX-FI-2XG)
 - 8-port 10-Gigabit Ethernet interface module (SX-FI-8XG)
 - 24-port Gigabit Ethernet fiber interface module (SX-FI-24HF)
 - 24-port Gigabit Ethernet copper interface module with PoE+ (SX-FI-24GPP)
- FastIron X Series devices support one configured tag-type per device along with the default tag-type of 8100. For example, if you configure an 802.1Q tag of 9100 on ports 1 – 12, then later configure an 802.1Q tag of 5100 on port 15, the device automatically applies the 5100 tag to all ports in the same port region as port 15, and also changes the 802.1Q tag-type on ports 1 – 12 to 5100.
- 802.1ad tagging and VSRP are not supported together on the same device.
- In addition to **tag-type**, FastIron WS and Brocade FCX Series devices support **tag-profile**. For more information, refer to [“Configuring 802.1ad tag profiles”](#) on page 808.

Enabling 802.1ad tagging

To enable 802.1ad tagging, configure an 802.1Q tag on the untagged edge links (the customer ports) to any value other than the 802.1Q tag for incoming traffic. For example, in [Figure 89](#), the 802.1Q tag on the untagged edge links (ports 11 and 12) is 9100, whereas, the 802.1Q tag for incoming traffic is 8100.

To configure 802.1 ad tagging as shown in [Figure 89](#), enter commands such as the following on the untagged edge links of devices C and D.

```
Brocade(config)# tag-type 9100 ethernet 11 to 12
Brocade(config)# aggregated-vlan
```

Note that because ports 11 and 12 belong to the port region 1 – 12, the 802.1Q tag actually applies to ports 1 – 12.

Syntax: [no] tag-type <num> [ethernet <port> [to <port>]]

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

802.1ad tagging configuration

The **ethernet** *<port>* to *<port>* parameter specifies the ports that will use the defined 802.1Q tag. This parameter operates with the following rules:

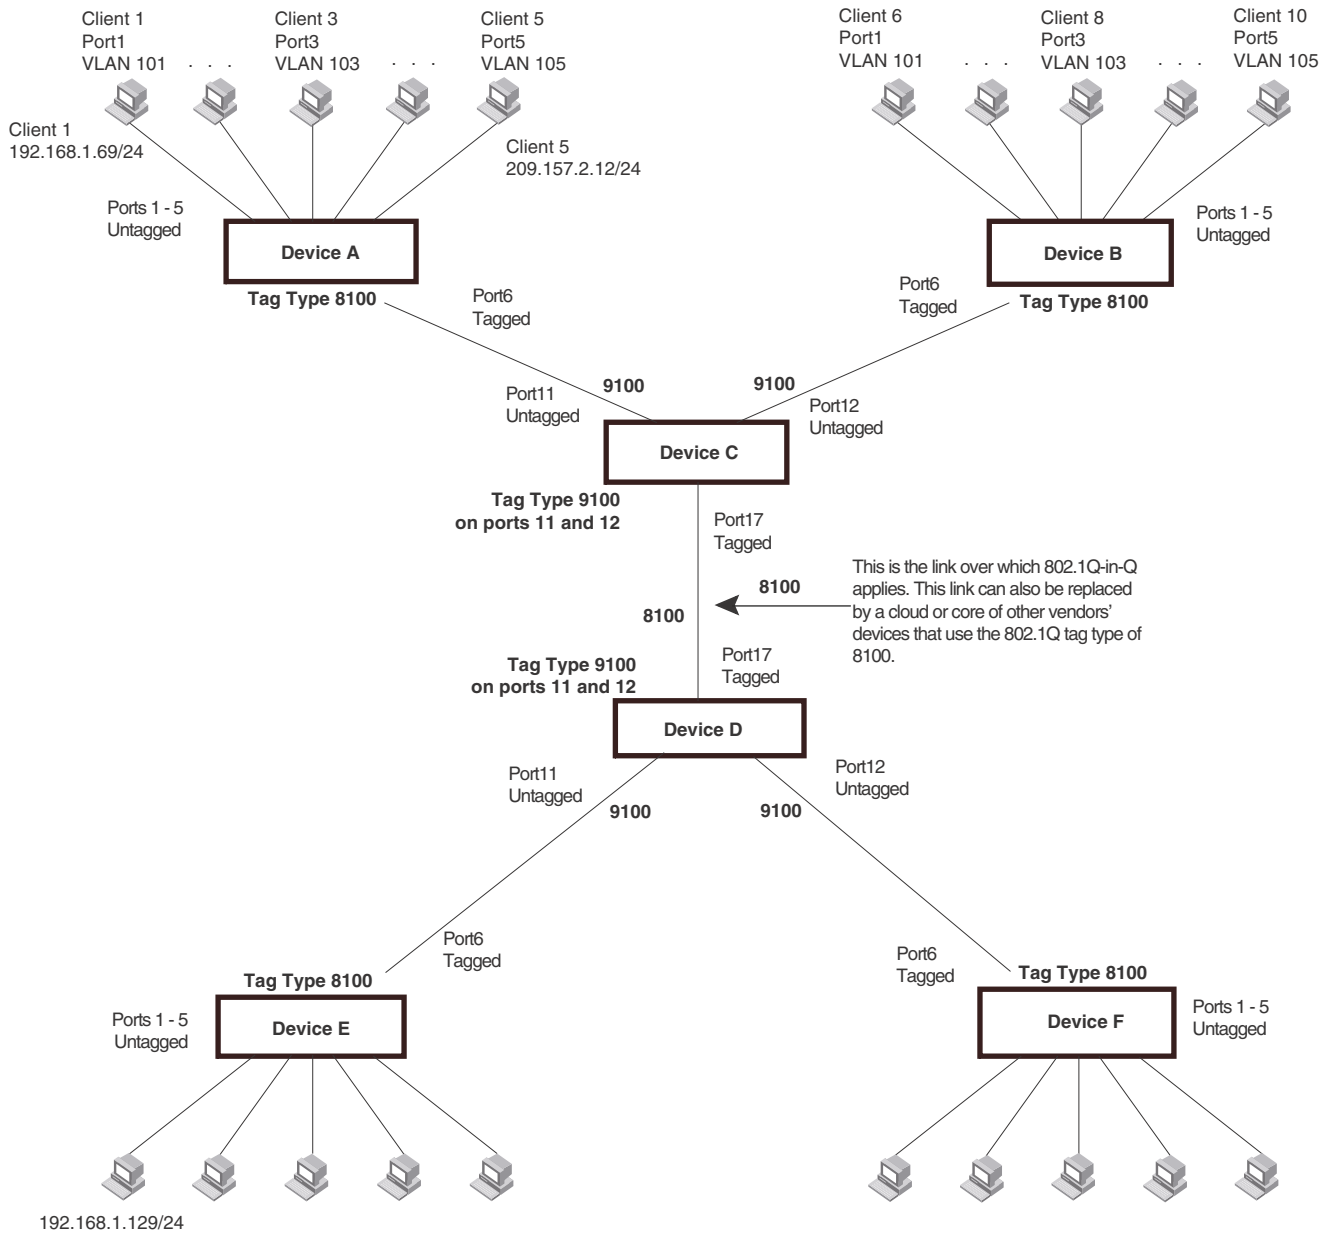

- If you specify a single port number, the 802.1Q tag applies to all ports within the port region. For example, if you enter the command **tag-type 9100 ethernet 1**, the Brocade device automatically applies the 802.1Q tag to ports 1 – 12 because all of these ports are in the same port region. You can use the **show running-config** command to view how the command has been applied.
- If you do not specify a port or range of ports, the 802.1Q tag applies to all Ethernet ports on the device.

Example 802.1ad configuration

[Figure 89](#) shows an example 802.1ad configuration.

FIGURE 89 Example 802.1ad configuration

802.1ad tagging configuration

Configuring 802.1ad tag profiles

NOTE

802.1ad tag profiles are not supported on FastIron X Series devices.

The 802.1ad tagging feature supports a **tag-profile** command that allows you to add a tag profile with a value of 0 to 0xffff in addition to the default tag-type 0x8100. This enhancement also allows you to add a tag profile for a single port, or to direct a group of ports to a globally-configured tag profile.

Configuration notes for 802.1ad tagging

- One global tag profile with a number between 0 and 0xffff can be configured on stackable devices.
- On individual ports, if **tag-profile** is enabled, it points to the global tag profile.
- **Tag-profile** can also be enabled for provisional ports.
- **Tag-type** and **tag-profile** cannot be configured at the same time. You will see the message “un-configure the tag-type to set the tag-profile.” If **tag-type** is already configured, you will need to unconfigure it and then add the **tag-profile**.
- Do not use the **tag-type** command in conjunction with the **tag-profile** command. If a **tag-type** has already been configured and you try to use the **tag-profile** command, you will see an error message telling you to remove the tag-type before you add the tag-profile.
- For devices operating in an IronStack topology, when a tag-type for a port is changed, the tag-type for all of the ports on a stack unit also changes. Because of this limitation, SAV and Q-in-Q cannot be used at the same time on stacking devices.

CLI Syntax for 802.1ad tagging

To add a global tag-profile enter the following command.

```
Brocade(config)# tag-profile 9500
```

This command adds a profile in addition to the default profile of 0x8100.

Syntax: [no] **tag-profile** <tag-no>

where <tag-no> can be 0x8100 (the default) or 0xffff.

To enable the new profile on individual ports, enter commands similar to the following.

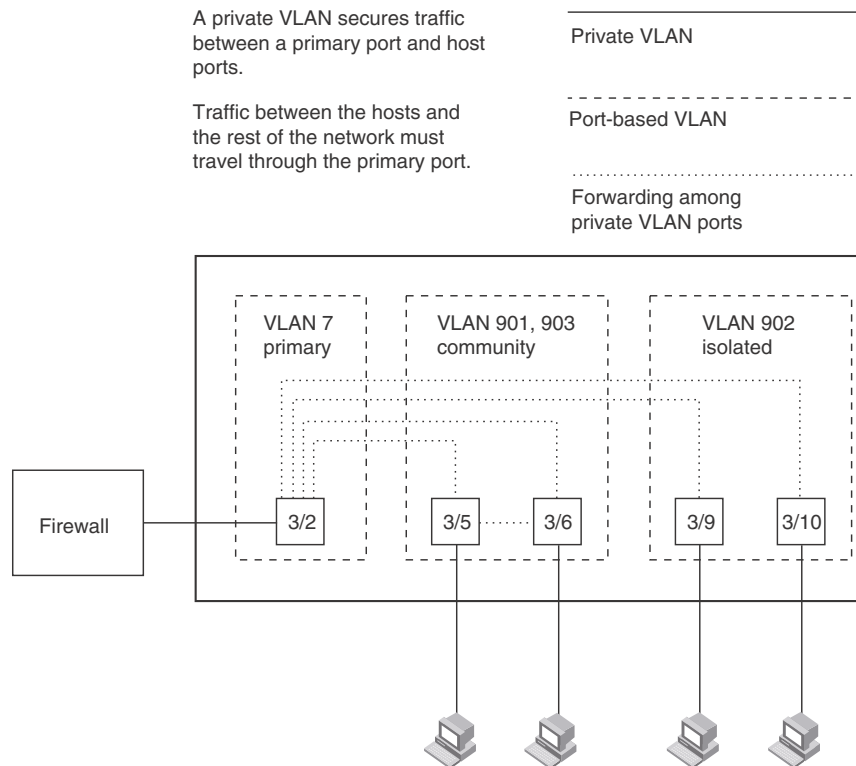

```
Brocade(config)# interface ethernet 1/1/1
Brocade(config-if-e1000-1/1/1)# tag-profile enable
Brocade(config-mif-1/1/1,1/2/1)# tag-profile enable
```

Syntax: [no] **tag-profile enable**

Private VLAN configuration

A private VLAN (PVLAN) is a VLAN that has the properties of standard Layer 2 port-based VLANs but also provides additional control over flooding packets on a VLAN. [Figure 90](#) shows an example of an application using a PVLAN.

FIGURE 90 PVLAN used to secure communication between a workstation and servers

This example uses a PVLAN to secure traffic between hosts and the rest of the network through a firewall. Five ports in this example are members of a PVLAN. The first port (port 3/2) is attached to a firewall. The next four ports (ports 3/5, 3/6, 3/9, and 3/10) are attached to hosts that rely on the firewall to secure traffic between the hosts and the rest of the network. In this example, two of the hosts (on ports 3/5 and 3/6) are in a community PVLAN, and thus can communicate with one another as well as through the firewall. The other two hosts (on ports 3/9 and 3/10), are in an isolated VLAN and thus can communicate only through the firewall. The two hosts are secured from communicating with one another even though they are in the same VLAN.

By default, in the FCX platform, the device will forward broadcast, unregistered multicast, and unknown unicast packets from outside sources into the PVLAN.

By default, in FastIron platforms other than the FCX, the device will not forward broadcast, unregistered multicast, and unknown unicast packets from outside sources into the PVLAN. If needed, you can override this behavior for broadcast packets, unknown-unicast packets, or both. (Refer to [“Displaying PVLAN information”](#) on page 825.)

You can configure a combination of the following types of PVLANS:

- Primary – The primary PVLAN ports are “promiscuous”. They can communicate with all the isolated PVLAN ports and community PVLAN ports in the isolated and community VLANs that are mapped to the promiscuous port.
- Isolated – Broadcasts and unknown unicasts received on isolated ports are sent only to the promiscuous ports and switch – switch ports. They are not flooded to other ports in the isolated VLAN.

NOTE

On ICX 6430 and ICX 6450 devices, however, private VLANs will act as a normal VLAN and will flood unknown destinations, broadcast and multicast traffic to all ports in the VLAN if the primary VLAN does not have the PVLAN mapping that defines the uplink port for the isolated VLAN.

- Community – Broadcasts and unknown unicasts received on community ports are sent to the primary port and also are flooded to the other ports in the community VLAN.

Each PVLAN must have a primary VLAN. The primary VLAN is the interface between the secured ports and the rest of the network. The PVLAN can have any combination of community and isolated VLANs.

As with regular VLANs, PVLANS can span multiple switches. The PVLAN is treated like any other VLAN by the PVLAN-trunk ports. The PVLAN-trunk port is added to both the primary and the secondary VLANs as a tagged member through the **pvlan-trunk** command. [Figure 91](#) shows an example of a PVLAN network across switches:

- Broadcast, unknown unicast or unregistered multicast traffic from the primary VLAN port is forwarded to all ports in isolated and community VLANs in both the switches.
- Broadcast, unknown unicast or unregistered multicast traffic from an isolated port in switch A is not forwarded to an isolated port in switch A. It will not be forwarded to an isolated port in switch B across the PVLAN-trunk port.
- Broadcast, unknown unicast or unregistered multicast traffic from a community port in switch A will be forwarded to a community port in switch B through the PVLAN-trunk port. It is forwarded to the promiscuous ports and switch – switch ports of the primary VLAN.

FIGURE 91 PVLAN across switches

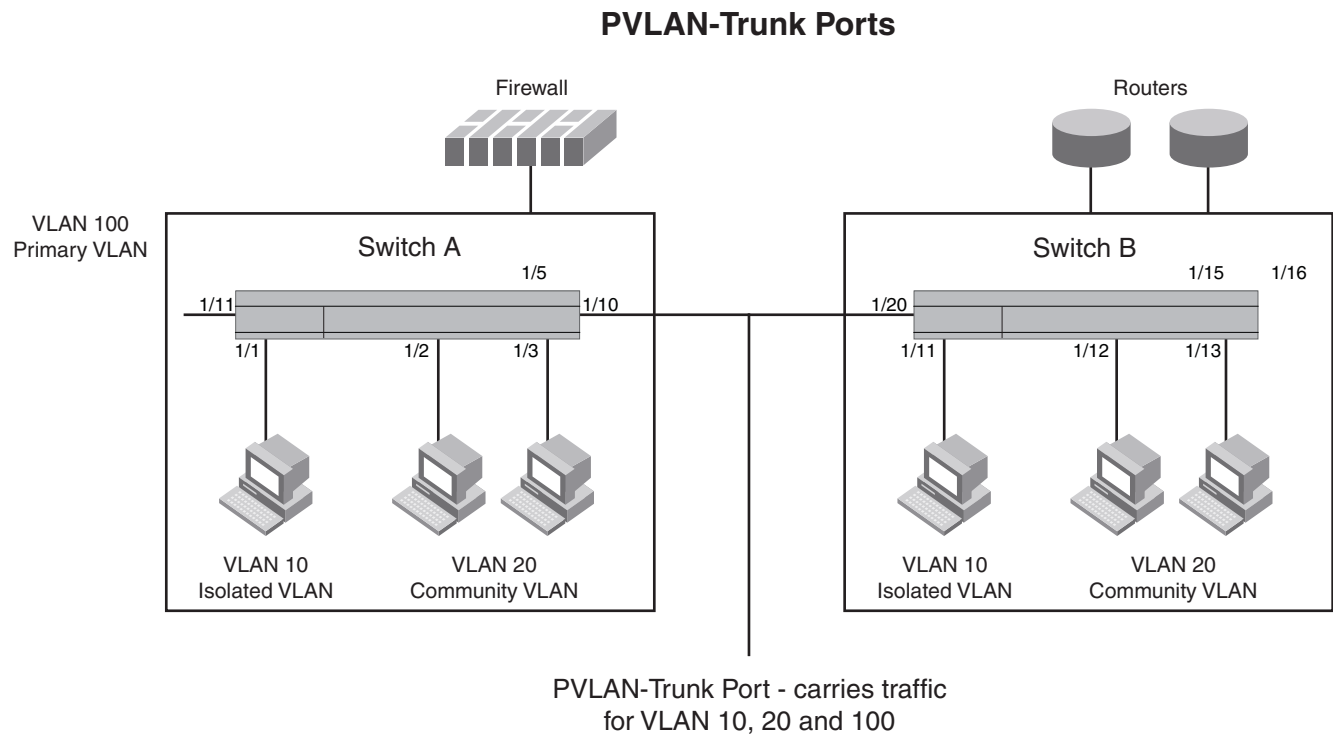

Figure 92 shows an example PVLAN network with tagged switch-switch link ports.

FIGURE 92 Example PVLAN network with tagged ports

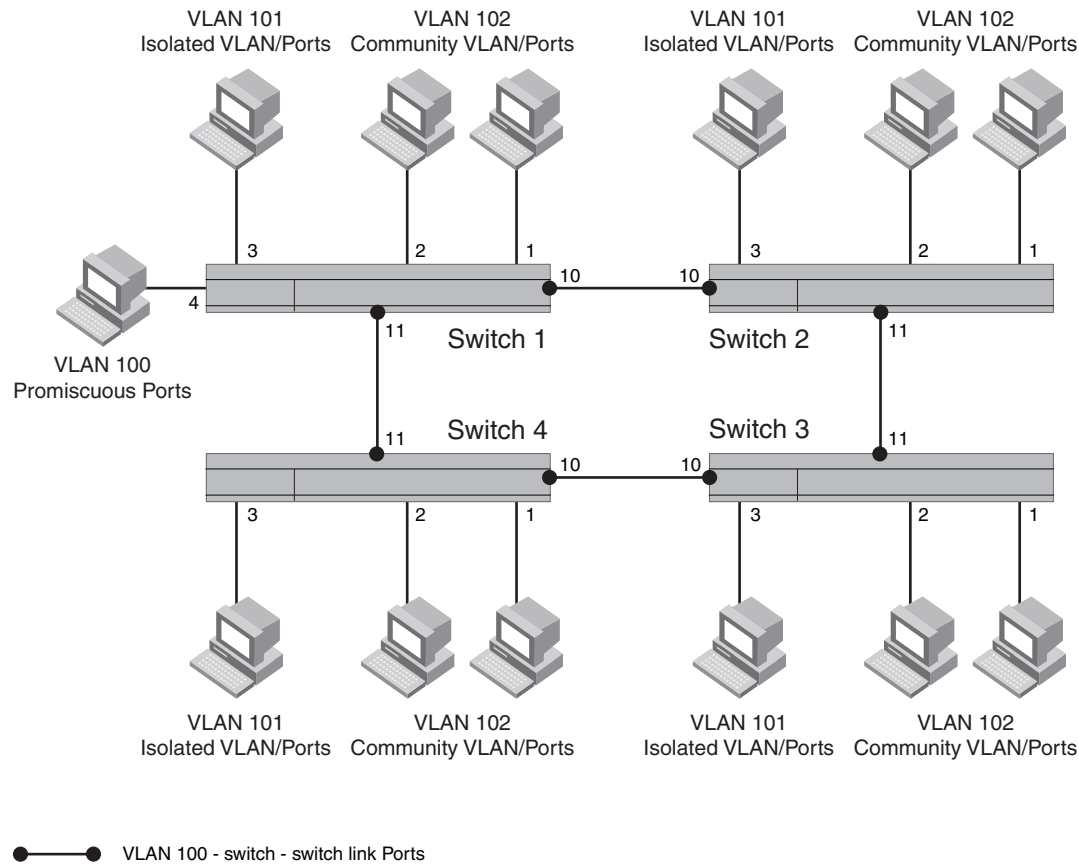

Table 142 lists the differences between PVLANS and standard VLANs.

TABLE 142 Comparison of PVLANS and standard port-based VLANs

Forwarding behavior	Private VLANs	Standard VLANs
All ports within a VLAN constitute a common layer broadcast domain	No	Yes
Broadcasts and unknown unicasts are forwarded to all the VLAN ports by default	No (isolated VLAN) Yes (community VLAN)	Yes
Known unicasts	Yes	Yes

Configuration notes for PVLANS and standard VLANs

- PVLANS are supported on untagged ports on all FastIron platforms. PVLANS are also supported on tagged ports on the FCX platform only.
- Normally, in any port-based VLAN, the Brocade device floods unknown unicast, unregistered multicast, and broadcast packets in hardware, although selective packets, such as IGMP, may be sent only to the CPU for analysis, based on the IGMP snooping configuration. When protocol or subnet VLANs are enabled, or if PVLAN mappings are enabled, the Brocade device will flood unknown unicast, unregistered multicast, and broadcast packets in software. The flooding of broadcast or unknown unicast from the community or isolated VLANs to other secondary VLANs will be governed by the PVLAN forwarding rules. The switching is done in hardware and thus the CPU does not enforce packet restrictions. The hardware forwarding behavior is supported on the FCX and Turbolron platforms only.
- There is currently no support for IGMP snooping within PVLANS. In order for clients in PVLANS to receive multicast traffic, IGMP snooping must be disabled so that all multicast packets are treated as unregistered packets and are flooded in software to all the ports.
- The FastIron forwards all known unicast traffic in hardware. This differs from the way the BigIron implements PVLANS, in that the BigIron uses the CPU to forward packets on the primary VLAN "promiscuous" port. In addition, on the BigIron, support for the hardware forwarding sometimes results in multiple MAC address entries for the same MAC address in the device MAC address table. On the FastIron, multiple MAC entries do not appear in the MAC address table because the FastIron transparently manages multiple MAC entries in hardware.
- To configure a PVLAN, configure each of the component VLANs (isolated, community, and public) as a separate port-based VLAN:
 - Use standard VLAN configuration commands to create the VLAN and add ports.
 - Identify the PVLAN type (isolated, community, or public)
 - For the primary VLAN, map the other PVLANS to the ports in the primary VLAN
- A primary VLAN can have multiple ports. All these ports are active, but the ports that will be used depends on the PVLAN mappings. Also, secondary VLANs (isolated and community VLANs) can be mapped to multiple primary VLAN ports.
- You can configure PVLANS and dual-mode VLAN ports on the same device. However, the dual-mode VLAN ports cannot be members of PVLANS.
- VLAN identifiers configured as part of a PVLAN (primary, isolated, or community) should be consistent across the switched network. The same VLAN identifiers cannot be configured as a normal VLAN or a part of any other PVLAN.
- Promiscuous and switch-switch link ports are member ports of the primary VLAN only. All switch-switch link ports are tagged ports.
- Member ports of isolated and community VLANs cannot be member ports of any other VLAN.
- All member ports that are part of the PVLAN (isolated or secondary) will perform VLAN classification based on the PVLAN ID (PVID) only (no VLAN classification by port, protocol, ACL and so on, if any).
- PVST, when needed in PVLANS, should be enabled on all (primary and secondary) private VLANs.

Configuring the primary VLAN

To configure a primary VLAN, enter commands such as the following.

```
Brocade(config)# vlan 7
Brocade(config-vlan-7)# untagged ethernet 3/2
Brocade(config-vlan-7)# pvlan type primary
Brocade(config-vlan-7)# pvlan mapping 901 ethernet 3/2
```

These commands create port-based VLAN 7, add port 3/2 as an untagged port, identify the VLAN as the primary VLAN in a PVLAN, and map the other secondary VLANs to the ports in this VLAN.

To map the secondary VLANs to the primary VLAN and to configure the tagged switch link port, enter commands such as the following.

```
Brocade(config)# vlan 100
Brocade(config-vlan-100)# tagged ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# untagged ethernet 1/1/4
Brocade(config-vlan-100)# pvlan type primary
Brocade(config-vlan-100)# pvlan mapping 101 ethernet 1/1/4
Brocade(config-vlan-100)# pvlan mapping 102 ethernet 1/1/4
Brocade(config-vlan-100)# pvlan pvlan-trunk 101 ethernet 1/1/10 to 1/1/11
```

These commands create port-based VLAN 100, add port 1/1/10 to 1/1/11 as a tagged port, identify the VLAN as the primary VLAN in a PVLAN, map the other secondary VLANs to the ports in this VLAN, and configure the tagged switch link port.

Syntax: **untagged ethernet** [<stack-unit>/<slotnum>/]<portnum> [**to** [<stack-unit>/<slotnum>/]<portnum> | **ethernet** [<stack-unit>/<slotnum>/]<portnum>]

or

Syntax: **tagged ethernet** [<stack-unit>/<slotnum>/]<portnum> [**to** [<stack-unit>/<slotnum>/]<portnum> | **ethernet** [<stack-unit>/<slotnum>/]<portnum>]

Syntax: [**no**] **pvlan type community** | **isolated** | **primary**

Syntax: [**no**] **pvlan mapping** <vlan-id> **ethernet** [<stack-unit>/<slotnum>/]<portnum>

Syntax: [**no**] **pvlan pvlan-trunk** <vlan-id> **ethernet** [<stack-unit>/<slotnum>/]<portnum> [**to** [<stack-unit>/<slotnum>/]<portnum>]

The **untagged** or **tagged** command adds the ports to the VLAN.

The **pvlan type** command specifies that this port-based VLAN is a PVLAN. Specify **primary** as the type.

The **pvlan mapping** command identifies the other PVLANS for which this VLAN is the primary. The command also specifies the primary VLAN ports to which you are mapping the other secondary VLANs. The mapping command is not allowed on the secondary VLANs. The parameters of the **pvlan mapping** command are as follows:

- The <vlan-id> parameter specifies another PVLAN. The other PVLAN you want to specify must already be configured.
- The **ethernet** <portnum> parameter specifies the primary VLAN port to which you are mapping all the ports in the other PVLAN (the one specified by <vlan-id>).

The **pvlan pvlan-trunk** command identifies the switch-switch link for the PVLAN. There can be more than one switch-switch link for a single community VLAN.

Configuring an isolated or community PVLAN

You can use the **pvlan type** command to configure the PVLAN as an isolated or community PVLAN. The following are some configuration considerations to be noted for configuring isolated and community PVLANs.

Isolated VLANs

- A port being added to the isolated VLAN can be either a tagged port or an untagged port.
- A member port of an isolated VLAN classifies a frame based on PVID only.
- An isolated port (member of an isolated VLAN) communicates only with the promiscuous port, if a promiscuous port is configured.
- An isolated VLAN must be associated with the primary VLAN for traffic from the isolated port to be switched. An isolated VLAN is associated with only one primary VLAN and to the same primary VLAN in the entire switched network.
- An isolated port communicates only with the configured switch-switch link port if there are no promiscuous ports configured for the isolated VLAN.
- A primary VLAN is associated with only one isolated VLAN. An isolated VLAN can only be mapped to a promiscuous port and a switch-switch link port that belong to the same primary VLAN.
- Link Aggregation Group (LAG) ports are not allowed as member ports of an isolated VLAN.

Community VLANs

- A port being added to the community VLAN can be either a tagged port or an untagged port.
- A member port of a community VLAN classifies a frame based on PVID only.
- A community VLAN is associated with only one primary VLAN and to the same primary VLAN in the entire switched network. A primary VLAN is associated with multiple community VLANs.
- A community VLAN must be associated with the primary VLAN for traffic from the community port to be switched.
- LAG ports are not allowed as member ports of a community VLAN.

To configure a community PVLAN, enter commands such as the following.

```
Brocade(config)# vlan 901
Brocade(config-vlan-901)# untagged ethernet 3/5 to 3/6
Brocade(config-vlan-901)# pvlan type community
```

These commands create port-based VLAN 901, add ports 3/5 and 3/6 to the VLAN as untagged ports, then specify that the VLAN is a community PVLAN.

Syntax: **untagged ethernet** [<slotnum>/]<portnum> [**to** [<slotnum>/]<portnum> | **ethernet** [<slotnum>/]<portnum>]

or

Syntax: **tagged ethernet** [<slotnum>/]<portnum> [**to** [<slotnum>/]<portnum> | **ethernet** [<slotnum>/]<portnum>]

Syntax: [**no**] **pvlan type community | isolated | primary**

The **untagged ethernet** or **tagged ethernet** command adds the ports to the VLAN.

The **pvlan type** command specifies that this port-based VLAN is a PVLAN and can be of the following types:

- **community** – Broadcasts and unknown unicasts received on community ports are sent to the primary port and also are flooded to the other ports in the community VLAN.
- **isolated** – Broadcasts and unknown unicasts received on isolated ports are sent only to the primary port. They are not flooded to other ports in the isolated VLAN.
- **primary** – The primary PVLAN ports are “promiscuous”. They can communicate with all the isolated PVLAN ports and community PVLAN ports in the isolated and community VLANs that are mapped to the promiscuous port.

Changing from one PVLAN type to another (for example, from primary to community or vice versa) is allowed but the mapping will be removed.

Enabling broadcast or unknown unicast traffic to the PVLAN

To enhance PVLAN security, the primary PVLAN does not forward broadcast or unknown unicast packets to its community and isolated VLANs, and other ports in the primary VLAN. For example, if port 3/2 in [Figure 90](#) on page 809 receives a broadcast packet from the firewall, the port does not forward the packet to the other PVLAN ports (3/5, 3/6, 3/9, and 3/10).

This forwarding restriction does not apply to traffic from the PVLAN. The primary port does forward broadcast and unknown unicast packets that are received from the isolated and community VLANs. For example, if the host on port 3/9 sends an unknown unicast packet, port 3/2 forwards the packet to the firewall.

If you want to remove the forwarding restriction, you can enable the primary port to forward broadcast or unknown unicast traffic, if desired, using the following CLI method. You can enable or disable forwarding of broadcast or unknown unicast packets separately.

NOTE

On Layer 2 switches and Layer 3 switches, you also can use MAC address filters to control the traffic forwarded into and out of the PVLAN. In addition, if you are using a Layer 2 switch, you also can use ACLs.

NOTE

FCX devices do not support ACLs on interface groups.

CLI example for a general PVLAN network

To configure the PVLANs shown in [Figure 90](#) on page 809, enter the following commands.

```
Brocade(config)# vlan 901
Brocade(config-vlan-901)# untagged ethernet 3/5 to 3/6
Brocade(config-vlan-901)# pvlan type community
Brocade(config-vlan-901)# exit
Brocade(config)# vlan 902
Brocade(config-vlan-902)# untagged ethernet 3/9 to 3/10
Brocade(config-vlan-902)# pvlan type isolated
Brocade(config-vlan-902)# exit
Brocade(config)# vlan 903
Brocade(config-vlan-903)# untagged ethernet 3/7 to 3/8
```

```

Brocade(config-vlan-903)# pvlan type community
Brocade(config-vlan-903)# exit
Brocade(config)# vlan 7
Brocade(config-vlan-7)# untagged ethernet 3/2
Brocade(config-vlan-7)# pvlan type primary
Brocade(config-vlan-7)# pvlan mapping 901 ethernet 3/2
Brocade(config-vlan-7)# pvlan mapping 902 ethernet 3/2
Brocade(config-vlan-7)# pvlan mapping 903 ethernet 3/2

```

CLI example for a PVLAN network with switch-switch link ports

To configure the PVLANs with tagged switch-switch link ports as shown in [Figure 92](#) on page 812, enter the following commands.

FCX Switch 1

```

Brocade(config)# vlan 101 by port
Brocade(config-vlan-101)# untagged ethernet 1/1/3
Brocade(config-vlan-101)# pvlan type isolated

Brocade(config)# vlan 102 by port
Brocade(config-vlan-102)# untagged ethernet 1/1/1 to 1/1/2
Brocade(config-vlan-102)# pvlan type community

Brocade(config)# vlan 100 by port
Brocade(config-vlan-100)# tagged ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# untagged ethernet 1/1/4
Brocade(config-vlan-100)# pvlan type primary
Brocade(config-vlan-100)# pvlan mapping 101 ethernet 1/1/4
Brocade(config-vlan-100)# pvlan mapping 102 ethernet 1/1/4
Brocade(config-vlan-100)# pvlan pvlan-trunk 101 ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# pvlan pvlan-trunk 102 ethernet 1/1/10 to 1/1/11

```

FCX Switch 2

```

Brocade(config)# vlan 101 by port
Brocade(config-vlan-101)# untagged ethernet 1/1/3
Brocade(config-vlan-101)# pvlan type isolated

Brocade(config)# vlan 102 by port
Brocade(config-vlan-102)# untagged ethernet 1/1/1 to 1/1/2
Brocade(config-vlan-102)# pvlan type community

Brocade(config)# vlan 100 by port
Brocade(config-vlan-100)# tagged ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# pvlan type primary
Brocade(config-vlan-100)# pvlan pvlan-trunk 102 ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# pvlan pvlan-trunk 101 ethernet 1/1/10 to 1/1/11

```

FCX Switch 3

```

Brocade(config)# vlan 101 by port
Brocade(config-vlan-101)# untagged ethernet 1/1/3
Brocade(config-vlan-101)# pvlan type isolated

Brocade(config)# vlan 102 by port

```

Dual-mode VLAN ports

```
Brocade(config-vlan-102)# untagged ethernet 1/1/1 to 1/1/2
Brocade(config-vlan-102)# pvlan type community

Brocade(config)# vlan 100 by port
Brocade(config-vlan-100)# tagged ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# pvlan type primary
Brocade(config-vlan-100)# pvlan pvlan-trunk 102 ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# pvlan pvlan-trunk 101 ethernet 1/1/10 to 1/1/11
```

FCX Switch 4

```
Brocade(config)# vlan 101 by port
Brocade(config-vlan-101)# untagged ethernet 1/1/3
Brocade(config-vlan-101)# pvlan type isolated

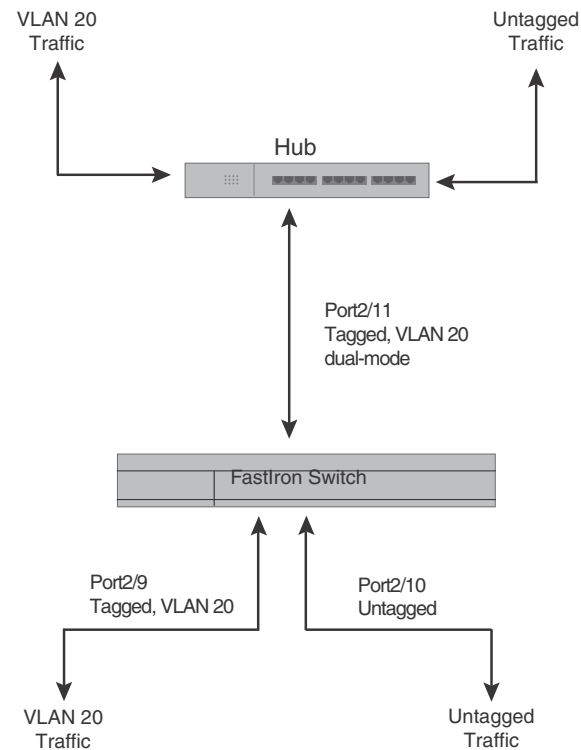

Brocade(config)# vlan 102 by port
Brocade(config-vlan-102)# untagged ethernet 1/1/1 to 1/1/2
Brocade(config-vlan-102)# pvlan type community
Brocade(config)# vlan 100 by port
Brocade(config-vlan-100)# tagged ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# pvlan type primary
Brocade(config-vlan-100)# pvlan pvlan-trunk 102 ethernet 1/1/10 to 1/1/11
Brocade(config-vlan-100)# pvlan pvlan-trunk 101 ethernet 1/1/10 to 1/1/11
```

Dual-mode VLAN ports

Configuring a tagged port as a **dual-mode** port allows it to accept and transmit both tagged traffic and untagged traffic at the same time. A dual-mode port accepts and transmits frames belonging to VLANs configured for the port, as well as frames belonging to the default VLAN (that is, untagged traffic).

For example, in [Figure 93](#), port 2/11 is a dual-mode port belonging to VLAN 20. Traffic for VLAN 20, as well as traffic for the default VLAN, flows from a hub to this port. The dual-mode feature allows traffic for VLAN 20 and untagged traffic to go through the port at the same time.

FIGURE 93 Dual-mode VLAN port example

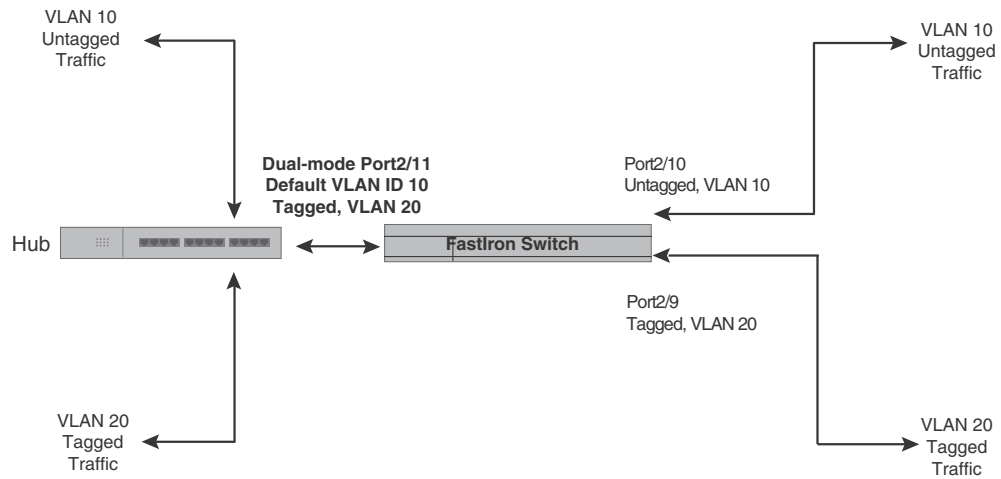

To enable the dual-mode feature on port 2/11 in [Figure 93](#), enter the following commands.

```
Brocade(config)# vlan 20
Brocade(config-vlan-20)# tagged ethernet 2/11
Brocade(config-vlan-20)# tagged ethernet 2/9
Brocade(config-vlan-20)# interface ethernet 2/11
Brocade(config-if-e1000-2/11)# dual-mode
Brocade(config-if-e1000-2/11)# exit
```

Syntax: [no] dual-mode

You can configure a dual-mode port to transmit traffic for a specified VLAN (other than the DEFAULT-VLAN) as untagged, while transmitting traffic for other VLANs as tagged. [Figure 94](#) illustrates this enhancement.

FIGURE 94 Specifying a default VLAN ID for a dual-mode port

In [Figure 94](#), tagged port 2/11 is a dual-mode port belonging to VLANs 10 and 20. The default VLAN assigned to this dual-mode port is 10. This means that the port transmits tagged traffic on VLAN 20 (and all other VLANs to which the port belongs) and transmits untagged traffic on VLAN 10.

The dual-mode feature allows tagged traffic for VLAN 20 and untagged traffic for VLAN 10 to go through port 2/11 at the same time. A dual-mode port transmits only untagged traffic on its default VLAN (that is, either VLAN 1, or a user-specified VLAN ID), and only tagged traffic on all other VLANs.

The following commands configure VLANs 10 and 20 in [Figure 94](#). Tagged port 2/11 is added to VLANs 10 and 20, then designated a dual-mode port whose specified default VLAN is 10. In this configuration, port 2/11 transmits only untagged traffic on VLAN 10 and only tagged traffic on VLAN 20.

```
Brocade(config)# vlan 10 by port
Brocade(config-vlan-10)# untagged ethernet 2/10
Brocade(config-vlan-10)# tagged ethernet 2/11
Brocade(config-vlan-10)# exit
Brocade(config)# vlan 20 by port
Brocade(config-vlan-20)# tagged ethernet 2/9
Brocade(config-vlan-20)# tagged ethernet 2/11
Brocade(config-vlan-20)# exit
Brocade(config)# interface ethernet 2/11
Brocade(config-if-e1000-2/11)# dual-mode 10
Brocade(config-if-e1000-2/11)# exit
```

Syntax: [no] dual-mode [<vlan-id>]

Notes:

- If you do not specify a <vlan-id> in the **dual mode** command, the port default VLAN is set to 1. The port transmits untagged traffic on the DEFAULT-VLAN.
- The dual-mode feature is disabled by default. Only tagged ports can be configured as dual-mode ports.
- In trunk group, either all of the ports must be dual-mode, or none of them can be.

The **show vlan** command displays a separate row for dual-mode ports on each VLAN.

Example

```
Brocade# show vlan
Total PORT-VLAN entries: 3
Maximum PORT-VLAN entries: 16

legend: [S=Slot]

PORT-VLAN 1, Name DEFAULT-VLAN, Priority level0, Spanning tree Off
  Untagged Ports: (S1) 1 2 3 4 5 6 7 8
  Untagged Ports: (S2) 1 2 3 4 5 6 7 8 12 13 14 15 16 17 18 19
  Untagged Ports: (S2) 20 21 22 23 24
  Tagged Ports: None
  Uplink Ports: None
DualMode Ports: None
PORT-VLAN 10, Name [None], Priority level0, Spanning tree Off
  Untagged Ports: (S2) 10
  Tagged Ports: None
  Uplink Ports: None
DualMode Ports: (S2) 11
PORT-VLAN 20, Name [None], Priority level0, Spanning tree Off
  Untagged Ports: None
  Tagged Ports: (S2) 9
  Uplink Ports: None
DualMode Ports: (S2) 11
```

Displaying VLAN information

After you configure the VLANs, you can verify the configuration using the **show** commands described in this section.

NOTE

If a VLAN name begins with "GVRP_VLAN_", the VLAN was created by the GARP VLAN Registration Protocol (GVRP). If a VLAN name begins with "STATIC_VLAN_", the VLAN was created by GVRP and then was converted into a statically configured VLAN.

Displaying VLANs in alphanumeric order

By default, VLANs are displayed in alphanumeric order, as shown in the following example.

```
Brocade# show run
...
vlan 2 by port
...
vlan 10 by port
...
vlan 100 by port
...
```

Displaying system-wide VLAN information

Use the **show vlans** command to display VLAN information for all the VLANs configured on the device.

The following example shows the display for the IP subnet and IPX network VLANs configured in the examples in [“Configuring an IP subnet VLAN with dynamic ports”](#) on page 785 and [“Configuring an IPX network VLAN with dynamic ports”](#) on page 785.

```
Brocade# show vlans
Total PORT-VLAN entries: 2
Maximum PORT-VLAN entries: 8
legend: [S=Slot]

PORT-VLAN 1, Name DEFAULT-VLAN, Priority level0, Spanning tree Off
  Untagged Ports: (S2) 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
  Untagged Ports: (S2) 17 18 19 20 21 22 23 24
  Untagged Ports: (S4) 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
  Untagged Ports: (S4) 17 18 19 20 21 22 23 24
  Tagged Ports: None

PORT-VLAN 10, Name IP_VLAN, Priority level0, Spanning tree Off
  Untagged Ports: (S1) 1 2 3 4 5 6
  Tagged Ports: None

IP-subnet VLAN 1.1.1.0 255.255.255.0, Dynamic port enabled
  Name: Mktg-LAN
  Static ports: None
  Exclude ports: None
  Dynamic ports: (S1) 1 2 3 4 5 6
PORT-VLAN 20, Name IPX_VLAN, Priority level0, Spanning tree Off
  Untagged Ports: (S2) 1 2 3 4 5 6
  Tagged Ports: None

IPX-network VLAN 0000ABCD, frame type ethernet_ii, Dynamic port enabled
  Name: Eng-LAN
  Static ports: None
  Exclude ports: None
  Dynamic ports: (S2) 1 2 3 4 5 6
```

In the **show vlans** output, ports that are tagged but are not dual-mode ports are listed as tagged ports. In the following example display output, ports 7 and 8 are dual-mode ports in port-based VLAN 4. Ports 7 and 8 also belong to port-based VLAN 3, but they are tagged ports only in VLAN 3 and are not configured as dual-mode ports.

```

Brocade# show vlan 4
Total PORT-VLAN entries: 5
Maximum PORT-VLAN entries: 3210
PORT-VLAN 4, Name [None], Priority level0, Spanning tree Off
  Untagged Ports: None
  Tagged Ports:   6   9  10  11
  Uplink Ports: None
  DualMode Ports:  7   8
ESX624FE+2XG Router# show vlan 3
Total PORT-VLAN entries: 5
Maximum PORT-VLAN entries: 3210
PORT-VLAN 3, Name [None], Priority level0, Spanning tree Off
  Untagged Ports: None
  Tagged Ports:   6   7   8   9  10
  Uplink Ports: None
  DualMode Ports: None

```

Syntax: `show vlans [<vlan-id> | ethernet [<slotnum>/]<portnum>]`

The `<vlan-id>` parameter specifies a VLAN for which you want to display the configuration information.

The `<slotnum>` parameter is required on chassis devices.

The `<portnum>` parameter specifies a port. If you use this parameter, the command lists all the VLAN memberships for the port.

Displaying global VLAN information

The **show vlan brief** command displays the following information:

- The system-max VLAN values (maximum, default, and current)
- The default VLAN ID number
- The total number of VLANs configured on the device
- The VLAN ID numbers of the VLANs configured on the device

The following shows example output.

```

Brocade# show vlan brief
System-max vlan Params: Max(4095) Default(64) Current(3210)
Default vlan Id :1
Total Number of Vlan Configured :5
VLANs Configured :1 to 4 10

```

Syntax: `show vlan brief`

Displaying VLAN information for specific ports

Use one of the following methods to display VLAN information for specific ports.

To display VLAN information for all the VLANs of which port 7/1 is a member, enter the following command.

Displaying VLAN information

```
Brocade# show vlans ethernet 7/1
Total PORT-VLAN entries: 3
Maximum PORT-VLAN entries: 8

legend: [S=Slot]

PORT-VLAN 100, Name [None], Priority level0, Spanning tree Off
Untagged Ports: (S7) 1 2 3 4
Tagged Ports: None
```

Syntax: `show vlans [<vlan-id> | ethernet [<slotnum>/]<portnum>]`

The `<vlan-id>` parameter specifies a VLAN for which you want to display the configuration information.

The `<slotnum>` parameter is required on chassis devices.

The `<portnum>` parameter specifies a port. If you use this parameter, the command lists all the VLAN memberships for the port.

Displaying a port VLAN membership

To display VLAN membership for a specific port on the device, enter a command such as the following.

```
Brocade# show vlan brief ethernet 7
Port 7 is a member of 3 VLANs
VLANs 3 to 4 10
```

Syntax: `show vlan brief ethernet [<slotnum>/]<portnum>`

The `<slotnum>` parameter is required on chassis devices.

Displaying a port dual-mode VLAN membership

The output of the **show interfaces** command lists dual-mode configuration and corresponding VLAN numbers. The following shows an example output.

```
Brocade# show interfaces ethernet 7
GigabitEthernet7 is down, line protocol is down
  Hardware is GigabitEthernet, address is 0012.f2a8.4706 (bia 0012.f2a8.4706)
  Configured speed auto, actual unknown, configured duplex fdx, actual unknown
  Configured mdi mode AUTO, actual unknown
  Member of 3 L2 VLANs, port is dual mode in Vlan 4, port state is BLOCKING
```

Syntax: `show interfaces ethernet [<slotnum>/]<portnum> [to [<slotnum>/]<portnum>] [ethernet [<slotnum>/]<portnum>...]`

The `<slotnum>` parameter is required on chassis devices.

Displaying port default VLAN IDs (PVIDs)

The output of the **show interfaces brief** command lists the port default VLAN IDs (PVIDs) for each port. PVIDs are displayed as follows:

- For untagged ports, the PVID is the VLAN ID number.
- For dual-mode ports, the PVID is the dual-mode VLAN ID number.
- For tagged ports without dual-mode, the PVID is always Not Applicable (NA).

```
Brocade# show interfaces brief
Port  Link      State   Dupl Speed Trunk Tag Pvid Pri MAC      Name
1      Up         Forward Full 1G    None No  1   0   0012.f2a8.4700 a12345678901
2      Up         Forward Full 1G    None Yes 1   0   0012.f2a8.4701
3      Up         Forward Full 1G    None Yes NA  0   0012.f2a8.4702
4      Up         Forward Full 1G    None Yes NA  0   0012.f2a8.4703
5      Up         Forward Full 1G    None No  2   0   0012.f2a8.4704
6      Down       None    None None None Yes NA  0   0012.f2a8.4705
7      Down       None    None None None Yes 4   0   0012.f2a8.4706
8      Down       None    None None None Yes 4   0   0012.f2a8.4707
9      Down       None    None None None Yes NA  0   0012.f2a8.4708
10     Down       None    None None None Yes NA  0   0012.f2a8.4709
```

Syntax: **show interfaces brief** [**ethernet** [<slotnum>/]<portnum> [**to** [<slotnum>/]<portnum> [**ethernet** [<slotnum>/]<portnum>...]]]

The <slotnum> parameter is required on chassis devices.

Displaying PVLAN information

To display the PVLAN configuration with respect to the primary VLAN and its associated secondary VLANs and to display the member ports, promiscuous ports, and the switch-switch link ports of a PVLAN, enter a command such as the following.

```
Brocade# show pvlan
PVLAN: primary VLAN 100
Port 1/1/4 1/1/10 1/1/11
Community VLAN 102
Port 1/1/1 1/1/2 1/1/10 1/1/11
Promiscuous Port: 1/1/4
Inter switch link Port: 1/1/10 1/1/11
BpduGuard enabled Port: 1/1/1 1/1/2
Isolate VLAN 101
Port 1/1/3 1/1/10 1/1/11
Promiscuous Port: 1/1/4
Inter switch link Port: 1/1/10 1/1/11
BpduGuard enabled Port: 1/1/1 1/1/2
```

Syntax: **show pvlan** <vid>

The <vid> variable specifies the VLAN ID of the PVLAN. If the VLAN ID is not specified, the command displays the default VLAN ID.

Displaying VLAN information

Multi-Chassis Trunking

Table 143 lists the individual Brocade FastIron switches and the Multi-Chassis Trunking (MCT) features they support.

TABLE 143 Supported MCT features

Feature	FSX 800 FSX 1600 ^a	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
MCT ^b	Yes	No	No	No	No
Cluster client automatic configuration	Yes	No	No	No	No
Cluster operation features	Yes	No	No	No	No
xSTP BPDU forwarding	Yes	No	No	No	No

- a. MCT ICL and CCEP connectivity is supported only on the following FSX 800 and FSX 1600 modules.
 - SX-FI-24GPP, 24-port Gigabit Ethernet copper interface module with PoE+
 - SX-FI-24HF, 24-port Gigabit Ethernet fiber interface module
 - SX-FI-2XG, 2-port 10 Gigabit Ethernet interface module
 - SX-FI-8XG, 8-port 10 Gigabit Ethernet interface module
 - SX-FI-48GPP, 48-port Gigabit Ethernet copper interface module with POE+ (2 slot high, 2:1 oversubscribed)
- b. MCT can operate on an FSX chassis that contains the modules listed in the previous footnote plus legacy modules, provided that CCEP and ICL are configured on the above-mentioned modules. MCT peering is supported only with FSX switches.

Multi-Chassis Trunking Overview

Multi-Chassis Trunking (MCT) is an alternative to spanning tree protocols. Spanning tree is a technology that protects the network against loops by blocking necessary ports, and having the network span to relearn topologies when one link fails in a network. MCT is a technology that allows two FSX switches to cluster together and appear as a single logical device. Trunking is a technology that allows multiple links of a device to appear as one logical link. The combination of MCT and trunking allows for creating a resilient network topology that utilizes all links in the network, creating an ideal network topology for latency sensitive applications.

Standard static or dynamic LACP trunks provide link-level redundancy and increased capacity. However, trunks do not provide device-level redundancy. If the device to which the trunk is attached fails, the entire trunk loses network connectivity. Two devices are needed for network resiliency with trunked links to both devices. With spanning tree, one of these trunks would be blocked from use until the failure of the other trunk is detected, taking from 1 to 30 seconds potentially adding latency and jitter, not only on the affected devices locally, but through-out the span topology. With MCT, member links of the trunk are split and connected to two clustered FSX chassis. MCT has integrated loop detections allowing all links to be active. If a failure is detected, traffic is dynamically allocated across the remaining links with the failure detection and allocation of traffic occurring in sub-second time without impacting the rest of the network.

MCT inherits all of the benefits of a trunk group by providing multiple physical links to act as a single logical link. The new available bandwidth is an aggregate of all the links in the group. The traffic is shared across the links in the group using dynamic flow-based load balancing and traffic is moved to a remaining link group in sub-seconds in the event of a failure in one of the links. MCT eliminates the single point of failure that exists at a device level when all links of a trunk terminate on the same device without the overhead associated with spanning tree. MCT diverts a subset of the links to a second device to provide redundancy and sub-second fault detection at the device level.

How MCT works

Figure 95 shows a basic MCT configuration. The MCT initiates at a single MCT-unaware server or switch and terminates at two MCT-aware devices.

FIGURE 95 How MCT works

The MCT process involves the following processes:

- Sub-second failover occurs in the event of a link, module, switch fabric, control plane, or device failure.
- Sub-second failover operates at the physical level.
- Layer 2 and Layer 3 forwarding (when using fast path forwarding) is done at the first hop regardless of VRRP-E state.
- Load balancing is flow-based (does not involve VLANs sharing across network links).
- Resiliency is supported regardless of the traffic type (Layer 3, Layer 2 or non-IP legacy protocols).
- Interaction with Metro Ring Protocol (MRP) builds larger resilient Layer 2 domains.
- Device level redundancy is provided in addition to link and modular redundancy.
- Traffic received from an ICL port is not forwarded to the Cluster Client Edge Ports (CCEPs) if the MCT peer device has the reach ability to the same cluster client.

- Traffic received from non-ICL ports is forwarded the same way as non-MCT devices.
- Known unicast, multicast, and broadcast traffic received on Cluster Edge Ports (CEP) or ICL ports is forwarded to the destination port.
- For unknown unicast, multicast, and broadcast traffic received on ICL ports, the forwarding behavior depends on the peer MCT device's ability to reach the same client.
- Unknown unicast, multicast, and broadcast traffic received from CCEP is forwarded as usual, with the default behavior to flood the entire VLAN.

MCT terminology

- MCT cluster: A pair of devices (switches) that is clustered together using MCT to appear as a single logical device. The devices are connected as peers through an Inter-Chassis Link (ICL).
- MCT cluster device: One of the two devices in an MCT cluster.
- MCT peer device: From the perspective of an MCT cluster device, the other device in the MCT cluster.
- MCT cluster client: A device that connects with MCT cluster devices through static or dynamic trunks. It can be a switch or an endpoint server host in the single-level MCT topology or another pair of MCT devices in a multi-tier MCT topology.
- Inter-Chassis Link (ICL): A single-port or multi-port 1 GbE or 10 GbE interface between the two MCT cluster devices. It provides the control path for CCP for the cluster and also serves as the data path between the two devices.
- MCT VLANs: VLANs on which MCT cluster clients are operating. Any VLAN that has an ICL port is an MCT VLAN, even though it does not have any clients.
- MCT session VLANs: The VLAN used by the MCT cluster for control operations. CCP protocol runs over this VLAN. The interface can be a single link or a trunk group port. If it is a trunk group port, it should be the primary port of the trunk group. The MCT session VLAN subnet is not distributed in routing protocols using redistribute commands.
- MCT keep-alive VLAN: The VLAN that provides a backup control path in the event that ICL goes down.
- Cluster Communication Protocol (CCP): A Brocade proprietary protocol that provides reliable, point-to-point transport to synchronize information between MCT cluster devices. It is the default MCT control path between the two peer devices. CCP comprises two main components: CCP peer management and CCP client management. CCP peer management deals with establishing, and maintaining a TCP transport session between peers, while CCP client management provides event-based, reliable packet transport to CCP peers.
- Cluster Client Edge Port (CCEP): A physical port or trunk group interface on an MCT cluster device that is connected to client devices.
- Cluster Edge Port (CEP): A port on an MCT cluster device that belongs to the MCT VLAN and connects to an upstream core switch/router, but is neither a CCEP nor an ICL.
- RBridgeID: RBridgeID is a value assigned to MCT cluster devices and clients to uniquely identify them, and helps in associating the source MAC address with an MCT device.

MCT data flow

MCT can be deployed in a single-level configuration involving two MCT cluster devices or in a cascading configuration with a pair of MCT cluster devices operating as switches and another pair operating as routers. Refer to “[Single-level MCT example](#)” on page 867 for a single-level illustration and configuration example, and “[Two-level MCT example](#)” on page 871 for a two-level or cascading configuration example.

Basic MCT data flow works as follows.

Broadcast, unknown unicast, and multicast (BUM) traffic from a client through a CCEP

1. Traffic originates at the client.
2. Because the link between the client switch and the MCT cluster is a trunk, the traffic travels over one physical link. In the example in [Figure 96](#), the traffic travels over the link towards cluster device 2. The traffic enters the MCT cluster through the CCEP of cluster device 2.
3. The traffic is sent to any local CEPs and CCEPs. It passes to the peer cluster device over the ICL link, where it is sent to the peer device's local CEPs.
4. Traffic does not pass back down to the client through the CCEP.

Refer to [Figure 96](#).

FIGURE 96 MCT data flow - BUM traffic from CCEP

Unicast traffic from a client through a CCEP to a CEP

1. Traffic originates at the client.
2. Because the link between the client switch and the MCT cluster is a trunk, the traffic travels over one physical link. In the example in [Figure 97](#), the traffic travels over the link towards cluster device 2. The traffic enters the MCT cluster through the CCEP of cluster device 2.
3. Depending on the destination, the traffic may pass over the ICL link to the other cluster device. In the example in [Figure 97](#), the destination is on cluster device 1, so the traffic is forwarded out to the ICL port.
4. The traffic passes out to the destination.

Refer to [Figure 97](#).

FIGURE 97 MCT data flow - unicast traffic from CCEP

Broadcast, unknown unicast, and multicast (BUM) traffic from a client through a CEP

1. Traffic originates at the client and enters one of the MCT cluster devices through a CEP.
2. The traffic is sent to the peer cluster device through the ICL link and also sent to any local CCEPs and CEPs. Once traffic is received on the peer cluster device, it will be sent to its local CEPs.
3. Traffic does not pass back down to the client through the CCEP.

Refer to [Figure 98](#).

FIGURE 98 MCT data flow - BUM traffic from a CEP

Unicast traffic from a client through a CEP to another CEP or a CCEP

1. Traffic originates at the client and enters one of the cluster devices through the CEP.
2. Depending on the destination, the traffic may pass over the ICL link to the other cluster device or sent to a local CCEP.
3. The traffic passes out to the destination.

Refer to [Figure 97](#).

FIGURE 99 MCT data flow - unicast traffic from a CEP

Port failure on the cluster device

1. A CCEP on the cluster device that received the unicast or BUM traffic fails.
2. The traffic is automatically redirected to the other MCT cluster device over the ICL and on to its destinations through CCEPs.

Refer to [Figure 100](#).

FIGURE 100 MCT data flow with port failure

**MCT and VLANs**

MCT relies on the following VLAN types:

- Session VLAN: Provides the control channel for CCP. Brocade recommends keeping only ICL ports in the session VLAN. A virtual interface is required to be configured on the session VLAN for the router image.
- Keep-alive VLAN: Provides a backup control path if the ICL goes down (optional, but strongly recommended).
- MCT VLAN: Serves the customer data traffic. An ICL must belong to every MCT VLAN to provide a data path between two cluster devices. When an ICL is added to a VLAN, it becomes an MCT VLAN.

Cluster client automatic configuration

Client configuration includes setting the client name, client RBridgeID (unique identification for each client), client interface (CCEP), and deployment settings on both MCT cluster devices. With up to 150 clients per cluster, manual configuration can take a considerable amount of time.

Cluster client automatic configuration saves the time that would be required to complete the entire configuration manually.

The following limitations apply to cluster client automatic configuration:

- Cluster client automatic configuration is designed for generating new clients, not for updating an existing client.
- A single client span across multiple devices is not supported (cascading MCT). For example, the configuration of cascading MCT through cluster client automatic configuration is not supported.
- Multiple clients on the same device are not supported.
- LACP client interface auto-detection is supported only for devices running release 7.4 software and later on FastIron platforms.
- RBridgeID collision: When hash collisions occur, cluster client automatic configuration reports errors, and manual intervention is required.

For cluster client automatic configuration to work, the following prerequisites are required on the cluster side:

- The cluster must be configured on both MCT cluster devices.
- An MCT VLAN must be configured on both MCT cluster devices.
- The trunk group configuration must be removed from the client interfaces.
- The client interfaces must be up and operational.

The following prerequisites are required on the client side:

- VLAN and trunk group configuration must be completed.
- Link Level Discovery Protocol (LLDP) must be enabled.

Refer to [“Setting up cluster client automatic configuration”](#) on page 841 for detailed instructions on the cluster client automatic configuration process.

MCT feature interaction

The following FastIron features are supported with MCT. Note that all security features are locally significant and are not synchronized across an MCT cluster.

- LACP on the CCEP.
- VRRP on the CCEP.
- MRP and MRP II, with the restriction that the ICL port cannot be the secondary port of the MRP ring.
- Flooding features (VLAN CPU protection, multicast flooding, and so on) on MCT VLANs.
- Unidirectional Link Detection (UDLD) as independent boxes (configured independently).
- ARP as independent boxes (configured independently).
- STP and RSTP.

- Ingress ACLs on all MCT ports. Egress ACLs are supported only on MCT CEPs or ICL ports. Egress ACLs are not supported on MCT CCEPs.
- QoS and MAC filters and profiles with the same configuration on both cluster devices.
- IPv4 ACLs and rate limits. If the rules are applied on the CCEPs, the same rules must be applied to the CCEP ports on both cluster devices.
- Layer 3 Routing. VE with IP address assignment is supported on CCEPs for VRRP. However, routing protocols are not enabled on CCEPs.
- Static multi-port MAC.
- Port MAC security, multi-port authentication, and 802.1X, only on CEPs.
- Static MAC address configuration. Static MAC addresses are programmed on both local and remote peers as static entries.
- DAI and DHCP snooping for clients connected through CEPs. They must be configured independently on both cluster devices.
 - If the trusted ports are off the CCEP, the **arp inspection trust** or **dhcp snoop trust** command must be used on the CCEPs and ICL ports.
 - DHCP and ARP entries are created on both MCT cluster devices if the flow traverses both the CCEP and ICL.
- Hitless failover. If the failover operation is performed with a cluster configuration, the TCP session is reestablished. The MAC addresses from the cluster peer devices will be revalidated and programmed accordingly.
- Hitless upgrade. If the upgrade operation is performed with a cluster configuration, the TCP session is reestablished. The MAC addresses from the cluster peer devices will be revalidated and programmed accordingly.

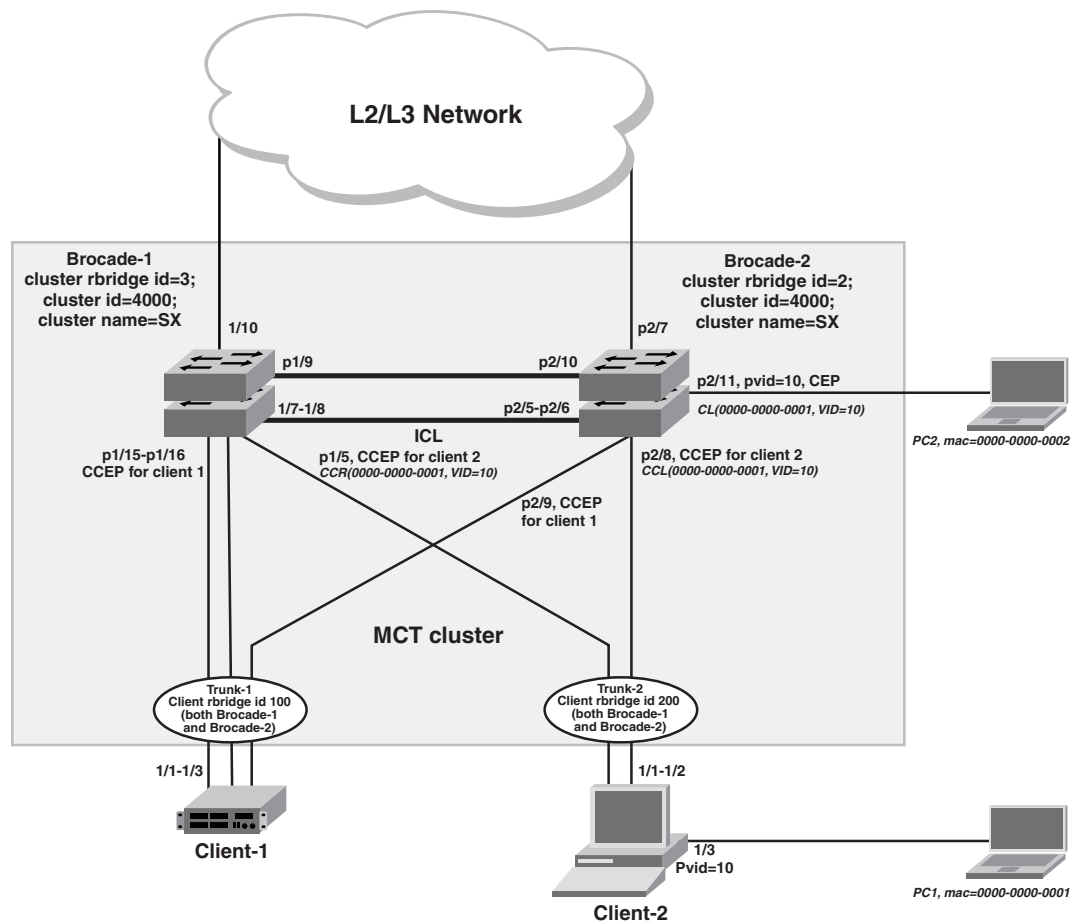

The following FastIron features are not supported with MCT:

- LACP on ICL.
- MSTP, VSRP, RIP, OSPF, IS-IS, and BGP.
- IPv6, VRRP-E (IPv6), and VRRPv3.
- GRE on the ICL VE interfaces.
- DAI on the CCEPs.
- Host security features (port MAC security, multi-port authentication, 802.1X, DAI, DHCP snooping) on CCEPs.
- Multi-port ARP on ICL or CCEPs.
- Web authentication on MCT VLANs.

Basic MCT configuration

This section describes how to set up a basic MCT configuration. [Figure 101](#) shows a basic MCT topology, which applies to Layer 2 and Layer 3. MCT can also be supported with VRRP or VRRP-E. Refer to [“MCT for VRRP or VRRP-E”](#) on page 857.

FIGURE 101 Basic MCT configuration

MCT configuration considerations

- When running STP, the STP state should be the same on both cluster devices. For additional information on running STP with MCT, refer to [“STP/RSTP”](#) on page 850.
- One ICL can be configured per device, and a device can be in only one cluster.
- The software version in both cluster devices must be exactly the same for the cluster to function.
- An ICL port should not be an untagged member of any VLAN. An ICL is preferably a static trunk that provides port level redundancy and higher bandwidth for cluster communication.
- ICL ports must be part of MCT VLANs and session VLANs.

- An ICL cannot be an LACP trunk (must be either a static trunk or single port).
- MAC learning is disabled on ICL ports for all VLANs.
- MDUP synchronizes all MAC entries for VLANs served by an ICL link.
- The cluster ID should be same on both cluster devices.
- The cluster RBridgeID should not conflict with any client RBridgeID or the peer RBridgeID.
- The client RBridgeID is unique and should be the same on the cluster devices.
- Brocade recommends keeping only ICL ports in the session VLAN during operation.
- MCT can support up to 12 members per trunk group.
- An ICL interface cannot be configured as the CCEP in any client.
- BPDU guard and root guard configuration should be identical on both cluster devices.
- As Egress PCL is configured on CCEPs, Egress ACL cannot be configured on them. All types of ingress ACLs, DDOS attacks, and so on can still be configured on those ports.
- Brocade recommends that you configure a keep-alive VLAN as a separate link (not ICL). The keep-alive VLAN provides a backup control path when CCP goes down.

Differences in configuring MCT for the switch and router image

There are some differences in the MCT configuration for the switch image versus the router image:

- On a switch image, STP is by default enabled for all the VLANs; however, for MCT, Layer 2 protocols such as STP and RSTP should not be enabled on the session VLAN. Therefore, STP must be disabled explicitly for the session VLAN. STP is automatically disabled in the router image.
- Virtual Ethernet (VE) cannot be configured on a session VLAN in a switch image, but an IP address is needed for the cluster devices to communicate via CCP. Therefore, in a switch image, the configured management IP address is used to establish communication between the cluster devices.
- The management IP addresses should be configured in each of the cluster devices in the same subnet. If the IP addresses are in different subnets, ARP does not resolve the addresses and MCT may not work. The ARP for the peer cluster devices is always learned on the ICL port or trunk, so any management traffic between the two devices will always go through the ICL ports.

Configuring MCT

This section provides basic configuration steps, which should be completed in the specified order.

Step 1: Configure trunks (if needed)

Step 2: Configure the session VLAN and recommended keep-alive VLAN

Step 3: Configure the cluster

Step 4: Configure clients

After completing these steps, you can verify the configuration by running the **show cluster** command. Refer to [“Displaying peer and client states”](#) on page 860.

Step 1: Configure trunks (if needed)

An ICL is typically a trunk group that provides port level redundancy and higher bandwidth for cluster communication. The ICL can be a single interface or a static trunk. LACP on ICL is not supported.

If needed, configure the ICL trunk as follows on each cluster device (configuration shown for Brocade-1 in [Figure 101](#)).

```
Brocade-1(config)#trunk ethernet 1/15 to 1/16
Brocade-1(config)#trunk deploy
```

On the client side, trunk configuration is required for a static trunk only before assigning interfaces as CCEP. It is not necessary to configure trunks for a single client interface or LACP client interface. If needed, configure client side trunks on each cluster device (configuration shown for Client-1 in [Figure 101](#)).

```
Client-1(config)#trunk ethernet 1/1 to 1/3
Client-1(config)#trunk deploy
```

Step 2: Configure the session VLAN and recommended keep-alive VLAN

To create the session VLAN and recommended keep-alive VLAN for Brocade-1 in the [Figure 101](#) topology, enter the following commands.

```
Brocade-1(config)#vlan 3001 name MCT-keep-alive
Brocade-1(config-vlan-3001)#tagged ethernet 1/9
Brocade-1(config-vlan-3001)#exit
Brocade-1(config)#vlan 3000 name Session-VLAN
Brocade-1(config-vlan-3000)#tagged ether 1/7 to 1/8
Brocade-1(config-vlan-3000)#no spanning-tree
```

For routers, add the following commands.

```
Brocade-1(config-vlan-3000)#router-interface ve 3000
Brocade-1(config)# interface ve 3000
Brocade-1(config-vif-3000)#ip address 1.1.1.3/24
```

For switches, add the following commands.

```
Brocade-1(config)#ip address 1.1.1.3/24
```

To create a session VLAN and keep-alive VLAN for Brocade-2, enter the following commands.

```
Brocade-2(config)#vlan 3001 name MCT-keep-alive
Brocade-2(config-vlan-3001)#tagged ethernet 2/10
Brocade-2(config-vlan-3001)#exit
Brocade-2(config)# vlan 3000 name Session-VLAN
Brocade-2(config-vlan-3000)#tagged ether 2/5 to 2/6
Brocade-2(config-vlan-3000)#no spanning-tree
```

For routers, add the following commands.

```
Brocade-2(config-vlan-3000)#router-interface ve 3000
Brocade-2(config)#interface ve 3000
Brocade-2(config-vif-3000)#ip address 1.1.1.2/24
```

For switches, add the following commands.

```
Brocade-2(config)#ip address 1.1.1.2/24
```

To implicitly configure the session VLAN and add the ICL as a tagged member of the VLAN, enter the following commands.

```
Brocade-1(config)#vlan 1000 name MCT-VLAN-example
Brocade-1(config-vlan-1000)#tagged ether 1/4 to 1/5 e 1/7 to 1/8
```

Step 3: Configure the cluster

Cluster local configuration uses the cluster ID and RBridgeID for the local switch or router.

Syntax: [no] cluster [<cluster-name>] <cluster-id>

Syntax: [no] rbridge-id <id>

Configuration of the peer device involves the peer's IP address, RBridgeID, and ICL specification. The <cluster-name> variable is optional; the device auto-generates the cluster name as CLUSTER-X when only the cluster ID is specified. The <cluster-id> variable must be the same on both cluster devices.

Syntax: [no] peer <peer-ip> rbridge-id <peer-rbridge> icl <map-icl>

The RBridgeID must be different from the cluster RBridge and any other client in the cluster. The MCT member VLAN is defined as any VLAN of which the ICL is a member.

To configure Brocade-1 for the cluster in the [Figure 101](#) topology, enter the following commands.

```
Brocade-1(config)#cluster SX 4000
Brocade-1(config-cluster-SX)#rbridge-id 3
Brocade-1(config-cluster-SX)#session-vlan 3000
Brocade-1(config-cluster-SX)#keep-alive-vlan 3001
Brocade-1(config-cluster-SX)#icl SX-MCT ethernet 1/7
Brocade-1(config-cluster-SX)#peer 1.1.1.2 rbridge-id 2 icl SX-MCT
Brocade-1(config-cluster-SX)#deploy
```

To configure Brocade-2 for the cluster in the [Figure 101](#) topology, enter the following commands.

```
Brocade-2(config)# cluster SX 4000
Brocade-2(config-cluster-SX)#rbridge-id 2
Brocade-2(config-cluster-SX)#session-vlan 3000
Brocade-2(config-cluster-SX)#keep-alive-vlan 3001
Brocade-2(config-cluster-SX)#icl SX-MCT ethernet 2/5
Brocade-2(config-cluster-SX)#peer 1.1.1.3 rbridge-id 3 icl SX-MCT
Brocade-2(config-cluster-SX)#deploy
```

Step 4: Configure clients

This section describes how to configure clients manually. For instructions on automatic client configuration, refer to [“Setting up cluster client automatic configuration”](#) on page 841.

Client configuration requires the client name, RBridgeID, and CCEP. In the network shown in [Figure 101](#), Client-1 has a three-port LACP trunk (1/1-1/3), while Client-2 has a two-port static trunk (1/1-1/2) towards the MCT cluster.

The client name can be different on the different cluster devices. To configure the client name, enter the following command.

Syntax: [no] client <client-name>

The client RBridgeID must be identical on both of the cluster devices. To configure the client RBridgeID, use the following command.

Syntax: `[no] rbridge-id <id>`

To configure the physical port or static trunk as the client CCEP, use the following command.

Syntax: `[no] client-interface ethernet <slot/port>`

To configure the LACP client CCEP port (you must specify all LACP ports with this command), use the following command.

Syntax: `client-interface link-aggregation ethernet <slot/port> to <slot/port>`

When LACP is automatically enabled on the specified client interfaces, it operates in active mode with the LACP long timeout mode by default.

To change the mode for link aggregation, enter the following command.

Syntax: `[no] client-interface link-aggregation <passive>`

To change the timeout mode for link aggregation, enter the following command.

Syntax: `[no] client-interface link-aggregation <timeout-short>`

To configure Client-1 on Brocade-1 in the [Figure 101](#) topology, enter the following command.

```
Brocade-1(config-cluster-SX)# client client-1
Brocade-1(config-cluster-SX-client-1)#rbridge-id 100
Brocade-1(config-cluster-SX-client-1)#client-interface link-aggregation ether
1/15 to 1/16
Brocade-1(config-cluster-SX-client-1)#deploy
```

To configure Client-1 on Brocade-2 in the [Figure 101](#) topology, enter the following command.

```
Brocade-2(config-cluster-SX)# client client-1
Brocade-2(config-cluster-SX-client-2)#rbridge-id 100
Brocade-2(config-cluster-SX-client-2)#client-interface link-aggregation ether 2/9
Brocade-2(config-cluster-SX-client-2)#deploy
```

To configure Client-2 on Brocade-1 in the [Figure 101](#) topology, enter the following command.

```
Brocade-1(config-cluster-SX)# client client-2
Brocade-1(config-cluster-SX-client-1)#rbridge-id 200
Brocade-1(config-cluster-SX-client-1)#client-interface ether 1/5
Brocade-1(config-cluster-SX-client-1)#deploy
```

To configure Client-2 on Brocade-2 in the [Figure 101](#) topology, enter the following command.

```
Brocade-2(config-cluster-SX)# client client-2
Brocade-2(config-cluster-SX-client-2)#rbridge-id 200
Brocade-2(config-cluster-SX-client-2)#client-interface ether 2/8
Brocade-2(config-cluster-SX-client-2)#deploy
```

Setting up cluster client automatic configuration

Complete the following steps to configure cluster client automatic configuration.

1. Enable the client auto-detect ports on both MCT devices.

```
Brocade-1(config-cluster-SX)#client-auto-detect ethernet 1/15-1/16
```

In the port list, specify all the CCEPs for all potential clients.

2. Start the client auto-detect process on both cluster devices.

```
Brocade-1(config-cluster-SX)#client-auto-detect start
```

Within one minute, the system reports information and errors (if there are mismatches such as an LACP configuration mismatch). You can fix the mismatch while the process is running.

3. Check and fix the automatically detected clients.

```
Brocade-1(config-cluster-SX)#show cluster cluster-SX client-auto-detect
cluster cluster-SX 4000
  rbridge-id 3
  session-vlan 3000
  icl SX-MCT ethernet 1/7
peer 1.1.1.2 rbridge-id 2 icl SX-MCT
client-auto-config ethe 8/1 to 8/2 ethe 8/5 ethe 8/7 eth 8/9
  client-auto-config start
deploy
  client AUTO-FCX624-Router002438769e00
  rbridge-id 3593
  client-interface link-aggregation ethe 8/1 to 8/2 ethe 8/5
  client AUTO-FCX624-Switch008738766700
  rbridge-id 2468
  client-interface static-trunk ethe 8/7 ethe 8/9
!
```

NOTE

At this point, the client configuration does not appear in the running configuration and cannot be modified. Static trunk and LACP configuration are not effective yet.

4. Configure automatically detected clients into the running configuration.

```
Brocade-1(config-cluster-SX)#client-auto-detect config
```

All automatically configured client information is now published into the running configuration and the static trunk configuration will be generated, created, and deployed. LACP will start. By default, clients are in the non-deployed state and the CCEPs will be put into the disable state. Ports that are successfully programmed as CCEP will be removed from the autoconfig-enabled port list. If the port list is empty, which means all ports are configured into clients successfully, the automatic configuration process will be stopped. The original LLDP configuration will be restored. Otherwise, the automatic configuration process will continue only on the ports still left in the list.

Other cluster client automatic configuration commands

You can use the following commands as an alternative to the step-by-step procedure in [“Cluster client automatic configuration”](#) on page 835.

Use the following command to enable or disable cluster client automatic configuration on a range of ports.

Syntax: [no] client-auto-detect Ethernet <x> [to <y>]

Use the following command as an alternate to **client-auto-detect config**. This command also configures automatically detected clients into the running configuration and deploys all of the automatically detected clients.

Syntax: client-auto-detect config deploy-all

Use the following command to start the cluster client automatic configuration. Within one minute of the time that each client is discovered, the client is automatically configured and deployed into the running configuration.

Make sure that the network connection and configuration are in place before using this command.

Syntax: `client-auto-detect start` [config-deploy-all]

Use the following command to stop the current running cluster client automatic configuration process. All auto-detected but unconfigured clients will be cleared.

Syntax: `client-auto-detect stop`

MCT failover scenarios

The following scenarios describe what happens if specific elements in the MCT configuration fail.

- Client interface on one of the MCT cluster devices goes down.
Traffic switches to the other cluster device with minimal traffic loss.
- MCT cluster device goes down.
When an MCT cluster device goes down (for example, due to a power failure), the traffic will fail over to the other MCT cluster device.
- Hitless failover occurs.
The MCT CCEPs stay up during hitless switchover, failover, or upgrade. Link protocols such as UDLD and LACP on CCEPs do not flap. Traffic disruption is minimal (sub-second). The MCT CCP connection will flap once, and MAC is re-synced between the peer devices.
The CCP will go down and come back up again once the hitless failover is completed.
- ICL interface or CCP goes down (keep-alive configured)
If a keep-alive VLAN is used, the devices in the cluster can communicate even if the ICL goes down. If the peer device is reachable over the keep-alive VLAN, the MCT peers perform the master/slave negotiation per client. After negotiation, the slave shuts down its client ports, and the master client ports continue to forward the traffic.

The master/slave negotiation is performed per MCT client on the basis of RBridgeID and client Local or Remote reachability. If the client is reachable from both MCT devices, the higher RBridgeID becomes the master. If the client is reachable from one of the MCT devices only, then the cluster device on which it is reachable becomes the master.

If the peer device is not reachable over the keep-alive VLAN, then both cluster devices will keep forwarding.

NOTE

Brocade recommends using keep-alive VLANs with the MCT configurations. This will provide an alternative reachability if the ICL interface goes down. However, a keep-alive VLAN should not be configured when **bpdu-flood-enable** is configured. Refer to [“BPDU forwarding”](#) on page 850.

- ICL interface or CCP goes down (keep-alive not configured)
When the keep-alive VLAN is not configured, both cluster devices will keep forwarding. Use the **client-isolation strict** command to remove the client interface as soon as the ICL link goes down and completely isolates the client.

- Double failures (for example, when the ICL goes down and the client interface goes down on one of the MCT cluster devices)

Multiple failures could drop traffic in this scenario, even if there is a physical path available.

Cluster failover mode

The following failover modes can be configured with MCT:

- Fast-failover (default) - As soon as the ICL interface goes down the CCP goes down. All the remote MAC addresses are flushed.
- Slow-failover - Even if the ICL interface goes down, the CCP waits for the hold-time before taking the CCP down. Remote MAC addresses are flushed only when the CCP is down.

To disable the fast-failover mode, enter a command such as the following.

```
Brocade-1(config-cluster-SX)#peer 1.1.1.3 disable-fast-failover
```

Syntax: [no] peer <peer-ip> disable-fast-failover

Client isolation mode

NOTE

The CLI will allow modification of the client isolation mode on MCT cluster devices even when the cluster is deployed. You must create the same isolation mode on both cluster devices.

MCT cluster devices can operate in two modes. Both peer devices should be configured in the same mode.

Loose mode (default): When the CCP goes down, the peer device performs the master/slave negotiation. After negotiation, the slave shuts down its peer ports, whereas the master peer ports continue to forward the traffic (keep-alive VLAN configured).

If the keep-alive VLAN is not configured, both peer devices become master and both of the client ports stay up.

```
Brocade-1(config-cluster-SX)#client-isolation loose
```

Strict mode: When the CCP goes down, the interfaces on both the cluster devices are administratively shut down. In this mode, the client is completely isolated from the network if the CCP is not operational.

```
Brocade-1(config-cluster-SX)#client-isolation strict
```

Syntax: [no] client-isolation <loose | strict>

Shutting down all client interfaces

Use the **client-interfaces shutdown** command when performing a hitless upgrade operation. This command can be used to shut down all the local client interfaces in the cluster. This would result in failover of traffic to the peer device.

```
Brocade-1(config-cluster-SX)#client-interfaces shutdown
```

Syntax: [no] client-interfaces shutdown

Using the keep-alive VLAN

CCRR messages are used to exchange information between peer devices. When the CCP is up, CCRR messages are sent over the CCP. When the CCP client reachability is down, you can use the **keep-alive-vlan** command under the cluster context so CCRR messages are periodically sent over the keep-alive VLAN. Only one VLAN can be configured as a keep-alive VLAN. The keep-alive VLAN cannot be a member VLAN of the MCT and this VLAN can be tagged or untagged.

NOTE

Keep-alive VLAN configuration is not allowed when the client isolation mode is strict, and when the keep-alive VLAN is configured, client isolation mode cannot be configured as strict.

```
Brocade-1(config-cluster-SX)#keep-alive-vlan 10
```

Syntax: **[no] keep-alive-vlan** <vlan-id>

The <vlan_id> variable specifies the VLAN range. Possible values are from 1 to 4089.

When the CCP is down, the following results occur.

- If the keep-alive VLAN is configured, then CCRR messages are sent every second over that VLAN.
- When CCP is down and the keep-alive VLAN is configured, master/slave selection is based on following criteria:
 - If one device's CCEPs are up and the peer's CCEPs are down, then the peer with the local CCEPs down becomes the slave.
 - Otherwise, the device with the higher RBridgeID becomes the slave.
- If no packets are received from the peer device for a period of three seconds, then the peer is considered down.
- If the keep-alive VLAN is not configured and both the peer devices are up, then both peers keep forwarding the traffic independently.

Setting keep-alive timers and hold-time

To specify the keep-alive timers and hold time for the peer devices, enter a command such as the following.

```
Brocade-1(config-cluster-SX)# peer 1.1.1.3 timers keep-alive 40 hold-time 120
```

Syntax: **[no] peer** <peer-ip> **timers keep-alive** <keep-alive time> **hold-time** <hold-time>

The <peer-ip> parameter should be in the same subnet as the cluster management interface.

The <keep-alive time> variable can be from 0 to 21845. The default is 10 seconds.

The <hold-time> variable can be from 3 to 65535 and must be at least 3 times the keep-alive time. The default is 90 seconds.

NOTE

The keep-alive VLAN and keep-alive timers are not related. The keep-alive timer is used by CCP.

Layer 2 behavior with MCT

This section describes the Layer 2 behavior when MCT is configured.

MAC operations

This section describes MAC address-related configuration operations.

MAC Database Update

The MAC addresses that are learned locally are given the highest priority or the cost of 0 so they are always selected as the best MAC address.

Each MAC address is advertised with a cost. Low cost MAC addresses are given preference over high cost addresses.

If a MAC address moves from a CCEP port to a CEP port, a MAC move message is sent to the peer and the peer moves the MAC address from its CCEP ports to the ICL links.

If the cost of a MAC address is the same, then the address learned from the Lower RBridgeID wins and is installed in the FDB.

MAC addresses in MCT VLANs are updated across the cluster using MDUP messages.

Cluster MAC types

Cluster Local MAC (CL): MAC addresses that are learned on the MCT VLAN and on CEPs locally. MAC addresses are synchronized to the cluster peer device and are subject to aging.

Cluster Remote MAC (CR): MAC addresses that are learned via MDUP messages from the peer device (CL on the peer). The MAC addresses are always programmed on the ICL port and do not age. They are deleted only when it is deleted from the peer. A MDB entry is created for these MAC addresses with a cost of 1, and associated with the peer RBridgeID.

Cluster Client Local MAC (CCL): MAC addresses that are learned on the MCT VLAN and on CCEPs.

The MAC addresses are synchronized to the cluster peer device and are subject to aging. A MDB entry is created for these addresses with a cost of 0 and are associated with the client and cluster RBridgeIDs.

Cluster Client Remote MAC (CCR): MAC addresses that are learned via MDUP message from the peer device (CCL on the peer). The MAC addresses are always programmed on the corresponding CCEP port and do not age. They are deleted only when it is deleted from the peer. A MDB entry is created for the MAC addresses with the cost of 1, and are associated with the client and peer RBridgeIDs.

Cluster Multi-Destination Local MAC (CML): A static MAC entry is configured locally on the MCT VLAN. Any static MAC address configured on MCT VLAN will have ICL added by default so it will automatically become a multi-destination MAC entry. The local configuration generates a local MDB, any CML entry can still have up to 2 MDBs associated with, one local and one remote. The remote MDB comes with the remote static configuration for the same (MAC, VLAN). If the dynamic MAC and static configuration co-exist, the dynamic MAC address will be removed whether it is locally learnt or learned from MDUP. The port list of a CML entry has a ICL port, the client ports from the client list in the local and remote (if exists) configuration, and all locally configured CEP ports.

Cluster Multi-Destination Remote MAC (CMR): A static MAC entry is configured on MCT VLAN on the peer side and there is no associated local configuration. The CMR entry has only the remote MDB. The port list of a CMR entry has an ICL port, and all the client ports from the client list in the remote configuration. When there is local configuration for the same entry, the CMR is converted to CML.

MAC aging

Only the local MAC entries are aged on a cluster device. The remote MAC address entries are aged based on explicit MDUP messages only.

The remote MAC addresses learned through MDUP messages are dynamic addresses with the exception that they never age from FDB.

MAC flush

If the CEP is down, the MAC addresses are flushed and individual MAC deletion messages are sent to the peer device.

If the CCEP local port is down, the MAC addresses are flushed locally and individual MAC deletion messages are sent to the peer device.

If the **clear mac** command is given, all the MDB and FDB are rebuilt.

If the **clear mac vlan** command is given, all the local MDB and FDB are rebuilt for that VLAN.

MAC movement happens normally on the local device.

CEP to CCEP MAC movement – MAC movement normally happens on the local device, and deletes all the other MDBs from the peer to create a new local MDB.

MAC show commands

To display all the cluster local MAC address entries for a cluster, use the **show mac cluster** command.

```
Brocade#show mac cluster 1000
Total Cluster Enabled(CL+CR+CCL+CCR) MACs: 1
Total Cluster Local(CL) MACs: 1
CCL: Cluster Client Local CCR:Cluster Client Remote CL:Local CR:Remote
Total active entries from all ports = 1
Total static entries from all ports = 3
MAC-Address      Port      Type      Index  MCT-Type  VLAN
1111.2222.3333   8/1       Static    4254    CML       20
1111.2222.3333   8/3       Static    4254    CML       20
1111.2222.3333   8/13      Static    4254    CML       20
```

Syntax: **show mac** [**cluster** <id> | <name> <local> | <remote>]

MAC clear commands

To clear all MAC addresses in the system, enter the following command.

```
Brocade#clear mac
```

Syntax: **clear mac**

Clearing cluster-specific MAC addresses

To clear cluster-specific MAC addresses in the system, enter a command such as the following.

```
Brocade#clear mac cluster AGG-1 local
```

Syntax: clear mac cluster <cluster-id> | <cluster-name> { local | remote }

Clearing client-specific MAC addresses

To clear client-specific MAC addresses in the system, enter a command such as the following.

```
Brocade#clear mac cluster AGG-1 client 1 local
```

Syntax: clear mac cluster <cluster-id> | <cluster-name> client <client-name> { local | remote }

Clearing VLAN-specific MAC addresses

To clear VLAN-specific MAC addresses in the system, enter a command such as the following.

```
Brocade#clear mac vlan 2
```

Syntax: clear mac vlan <vlan_id>

Clearing MCT VLAN-specific MAC addresses

To clear MCT VLAN-specific MAC addresses in the system, enter a command such as the following.

```
Brocade#clear mac cluster AGG-1 vlan 1 local
```

Syntax: clear mac cluster <cluster_id> | <cluster-name> vlan <vlan_id> {local | remote}

Clearing cluster client vlan-specific MACs

To clear cluster client-specific MAC addresses in the system, enter a command such as the following.

```
Brocade#clear mac cluster AGG-1 vlan 2 client 1 local
```

Syntax: clear mac cluster <cluster_id> | <cluster-name> vlan <vlan_id> client <client_name> {local | remote}

Displaying MDUP packet statistics

To display the statistics of MDUP packets, enter a command such as the following.

```
Brocade#show mac mdup-stats
MDUP Information
=====
MDUP Data buffers in queue : 0
MDUP Statistics
=====
MDUP Update Messages sent: 7

MDUP Flush Messages received: 0
MDUP Synch Messages received: 0
```

Syntax: show mac mdup-stats

Syncing router MAC addresses to peer MCT devices

The MCT cluster device uses a router MAC address to identify the packets that are addressed to the switch. Such packets may be received by a peer cluster device. The peer device switches packets over the ICL to the local MCT device to be routed properly.

Dynamic trunks

MCT client creates a single dynamic trunk group towards the MCT cluster devices. The dynamic trunk group consists of two trunk groups, each of which is configured on one of the MCT devices. A dynamic trunk group runs Link Aggregation Control Protocol (LACP).

For the two dynamic trunk groups of the MCT to behave as a single trunk group from the MCT client's perspective, both of the dynamic trunk groups should have the same LACP system ID and key, referred to as the MCT system ID and MCT key.

The LACP system ID in the FSX product normally comes from the port MAC address. To support LACP over MCT, it is necessary to obtain the ID in another way. To do so, MCT uses a pre-defined algorithm.

NOTE

Each MCT cluster device has a unique cluster ID, and one MCT client ID. The LACP key is predefined from the client ID and cluster ID. The user cannot change the key.

MCT does not involve stacking, and control protocol synchronization is minimal. The LACP runs independently on the cluster devices.

Port loop detection

Loop detection can be used in an MCT topology to detect Layer 2 loops due to misconfigurations, for example, on the client side when MCT links are not configured as trunk links on the MCT-unaware client.

In MCT, the ICL link should be up at all times to prevent the cluster from going down. They should not be shut down when a loop is detected in a network. Instead other available ports (CCEPs) should be shut down. If loop detection BDPUs are received on the ICL port, then instead of shutting down the ICL links, all the CCEPs will be error-disabled and the user will be notified with the following log message.

```
Loop-detection:Packet received on ICL port <port_number> for vlan
<vlan_id>.Errdisable CCEPs.
```

Strict mode loop detection can be enabled on ICL ports. This is because in strict mode, a port is disabled only if a packet is looped back to that same port. Strict mode overcomes specific hardware issues where packets are echoed back to the input port. This process assists in detecting hardware faults on ICL ports.

Loop-detection can be enabled on MCT and non-MCT VLANs simultaneously. There is no change in loop detection behavior when enabled on non-MCT VLANs.

MCT Layer 2 protocols

Keep the following information in mind when configuring Layer 2 protocols with MCT.

MRP

- An ICL interface cannot be configured as an MRP secondary interface or vice versa, because the ICL cannot be BLOCKING.
- MRP cannot be enabled on MCT CCEP port and vice versa.

STP/RSTP

- STP is not recommended to be configured on MCT VLANs at MCT cluster devices. By default, the spanning tree is disabled in the MCT VLANs. If the network topology may be creating Layer 2 loops through external connections, STP could be enabled on switches outside the MCT cluster to prevent the Layer 2 loop. The MCT cluster devices will perform a pass-through forwarding of STP BPDUs received through its ports in the MCT VLAN.
- In rare cases in which the network topology consists of Layer 2 loops outside the MCT cluster that require STP/RSTP to be enabled on MCT VLANs in the cluster, the CCEPs will always be in the spanning tree disabled state.
- The STP/RSTP algorithms have been modified such that ICL never goes to blocking. The ICL guard mechanism ensures that if ICL is going into a blocking state, then the port on which the superior BPDUs are being received is moved to blocking state and the ICL guard timer starts running on it. This timer runs as long as superior BPDUs are received on this interface. As long as this timer runs on an interface, the superior BPDUs are dropped.
- The new BLK_BY_ICL STP state indicates that the superior BPDUs were received on this interface, which could have led to blocking of the ICL interface, with the result that the CL port guard mechanism has been triggered on this port.
- In a 802.1s MSTP deployment, Brocade recommends disabling spanning tree on the MCT cluster devices at the global level. MSTP cannot be configured on individual cluster devices.
- An MCT cluster can support up to 32 spanning tree instances.

BPDU forwarding

If the network deploys single STP or IEEE 802.1s (MSTP), both the MCT cluster devices must be configured using the **bpdu-flood-enable** command to flood the single STP/MSTP BPDUs in the SSTP/MSTP domain (forward to all of the ports in the cluster switch irrespective of VLAN.)

Syntax: [no] **bpdu-flood-enable**

When **bpdu-flood-enable** is configured, there should not be any links other than the ICL (including the keep-alive VLAN link) connecting the two MCT cluster devices. If there is an additional link, then the flooded BPDU will cause a loop and high CPU utilization.

Protocol-based VLANs

Protocol and subnet VLANs can be configured on MCT VLANs, however, ICL and CCEPs cannot be configured as dynamic members of protocol based VLANs (and vice versa). ICL and CCEP can either be excluded or static members of protocol based VLANs. CCEPs can be configured as dynamic or static, or exclude members of protocol based VLANs.

In a cluster, both cluster devices should have exactly same protocol VLAN membership with respect to ICL and CCEP. ICL and CCEPs should be configured with same type of protocol/VLAN membership, although there is no such restriction from the CLI.

Uplink switch

Uplink switch is supported on MCT VLANs. ICLs and CCEPs can be configured as uplink-switch ports. Both cluster devices should have exactly same uplink-switch port memberships with respect to the ICL and CCEPs.

Layer 2 multicast snooping over MCT

To support multicast snooping over MCT, the ICL port is used to synchronize the following information between the cluster devices using MDUP:

- MAC - forward entries (mcache entries on MCT VLAN).
- IGMP/MLD Join/Leave (control packets on MCT VLAN).
- PIM-SM Join/Prune (control packets on MCT VLAN).

IGMP/MLD snooping

Snooping can be configured globally or at the VLAN level. Each cluster device in the MCT VLAN can be configured either as active or passive. There is no restriction for cluster devices to run active-active or passive-passive configuration.

The following commands show configuration commands for the VLAN level (IGMP), VLAN level (MLD), global level (IGMP/MLD), and for PIM-SM.

VLAN level (IGMP)

```
Brocade(config)#vlan 100
Brocade(config-vlan-100)#multicast active/passive
```

VLAN level (MLD)

```
Brocade(config-vlan-100)# mld-snooping active/passive
```

Global Level (IGMP/MLD)

```
Brocade(config)#ip multicast active/passive
Brocade(config)#ipv6 mld-snooping active/passive
```

PIM-SM snooping (configured only on a VLAN and requires IGMP snooping to run in a passive mode):

```
Brocade(config)#vlan 100
Brocade(config-vlan-100)#multicast passive
Brocade(config-vlan-100)# multicast pimsm-snooping
```

IGMP/MLD snooping behavior on MCT cluster devices

- Local information is synchronized to the MCT peer device using CCP. The information includes Mcache/FDB entry (on arrival of data traffic), joins/leaves, dynamic router ports, and PIM-SM snooping joins/prunes.
- Native control packets (joins/leaves) that are received are processed by protocol code, and also forwarded out if required.
- All control/data traffic is received on ICL. The traffic is forwarded out of CCEP only if the remote CCEP is down; otherwise, it is dropped by the egress filters on CCEP.
- ICL is added as OIF by default whenever the CCEP is involved as either source or receiver. This provides faster convergence during MCT failover.
- For IGMP/MLD joins/leaves:
 - The control packets only received on CCEP are synced to the MCT peer using CCP.
 - The control packets received on CEP are not synced to MCT peer using CCP.
- Static groups and static router ports configured on CCEP are not synced across to the MCT peer. For these features to work correctly, they must be manually configured on the respective CCEP of both the cluster nodes.

MCT failover handling for Layer 2 multicast over MCT

The following failover scenarios may occur. Refer to [“MCT failover scenarios”](#) on page 843 for other types of failover scenarios.

- Local CCEP Down EVENT:
 - Outgoing traffic on local CCEP will now go through ICL and out of the remote CCEP.
 - Incoming traffic on local CCEP will now ingress through the remote CCEP, and then ingress through ICL locally.
- Local CCEP Up EVENT:
 - Outgoing traffic on remote CCEP (after egressing through local ICL) will now start going out of local CCEP.
 - Incoming traffic from client through ICL (after ingressing on remote CCEP) will now switch back to local CCEP (this is true only if the client trunk hashing sends the traffic towards local CCEP).
- CCP (Cluster communication protocol) Down EVENT:
 - All related information (i.e. IGMP/MLD group, mcache, dynamic router port, pim-sm snooping entry) that were synced from the peer device will now be marked for aging locally.
- CCP (Cluster communication protocol) Up EVENT:
 - All related information (i.e. IGMP/MLD group, mcache, dynamic router port, pim-sm snooping entry) that were locally learned will be synced to the peer device.

PIM-SM snooping over MCT

- PIM-SM snooping can be configured only on a VLAN. It requires IGMP snooping to be running in passive mode. IPv6 snooping is not supported.
- Router ports can be configured on a VLAN or globally. They can be learned dynamically on the port where the query is received or configured statically.

- Both MCT1 devices must run pimsm-snoop.
- PIM messages are forwarded by way of hardware.
- PIM join/prune is synced to the peer cluster device using CCP.
- PIM prune is processed only if indicated by the peer cluster device.
- PIM join/prune received natively on ICL is ignored.
- PIM hello is not synced, but is received natively on ICL.
- PIM port/source information is refreshed on both cluster devices by syncing PIM messages and ages out if not refreshed.

Forwarding entries for PIM-SM multicast snooping

Table 144 and Table 145 list the forwarding entries for PIM-SM multicast snooping.

TABLE 144 Forwarding entries (*,G)^a

Event	MCT-1	MCT-2
No-Join	(*,G)->blackhole	(*,G)->blackhole
(S,G)Join on (MCT-1)CEP	(*,G)->CEP [s] ^b	(*,G)->ICL [s]
(S,G)Join on (MCT-2)CEP	(*,G)->ICL [s]	(*,G)->CEP [s]
(S,G)Join on (MCT-1)CCEP	(*,G)->CCEP [s], ICL [s]	(*,G)->CCEP [s], ICL [s]
(S,G)Join on (MCT-2)CCEP	(*,G)->CCEP[s], ICL [s]	(*,G)->CCEP [s], ICL [s]

a. *ICL: The ICL port is added as default whenever CCEP is in OIF. The data traffic receiving from ICL port will be filtered out by egress filter (dynamically programmed) on CCEPs.

b. [s]: denotes sources maintained on port hash-list.

TABLE 145 Forwarding entries (S,G)^a

Event	MCT-1	MCT-2
No-Join	(S,G)->blackhole	(S,G)->blackhole
Join (MCT-1)CEP	(S,G)->CEP	(S,G)->ICL
Join (MCT-2)CEP	(S,G)->ICL	(S,G)->CEP
Join (MCT-1)CCEP	(S,G)->CCEP, ICL	(S,G)->CCEP, ICL
Join (MCT-2)CCEP	(S,G)->CCEP, ICL	(S,G)->CCEP, ICL

a. *ICL: The ICL port is added as default whenever CCEP is in OIF. The data traffic receiving from ICL port will be filtered out by egress filter (dynamically programmed) on CCEPs.

Layer 3 behavior with MCT

Table 146 lists the type of Layer 3 support available with MCT. Note that routing protocols are not supported on ICL and CCEPs. At the edge network, it is highly recommended to configure VRRP/VRRP-E when MCT is enabled.

TABLE 146 Layer 3 Feature Support with MCT

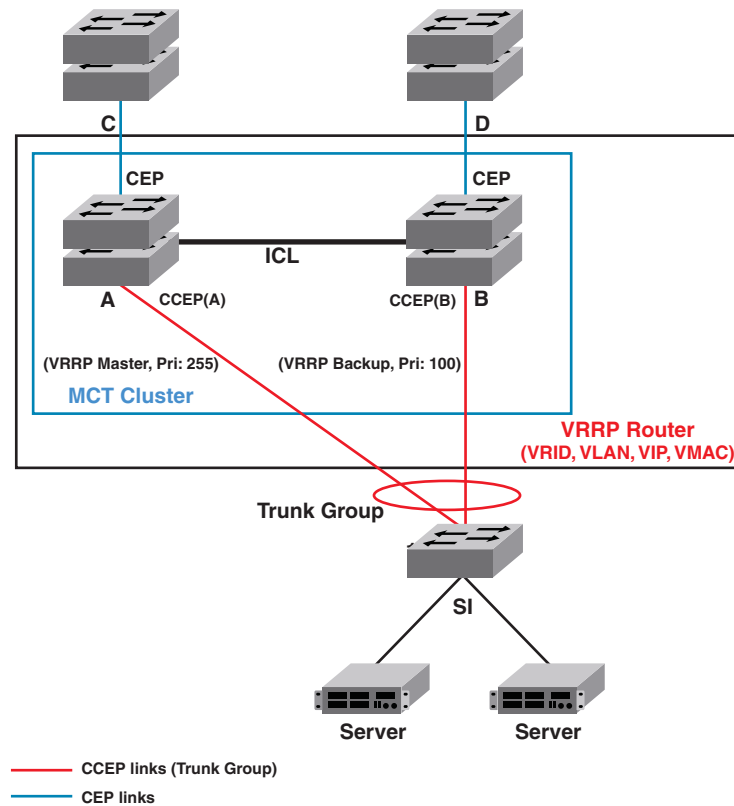

Feature	Sub-feature	Session VLAN VE	Member VLAN VE	Design Philosophy

MCT for VRRP or VRRP-E

A simple MCT topology addresses resiliency and efficient load balancing in Layer 2 network topologies. To interface with a Layer 3 network, MCT is configured with Virtual Router Redundancy Protocol (VRRP) to add redundancy in Layer 3. The standard VRRP mode is master-backup and all traffic is forwarded through the master. In VRRP-E server virtualization, multiple VRRP standby devices are supported and each device can be configured to route to an upstream Layer 3 network. This provides efficient deployment for both Layer 2 and Layer 3 networks.

The MCT device that acts as backup router needs to ensure that packets sent to a VRRP or VRRP-E virtual IP address can be Layer 2-switched to the VRRP-E master router for routing. The VRRP or VRRP-E backup learns the VMAC while processing the VRRP hello message from the VRRP master. Both data traffic and VRRP or VRRP-E control traffic travel through the ICL unless the short-path forwarding feature is enabled (VRRP-E only).

Layer 3 traffic forwarding from CCEPs to CCEPs

Traffic destined to the CCEPs from the client or CEPs follow the normal IP routing on both master and backup devices. By default, the best route should not involve the ICL link. Only when the local CCEP is down will the traffic be re-routed to pass through ICL link.

Layer 3 traffic forwarding from CCEPs to CEPs

For Layer 3 forwarding to work on MCT devices, a dynamic trunk must be configured on the MCT client. VRRP/VRRP-E and VRRP-E2 SPF should be enabled, if required. Routes should be statically configured on the MCT cluster devices for all member VLANs.

If VRRP is deployed or VRRP-E is deployed without the short path forwarding feature on the VRRP-E backup, it is likely that almost 50% (and 100% in the worst case) of CCEP to CEP traffic can pass through the ICL from the backup to the master device. This fact should be considered when designing ICL capacity in the network.

ARP resolution

ARP resolution is initially done through the ICL if the S1 MAC address is not already known on the CCEP at A. When the MDUP message from the cluster peer device moves the S1 MAC from ICL to CCEP, the ARP is also moved.

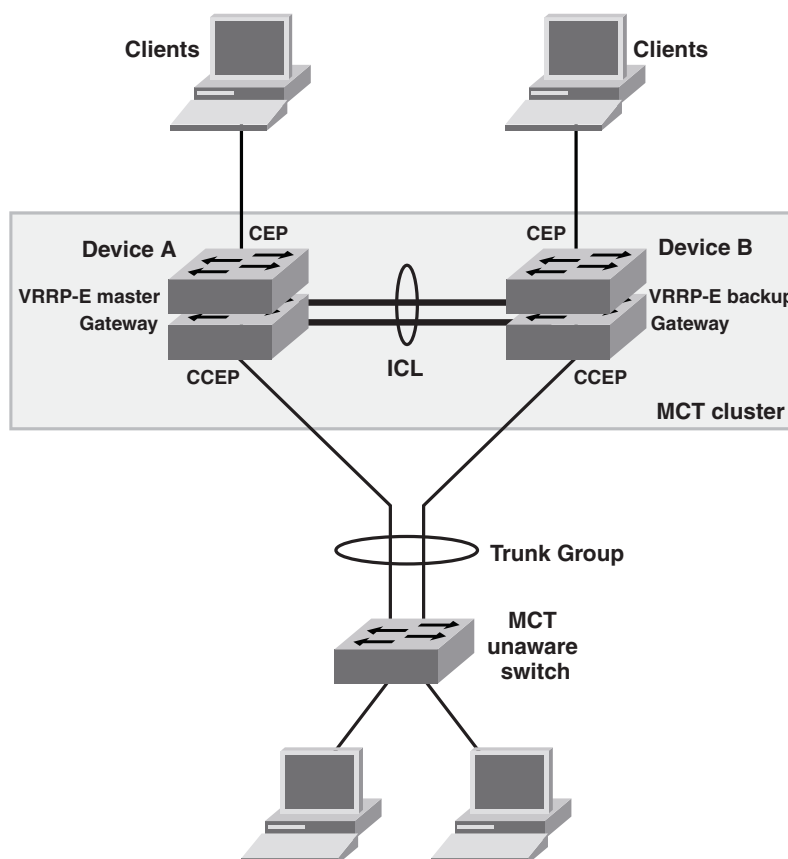

If S1 triggers an ARP request, it generally does so for the default gateway address (virtual IP address if VRRP is deployed). This ARP request can reach A either directly from S1, or through B.

- If the ARP request reaches A directly, it replies through the same port on which it learned S1's MAC address.
- If the request is by way of B, S1's ARP response will be learned on the ICL first, then it will move to the CCEP link when the MDUP message for S1's MAC address is received from B.

VRRP or VRRP-E configuration with MCT

In [Figure 103](#), MCT devices A and B both need to ensure packets sent to VRRP-E virtual IP address can be Layer 2-switched to the VRRP-E master router for routing. Both data traffic and VRRP-E control traffic travel through ICL, unless the short-path forwarding feature is enabled. The VRRP or VRRP-E virtual MAC address will be learned on ICL ports on backup routers through the ICL. The VRRP or VRRP-E master router will broadcast hello packets to all VLAN member ports, including ICL ports.

FIGURE 103 Example of MCT configuration with Layer 2 switching

Configuration considerations

- MCT devices must have complete routing information using static routes for Layer 3 forwarding.

- For MCT devices configured with VRRP or VRRP-E, track-port features can be enabled to track the link status to the core devices so the VRRP or VRRP-E failover can be triggered.
- It is not supported to configure several Layer 3 features on VE of the session VLAN. If already configured, such a VLAN cannot be made the session VLAN.
- It is not supported to configure UC/MC routing protocols and the IP follow feature on VEs of member VLANs. If already configured, such a VLAN cannot be made a member VLAN.
- IPv6 configurations are not supported on VEs of session and member VLANs,
- Route-only ports cannot be used as CCEP and ICL ports.
- Global route-only configuration is mutually exclusive with MCT cluster configuration.
- It is not supported to use MCT management interface IPs for tunnel source.
- It is not supported to configure static and policy based routes using VE on MCT session VLAN.
- Configurations to redistribute connected routes will not advertise IPs on MCT management interface.
- IP addresses on the MCT management interface should not be used for BGP peers on neighboring devices.
- IP addresses on the MCT management interface should not be used for static configurations on neighboring devices.
- The track port feature should be used for VRRP switchover and controlling the validity of SPF feature.
- Up to 64 VRRP or VRRP-E instances are supported on an MCT cluster; however, with Jumbo enabled, a maximum of 32 VRRP or VRRP-E instances is supported on an MCT cluster.

NOTE

Brocade recommends disabling ICMP redirect globally to avoid unintended CPU forwarding of traffic when VRRP or VRRP-E is configured.

Layer 3 traffic forwarding behaviors

When one MCT device acts as a VRRP or VRRP-E master router and the peer device is VRRP or VRRP-E backup, the following behavior will be seen:

- Packets sent to VRRP-E virtual IP address will be Layer 2-switched to the VRRP-E master device for routing.
- The VRRP-E MAC address will be learned by the other MCT device that acts as backup router.
- Both data traffic and VRRP-E control traffic received by the VRRP backup from MCT client will need to travel through ICL unless the short-path forwarding feature is enabled.

When both MCT devices act as the VRRP or VRRP-E backup routers, the following behavior will be seen:

- Packets sent to VRRP-E virtual IP address will be Layer 2-switched to the VRRP-E master router for routing.
- The VRRP-E MAC address will be learned by both MCT devices acting as backup routers.
- Both data traffic and VRRP-E control traffic will travel through the links connecting them to the VRRP master.

VRRP-E short-path forwarding and revertible option

Under the VRRP-E VRID configuration level, use the **short-path-forwarding** command. If the revertible option is not enabled, the default behavior will remain the same. Use the following command to enable short path forwarding.

The **track-port** command will monitor the status of the outgoing port on the backup. It will revert back to standard behavior (no short-path forwarding) temporarily even if short-path forwarding is configured.

```
Brocade(config-if-e1000-vrid-2)#short-path-forwarding revert-priority 60
```

Syntax: [no] **short-path-forwarding** [revert-priority <value>]

Use the supplied priority value as a threshold to determine if the **short-path-forwarding** behavior should be effective or not. If one or more ports tracked by the **track-port** command go down, the current priority of VRRP-E will be lowered by a specific amount configured in the **track-port** command for each port that goes down.

Once the current-priority is lower than the threshold, short path forwarding will be temporarily suspended and revert back to the regular VRRP-E forwarding behavior (non-short path forwarding behavior).

The reverting behavior is only temporary. If one or more of the already down ports tracked by the **track-port** command come back, it is possible that the current priority of VRRP-E will be higher than the threshold again and the **short-path-forwarding** behavior will be resumed.

Displaying MCT information

This section describes the commands available to display information about MCT configuration and operation.

Displaying peer and client states

Use the **show cluster config** command to display the peer device and client states.

```
Brocade#show cluster SXR122 config
cluster SXR122 100
rbridge-id 100
session-vlan 1
keep-alive-vlan 3
icl SXR122-MCT ethernet 1/1
peer 172.17.0.2 rbridge-id 101 icl SXR122-MCT
deploy
client KL134
rbridge-id 14
client-interface ethernet 1/23
deploy
client AGG131
rbridge-id 10
client-interface ethernet 12/2
deploy
client FOX135
rbridge-id 15
client-interface ethernet 1/25
deploy
```

Syntax: `show cluster <cluster-name/cluster-id> config`

Displaying state machine information

Use the **show cluster client** command to display additional state machine information including the reason for Local CCEP down. You can optionally specify an individual cluster and client.

```
Brocade#show cluster 1 client
Cluster 1 1
=====
Rbridge Id: 101, Session Vlan: 3999, Keep-Alive Vlan: 4001
Cluster State: Deploy
Client Isolation Mode: Loose
Configured Member Vlan Range: 100 to 105
Active Member Vlan Range: 100 to 105
MCT Peer's Reachability status using Keep-Alive Vlan: Peer Reachable

Client Info:
-----
Client: c1, rbridge-id: 300, Deployed
Client Port: 3/11
State: Up
Number of times Local CCEP down: 0
Number of times Remote CCEP down: 0
Number of times Remote Client undeployed: 0
Total CCRR packets sent: 4
Total CCRR packets received: 3
```

Syntax: `show cluster <cluster_name/cluster_id> client [<client_name/client_RbridgeID>]`

Table 147 shows the reasons for local CCEP down.

TABLE 147 Reasons for Local CCEP down

Reason for Local CCEP down	Meaning
client-interfaces shutdown	Command is configured.
client-isolation strict	Command is configured.
Deploy mismatch	Client is not deployed remotely.
Slave state	Client is in slave state when CCP is down.
cluster and client undeployed	Neither the cluster nor client is deployed.
cluster undeployed	Cluster is not deployed.
client undeployed	Client is not deployed.

Displaying cluster, peer, and client states

Use the **show cluster ccp peer** command to display cluster, peer device, and client states. You can optionally specify an individual cluster and request additional details.

```
Brocade#show cluster 1 ccp peer
...
PEER IP ADDRESS          STATE          UP TIME
-----
1.1.1.1                  OPERATIONAL    0 days: 2 hr:25 min:16 sec

Brocade (config-cluster-SX_1)# show cluster 1 ccp peer detail
*****Peer Session Details*****
IP address of the peer          1.1.1.1
Rbridge ID of the peer          100
Session state of the peer        OPERATIONAL
Next message ID to be send       287
Keep Alive interval in seconds   30
Hold Time Out in seconds         90
Fast Failover is enable for the session
UP Time                          0 days: 2 hr:22 min:58 sec
Number of tcp packet allocations failed 0
Message      Init      Keepalive  Notify      Application  Badmessages
Send         3         2421     2           53           0
Receive      3         2415     0           37           0
TCP connection is up
TCP connection is initiated by    1.1.1.2
TCP connection tcbHandle not pending
TCP connection packets not received
*****TCP Connection Details*****
TCP Connection state: ESTABLISHED      Maximum segment size: 1436
Local host: 1.1.1.2, Local Port: 12203
Remote host: 1.1.1.1, Remote Port: 4175
ISentSeq: 1867652277 SendNext: 1867660731 TotUnAck: 0
TotSent: 8454 ReTrans: 9 UnAckSeq: 1867660731
IRcvSeq: 3439073167 RcvNext: 3439078415 SendWnd: 16384
TotalRcv: 5248 DupliRcv: 16 RcvWnd: 16384
SendQue: 0 RcvQue: 0 CngstWnd: 1452
```

Syntax: **show cluster** [*<cluster_name/cluster-id>*] **ccp peer** [*detail*]

Displaying information about Ethernet interfaces

Use the **show interface ethernet** command to display information about Ethernet interfaces. The MCT-related information is shown in bold in the following example.

```
Brocade#show interface ethernet 7/1
...
GigabitEthernet7/1 is disabled, line protocol is down
Hardware is GigabitEthernet, address is 0024.3822.8260 (bia 0024.3822.8260)
Configured speed auto, actual unknown, configured duplex fdx, actual unknown
Configured mdi mode AUTO, actual unknown
Member of L2 VLAN ID 1, port is untagged, port state is DISABLED
BPDU guard is Disabled, ROOT protect is Disabled
Link Error Dampening is Disabled
STP configured to ON, priority is level0
Flow Control is config enabled, oper disabled, negotiation disabled
```

```

Mirror disabled, Monitor disabled
Not member of any active trunks
Not member of any configured trunks
No port name
IPG MII 96 bits-time, IPG GMII 96 bits-time
MTU 1500 bytes, encapsulation Ethernet
ICL port for icl1 in cluster id 1

```

```

300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
300 second output rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
0 packets input, 0 bytes, 0 no buffer
Received 0 broadcasts, 0 multicasts, 0 unicasts
0 input errors, 0 CRC, 0 frame, 0 ignored
0 runs, 0 giants
0 packets output, 0 bytes, 0 underruns
Transmitted 0 broadcasts, 0 multicasts, 0 unicasts
0 output errors, 0 collisions
Relay Agent Information option: Disabled

```

```
show interface ethernet 7/3
```

```

GigabitEthernet7/3 is disabled, line protocol is down
Hardware is GigabitEthernet, address is 0024.3822.8262 (bia 0024.3822.8262)
Configured speed auto, actual unknown, configured duplex fdx, actual unknown
Configured mdi mode AUTO, actual unknown
Member of L2 VLAN ID 1, port is untagged, port state is DISABLED
BPDU guard is Disabled, ROOT protect is Disabled
Link Error Dampening is Disabled
STP configured to ON, priority is level0
Flow Control is config enabled, oper disabled, negotiation disabled
Mirror disabled, Monitor disabled
Not member of any active trunks
Not member of any configured trunks
No port name
IPG MII 96 bits-time, IPG GMII 96 bits-time
MTU 1500 bytes, encapsulation Ethernet
CCEP for client c149_150 in cluster id 1

```

```

300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
300 second output rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
0 packets input, 0 bytes, 0 no buffer
Received 0 broadcasts, 0 multicasts, 0 unicasts
0 input errors, 0 CRC, 0 frame, 0 ignored
0 runs, 0 giants
0 packets output, 0 bytes, 0 underruns
Transmitted 0 broadcasts, 0 multicasts, 0 unicasts
0 output errors, 0 collisions
Relay Agent Information option: Disabled

```

Syntax: show interface ethernet <x/y>

Displaying STP information

Use the **show span** command to display STP information for an entire device. The MCT-related information is shown in bold in the following example.

```
Brocade#show span
...
STP instance owned by VLAN 10
Global STP (IEEE 802.1D) Parameters:
```

VLAN ID	Root ID	Root Cost	Root Port	Root Prio	Max He- rity	Ho- Age	Fwd llo	Last ld	Chg dly	Bridge cnt	Address
		Hex	sec	sec	sec	sec	sec				
10	00000012f2aacf84	00243822226e	4	7/15	8000	20	2	1	15	10	1

```
Port STP Parameters:
```

Port Num	Prio	Path rity	State Cost	Fwd	Design Trans	Designated Cost	Designated Root
7/15	80	4	FWD_BY_MCT	1	0	00000012f2aacf84	00000012f2aacf84
7/21	80	4	BLK_BY_ICL	1	4	00000012f2aacf84	800000243822226e
7/23	80	4	FORWARDING	7	4	00000012f2aacf84	800000243822226e

```
STP instance owned by VLAN 15
Global STP (IEEE 802.1D) Parameters:
```

VLAN ID	Root ID	Root Cost	Root Port	Root Prio	Max He- rity	Ho- Age	Fwd llo	Last ld	Chg dly	Bridge cnt	Address
		Hex	sec	sec	sec	sec	sec				
15	00000012f2aacf84	00243822226e	4	7/15	8000	20	2	1	15	10	1

```
Port STP Parameters:
```

Port Num	Prio	Path rity	State Cost	Fwd	Design Trans	Designated Cost	Designated Root
7/15	80	4	BLK_BY_MCT	1	0	00000012f2aacf84	00000012f2aacf84
7/21	80	4	BLK_BY_ICL	1	4	00000012f2aacf84	800000243822226e
7/23	80	4	FORWARDING	7	4	00000012f2aacf84	800000243822226e

Syntax: **show span** [vlan <vlan-id>] | [pvst-mode] | [<num>] | [detail [vlan <vlan-id> [Ethernet [<stack-unit><slotnum>]/<portnum>] | <num>]]

Displaying information for multicast snooping

Use the **show ip multicast pimsm-snooping** command to display port numbers for multicast snooping. Refer to [Figure 107](#) for port numbers. In the example, join is received from CCEP on mct-1 and CEP on mct-2.

(S,G) entry:

```
Brocade# show ip multicast pimsm-snooping
vlan 100, has 1 caches.
1 (11.0.0.2 224.10.10.10) has 2 pim join ports out of 2 OIF
  7/3 (age=10), 7/5 (age=10),
```

```
Brocade# show ip multicast pimsm-snooping
vlan 100, has 1 caches.
1 (11.0.0.2 224.10.10.10) has 3 pim join ports out of 3 OIF
  3/8 (age=0), 3/3 (age=50), 3/7 (age=50),
```

(*G) entry:

```
Brocade# show ip multicast pimsm-snooping
vlan 100, has 1 caches.
1 (* 224.10.10.10) has 2 pim join ports out of 2 OIF
  7/5 (age=10), 7/3 (age=10),
  7/5 has 1 src: 11.0.0.2(10)
  7/3 has 1 src: 11.0.0.2(10)
```

```
Brocade# show ip multicast pimsm-snooping
vlan 100, has 1 caches.
1 (* 224.10.10.10) has 3 pim join ports out of 3 OIF
  3/3 (age=20), 3/7 (age=20), 3/8 (age=20),
  3/3 has 1 src: 11.0.0.2(20)
  3/7 has 1 src: 11.0.0.2(20)
```

Syntax: show ip multicast pimsm-snooping

Use the **show ip multicast cluster** commands to display information about multicast snooping activity.

In the following command, YES indicates that reports/leaves were received by locally (processing native control packets).

```
Brocade(config)#show ip multicast cluster group
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL100 : 1 groups, 1 group-port
group p-port ST QR life mode source local
1 225.1.1.1 e5/5 no no 200 EX 0 YES
2 225.1.1.1 e5/10 no no 200 EX 0 YES
```

In the following command, NO indicates that reports/leaves were received remotely. In this case, a join was received on the CCEP of the MCT peer device. Native control packets were processed by the peer device and then the entries were synched over MDUP to this cluster device.

```
Brocade(config)#show ip multicast cluster group
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL100 : 1 groups, 1 group-port
group p-port ST QR life mode source local
1 225.1.1.1 e1/10 no no 200 EX 0 NO
2 225.1.1.1 e1/10 no no 200 EX 0 NO
```

The following command displays information about the IGMP multicast mcache. It is used to verify if FDB is programmed when a data packet arrives.

```
Brocade(config)#show ip multicast mcache
Example: (S G) cnt=: cnt is number of SW processed packets
OIF: e1/22 TR(e1/32), TR is trunk, e1/32 primary
vlan 100, 1 caches. use 1 VIDX
1 (* 230.1.1.10) cnt=673
```

22 Displaying MCT information

```
OIF: TR(e5/4) tag TR(e5/5)
age=1s up-time=2005s, change=4s vidx=8187 (ref-cnt=1)
```

The following command displays status about the IGMP router port.

```
Brocade(config)#show ip multicast cluster vlan 100
Version=2, Intervals: Query=125, Group Age=260, Max Resp=10, Other Qr=260
VL100: cfg V3, vlan cfg passive, 1 grp, 2 (SG) cache, rtr ports,
router ports: e5/9(260) 100.100.100.1 (local:1, mct peer:0),
e5/4 has 1 groups,
This interface is non-Querier (passive)
default V3 trunk
(local:1, mct peer:0)
```

Syntax: `show ip multicast cluster {group | mcache | vlan <vlan-id>}`

Use the `show ip multicast cluster pimsm-snooping` command to display detailed information about multicast snooping activity.

```
Brocade(config)#show ip multicast cluster pimsm-snooping
Example: Port: 7/3 (age, port type, ref_count, owner flag, pruned flag)
source: 7/3 has 1 src: 11.0.0.5(age, ref_count, owner flag, pruned flag)
owner flag: 0x0: local, 0x1 remote cep, 0x2 remote ccep

vlan 100, has 1 caches.
1 (* 224.10.10.10) has 2 pim join ports out of 2 OIF
7/3 (20, ICL, 1, 0x0, 0), 7/5 (20, CCEP, 1, 0x0, 0),
7/3 has 4 src: 11.0.0.5(20, 1, 0x0, 0), 11.0.0.4(20, 1, 0x0, 0), 11.0.0.3(20, 1,
0x0, 0), ...cut
7/5 has 4 src: 11.0.0.5(20, 1, 0x0, 0), 11.0.0.4(20, 1, 0x0, 0), 11.0.0.3(20, 1,
0x0, 0), ...cut
```

Syntax: `show ip multicast cluster pimsm-snooping [group | vlan]`

The following `show ipv6 mld` commands have output that is similar to the corresponding `show ip multicast` commands.

MLD multicast group commands:

```
Brocade(config)#show ipv6 mld cluster group
```

MLD multicast mcache output:

```
Brocade(config)#show ipv6 mld mcache
```

MLD router port output:

```
Brocade(config)#show ipv6 mld cluster vlan 100
```

Syntax: `show ipv6 mld cluster {group | mcache | vlan <vlan-id>}`

MCT configuration examples

The examples in this section show the topology and configuration for a single-level MCT deployment, two-level MCT deployment, VRRP/VRRP-E, and multicast snooping.

Single-level MCT example

[Table 104](#) shows an example single-level MCT configuration. The associated configuration follows.

FIGURE 104 Single level MCT configuration

Client 1 - Configuration

This section presents the configuration for client 1 in [Table 104](#).

```
!
vlan 1905 by port
  tagged ethe 5/1/47 to 5/1/48 ethe 7/1/1 to 7/1/3 ethe 8/1/1 to 8/1/3 ethe 8/1/45
  spanning-tree
!
!
interface ethernet 7/1/1
  link-aggregate configure timeout short

GVRP

[Table 148](#) lists the individual Brocade FastIron switches and the GARP VLAN Registration Protocol (GVRP) features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 148 Supported GVRP features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
GVRP	Yes	Yes	Yes	Yes	Yes
Configurable GVRP base VLAN ID	Yes	Yes	Yes	Yes	Yes
Leaveall timer	Yes	Yes	Yes	Yes	Yes
Ability to disable VLAN advertising	Yes	Yes	Yes	Yes	Yes
Ability to disable VLAN learning	Yes	Yes	Yes	Yes	Yes
GVRP timers	Yes	Yes	Yes	Yes	Yes
Conversion of a GVRP VLAN to a statically-configured VLAN	Yes	Yes	Yes	Yes	Yes

GVRP overview

GARP VLAN Registration Protocol (GVRP) is a Generic Attribute Registration Protocol (GARP) application that provides VLAN registration service by means of dynamic configuration (registration) and distribution of VLAN membership information.

A Brocade device enabled for GVRP can do the following:

- Learn about VLANs from other Brocade devices and configure those VLANs on the ports that learn about the VLANs. The device listens for GVRP Protocol Data Units (PDUs) from other devices, and implements the VLAN configuration information in the PDUs.
- Advertise VLANs configured on the device to other Brocade devices. The device sends GVRP PDUs advertising its VLANs to other devices. GVRP advertises statically configured VLANs and VLANs learned from other devices through GVRP.

GVRP enables a Brocade device to dynamically create 802.1Q-compliant VLANs on links with other devices that are running GVRP. GVRP reduces the chances for errors in VLAN configuration by automatically providing VLAN ID consistency across the network. You can use GVRP to propagate VLANs to other GVRP-aware devices automatically, without the need to manually configure the VLANs on each device. In addition, if the VLAN configuration on a device changes, GVRP automatically changes the VLAN configurations of the affected devices.

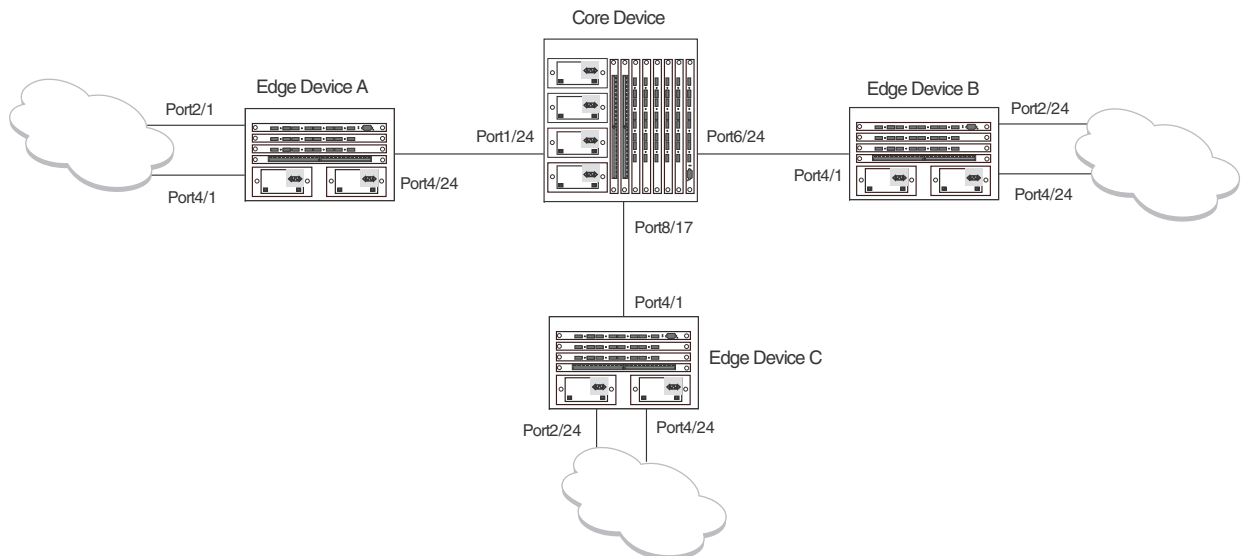

The Brocade implementation of GARP and GVRP is based on the following standards:

- ANSI/IEEE standard 802.1D, 1998 edition
- IEEE standard 802.1Q, 1998 edition; approved December 8, 1998
- IEEE draft P802.1w/D10, March 26, 2001
- IEEE draft P802.1u/D9, November 23, 2000
- IEEE draft P802.1t/D10, November 20, 2000

GVRP application examples

Figure 108 shows an example of a network that uses GVRP. This section describes various ways you can use GVRP in a network such as this one. “GVRP CLI examples” on page 902 lists the CLI commands to implement the applications of GVRP described in this section.

FIGURE 108 Example of GVRP

In this example, a core device is attached to three edge devices. Each of the edge devices is attached to other edge devices or host stations (represented by the clouds).

The effects of GVRP in this network depend on which devices the feature is enabled on, and whether both learning and advertising are enabled. In this type of network (a core device and edge devices), you can have the following four combinations:

- Dynamic core and fixed edge
- Dynamic core and dynamic edge
- Fixed core and dynamic edge
- Fixed core and fixed edge

Dynamic core and fixed edge

In this configuration, all ports on the core device are enabled to learn and advertise VLAN information. The edge devices are configured to advertise their VLAN configurations on the ports connected to the core device. GVRP learning is disabled on the edge devices.

Core device	Edge device A	Edge device B	Edge device C
<ul style="list-style-type: none"> GVRP is enabled on all ports. Both learning and advertising are enabled. <p>NOTE: Since learning is disabled on all the edge devices, advertising on the core device has no effect in this configuration.</p>	<ul style="list-style-type: none"> GVRP is enabled on port 4/24. Learning is disabled. VLAN 20 Port 2/1 (untagged) Port 4/24 (tagged) VLAN 40 Port 4/1 (untagged) Port 4/24 (tagged) 	<ul style="list-style-type: none"> GVRP is enabled on port 4/1. Learning is disabled. VLAN 20 Port 2/24 (untagged) Port 4/1 (tagged) VLAN 30 Port 4/24 (untagged) Port 4/1 (tagged) 	<ul style="list-style-type: none"> GVRP is enabled on port 4/1. Learning is disabled. VLAN 30 Port 2/24 (untagged) Port 4/1 (tagged) VLAN 40 Port 4/24 (untagged) Port 4/1 (tagged)

In this configuration, the edge devices are statically (manually) configured with VLAN information. The core device dynamically configures itself to be a member of each of the edge device VLANs. The operation of GVRP on the core device results in the following VLAN configuration on the device:

- VLAN 20
 - 1/24 (tagged)
 - 6/24 (tagged)
- VLAN 30
 - 6/24 (tagged)
 - 8/17 (tagged)
- VLAN 40
 - 1/24 (tagged)
 - 8/17 (tagged)

VLAN 20 traffic can now travel through the core between edge devices A and B. Likewise, VLAN 30 traffic can travel between B and C and VLAN 40 traffic can travel between A and C. If an edge device is moved to a different core port or the VLAN configuration of an edge device is changed, the core device automatically reconfigures itself to accommodate the change.

Notice that each of the ports in the dynamically created VLANs is tagged. All GVRP VLAN ports configured by GVRP are tagged, to ensure that the port can be configured for additional VLANs.

NOTE

This example assumes that the core device has no static VLANs configured. However, you can have static VLANs on a device that is running GVRP. GVRP can dynamically add other ports to the statically configured VLANs but cannot delete statically configured ports from the VLANs.

Dynamic core and dynamic edge

GVRP is enabled on the core device and on the edge devices. This type of configuration is useful if the devices in the edge clouds are running GVRP and advertise their VLANs to the edge devices. The edge devices learn the VLANs and also advertise them to the core. In this configuration, you do not need to statically configure the VLANs on the edge or core devices, although you can have statically configured VLANs on the devices. The devices learn the VLANs from the devices in the edge clouds.

Fixed core and dynamic edge

GVRP learning is enabled on the edge devices. The VLANs on the core device are statically configured, and the core device is enabled to advertise its VLANs but not to learn VLANs. The edge devices learn the VLANs from the core.

Fixed core and fixed edge

The VLANs are statically configured on the core and edge devices. On each edge device, VLAN advertising is enabled but learning is disabled. GVRP is not enabled on the core device. This configuration enables the devices in the edge clouds to learn the VLANs configured on the edge devices.

VLAN names created by GVRP

The **show vlans** command lists VLANs created by GVRP as “GVRP_VLAN_<vlan-id>”. VLAN names for statically configured VLANs are not affected. To distinguish between statically-configured VLANs that you add to the device and VLANs that you convert from GVRP-configured VLANs into statically-configured VLANs, the **show vlans** command displays a converted VLAN name as “STATIC_VLAN_<vlan-id>”.

Configuration notes for GVRP

- If you disable GVRP, all GVRP configuration information is lost if you save the configuration change (**write memory** command) and then reload the software. However, if you reload the software without first saving the configuration change, the GVRP configuration is restored following a software reload.
- The maximum number of VLANs supported on a device enabled for GVRP is the same as the maximum number on a device that is not enabled for GVRP.
 - To display the maximum number of VLANs allowed on your device, enter the **show default values** command. See the “vlan” row in the System Parameters section. Make sure you allow for the default VLAN (1), the GVRP base VLAN (4093), and the Single STP VLAN (4094). These VLANs are maintained as “Registration Forbidden” in the GVRP database. Registration Forbidden VLANs cannot be advertised or learned by GVRP.
 - To increase the maximum number of VLANs supported on the device, enter the **system-max vlan <num>** command at the global CONFIG level of the CLI, then save the configuration and reload the software. The maximum number you can specify is listed in the Maximum column of the **show default values** display.

- The default VLAN (VLAN 1) is not advertised by the Brocade implementation of GVRP. The default VLAN contains all ports that are not members of statically configured VLANs or VLANs enabled for GVRP.

NOTE

The default VLAN has ID 1 by default. You can change the VLAN ID of the default VLAN, but only before GVRP is enabled. You cannot change the ID of the default VLAN after GVRP is enabled.

- Single STP must be enabled on the device. Brocade implementation of GVRP requires Single STP. If you do not have any statically configured VLANs on the device, you can enable Single STP as follows.

```
Brocade(config)#vlan 1
Brocade(config-vlan-1)#exit
Brocade(config)#span
Brocade(config)#span single
```

These commands enable configuration of the default VLAN (VLAN 1), which contains all the device ports, and enable STP and Single STP.

- All VLANs that are learned dynamically through GVRP are added to the single spanning tree.
- All ports that are enabled for GVRP become tagged members of the GVRP base VLAN (4093). If you need to use this VLAN ID for another VLAN, you can change the GVRP VLAN ID. Refer to [“Changing the GVRP base VLAN ID”](#) on page 888. The software adds the GVRP base VLAN to the single spanning tree.
- All VLAN ports added by GVRP are tagged.
- GVRP is supported only for tagged ports or for untagged ports that are members of the default VLAN. GVRP is not supported for ports that are untagged and are members of a VLAN other than the default VLAN.
- To configure GVRP on a trunk group, enable the protocol on the primary port in the trunk group. The GVRP configuration of the primary port is automatically applied to the other ports in the trunk group.
- You can use GVRP on a device even if the device has statically configured VLANs. GVRP does not remove any ports from the statically configured VLANs, although GVRP can add ports to the VLANs. GVRP advertises the statically configured VLANs. Ports added by GVRP do not appear in the running-config and will not appear in the startup-config file when save the configuration. You can manually add a port to make the port a permanent member of the VLAN. After you manually add the port, the port will appear in the running-config and be saved to the startup-config file when you save the configuration.
- VLANs created by GVRP do not support virtual routing interfaces or protocol-based VLANs. virtual routing interfaces and protocol-based VLANs are still supported on statically configured VLANs even if GVRP adds ports to those VLANs.
- You cannot manually configure any parameters on a VLAN that is created by GVRP. For example, you cannot change STP parameters for the VLAN.
- The GVRP timers (Join, Leave, and Leaveall) must be set to the same values on all the devices that are exchanging information using GVRP.
- If the network has a large number of VLANs, the GVRP traffic can use a lot of CPU resources. If you notice high CPU utilization after enabling GVRP, set the GVRP timers to longer values. In particular, set the Leaveall timer to a longer value. Refer to [“Changing the GVRP timers”](#) on page 890.
- The feature is supported only on Ethernet ports.

NOTE

If you plan to change the GVRP base VLAN ID (4093) or the maximum configurable value for the Leaveall timer (300000 ms by default), you must do so before you enable GVRP.

GVRP configuration

To configure a device for GVRP, globally enable support for the feature, then enable the feature on specific ports. Optionally, you can disable VLAN learning or advertising on specific interfaces.

You can also change the protocol timers and the GVRP base VLAN ID.

Changing the GVRP base VLAN ID

By default, GVRP uses VLAN 4093 as a base VLAN for the protocol. All ports that are enabled for GVRP become tagged members of this VLAN. If you need to use VLAN ID 4093 for a statically configured VLAN, you can change the GVRP base VLAN ID.

NOTE

If you want to change the GVRP base VLAN ID, you must do so before enabling GVRP.

To change the GVRP base VLAN ID, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#gvrp-base-vlan-id 1001
```

This command changes the GVRP VLAN ID from 4093 to 1001.

Syntax: [no] **gvrp-base-vlan-id** <vlan-id>

The <vlan-id> parameter specifies the new VLAN ID. You can specify a VLAN ID from 2 – 4092 or 4095.

Increasing the maximum configurable value of the Leaveall timer

By default, the highest value you can specify for the Leaveall timer is 300000 ms. You can increase the maximum configurable value of the Leaveall timer to 1000000 ms.

NOTE

You must enter this command before enabling GVRP. Once GVRP is enabled, you cannot change the maximum Leaveall timer value.

NOTE

This command does not change the default value of the Leaveall timer itself. The command only changes the maximum value to which you can set the Leaveall timer.

To increase the maximum value you can specify for the Leaveall timer, enter a command such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#gvrp-max-leaveall-timer 1000000
```

Syntax: [no] **gvrp-max-leaveall-timer** <ms>

The <ms> parameter specifies the maximum number of ms to which you can set the Leaveall timer. You can specify from 300000 – 1000000 (one million) ms. The value must be a multiple of 100 ms. The default is 300000 ms.

Enabling GVRP

To enable GVRP, enter commands such as the following at the global CONFIG level of the CLI.

```
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable all
```

The first command globally enables support for the feature and changes the CLI to the GVRP configuration level. The second command enables GVRP on all ports on the device.

The following command enables GVRP on ports 1/24, 2/24, and 4/17.

```
Brocade(config-gvrp)#enable ethernet 1/24 ethernet 2/24 ethernet 4/17
```

Syntax: [no] **gvrp-enable**

Syntax: [no] **enable all** | **ethernet** <port> [**ethernet** <port> | **to** <port>]

The **all** keyword enables GVRP on all ports.

ethernet <port> specifies a port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

To specify a list of ports, enter each port as **ethernet** <port> followed by a space. For example, **ethernet 1/24 ethernet 6/24 ethernet 8/17**

To specify a range of ports, enter the first port in the range as **ethernet** <port> followed by the last port in the range. For example, **ethernet 1/1 to 1/8**.

You can combine lists and ranges in the same command. For example: **enable ethernet 1/1 to 1/8 ethernet 1/24 ethernet 6/24 ethernet 8/17**.

Disabling VLAN advertising

To disable VLAN advertising on a port enabled for GVRP, enter a command such as the following at the GVRP configuration level.

```
Brocade(config-gvrp)#block-applicant ethernet 1/24 ethernet 6/24 ethernet 8/17
```

This command disables advertising of VLAN information on ports 1/24, 6/24, and 8/17.

Syntax: [no] **block-applicant all** | **ethernet** <port> [**ethernet** <port> | **to** <port>]

NOTE

Leaveall messages are still sent on the GVRP ports.

The **all** keyword disables VLAN advertising on all ports enabled for GVRP.

ethernet <port> specifies a port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

To specify a list of ports, enter each port as **ethernet** <port> followed by a space. For example, **ethernet 1/24 ethernet 6/24 ethernet 8/17**

To specify a range of ports, enter the first port in the range as **ethernet** <port> followed by the last port in the range. For example, **ethernet 1/1 to 1/8**.

You can combine lists and ranges in the same command. For example: **enable ethernet 1/1 to 1/8 ethernet 1/24 ethernet 6/24 ethernet 8/17**.

Disabling VLAN learning

To disable VLAN learning on a port enabled for GVRP, enter a command such as the following at the GVRP configuration level.

```
Brocade(config-gvrp)#block-learning ethernet 6/24
```

This command disables learning of VLAN information on port 6/24.

NOTE

The port still advertises VLAN information unless you also disable VLAN advertising.

Syntax: [no] **block-learning** all | **ethernet** <port> [**ethernet** <port> | **to** <port>]

The **all** keyword disables VLAN learning on all ports enabled for GVRP.

ethernet <port> specifies a port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

To specify a list of ports, enter each port as **ethernet** <port> followed by a space. For example, **ethernet 1/24 ethernet 6/24 ethernet 8/17**

To specify a range of ports, enter the first port in the range as **ethernet** <port> followed by the last port in the range. For example, **ethernet 1/1 to 1/8**.

You can combine lists and ranges in the same command. For example: **enable ethernet 1/1 to 1/8 ethernet 1/24 ethernet 6/24 ethernet 8/17**.

Changing the GVRP timers

GVRP uses the following timers:

- **Join** – The maximum number of milliseconds (ms) a device GVRP interfaces wait before sending VLAN advertisements on the interfaces. The actual interval between Join messages is randomly calculated to a value between 0 and the maximum number of milliseconds specified for Join messages. You can set the Join timer to a value from 200 – one third the value of the Leave timer. The default is 200 ms.
- **Leave** – The number of ms a GVRP interface waits after receiving a Leave message on the port to remove the port from the VLAN indicated in the Leave message. If the port receives a Join message before the Leave timer expires, GVRP keeps the port in the VLAN. Otherwise, the port is removed from the VLAN. When a port receives a Leave message, the port GVRP state is changed to Leaving. Once the Leave timer expires, the port GVRP state changes to Empty. You can set the Leave timer to a value from three times the Join timer – one fifth the value of the Leaveall timer. The default is 600 ms.

NOTE

When all ports in a dynamically created VLAN (one learned through GVRP) leave the VLAN, the VLAN is immediately deleted from the device's VLAN database. However, this empty VLAN is still maintained in the GVRP database for an amount of time equal to the following.

$(\text{number-of-GVRP-enabled-up-ports}) * (2 * \text{join-timer})$

While the empty VLAN is in the GVRP database, the VLAN does not appear in the **show vlans** display but does still appear in the **show gvrp vlan all** display.

- **Leaveall** – The minimum interval at which GVRP sends Leaveall messages on all GVRP interfaces. Leaveall messages ensure that the GVRP VLAN membership information is current by aging out stale VLAN information and adding information for new VLAN memberships, if the information is missing. A Leaveall message instructs the port to change the GVRP state for all its VLANs to Leaving, and remove them unless a Join message is received before the Leave timer expires. By default, you can set the Leaveall timer to a value from five times the Leave timer – maximum value allowed by software (configurable from 300000 – 1000000 ms). The default is 10000.

NOTE

The actual interval is a random value between the Leaveall interval and $1.5 * \text{the Leaveall time}$ or the maximum Leaveall time, whichever is lower.

NOTE

You can increase the maximum configurable value of the Leaveall timer from 300000 ms up to 1000000 ms using the **gvrp-max-leaveall-timer** command. (Refer to [“Increasing the maximum configurable value of the Leaveall timer”](#) on page 888.)

Timer configuration requirements

- All timer values must be in multiples of 100 ms.
- The Leave timer must be $\geq 3 * \text{the Join timer}$.
- The Leaveall timer must be $\geq 5 * \text{the Leave timer}$.
- The GVRP timers must be set to the same values on all the devices that are exchanging information using GVRP.

Changing the Join, Leave, and Leaveall timers

The same CLI command controls changes to the Join, Leave, and Leaveall timers. To change values to the timers, enter a command such as the following.

```
Brocade(config-gvrp)#join-timer 1000 leave-timer 3000 leaveall-timer 15000
```

This command changes the Join timer to 1000 ms, the Leave timer to 3000 ms, and the Leaveall timer to 15000.

Syntax: [no] join-timer <ms> leave-timer <ms> leaveall-timer <ms>

NOTE

When you enter this command, all the running GVRP timers are canceled and restarted using the new times specified by the command.

Resetting the timers to their defaults

To reset the Join, Leave, and Leaveall timers to their default values, enter the following command.

```
Brocade(config-gvrp)#default-timers
```

Syntax: default-timers

This command resets the timers to the following values:

- Join – 200 ms
- Leave – 600 ms
- Leaveall – 10000 ms

Converting a VLAN created by GVRP into a statically-configured VLAN

You cannot configure VLAN parameters on VLANs created by GVRP. Moreover, VLANs and VLAN ports added by GVRP do not appear in the running-config and cannot be saved in the startup-config file.

To be able to configure and save VLANs or ports added by GVRP, you must convert the VLAN ports to statically-configured ports.

To convert a VLAN added by GVRP into a statically-configured VLAN, add the ports using commands such as the following.

```
Brocade(config)#vlan 22
Brocade(config-vlan-222)#tagged ethernet 1/1 to 1/8
```

These commands convert GVRP-created VLAN 22 containing ports 1/1 through 1/8 into statically-configured VLAN 22.

Syntax: [no] vlan <vlan-id>

Syntax: [no] tagged ethernet <port> [to <port> | ethernet <port>]

Use the same commands to statically add ports that GVRP added to a VLAN.

NOTE

You cannot add the VLAN ports as untagged ports.

NOTE

After you convert the VLAN, the VLAN name changes from “GVRP_VLAN_<vlan-id>” to “STATIC_VLAN_<vlan-id>”.

ethernet <port> specifies a port. Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

To specify a list of ports, enter each port as **ethernet** <port> followed by a space. For example, **ethernet 1/24 ethernet 6/24 ethernet 8/17**

To specify a range of ports, enter the first port in the range as **ethernet** <port> followed by the last port in the range. For example, **ethernet 1/1 to 1/8**.

You can combine lists and ranges in the same command. For example: **enable ethernet 1/1 to 1/8 ethernet 1/24 ethernet 6/24 ethernet 8/17**.

Displaying GVRP information

You can display the following GVRP information:

- GVRP configuration information
- GVRP VLAN information
- GVRP statistics
- CPU utilization statistics
- GVRP diagnostic information

Displaying GVRP configuration information

To display GVRP configuration information, enter a command such as the following.

```
Brocade#show gvrp
GVRP is enabled on the system

GVRP BASE VLAN ID          : 4093
GVRP MAX Leaveall Timer    : 300000 ms

GVRP Join Timer            : 200 ms
GVRP Leave Timer           : 600 ms
GVRP Leave-all Timer      : 10000 ms

=====
Configuration that is being used:

block-learning ethe 1/3
block-applicant ethe 2/7 ethe 2/11
enable ethe 1/1 to 1/7 ethe 2/1 ethe 2/7 ethe 2/11

=====

Spanning Tree: SINGLE SPANNING TREE
Dropped Packets Count: 0

=====

Number of VLANs in the GVRP Database: 15
Maximum Number of VLANs that can be present: 4095

=====
```

Syntax: `show gvrp [ethernet <port>]`

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

This display shows the following information.

TABLE 149 CLI display of summary GVRP information

Field	Description
Protocol state	The state of GVRP. The display shows one of the following: <ul style="list-style-type: none"> • GVRP is disabled on the system • GVRP is enabled on the system
GVRP BASE VLAN ID	The ID of the base VLAN used by GVRP.
GVRP MAX Leaveall Timer	The maximum number of ms to which you can set the Leaveall timer. <p>NOTE: To change the maximum value, refer to “Increasing the maximum configurable value of the Leaveall timer” on page 888.</p>

TABLE 149 CLI display of summary GVRP information (Continued)

Field	Description
GVRP Join Timer	The value of the Join timer. NOTE: For descriptions of the Join, Leave, and Leaveall timers or to change the timers, refer to “Changing the GVRP timers” on page 890.
GVRP Leave Timer	The value of the Leave timer.
GVRP Leave-all Timer	The value of the Leaveall timer.
Configuration that is being used	The configuration commands used to enable GVRP on individual ports. If GVRP learning or advertising is disabled on a port, this information also is displayed.
Spanning Tree	The type of STP enabled on the device. NOTE: The current release supports GVRP only with Single STP.
Dropped Packets Count	The number of GVRP packets that the device has dropped. A GVRP packet can be dropped for either of the following reasons: <ul style="list-style-type: none"> GVRP packets are received on a port on which GVRP is not enabled. NOTE: If GVRP support is not globally enabled, the device does not drop the GVRP packets but instead forwards them at Layer 2. <ul style="list-style-type: none"> GVRP packets are received with an invalid GARP Protocol ID. The protocol ID must always be 0x0001.
Number of VLANs in the GVRP Database	The number of VLANs in the GVRP database. NOTE: This number includes the default VLAN (1), the GVRP base VLAN (4093), and the single STP VLAN (4094). These VLANs are not advertised by GVRP but are maintained as “Registration Forbidden”.
Maximum Number of VLANs that can be present	The maximum number of VLANs that can be configured on the device. This number includes statically configured VLANs, VLANs learned through GVRP, and VLANs 1, 4093, and 4094. To change the maximum number of VLANs the device can have, use the system-max vlan <num> command. Refer to “Displaying and modifying system parameter default settings” on page 578.

To display detailed GVRP information for an individual port, enter a command such as the following.

Displaying GVRP information

```
Brocade#show gvrp ethernet 2/1
Port 2/1 -
  GVRP Enabled    : YES
  GVRP Learning   : ALLOWED
  GVRP Applicant  : ALLOWED
  Port State      : UP
  Forwarding      : YES

VLAN Membership:      [VLAN-ID]      [MODE]
                      1              FORBIDDEN
                      2              FIXED
                      1001           NORMAL
                      1003           NORMAL
                      1004           NORMAL
                      1007           NORMAL
                      1009           NORMAL
                      1501           NORMAL
                      2507           NORMAL
                      4001           NORMAL
                      4093           FORBIDDEN
                      4094           FORBIDDEN
```

This display shows the following information.

TABLE 150 CLI display of detailed GVRP information for a port

Field	Description
Port number	The port for which information is being displayed.
GVRP Enabled	Whether GVRP is enabled on the port.
GVRP Learning	Whether the port can learn VLAN information from GVRP.
GVRP Applicant	Whether the port can advertise VLAN information into GVRP.
Port State	The port link state, which can be UP or DOWN.
Forwarding	Whether the port is in the GVRP Forwarding state: <ul style="list-style-type: none">• NO – The port is in the Blocking state.• YES – The port is in the Forwarding state.
VLAN Membership	The VLANs of which the port is a member. For each VLAN, the following information is shown: <ul style="list-style-type: none">• VLAN ID – The VLAN ID.• Mode – The type of VLAN, which can be one of the following:• FIXED – The port will always be a member of this VLAN and the VLAN will always be advertised on this port by GVRP. A port becomes FIXED when you configure the port as a tagged member of a statically configured VLAN.• FORBIDDEN – The VLAN is one of the special VLANs that is not advertised or learned by GVRP. In the current release, the following VLANs are forbidden: the default VLAN (1), the GVRP base VLAN (4093), or the Single STP VLAN (4094).• NORMAL – The port became a member of this VLAN after learning about the VLAN through GVRP. The port membership in the VLAN depends on GVRP. If the VLAN is removed from the ports that send GVRP advertisements to this device, then the port will stop being a member of the VLAN.

Displaying GVRP VLAN information

To display information about all the VLANs on the device, enter the following command.

```
Brocade#show gvrp vlan brief
```

Number of VLANs in the GVRP Database: 7

Maximum Number of VLANs that can be present: 4095

[VLAN-ID]	[MODE]	[VLAN-INDEX]
1	STATIC-DEFAULT	0
7	STATIC	2
11	STATIC	4
1001	DYNAMIC	7
1003	DYNAMIC	8
4093	STATIC-GVRP-BASE-VLAN	6
4094	STATIC-SINGLE-SPAN-VLAN	5

=====

Syntax: show gvrp vlan all | brief | <vlan-id>

This display shows the following information.

TABLE 151 CLI display of summary VLAN information for GVRP

Field	Description
Number of VLANs in the GVRP Database	The number of VLANs in the GVRP database. NOTE: This number includes the default VLAN (1), the GVRP base VLAN (4093), and the single STP VLAN (4094). These VLANs are not advertised by GVRP but are included in the total count.
Maximum Number of VLANs that can be present	The maximum number of VLANs that can be configured on the device. This number includes statically configured VLANs, VLANs learned through GVRP, and VLANs 1, 4093, and 4094. To change the maximum number of VLANs the device can have, use the system-max vlan <num> command. Refer to “Displaying and modifying system parameter default settings” on page 578.
VLAN-ID	The VLAN ID.
MODE	The type of VLAN, which can be one of the following: <ul style="list-style-type: none"> • STATIC – The VLAN is statically configured and cannot be removed by GVRP. This includes VLANs you have configured as well as the default VLAN (1), base GVRP VLAN (4093), and Single STP VLAN (4094). • DYNAMIC – The VLAN was learned through GVRP.
VLAN-INDEX	A number used as an index into the internal database.

To display detailed information for a specific VLAN, enter a command such as the following.

```
Brocade#show gvrp vlan 1001
```

```
VLAN-ID: 1001, VLAN-INDEX: 7, STATIC: NO, DEFAULT: NO, BASE-VLAN: NO
Timer to Delete Entry Running: NO
Legend: [S=Slot]
```

Forbidden Members: None

Fixed Members: None

Normal(Dynamic) Members: (S2) 1

This display shows the following information.

TABLE 152 CLI display of summary VLAN information for GVRP

Field	Description
VLAN-ID	The VLAN ID.
VLAN-INDEX	A number used as an index into the internal database.
STATIC	Whether the VLAN is a statically configured VLAN.
DEFAULT	Whether this is the default VLAN.
BASE-VLAN	Whether this is the base VLAN for GVRP.
Timer to Delete Entry Running	Whether all ports have left the VLAN and the timer to delete the VLAN itself is running. The timer is described in the note for the Leave timer in “Changing the GVRP timers” on page 890.
Legend	The meanings of the letter codes used in other parts of the display.
Forbidden Members	The ports that cannot become members of a VLAN advertised or learned by GVRP.
Fixed Members	The ports that are statically configured members of the VLAN. GVRP cannot remove these ports.
Normal(Dynamic) Members	The ports that were added by GVRP. These ports also can be removed by GVRP.
MODE	The type of VLAN, which can be one of the following: <ul style="list-style-type: none"> • STATIC – The VLAN is statically configured and cannot be removed by GVRP. This includes VLANs you have configured as well as the default VLAN (1), base GVRP VLAN (4093), and Single STP VLAN (4094). • DYNAMIC – The VLAN was learned through GVRP.

To display detailed information for all VLANs, enter the **show gvrp vlan all** command.

Displaying GVRP statistics

To display GVRP statistics for a port, enter a command such as the following.

```
Brocade#show gvrp statistics ethernet 2/1
PORT 2/1 Statistics:
  Leave All Received           : 147
  Join Empty Received         : 4193
  Join In Received            : 599
  Leave Empty Received        : 0
  Leave In Received           : 0
  Empty Received              : 588
  Leave All Transmitted       : 157
  Join Empty Transmitted      : 1794
  Join In Transmitted         : 598
  Leave Empty Transmitted     : 0
  Leave In Transmitted        : 0
  Empty Transmitted           : 1248
  Invalid Messages/Attributes Skipped : 0
  Failed Registrations        : 0
```

Syntax: **show gvrp statistics all | ethernet <port>**

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

This display shows the following information for the port.

TABLE 153 CLI display of GVRP statistics

Field	Description
Leave All Received	The number of Leaveall messages received.
Join Empty Received	The number of Join Empty messages received.
Join In Received	The number of Join In messages received.
Leave Empty Received	The number of Leave Empty messages received.
Leave In Received	The number of Leave In messages received.
Empty Received	The number of Empty messages received.
Leave All Transmitted	The number of Leaveall messages sent.
Join Empty Transmitted	The number of Join Empty messages sent.
Join In Transmitted	The number of Join In messages sent.
Leave Empty Transmitted	The number of Leave Empty messages sent.
Leave In Transmitted	The number of Leave In messages sent.
Empty Transmitted	The number of Empty messages sent.
Invalid Messages/Attributes Skipped	<p>The number of invalid messages or attributes received or skipped. This can occur in the following cases:</p> <ul style="list-style-type: none"> • The incoming GVRP PDU has an incorrect length. • "End of PDU" was reached before the complete attribute could be parsed. • The Attribute Type of the attribute that was being parsed was not the GVRP VID Attribute Type (0x01). • The attribute that was being parsed had an invalid attribute length. • The attribute that was being parsed had an invalid GARP event. • The attribute that was being parsed had an invalid VLAN ID. The valid range is 1 – 4095.
Failed Registrations	<p>The number of failed registrations that have occurred. A failed registration can occur for the following reasons:</p> <ul style="list-style-type: none"> • Join requests were received on a port that was blocked from learning dynamic VLANs (GVRP Blocking state). • An entry for a new GVRP VLAN could not be created in the GVRP database.

To display GVRP statistics for all ports, enter the **show gvrp statistics all** command.

Displaying CPU utilization statistics

You can display CPU utilization statistics for GVRP.

To display CPU utilization statistics for GVRP for the previous one-second, one-minute, five-minute, and fifteen-minute intervals, enter the following command at any level of the CLI.

```
Brocade#show process cpu
```

Process Name	5Sec(%)	1Min(%)	5Min(%)	15Min(%)	Runtime(ms)
ARP	0.01	0.03	0.09	0.22	9
BGP	0.00	0.00	0.00	0.00	0
GVRP	0.00	0.03	0.04	0.07	4
ICMP	0.00	0.00	0.00	0.00	0
IP	0.00	0.00	0.00	0.00	0
OSPF	0.00	0.00	0.00	0.00	0
RIP	0.00	0.00	0.00	0.00	0
STP	0.00	0.00	0.00	0.00	0
VRRP	0.00	0.00	0.00	0.00	0

If the software has been running less than 15 minutes (the maximum interval for utilization statistics), the command indicates how long the software has been running. An example is given below.

```
Brocade#show process cpu
```

The system has only been up for 6 seconds.

Process Name	5Sec(%)	1Min(%)	5Min(%)	15Min(%)	Runtime(ms)
ARP	0.01	0.00	0.00	0.00	0
BGP	0.00	0.00	0.00	0.00	0
GVRP	0.00	0.00	0.00	0.00	0
ICMP	0.01	0.00	0.00	0.00	1
IP	0.00	0.00	0.00	0.00	0
OSPF	0.00	0.00	0.00	0.00	0
RIP	0.00	0.00	0.00	0.00	0
STP	0.00	0.00	0.00	0.00	0
VRRP	0.00	0.00	0.00	0.00	0

To display utilization statistics for a specific number of seconds, enter a command such as the following.

```
Brocade#show process cpu 2
```

Statistics for last 1 sec and 80 ms

Process Name	Sec(%)	Time(ms)
ARP	0.00	0
BGP	0.00	0
GVRP	0.01	1
ICMP	0.00	0
IP	0.00	0
OSPF	0.00	0
RIP	0.00	0
STP	0.01	1
VRRP	0.00	0

When you specify how many seconds' worth of statistics you want to display, the software selects the sample that most closely matches the number of seconds you specified. In this example, statistics are requested for the previous two seconds. The closest sample available is actually for the previous 1 second plus 80 milliseconds.

Syntax: `show process cpu [<num>]`

The `<num>` parameter specifies the number of seconds and can be from 1 – 900. If you use this parameter, the command lists the usage statistics only for the specified number of seconds. If you do not use this parameter, the command lists the usage statistics for the previous one-second, one-minute, five-minute, and fifteen-minute intervals.

Clearing GVRP statistics

To clear the GVRP statistics counters, enter the **clear gvrp statistics all** command.

```
Brocade#clear gvrp statistics all
```

This command clears the counters for all ports. To clear the counters for a specific port only, enter a command such as the following.

```
Brocade#clear gvrp statistics ethernet 2/1
```

Syntax: `clear gvrp statistics all | ethernet <port>`

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

GVRP CLI examples

The following sections show the CLI commands for implementing the applications of GVRP described in [“GVRP application examples”](#) on page 884.

NOTE

Although some of the devices in these configuration examples do not have statically configured VLANs, this is not a requirement. You always can have statically configured VLANs on a device that is running GVRP.

Dynamic core and fixed edge

In this configuration, the edge devices advertise their statically configured VLANs to the core device. The core device does not have any statically configured VLANs but learns the VLANs from the edge devices.

Enter the following commands on the core device.

```
Brocade> enable
Brocade#configure terminal
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable all
```

These commands globally enable GVRP support and enable the protocol on all ports.

Enter the following commands on edge device A.

```
Brocade> enable
Brocade#configure terminal
Brocade(config)#vlan 20
Brocade(config-vlan-20)#untag ethernet 2/1
Brocade(config-vlan-20)#tag ethernet 4/24
Brocade(config-vlan-20)#vlan 40
Brocade(config-vlan-40)#untag ethernet 2/1
Brocade(config-vlan-40)#tag ethernet 4/24
Brocade(config-vlan-40)#exit
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable ethernet 4/24
Brocade(config-gvrp)#block-learning ethernet 4/24
```

These commands statically configure two port-based VLANs, enable GVRP on port 4/24, and block GVRP learning on the port. The device will advertise the VLANs but will not learn VLANs from other devices.

Enter the following commands on edge device B.

```
Brocade> enable
Brocade#configure terminal
Brocade(config)#vlan 20
Brocade(config-vlan-20)#untag ethernet 2/24
Brocade(config-vlan-20)#tag ethernet 4/1
Brocade(config-vlan-20)#vlan 30
Brocade(config-vlan-30)#untag ethernet 4/24
Brocade(config-vlan-30)#tag ethernet 4/1
Brocade(config-vlan-30)#exit
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable ethernet 4/1
Brocade(config-gvrp)#block-learning ethernet 4/1
```

Enter the following commands on edge device C.

```
Brocade> enable
Brocade#configure terminal
Brocade(config)#vlan 30
Brocade(config-vlan-30)#untag ethernet 2/24
Brocade(config-vlan-30)#tag ethernet 4/1
Brocade(config-vlan-20)#vlan 40
Brocade(config-vlan-40)#untag ethernet 4/24
Brocade(config-vlan-40)#tag ethernet 4/1
Brocade(config-vlan-40)#exit
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable ethernet 4/1
Brocade(config-gvrp)#block-learning ethernet 4/1
```

Dynamic core and dynamic edge

In this configuration, the core and edge devices have no statically configured VLANs and are enabled to learn and advertise VLANs. The edge and core devices learn the VLANs configured on the devices in the edge clouds. To enable GVRP on all the ports, enter the following command on each edge device **and** on the core device.

```
Brocade> enable
Brocade#configure terminal
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable all
```

Fixed core and dynamic edge

In this configuration, GVRP learning is enabled on the edge devices. The VLANs on the core device are statically configured, and the core device is enabled to advertise its VLANs but not to learn VLANs. The edge devices learn the VLANs from the core.

Enter the following commands on the core device.

```
Brocade> enable
Brocade#configure terminal
Brocade(config)#vlan 20
Brocade(config-vlan-20)#tag ethernet 1/24
Brocade(config-vlan-20)#tag ethernet 6/24
Brocade(config-vlan-20)#vlan 30
Brocade(config-vlan-30)#tag ethernet 6/24
Brocade(config-vlan-30)#tag ethernet 8/17
Brocade(config-vlan-30)#vlan 40
Brocade(config-vlan-40)#tag ethernet 1/5
Brocade(config-vlan-40)#tag ethernet 8/17
Brocade(config-vlan-40)#vlan 50
Brocade(config-vlan-50)#untag ethernet 6/1
Brocade(config-vlan-50)#tag ethernet 1/11
Brocade(config-vlan-50)#exit
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable ethernet 1/24 ethernet 6/24 ethernet 8/17
Brocade(config-gvrp)#block-learning ethernet 1/24 ethernet 6/24 ethernet 8/17
```

These VLAN commands configure VLANs 20, 30, 40, and 50. The GVRP commands enable the protocol on the ports that are connected to the edge devices, and disable VLAN learning on those ports. All the VLANs are advertised by GVRP.

Enter the following commands on edge devices A, B, and C.

```
Brocade> enable
Brocade#configure terminal
Brocade(config)#gvrp-enable
Brocade(config-gvrp)#enable all
Brocade(config-gvrp)#block-applicant all
```

Fixed core and fixed edge

The VLANs are statically configured on the core and edge devices. On each edge device, VLAN advertising is enabled but learning is disabled. GVRP is not configured on the core device. This configuration enables the devices in the edge clouds to learn the VLANs configured on the edge devices.

This configuration does not use any GVRP configuration on the core device.

The configuration on the edge device is the same as in [“Dynamic core and fixed edge”](#) on page 902.

MAC-based VLANs

Table 154 lists the individual Brocade FastIron switches and the MAC-based VLAN features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 154 Supported MAC-based VLAN features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
MAC-Based VLANs:	No	Yes	Yes	Yes	Yes
<ul style="list-style-type: none"> Source MAC address authentication Policy-based classification and forwarding 					
MAC-based VLANs and 802.1X security on the same port	No	Yes	Yes	Yes	Yes
MAC-based VLAN aging	No	Yes	Yes	Yes	Yes
Dynamic MAC-Based VLANs	No	Yes	Yes	Yes	Yes

MAC-based VLAN overview

The MAC-based VLAN feature controls network access by authenticating a host source MAC address, and mapping the incoming packet source MAC to a VLAN. Mapping is based on the MAC address of the end station connected to the physical port. Users who relocate can remain on the same VLAN as long as they connect to any switch in the same domain, on a port which is permitted in the VLAN. The MAC-based VLAN feature may be enabled for two types of hosts: static and dynamic.

MAC-based VLAN activity is determined by authentication through a RADIUS server. Incoming traffic that originates from a specific MAC address is forwarded only if the source MAC address-to-VLAN mapping is successfully authenticated. While multi-device port authentication is in progress, all traffic from the new MAC address will be blocked or dropped until the authentication succeeds. Traffic is dropped if the authentication fails.

Static and dynamic hosts

Static hosts are devices on the network that do not speak until spoken to. Static hosts may not initiate a request for authentication on their own. Such static hosts can be managed through a **link up** or **link down** notification.

Dynamic hosts are “chatty” devices that generate packets whenever they are in the **link up** state. Dynamic hosts must be authenticated before they can switch or forward traffic.

MAC-based VLAN feature structure

The MAC-based VLAN feature operates in two stages:

- Source MAC Address Authentication
- Policy-Based Classification and Forwarding

Source MAC address authentication

Source MAC address authentication is performed by a central RADIUS server when it receives a PAP request with a username and password that match the MAC address being authenticated. When the MAC address is successfully authenticated, the server must return the VLAN identifier, which is carried in the Tunnel-Type, Tunnel-Medium-Type, and Tunnel-Private-Group-ID attributes of the RADIUS packets. If the Tunnel-Type is *tagged*, the MAC address will be blocked or restricted. If the identified VLAN does not exist, then the authentication is considered a failure, and action is taken based on the configured failure options. (The default failure action is to drop the traffic.) The RADIUS server may also optionally return the QoS attribute for the authenticated MAC address. Refer to [Table 157](#) on page 911 for more information about attributes.

Policy-based classification and forwarding

Once the authentication stage is complete, incoming traffic is classified based on the response from the RADIUS server. There are three possible actions:

- Incoming traffic from a specific source MAC is dropped because authentication failed
- Incoming traffic from a specific source MAC is classified as untagged into a specific VLAN
- Incoming traffic from a specific source MAC is classified as untagged into a restricted VLAN

Traffic classification is performed by programming incoming traffic and RADIUS-returned attributes in the hardware. Incoming traffic attributes include the source MAC address and the port on which the feature is enabled. The RADIUS-returned attributes are the VLAN into which the traffic is to be classified, and the QoS priority.

NOTE

This feature drops any incoming *tagged* traffic on the port, and classifies and forwards untagged traffic into the appropriate VLANs.

This feature supports up to a maximum of 32 MAC addresses per physical port, with a default of 2.

NOTE

Even though the feature supports up to a maximum of 32 MAC address per physical port, the configuration of the maximum number of MAC addresses per port is limited by the available hardware resources.

Once a client MAC address is successfully authenticated and registered, the MAC-to-VLAN association remains until the port connection is dropped, or the MAC entry expires.

MAC-based VLAN and port up or down events

When the state of a port is changed to *down*, all authorized and unauthorized MAC addresses are removed from the MAC-to-VLAN mapping table, any pending authentication requests are cancelled.

Dynamic MAC-based VLAN

When enabled, the dynamic MAC-based VLAN feature allows the dynamic addition of mac-vlan-permit ports to the VLAN table only after successful RADIUS authentication. Ports that fail RADIUS authentication are not added to the VLAN table.

When this feature is not enabled, the physical port is statically added to the hardware table, regardless of the outcome of the authentication process. This feature prevents the addition of unauthenticated ports to the VLAN table. For information about how to configure Dynamic MAC-based VLAN, refer to [“Configuring dynamic MAC-based VLAN”](#) on page 914.

Configuration notes and feature limitations for dynamic MAC-based VLAN

The following guidelines apply to MAC-based VLAN configurations:

- MAC-based VLAN is not currently supported for trunk ports and LACP.
- MAC-based VLAN is not supported for VLAN groups, topology groups and dual-mode configuration.
- MAC-based VLAN is not supported together with ACLs or MAC address filters.
- FastIron devices do not support UDLD link-keepalives on ports with MAC-based VLAN enabled.
- FastIron devices do not support STP BPDU packets on ports with MAC-based VLAN enabled.
- MAC-to-VLAN mapping must be associated with VLANs that exist on the switch. Create the VLANs before you configure the MAC-based VLAN feature.
- Ports participating in MAC-based VLANs must first be configured as **mac-vlan-permit** ports under the VLAN configuration.
- In the RADIUS server configuration file, a MAC address cannot be configured to associate with more than one VLAN.
- This feature does not currently support dynamic assignment of a port to a VLAN. Users must pre-configure VLANs and port membership before enabling the feature.
- Multi-device port authentication filters will not work with MAC-based VLANs on the same port.

Dynamic MAC-based VLAN CLI commands

The following table describes the CLI commands used to configure MAC-based VLANs.

TABLE 155 CLI commands for MAC-based VLANs

CLI command	Description	CLI level
mac-auth mac-vlan enable	Enables per-port MAC-based VLAN	Interface
mac-auth mac-vlan disable	Disables per-port MAC-based VLAN	interface
mac-auth mac-vlan-dyn-activation	Enables Dynamic MAC-based VLAN	global
no mac-auth mac-vlan-dyn-activation	Disables Dynamic MAC-based VLAN	global
no mac-auth mac-vlan	Removes the MAC-VLAN configuration from the port	interface

TABLE 155 CLI commands for MAC-based VLANs (Continued)

CLI command	Description	CLI level
mac-auth mac-vlan max-mac-entries <num of entries>	The maximum number of allowed and denied MAC addresses (static and dynamic) that can be learned on a port. The default is 2.	interface
mac-auth mac-vlan <mac-addr> vlan <vlan id> priority <0-7>	Adds a static MAC-VLAN mapping to the MAC-based VLAN table (for static hosts)	interface
clear table-mac-vlan	Clears the contents of the authenticated MAC address table	global
clear table-mac-vlan ethernet <port>	Clears all MAC-based VLAN mapping on a port	global
show table-mac-vlan	Displays information about allowed and denied MAC addresses on ports with MAC-based VLAN enabled.	global
show table-mac-vlan allowed-mac	Displays MAC addresses that have been successfully authenticated	global
show table-mac-vlan denied-mac	Displays MAC addresses for which authentication failed	global
show table-mac-vlan detailed	Displays detailed MAC-VLAN settings and classified MAC addresses for a port with the feature enabled	global
show table-mac-vlan <mac-address>	Displays status and details for a specific MAC address	global
show table-mac-vlan ethernet <port>	Displays all MAC addresses allowed or denied on a specific port	global

Dynamic MAC-based VLAN configuration example

The following example shows a MAC-based VLAN configuration.

```
Brocade#show run
Current configuration:
ver 04.0.00b122T7e1
fan-threshold mp speed-3 35 100
module 1 fls-24-port-copper-base-module
module 4 fls-xfp-1-port-10g-module
vlan 1 by port
  untagged ethe 0/1/10
  mac-vlan-permit ethe 0/1/1 to 0/1/3
  no spanning-tree
vlan 2 by port
  untagged ethe 0/1/24
  mac-vlan-permit ethe 0/1/1 to 0/1/3
  no spanning-tree
vlan 222 name RESTRICTED_MBV by port
  untagged ethe 0/1/4
  mac-vlan-permit ethe 0/1/1 to 0/1/3
vlan 666 name RESTRICTED_MAC_AUTH by port
  untagged ethe 0/1/20
  mac-vlan-permit ethe 0/1/1 to 0/1/3
  spanning-tree 802-1w
vlan 4000 name DEFAULT-VLAN by port
vlan 4004 by port
```

```

mac-vlan-permit ethe 0/1/1 ethe 0/1/3
default-vlan-id 4000
ip address 10.44.3.3 255.255.255.0
ip default-gateway 10.44.3.1
radius-server host 10.44.3.111
radius-server key 1 $-ndUno
mac-authentication enable
mac-authentication mac-vlan-dyn-activation
mac-authentication max-age 60
mac-authentication hw-deny-age 30
mac-authentication auth-passwd-format xxxx.xxxx.xxxx
mac-authentication auth-fail-vlan-id 666

interface ethernet 0/1/3
  mac-authentication mac-vlan enable
  mac-authentication auth-fail-action restrict-vlan
!
end

```

MAC-based VLAN configuration

Configure MAC-based VLAN mapping on the switch statically for static hosts, or dynamically for non-static hosts, by directing the RADIUS server to authenticate the incoming packet.

To configure the a MAC-based VLAN, first perform the following tasks:

- In the VLANs, configure **mac-vlan-permit** for each port that will be participating in the MAC-based VLAN
- If a port has been MAC-based VLAN-enabled, but has **not** been added as **mac-vlan-permit** in any of the VLANs, any MAC addresses learned on this port will be blocked in the reserved VLAN. To prevent this, you must create all of the VLANs and add all ports as **mac-vlan-permit** **before** enabling MAC-based VLAN on any ports.
- Disable any multi-device port authentication on ports you will be using for MAC-to-VLAN mapping

NOTE

Do not configure MAC-based VLAN on ports that are tagged to any VLAN. Do not use ports on which MAC-based VLAN is configured as tagged ports.

NOTE

For FCX devices, MAC-based VLAN with 802.1X will not work on the same port if 802.1X has the RADIUS VLAN attribute defined as an untagged VLAN (for example U:1, U:2).

NOTE

MAC-based VLAN is not supported on trunk or LACP ports. Do not configure trunks on MAC-based VLAN-enabled ports.

Using MAC-based VLANs and 802.1X security on the same port

On Brocade devices, MAC-based VLANs and 802.1X security can be configured on the same port. When both of these features are enabled on the same port, MAC-based VLAN is performed prior to 802.1X authentication. If MAC-based VLAN is successful, 802.1X authentication may be performed, based on the configuration of a vendor-specific attribute (VSA) in the profile for the MAC address on the RADIUS server.

When both features are configured on a port, a device connected to the port is authenticated as follows.

1. MAC-based VLAN is performed on the device to authenticate the device MAC address.
2. If MAC-based VLAN is successful, the device then checks to see if the RADIUS server included the Foundry-802_1x-enable VSA (described in [Table 157](#)) in the Access-Accept message that authenticated the device.
3. If the Foundry-802_1x-enable VSA is not present in the Access-Accept message, or is present and set to 1, then 802.1X authentication is performed for the device.
4. If the Foundry-802_1x-enable VSA is present in the Access-Accept message, and is set to 0, then 802.1X authentication is skipped.

Configuring generic and Brocade vendor-specific attributes on the RADIUS server

If the RADIUS authentication process is successful, the RADIUS server sends an Access-Accept message to the Brocade device, authenticating the device. The Access-Accept message includes Vendor-Specific Attributes (VSAs) that specify additional information about the device.

Add Brocade vendor-specific attributes to your RADIUS server configuration, and configure the attributes in the individual or group profiles of the devices that will be authenticated. Brocade vendor-ID is 1991, vendor-type 1. [Table 156](#) lists generic RADIUS attributes. [Table 157](#) lists Brocade Vendor-Specific Attributes.

TABLE 156 Generic RADIUS attributes

Attribute name	Attribute ID	Data type	Optional or mandatory	Description
Tunnel-Type	64	13 decimal VLAN	Mandatory	RFC 2868.
Tunnel-Medium-Type	65	6 decimal 802	Mandatory	RFC 2868.
Tunnel-Private-Group-ID	81	decimal	Mandatory	RFC 2868. <vlan-id> or U:<vlan -id> – a MAC-based VLAN ID configured on the Brocade device.

TABLE 157 Brocade vendor-specific attributes for RADIUS

Attribute name	Attribute ID	Data type	Optional or mandatory	Description
Foundry-MAC-based VLAN-QoS	8	decimal	Optional	The QoS attribute specifies the priority of the incoming traffic based on any value between 0 (lowest priority) and 7 (highest priority). Default is 0.
Foundry-802_1x-enabled	6	integer	Optional	Specifies whether 802.1X authentication is performed when MAC-based VLAN is successful for a device. This attribute can be set to one of the following: 0 - Do not perform 802.1X authentication on a device that passes MAC-based VLAN. Set the attribute to zero (0) for devices that do not support 802.1X authentication. 1 - Perform 802.1X authentication when a device passes MAC-based VLAN. Set the attribute to one (1) for devices that support 802.1X authentication.
Foundry-802_1x-val id	7	integer	Optional	Specifies whether the RADIUS record is valid only for MAC-based VLAN, or for both MAC-based VLAN and 802.1X authentication. This attribute can be set to one of the following: 0 - The RADIUS record is valid only for MAC-based VLAN. Set this attribute to zero (0) to prevent a user from using their MAC address as username and password for 802.1X authentication 1 - The RADIUS record is valid for both MAC-based VLAN and 802.1X authentication.

Aging for MAC-based VLAN

The aging process for MAC-based VLAN works as described below.

For permitted hosts

For permitted hosts, as long as the Brocade device is receiving traffic aging does not occur. The age column in the output of the **show table-mac-vlan** command displays Ena or S <num>. If the Brocade device stops receiving traffic, the entry first ages out from the MAC table (in the hardware) and then the aging cycle for MAC-based VLAN begins. Aging in the MAC-based VLAN continues for 2 minutes (the default is 120 seconds) after which the MAC-based VLAN session is flushed out.

For blocked hosts

For blocked hosts, as long as the Brocade device is receiving traffic, aging does not occur. In the output of the **show table-mac-vlan command**, the age column displays H0 to H70, S0, and H0 to H70, etc. Aging of the MAC-based VLAN MAC occurs in two phases: hardware aging and software aging. The hardware aging period can be configured using the **mac-authentication hw-deny-age** command in config mode. The default is 70 seconds. The software aging time for MAC-based VLAN MACs can be configured using the **mac-authentication max-age** command. When the Brocade device is no longer receiving traffic from a MAC-based VLAN MAC address, the hardware aging period begins and lasts for a fixed length of time (default or user-configured). When the hardware

aging period ends, the software aging period begins. The software aging period lasts for a configurable amount of time (the default is 120 seconds). After the software aging period ends, the MAC-based VLAN session is flushed, and the MAC address can be authenticated or denied if the Brocade device again receives traffic from that MAC address.

For MAC-based dynamic activation

If all of the sessions age out on a port, the port is dynamically removed from the VLAN table. When any new session is established, the port is dynamically added back to the VLAN table.

NOTE

If the Brocade device receives a packet from an authenticated MAC address, and the MAC-based VLAN software aging is still in progress (hardware aging has already occurred), a RADIUS message is NOT sent to the RADIUS server. Instead the MAC address is reentered in the hardware along with the parameters previously returned from the RADIUS server. A RADIUS message is sent only when the MAC-based VLAN session ages out from the software.

To change the length of the software aging period

To change the length of the software aging period for blocked MAC addresses, enter a command such as the following.

```
Brocade(config)#mac-authentication max-age 180
```

Syntax: [no] **mac-authentication max-age** <seconds>

You can specify from 1 – 65535 seconds. The default is 120 seconds.

Disabling aging for MAC-based VLAN sessions

MAC addresses that have been authenticated or denied by a RADIUS server are aged out if no traffic is received from the MAC address for a certain period of time.

You can optionally disable aging for MAC-based VLAN session subject to authentication, either for all MAC addresses or for those learned on a specified interface.

Globally disabling aging

On most devices, you can disable aging on all interfaces where MAC-based VLAN has been enabled, by entering the following command.

```
Brocade(config)#mac-authentication disable-aging
```

Syntax: **mac-authentication disable-aging**

Enter the command at the global or interface configuration level.

The **denied-mac-only** parameter prevents denied sessions from being aged out, but ages out permitted sessions.

The **permitted-mac-only** parameter prevents permitted (authenticated and restricted) sessions from being aged out and ages denied sessions.

Disabling the aging on interfaces

To disable aging on a specific interface where MAC-based VLAN has been enabled, enter the command at the interface level.

```
Brocade(config)#interface e 3/1
Brocade(config-if-e1000-3/1)#mac-authentication disable-aging
```

Syntax: [no] **mac-authentication disable-aging**

Configuring the maximum MAC addresses per port

To configure the maximum number of MAC addresses allowed per port, use the following commands:

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#mac-authentication mac-vlan max-mac-entries 24
```

NOTE

32 MAC addresses maximum are allowed per port. This total includes both static and dynamic hosts. The default number of allowed MACs is 2. Even though the feature supports up to a maximum of MAC address per physical port, the configuration of the maximum number of MAC addresses per port is limited by the available hardware resources.

NOTE

To change the maximum MAC addresses per port, you must first disable MAC-based VLAN on that port.

Configuring a MAC-based VLAN for a static host

Follow the steps given below to configure a MAC-based VLAN for a static host.

1. Enable multi-device port authentication globally using the following command.

```
Brocade(config)#mac-authentication enable
```

2. Add each port on which you want MAC-based VLAN enabled as **mac-vlan-permit** for a specific VLAN.

```
Brocade(config)#vlan 10 by port
Brocade(config-vlan-10)#mac-vlan-permit ethernet 0/1/1 to 0/1/6
added mac-vlan-permit ports ethe 0/1/1 to 0/1/6 to port-vlan 10.
```

3. Add the static MAC-based VLAN configuration on the port.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#mac-authentication mac-vlan 0000.0010.0011
vlan 10 priority 5
```

4. To enable MAC-based VLAN on the port.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#mac-authentication mac-vlan enable
```

5. To disable MAC-based VLAN on the port.

```
Brocade(config)#interface e 0/1/1
Brocade(interface-0/1/1)#mac-auth mac-vlan disable
```

6. To remove and disable the MAC-based VLAN configuration.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#no mac-auth mac-vlan
```

Configuring MAC-based VLAN for a dynamic host

Follow the steps given below to configure MAC-based VLAN for a dynamic host.

1. Enable multi-device port authentication globally using the following command.

```
Brocade(config)#mac-authentication enable
```

2. Add each port on which you want MAC-based VLAN enabled as **mac-vlan-permit** for a specific VLAN.

```
Brocade(config)#vlan 10 by port
Brocade(config-vlan-10)#mac-vlan-permit ethernet 0/1/1 to 0/1/6
```

3. Enable MAC-based VLAN on the port.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#mac-authentication mac-vlan enable
```

4. Disable MAC-based VLAN on the port.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#mac-auth mac-vlan disable
```

5. Remove and disable the MAC-based VLAN configuration.

```
Brocade(config)#interface e 0/1/1
Brocade(config-if-e1000-0/1/1)#no mac-auth mac-vlan
```

Configuring dynamic MAC-based VLAN

To globally enable MAC-based VLAN globally (for all MAC-based VLAN ports), enter the following commands.

```
Brocade(config)#mac-authentication enable
Brocade(config)#mac-authentication mac-vlan-dyn-activation
```

To configure Dynamic MAC-based VLAN to add a specific port to a specific VLAN, enter commands similar to the following.

```
Brocade(config)#vlan 10
Brocade(config-vlan-10)#mac-vlan-permit e 0/1/35
```

Syntax: **mac-vlan-permit ethernet** <stack-unit/slotnum/portnum>

To disable Dynamic MAC-based VLAN, enter the following command.

```
Brocade(config)#no mac-authentication mac-vlan-dyn-activation
```

NOTE

If static Mac-Based VLAN is configured on a port, the port will be added only to the VLAN table for which the static MAC-based VLAN configuration exists.

NOTE

If the Dynamic MAC-based VLAN is enabled after any MAC-based VLAN sessions are established, all sessions are flushed and the mac-vlan-permit ports are removed from the VLAN. The ports are then added back to the VLAN dynamically after they successfully pass the RADIUS authentication process.

Configuring MAC-based VLANs using SNMP

Several MIB objects have been developed to allow the configuration of MAC-based VLANs using SNMP. For more information, refer to the *IronWare MIB Reference Guide*.

Displaying Information about MAC-based VLANs

This section describes the **show** commands that display information related to MAC-based VLANs.

Displaying the MAC-VLAN table

Enter the following command to display the MAC-VLAN table.

```
Brocade(config)#show table-mac-vlan
```

Port	Vlan	Accepted Macs	Rejected Macs	Attempted Macs	Static Macs	Static Conf	Max Macs
1/1/1	N/A	1	1	0	0	1	10

Syntax: **show table-mac-vlan**

The following table describes the information in this output.

Field	Description
Port	The port number where MAC-based VLAN is enabled.
Vlan	Not applicable for this feature, will always display n/a.
Accepted Macs	The number of MAC addresses that have been successfully authenticated (dynamic hosts) combined with the number of active static MAC addresses (static hosts).
Rejected Macs	The number of MAC addresses for which authentication has failed for dynamic hosts.
Attempted Macs	The number of attempts made to authenticate MAC addresses.
Static Macs	The number of currently connected active static hosts.
Static Conf	The number of static hosts that are configured on the physical port.
Max Macs	The maximum number of allowed MAC addresses.

Displaying the MAC-VLAN table for a specific MAC address

Enter the **show table-mac-vlan** command to display the MAC-VLAN table information for a specific MAC address.

```
Brocade(config)#show table-mac-vlan 0000.0010.1001
```

```
-----
MAC Address      Port          Vlan  Authenticated  Time      Age      dot1x
-----
0000.0010.1001  1/1/1        2     Yes           00d00h05m45s  Ena      Dis
```

Syntax: show table-mac-vlan <mac-address>

The following table describes the information in this output.

Field	Description
MAC Address	The MAC address for which this information is displayed.
Port	The port where MAC-based VLAN is enabled.
Vlan	The VLAN to which the MAC address has been assigned.
Authenticated	Yes indicates authentication is successful. No indicates authentication has failed. Inp indicates authentication in progress Rst indicates a restricted VLAN
Time	The time at which the MAC address was authenticated. If the clock is set on the Brocade device, then the actual date and time are displayed. If the clock has not been set, then the time is displayed relative to when the device was last restarted.
Age	The age of the MAC address entry in the authenticated MAC address list.
Dot1x	Indicates if 802.1X authentication is enabled or disabled for the MAC address.

Displaying allowed MAC addresses

Enter the **show table-mac-vlan allowed-mac** command to display information about successfully authenticated MAC addresses.

```
Brocade#show table-mac-vlan allowed-mac
```

```
-----
MAC Address      Port          Vlan  Authenticated  Time      Age      dot1x
-----
0030.4874.3181  2/1/17        76     Yes           00d01h17m22s  Ena      Dis
```

Syntax: show table-mac-vlan allowed-mac

The following table describes the information in this output.

Field	Description
MAC Address	The allowed MAC addresses for which the information is displayed.
Port	The port where MAC-based VLAN is enabled.
Vlan	The VLAN to which the MAC address has been assigned.
Authenticated	Yes indicates authentication has been successful. Inp indicates authentication is in progress.

Field	Description
Time	The time at which each MAC address was authenticated. If the clock is set on the Brocade device, then the actual date and time are displayed. If the clock has not been set, then the time is displayed relative to when the device was last restarted.
Age	The age of the MAC address entry in the authenticated MAC address list.
Dot1x	Indicates whether 802.1X authentication is enabled or disabled for each MAC address.

Displaying denied MAC addresses

Enter the **show table-mac-vlan denied-mac** command to display information about denied (authentication failed) MAC addresses.

```
Brocade(config)#show table-mac-vlan denied-mac
```

```
-----
MAC Address      Port          Vlan  Authenticated Time      Age      dot1x
-----
0000.0030.1002   1/1/1         4092 No       00d00h11m57s H40      Dis
```

Syntax: show table-mac-vlan denied-mac

The following table describes the information in this output.

Field	Description
MAC Address	The denied MAC address for which the information is displayed.
Port	The port where MAC-based VLAN is enabled.
Vlan	This field displays VLAN 4092 for blocked hosts, or the restricted VLAN ID if it is configured on the port.
Authenticated	No indicates that authentication has failed. Inp indicates that authentication is in progress.
Time	The time at which authentication failed.
Age	The age of the MAC address entry in the authenticated MAC address list.
Dot1x	Indicates whether 802.1X authentication is disabled (Dis) or enabled (Ena) for this MAC address.

Displaying detailed MAC-VLAN data

Enter the **show table-mac-vlan detailed** command to display a detailed version of MAC-VLAN information.

```
Brocade#show table-mac-vlan detailed e 0/1/2
```

```
Port                               : 0/1/2

The following table describes the information in this output.

Field	Description
MAC Address	The MAC addresses related to the specified interface.
Port	The interface for which this information is displayed.
Vlan	The VLAN to which the interface has been assigned.
Authenticated	Yes indicates authentication is successful. No indicates authentication has failed. Inp indicates authentication in progress Rst indicates a restricted VLAN
Time	The time at which the MAC address was authenticated. If the clock is set on the Brocade device, then the actual date and time are displayed. If the clock has not been set, then the time is displayed relative to when the device was last restarted.
Age	The age of the MAC address entry in the authenticated MAC address list.
CAM Index	This field displays the index of the CAM entry. The index value will be between 0 and 31. A value of "ff" indicates that the index is not used.
MAC Index	The index of the entry in the hardware MAC table.
Dot1x	Indicates whether 802.1X authentication is enabled or disabled for this MAC address.

Field	Description
Type	Dyn Indicates a dynamic host. Sta indicates a static host.
Pri	This field indicates the value set for Foundry-MAC-based VLAN-QoS attribute in the RADIUS configuration for dynamic hosts, if configured. If the Foundry-MAC-based VLAN-QoS attribute is not configured, the value will be zero. For static hosts, the user-configured priority value for the MAC address is displayed.

Displaying MAC addresses in a MAC-based VLAN

Enter the **show mac-address** command to display a list of MAC addresses in a MAC-based VLAN.

```
Brocade#show mac-address
Total active entries from all ports = 1541
MAC-Address      Port          Type          Index      VLAN
0000.2000.0001   0/1/32        Dynamic (MBV)  1048       1
0000.2000.0002   0/1/32        Dynamic (MBV)  1832       1
0000.2000.0003   0/1/32        Dynamic (MBV)  9772       1
0000.2000.0004   0/1/32        Static (MBV)   328        1
0000.2000.0005   0/1/32        Dynamic (MBV)  8268       1
0000.2000.0006   0/1/32        Dynamic (MBV)  9084       1
0000.2000.0007   0/1/32        Dynamic (MBV)  632        1
0000.2000.0008   0/1/32        Dynamic (MBV)  3464       1
0000.2000.0009   0/1/32        Dynamic (MBV)  11404      1
0000.2000.000a   0/1/32        Dynamic (MBV)  12220      1
0000.2000.000b   0/1/32        Dynamic (MBV)  3768       1
```

NOTE

In this output, (MBV) indicates MAC-based VLAN is enabled.

The following table describes the output from this command.

Field	Description
Total active entries	The total number of active entries for all ports.
MAC Address	The MAC addresses assigned to this VLAN.
Port	The interface for which this information is displayed.
Type	Dynamic (MBV) Indicates a dynamic host. Static (MBV) indicates a static host.
Index	The index of the entry in the hardware MAC table.
VLAN	The VLAN to which these addresses are assigned.

Displaying MAC-based VLAN logging

Enter the **show logging** command to display MAC-based VLAN logging activity.

```
Brocade#show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 15 overruns)
  Buffer logging: level ACDMEINW, 50 messages logged
  level code: A=alert C=critical D=debugging M=emergency E=error
Static Log Buffer
0d00h00m12s:A:System: Power supply 1 is up
Dynamic Log Buffer (50 lines):
0d18h46m28s:I:running-config was changed from console
0d02h12m25s:A:MAC Based Vlan Mapping failed for [0000.1111.0108 ] on port 0/2/1
(Invalid User)
0d02h08m52s:A:MAC Based Vlan Mapping failed for [0000.1111.011b ] on port 0/2/1
(Invalid User)

0d01h58m43s:N:MAC Based Vlan Enabled on port 0/2/1
0d01h58m32s:N:MAC Based Vlan Disabled on port 0/2/1
0d01h39m00s:I:running-config was changed from console
0d01h38m28s:I:System: Interface ethernet 0/1/47, state up
0d01h38m27s:I:System: Interface ethernet 0/1/46, state up
0d01h38m27s:I:System: Interface ethernet 0/1/34, state up
0d01h38m27s:I:System: Interface ethernet 0/1/25, state up
```

Clearing MAC-VLAN information

Enter the **clear table-mac-vlan <interface>** command to clear MAC-VLAN information. Add the interface id to clear information for a specific interface.

```
Brocade#clear table-mac-vlan <interface>
```

Sample MAC-based VLAN application

[Figure 109](#) illustrates a sample configuration that uses MAC-based VLAN on port e 0/1/1 on the Brocade device. In this configuration, three host PCs are connected to port e 0/1/1 through a hub.

Host A MAC address is statically configured on port e 0/1/1. The profile for Host B MAC address on the RADIUS server specifies that the PC should be assigned to VLAN 2. Host C profile does not exist in the RADIUS server, and will be put into a restricted VLAN.

FIGURE 109 Sample MAC-based VLAN configuration

Host A MAC address is statically mapped to VLAN 1 with priority 1 and is not subjected to RADIUS authentication. When Host B MAC address is authenticated, the Access-Accept message from the RADIUS server specifies that Host B MAC address be placed into VLAN 2. Since Host C MAC address is not present in the RADIUS server, Host C will be rejected by the server and its MAC address will be placed into a restricted VLAN.

Below is the configuration for this example.

```
module 1 fgs-48-port-management-module
module 2 fgs-xfp-1-cx4-1-port-10g-module
vlan 1 by port
  untagged ethe 0/1/10
  mac-vlan-permit ethe 0/1/1 to 0/1/2
  no spanning-tree
vlan 2 by port
  untagged ethe 0/1/30
  mac-vlan-permit ethe 0/1/1 to 0/1/2
  no spanning-tree
vlan 666 name mac_restricted by port
  untagged ethe 0/1/20
  mac-vlan-permit ethe 0/1/1 to 0/1/2
  no spanning-tree
vlan 4000 name DEFAULT-VLAN by port
  no spanning-tree
vlan 4004 by port
  mac-vlan-permit ethe 0/1/1
default-vlan-id 4000
ip address 10.44.3.8 255.255.255.0
ip default-gateway 10.44.3.1
radius-server host 10.44.3.111
radius-server key 1 $-ndUno
mac-authentication enable
mac-authentication max-age 60
```

```

mac-authentication hw-deny-age 30
mac-authentication auth-passwd-format xxxx.xxxx.xxxx
interface ethernet 0/1/1
  mac-authentication mac-vlan max-mac-entries 5
  mac-authentication mac-vlan 0030.4888.b9fe vlan 1 priority 1
  mac-authentication mac-vlan enable
!
interface ethernet 0/1/2
mac-authentication mac-vlan max-mac-entries 5
mac-authentication mac-vlan enable
!
!
end

```

The **show table-mac-vlan** command returns the following results for all ports in this configuration.

```
Brocade#show table-mac-vlan
```

Port	Vlan	Accepted Mac	Rejected Mac	Attempted Mac	Static Mac	Static Conf	Max Mac
0/1/1	N/A	2	1	0	1	1	5
0/1/2	N/A	0	0	0	0	0	5

The **show table-mac-vlan e 0/1/1** command returns the following results for port 0/1/1 in this configuration.

```
Brocade#show table-mac-vlan e 0/1/1
```

MAC Address	Port	Vlan	Authenticated	Time	Age	CAM Index	MAC Index	Dot1x	Type	Pri

Sample MAC-based VLAN application

Port mirroring and Monitoring

Table 158 lists the individual Brocade FastIron switches and the mirroring features they support. These features are supported in the Layer 2, base Layer 3, edge Layer 3, and full Layer 3 software images, except where explicitly noted.

TABLE 158 Supported port mirroring and monitoring features

Feature	FESX FSX 800 FSX 1600	FWS	FCX	ICX 6610	ICX 6430 ICX 6450
Port mirroring and monitoring (mirroring of both inbound and outbound traffic on individual ports)	Yes	Yes	Yes	Yes	Yes
ACL-based mirroring of denied traffic	Yes, on SX-FI48GPP, SX-FI-2XG, SX-FI8XG, SX-FI-24GPP, and SX-FI-24HF modules	Yes	Yes	Yes	Yes
ACL-based mirroring of permitted traffic	Yes	Yes	Yes	Yes	Yes
MAC address filter-based mirroring	No	Yes	Yes	Yes	Yes
VLAN-based mirroring	Supported on third generation SX modules only	Yes	Yes	Yes	Yes

NOTE

FWS, FCX, and ICX devices support only ingress VLAN-based mirroring. FSX devices support both ingress and egress VLAN-based mirroring.

The procedures in this chapter describe how to configure port mirroring on Brocade devices.

Port mirroring and monitoring overview

Port mirroring is a method of monitoring network traffic that forwards a copy of each incoming or outgoing packet from one port on a network switch to another port where the packet can be analyzed. Port mirroring can be used as a diagnostic tool or debugging feature, especially for preventing attacks. Port mirroring can be managed locally or remotely.

Port mirroring and monitoring overview

You can configure port mirroring, by assigning a port (known as the Monitor port), from which the packets are copied and sent to a destination port (known as the Mirror port). All packets received on the Monitor port or issued from it, are forwarded to the second port. You next attach a protocol analyzer on the mirror port to monitor each segment separately. The analyzer captures and evaluates the data without affecting the client on the original port.

The mirror port may be a port on the same switch with an attached RMON probe, a port on a different switch in the same hub, or the switch processor.

Port mirroring and monitoring configuration

To configure port monitoring, first specify the mirror port, then enable monitoring on the monitored port.

The *mirror port* is the port to which the monitored traffic is copied. Attach your protocol analyzer to the mirror port. The *monitored port* is the port with the traffic you want to monitor.

[Table 159](#) lists the number of mirror and monitor ports supported on the Brocade devices. For more information about port regions, refer to [“About port regions”](#) on page 556.

TABLE 159 Number of mirror and monitored ports supported

Port type	Maximum number supported		
	FastIron X Series	FCX	ICX
Ingress mirror ports	1 per port region	1 per port region	1 per port region
Egress mirror ports	1 per port region	1 per port region	1 per port region
Ingress monitored ports	No limit	No limit	No limit
Egress monitored ports	8	8	8

NOTE

FastIron X Series devices support multiple ingress and egress mirror ports. For 1 Gbps ports, ports in groups of 12 share one ingress mirror port and one egress mirror port. Therefore, ports 1 and 2 cannot have different mirror ports, but ports 1 and 13 can (port 25, for third-generation modules). Each 10 Gbps port (or each third-generation 10 GbE module) can have one ingress mirror port and one egress mirror port.

NOTE

For devices other than the FastIron X Series, it is possible to configure more than eight egress ports, although only the first eight are operational. This is also true for mirrored VLANs - more than eight can be configured, but only the first eight are operational.

Configuration notes for port mirroring and monitoring

Refer to the following guidelines when configuring port mirroring and monitoring:

- If you configure both ACL mirroring and ACL-based rate limiting on the same port, then all packets that match are mirrored, including the packets that exceed the rate limit.
- FWS and FCX Series devices support sFlow and port monitoring together on the same port.
- FastIron X Series devices support port monitoring and sFlow together on the same device. The caveat is that port monitoring and sFlow cannot be configured together within the same port region. Refer to [“About port regions”](#) on page 556 for a list of valid port ranges on these devices. This restriction only applies to first- and second-generation modules.
- You can configure a mirror port specifically as an ingress port, an egress port, or both.
- Mirror ports can run at any speed and are not related to the speed of the ingress or egress monitored ports.
- The same port cannot be both a monitored port and the mirror port.

- The same port can be monitored by one mirror port for ingress traffic and another mirror port for egress traffic.
- The mirror port cannot be a trunk port.
- The monitored port and its mirror port do not need to belong to the same port-based VLAN:
 - If the mirror port is in a *different* VLAN from the monitored port, the packets are tagged with the monitor port VLAN ID. This does not apply if the mirror port resides on the SX-FI48GPP module. In this case, mirrored packets are not tagged with a monitor port VLAN ID.
 - If the mirror port is in the *same* VLAN as the monitored port, the packets are tagged or untagged, depending on the mirror port configuration.
- More than one monitored port can be assigned to the same mirror port.
- If the primary interface of a trunk is enabled for monitoring, the entire trunk is monitored. You can also enable an individual trunk port for monitoring using the **config-trunk-ind** command.
- With FastIron X Series IPv4 hardware, the following port mirroring functions may not work across modules when only one switch fabric is present in the system:
 - Input mirroring
 - Output mirroring
 - Both input mirroring and output mirroring

Additional factors that can affect cross-module port mirroring include:

- Switch fabric slot configuration (SF1 or SF2)
- Interface modules configured for port mirroring
- For *stacked* devices, if the ingress and egress analyzer ports are always network ports on the local device, each device may configure the ingress and egress analyzer port independently. However, if you need to mirror to a remote port, then only one ingress and one egress analyzer port are supported for the entire system.
- For ingress ACL mirroring, the ingress rule for stacked devices also applies. The analyzer port setting command **acl-mirror-port** must be specified for each port, even though the hardware only supports one port per device. This applies whether the analyzer port is on the local device or on a remote device. For example, when port mirroring is set to a remote device, any mirroring-enabled ports (ACL, MAC address filter, or VLAN) enabled ports are set globally to a single analyzer port, as shown in the following example.

```
Brocade(config)# mirror ethernet 1/1/24
Brocade(config)# mirror ethernet 2/1/48
Brocade(config)# interface ethernet 1/1/1
Brocade(config-if-e1000-1/1/1)# monitor ethernet 2/1/48 both
```

The analyzer port (2/1/48) is set to all devices in the system.

```
Brocade(config)# interface ethernet 1/1/2
Brocade(config-if-e1000-1/1/2)# ip access-group 101 in
Brocade(config-if-e1000-1/1/2)# interface ethernet 1/1/1
Brocade(config-if-e1000-1/1/1)# acl-mirror-port ethernet 2/1/48
```

The previous command is required even though the analyzer port is already set globally by the port mirroring command.

```
Brocade(config)# interface ethernet 1/1/3
Brocade(config-if-e1000-1/1/3)# ip access-group 101 in
Brocade(config-if-e1000-1/1/3)# acl-mirror-port ethernet 2/1/48
Brocade(config-if-e1000-1/1/3)# ip access-group 102 in
```

- Because of hardware limitations on the SX-FI48GPP interface module, if the monitored port is on the SX-FI48GPP module, mirrored packets vary slightly from original (monitored) packets, depending on the type of management or interface module on which the mirror port (analyzer) is configured:
 - When ingress or egress mirroring is enabled between a monitored port on an SX-FI48GPP interface module and a mirror port on an IPv4 interface module, mirrored packets contain CRC errors. All other data in the original and mirrored packets is the same.
 - When ingress or egress mirroring is enabled between a monitored port on an SX-FI48GPP interface module and a mirror port on an IPv4 8-port management module, IPv6 management module, IPv6 interface module, or SX-FI48GPP module, mirrored packets are larger than the original packet by 4 bytes, but do not contain CRC errors. All other data in the original and mirrored packets is the same.

Command syntax for port mirroring and monitoring

This section describes how to configure port mirroring and monitoring.

Monitoring a port

To configure port monitoring on an individual port on a Brocade device, enter commands similar to the following.

```
Brocade(config)#mirror-port ethernet 1/2/4
Brocade(config)#interface ethernet 1/2/11
Brocade(config-if-e1000-11)#monitor ethernet 1/2/4 both
```

Traffic on port e 1/2/11 will be monitored, and the monitored traffic will be copied to port e 1/2/4, the mirror port.

Syntax: [no] mirror-port ethernet <port> [input | output]

Syntax: [no] monitor ethernet <port> both | in | out

The <port> variable for **mirror-port ethernet** specifies the port to which the monitored traffic is copied. The <port> variable for **monitor ethernet** specifies the port on which traffic is monitored.

Specify the *port* variable in one of the following formats:

- FWS, FCX, and ICX stackable switches – *stack-unit/slotnum/portnum*
- FSX 800 and FSX 1600 chassis devices – *slotnum/portnum*
- ICX devices – *slotnum/portnum*
- FESX compact switches – *portnum*

The **input** and **output** parameters configure the mirror port exclusively for ingress or egress traffic. If you do not specify one, both types of traffic apply.

The **both**, **in**, and **out** parameters specify the traffic direction you want to monitor on the mirror port. There is no default.

To display the port monitoring configuration, enter the **show monitor** and **show mirror** commands.

Monitoring an individual trunk port

You can monitor the traffic on an individual port of a static trunk group, and on an individual port of an LACP trunk group.

By default, when you monitor the primary port in a trunk group, aggregated traffic for all the ports in the trunk group is copied to the mirror port. You can configure the device to monitor individual ports in a trunk group. You can monitor the primary port or a secondary port individually.

To configure port monitoring on an individual port in a trunk group, enter commands such as the following.

```
Brocade(config)#mirror-port ethernet 2/6
Brocade(config)#trunk e 2/2 to 2/5
Brocade(config-trunk-2/2-2/5)#config-trunk-ind
Brocade(config-trunk-2/2-2/5)#monitor ethe-port-monitored 2/4 ethernet 2/6 in
```

Traffic on trunk port e 2/4 is monitored, and the monitored traffic is copied to port e 2/6, the mirror port.

The **config-trunk-ind** command enables configuration of individual ports in the trunk group. You enter the **config-trunk-ind** command only once in a trunk group. After you enter the command, all applicable port configuration commands apply to individual ports only.

NOTE

If you enter **no config-trunk-ind**, all port configuration commands are removed from the individual ports and the configuration of the primary port is applied to all the ports. Also, once you enter the **no config-trunk-ind** command, the **enable**, **disable**, and **monitor** commands are valid only on the primary port and apply to the entire trunk group.

mirroring configuration on an IronStack

You can configure mirroring on a Brocade IronStack. An IronStack consists of up to eight FCX devices. The stack operates as a chassis. The following examples show how to configure mirroring for ports that are on different members of a stack, and for ports that are on the same stack member as the mirror port.

Configuration notes for Ironstack mirroring

The following mirroring configuration information applies to FCX devices connected in an IronStack topology:

- The input or output mirroring port can be on different ports.
- An IronStack can have one mirroring port that monitors multiple ports, but cannot have multiple mirror ports for one monitored port.
- If the mirror port and the monitored ports are on different stack units, only one active mirror port is allowed for the entire IronStack.
- If the mirror port and the monitored ports are on the same port region, multiple active mirror ports are allowed for the entire IronStack. Devices in an IronStack support 24 ports per port region.

- The maximum number of monitored VLANs on an IronStack is 8.

Configuring mirroring for ports on different members in an IronStack example

In this example, although two ports are configured as active ports, only one active mirror port (port 1/1/24) is allowed for the entire stack because the mirror ports and the monitored ports are on different stack members.

```
Brocade(config)#mirror-port ethernet 1/1/24
Brocade(config)#mirror-port ethernet 2/1/24
Brocade(config)#interface ethernet 1/1/1
Brocade(config-if-e1000-1/1/1)#monitor ethernet 1/1/24 both
Brocade(config)#interface ethernet 2/1/1
Brocade(config-if-e1000-2/1/1)#monitor ethernet 1/1/24 both
Brocade(config)#interface ethernet 4/1/1
Brocade(config-if-e1000-4/1/1)#monitor ethernet 1/1/24 both
```

Configuring mirroring for ports on the same stack member in an IronStack example

In this example, the mirror ports are assigned to different monitor ports.

```
Brocade(config)#mirror-port ethernet 1/1/24
Brocade(config)#mirror-port ethernet 2/1/24
Brocade(config)#mirror-port ethernet 3/1/24
Brocade(config)#mirror-port ethernet 4/1/24
Brocade(config)#interface ethernet 1/1/1
Brocade(config-if-e1000-1/1/1)#monitor ethernet 1/1/24 both
Brocade(config)#interface ethernet 2/1/1
Brocade(config-if-e1000-2/1/1)#monitor ethernet 2/1/24 both
Brocade(config)#interface ethernet 4/1/1
Brocade(config-if-e1000-4/1/1)#monitor ethernet 4/1/24 both
```

ACL-based inbound mirroring

This section describes ACL-based inbound mirroring for FastIron devices.

Creating an ACL-based inbound mirror clause for FWS and FCX devices

The following example shows how to configure an ACL-based inbound mirror clause.

1. Configure the mirror port.

```
Brocade(config)#mirror-port ethernet 1/1/2
```

2. Configure the ACL-based inbound mirror clause.

```
